Backlogs? Rush requests? Now they're a thing of the past.

MSA's new Executive Peachpak II links your company's personal computers directly to your mainframe. So executives can get to vital information without waiting for print-outs.

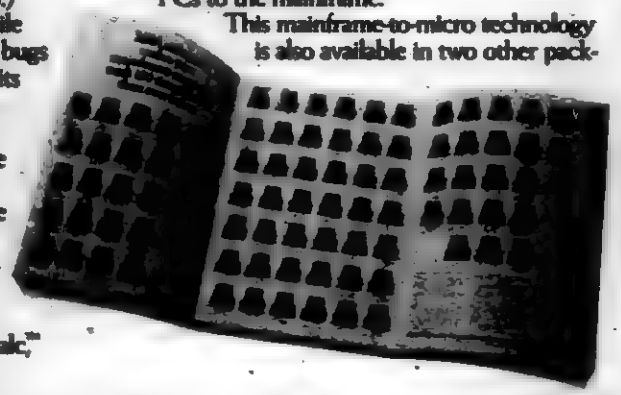
Best of all, this hot new technology is available from MSA *right now.* (In fact, it's already installed and working for companies across the country.)

MSA is the mainframe-to-micro leader. While other companies are still trying to work the bugs out of their initial offerings, MSA already has its second successful mainframe-to-micro product: Executive Peachpak II.

It offers such advanced features as Database Sharing, MSA's database-to-database transfer technology that lets you get all the mainframe information you need instantly.

And a Universal Interface with most micro-software packages including Peachtree Software, 1-2-3™ from Lotus, and VisiCalc.™

Executive Peachpak II also includes PeachCalc,™ an electronic spreadsheet. A Business Graphics System for color charts and other graphics. Telecommunications that let personal computers talk to each other—or link to resources such as Dow Jones News/Retrieval.® PeachText,™ complete report production system that lets executives edit and footnote reports. A List Manager for organization. And PeachLink,™ the software that links your PCs to the mainframe.



This mainframe-to-micro technology is also available in two other packages: Administrative Peachpak, which includes comprehensive word processing functions. And Graphics Peachpak, for color graphs and charts.

All include PeachLink.™ And all are backed by the service and support MSA is so famous for.

This revolutionary new link means you can now deal with one software company that supplies all the advanced mainframe systems your company needs. All the software for your personal computers through our Peachtree Software Company. And the software that links them together.

Talk to MSA about new Executive Peachpak II. And see how much more you could be getting from your mainframe. Call Robert Carpenter at (404) 239-2000, or write to Management Science America, Inc., 3445 Peachtree Road, N.E., Atlanta, Georgia 30326.

NEWSPAPER

AT&T takes on the computer market

Unwraps five superminis, multiuser micro, local net, PC Interface

By John Dix
CW Staff

NEW YORK — AT&T made its long-expected entry into the computer industry last week with the commercial introduction of a family of Unix-based 32-bit processors that includes a multiuser microcomputer and five superminis.

Announced along with the 3B processor family at a press conference here last Tuesday were Ethernet-type local-area network interfaces and an interface that reportedly enables interaction between the Unix environment of the AT&T supermicro and micros that run under PC-DOS, the operating system for IBM's Personal Computer.

The 3B processors are not for everyone. Noting that they lack AT&T-supplied or supported applications software, Robert J. Casale, president of marketing and sales for AT&T Information Systems, Inc., said the processors' target markets are value-added resellers and large users that want to shoulder the responsibility for applications development and/or procurement.

Addressing the applications void, Casale pointed out that more than 90 companies market 300 commercially available Unix applications packages. However, it is unclear how many of the packages are compatible with the System V version of Unix bundled into all of the new AT&T processors.

In a nutshell, the products unveiled last week by AT&T include:

■ The 3B20 line of superminis, available in three configurations: the single-processor 3B20S, the attached processor 3B20A and the dual-processor 3B20D. The systems range in price from $230,000 to $340,000. *Story on page 8.*

■ The 3B5 mid-range superminis, which are said to be optimized for Unix and range in price from $57,000 to $73,000. The two models in the 3B5 line, the 3B5/100 and 3B5/200, are based on AT&T Technology Systems Group's 32-bit WE 32000 microprocessor, developed by AT&T's Bell Laboratories, and use 256K-byte random-access memory chips. *Story on page 8.*

■ The 3B2/300, a $9,950 multiuser microcomputer that is also based on the WE 32000. The 3B2/300 uses 256K-byte RAM chips, has a 10M-byte Winchester disk and can reportedly support up to 18 users. *Story on page 9.*

■ Two Ethernet-compatible local-area network interfaces. One is a three-board AT&T set for the 3B20 and 3B5 superminis that uses a WE 32000 and costs $7,000. The second is a $3,000, single-board interface that uses an Intel Corp./Seeq Technologies, Inc. chip set for the 3B2/300. *Story on page 9.*

■ The hardware/software PC Interface. The PC interface enables the 3B2/300 to act as a host in a star network of IBM Personal Computers and compatible microcomputers running under PC-DOS, IBM's version of Microsoft, Inc.'s MS-DOS operating system; allows files to be transferred between machines using PC-DOS and those running Unix; enables the micros to act as Unix terminals; and allows the micros to communicate with each other. The price of the PC Interface will not be announced until the third quarter, when the product will be available for shipment, according to AT&T.

While together these products represent what Casale claimed is the broadest range of initial product offerings ever made by a

Wang brings out top-of-the-line supermini

By Tom Henkel
CW Staff

LOWELL, Mass. — Wang Laboratories, Inc. last week announced its largest processor to date, an addition to its VS line of 32-bit superminicomputers that is said to offer users three times the internal performance of the former top-of-the-line VS 100.

The VS 300 is compatible with systems software and application programs developed on Wang's VS 25, VS 45, VS 85, VS 90 and VS 100 systems.

The new supermini features a pipelined central processor that reportedly can perform three functions at one time. In one 120-nsec cycle, Wang claimed, the CPU can simultaneously execute an instruction, decode a second instruction and fetch a third instruction.

Industry watchers had expected the announcement of the VS 300 for some time. Craig Symons, a financial analyst with Gartner Group, Inc. of Stamford, Conn., explained last week that Wang needed a high-end processor to compete with similar systems offered by its competitors, such as Data General Corp.'s MV/10000 and Prime Computer, Inc.'s 9950. It also needed a powerful supermini that could be used as a vehicle for connecting corporate microcomputers, Symons added, observing that the VS 300 appears to offer the potential for such applications.

The VS 300 features 4M to 16M bytes of main memory and a 32K-byte cache memory. A dedicated, buffered Memory Control Unit relieves the processor and I/O subsystem from the task of managing memory requests, the vendor said.

The system can execute up to 255 concurrent user tasks; up to 192 workstations and printers can be attached to it. The VS 300 uses an enhanced version of Wang's VS operating system that is compatible with existing word processing, DP and communications software, according to a

TOP OF THE NEWS

AT&T and Wang Laboratories, Inc. rang up with the major hardware news last week, but National Advanced Systems, Inc. was also on the line. It answered IBM's 3080 X series announcements with price cuts and memory expansions for its high-end AS/9000 mainframes. **Page 2.** Sperry Corp., meanwhile, said it will be holding a press conference today to introduce what it refers to as the industry's first fourth-generation language micros for stand-alone use or mainframe connection. **Page 4.**

■

Ashton-Tate was among the software vendors that called in major announcements last week. Its introduction of an integrated microcomputer software package called Framework pits the company directly against Lotus Development Corp. **Page 5.** In addition, Data General Corp. brought out what it claimed is the first large-scale financial management package integrated with an office automation system. **Page 6.** Artificial Intelligence Corp. introduced two versions of Intellect that provide an interface to IBM's SQL/DS. **Page 10.**

■

How long will your data communications bills stay the same? Maybe until June 13. Maybe not. There's been a lot of action at the Federal Communications Commission lately. **Page 4.**

■

For large users, the office automation marketplace is maturing more rapidly than expected, a major survey reported last week. **Page 6.**

■

The Department of Defense has been empowered to review export licenses for computers and other high-technology items to noncommunist countries suspected of being shipment points to Eastern bloc nations. **Page 14.**

We apologize if your *Computerworld* arrived late this week. The blizzard that hit the East Coast last Thursday knocked out the lines supplying CW's Framingham, Mass., offices with power, bringing down the text editing system used to create and typeset the newspaper. As a result, publication of the paper was delayed for one day.

AS/9000 prices cut, memory hiked

By Jeffry Stooker
CW West Coast Bureau

MOUNTAIN VIEW, Calif. — National Advanced Systems Corp. (NAS) last week trimmed the prices of two of its AS/9000 series mainframes by 8% and 10% and expanded the machines' main memory by 16M bytes. Similar expansions of internal storage were also announced for two other members of the NAS 9000 family of IBM-compatible processors.

In a related move, NAS cut the 9000 line's maintenance prices by 5% to 27%.

Together, the main memory enhancements and the cuts in both purchase prices and maintenance expenses constitute the first stage of NAS' reply to IBM's recent 3080 X family upgrade [CW, Feb. 27]. The second phase of that response is expected to come early next month with the expansion of NAS' 8000 family of IBM-compatible CPUs, industry sources said.

NAS last week also disclosed its revised timetable for testing and delivering IBM's Extended Architecture (XA) for the 9000 series. Testing of XA will start this year during the second quarter both here and in Japan, with shipments of XA upgrade kits scheduled to begin reaching 9000 series users during the third quarter.

Originally, NAS had intended to start making XA available to users of the 9000 family during the second quarter of this year. But snags in IBM's own XA shipment schedule forced NAS to delay its delivery dates by one quarter, according to Mitch Schoch, director of NAS' North American systems marketing.

XA is also slated to be added to one of the 9000 family's sister products, NAS' AS/8000 mainframe line, which made its debut last year. In fact, 8000 series users will begin to receive their XA upgrade kits during the fourth quarter, Schoch said.

NAS' latest mainframe pricing moves apply both to the company's 9060 and 9080 processors, whose purchase prices the vendor has pared by 10% and 8%, respectively. As a result, a basic 9060 now sells for $2.7 million, compared with $4.5 million for a comparably configured 9080.

As part of the same announcement last week, NAS expanded from 48M to 64M bytes the main memory capacity of both the 9060 and 9070. The enhancement has left the two machines equal in internal storage to the 9000 family's top-of-the-line member, the 9080, whose maximum capacity of 64M bytes remains unchanged.

Elsewhere in the 9000 series, NAS boosted from 32M to 48M bytes the main memory of the product line's two low-end models, the 9040 and 9050.

In yet another announcement, the vendor trimmed the 9000 series' maintenance prices by 14.6% for the 9040, 14.7% for the 9050, 17.7% for the 9060, 15% for the 9070 and 26.5% for the 9080. Each of these price cuts refers only to the five models' basic configurations, Schoch noted. The exact amount of the maintenance price cuts varies with the machines' main memory and channel capacities.

In any event, the change in NAS' pricing structure has cut the monthly maintenance charges for the 9000's five minimum configurations to $4,821 for the 9040, $5,724 for the 9050, $6,662 for the 9060, $8,790 for the 9070 and $10,437 for the 9080.

NAS' announcement of price cuts and memory enhancements comes only about a month after IBM's announcement of six additions to its 3080 X family of large-scale processors. Introduced during the week of Feb. 20, the six machines reportedly provide 5% to 14% greater performance than the 3083, 3081 and 3084 models they replace.

Both the price reductions and memory enhancements for the 9000 family machines take effect immediately, according to NAS, which is based at 800 E. Middlefield Road, Mountain View, Calif. 94042.

Reaction to 3480: It may not replace 3420

By James Connolly
CW Staff

Possible savings in time, space and energy sparked IBM users' interest in the long-awaited IBM 3480 tape drive, but that interest doesn't ensure that the cartridge system will replace IBM 3420-type drives in a year, seven years or ever, users and industry observers indicated in interviews last week.

"Anything that saves us space, power and cooling is interesting. Anything that increases the speed with which 3380 [disk drives] can be dumped is interesting. But the change in media means we have to be careful about jumping in too fast," said Laura Gregory, vice-president for technical management at Bank of America in San Francisco.

Moreover, she added, "From what I've seen, it doesn't look like the price comparison is going to be as favorable as we would like."

Richard Wagner, manager of technical services, operations and communications for the Lycoming Division of Avco, Inc. in Stratford, Conn., said his initial reaction "is that finally, after all we have been hearing, the announcement has been made."

"We are definitely interested in the speed of the new system," Wagner said. "The other thing of interest to us is the footprint. Like other people, we are interested in getting more square footage in the machine room. Every square foot that we save puts off the time that we go to the company and ask to expand."

Gregory, Wagner, other users and consultants commented on the 3480 in the days following IBM's March 22 announcement that the high-end tape system will be available in early 1985 to replace the 11-year-old 3420 drives [CW, March 26].

The 3480 features a 3M byte/sec data transfer rate, which more than doubles the 1.25M byte/sec rate of the 3420, and the use of 18 recording tracks on the ½-in. chromium dioxide tape, resulting in a sixfold recording density increase, from 6,250 to 38K byte/in. Utilizing a 4- by 5-in. cartridge rather than a 10½-in. reel, the 3480 was designed to save tape storage space and to use 60% less computer room space than the 3420.

The 3480's Data Facility Hierarchical Storage Manager, Version 2, relieves the host computer of the job of transferring data from disk to tape and allows the computer to just instruct the disk to unload data. That feature is intended to free the host for other tasks.

After examining the 3480's specs, Tom Baker, second vice-president for data processing at Guardian Life Insurance in New York, said, "With the advent of the high-capacity disk and the large data center, it takes a lot of time to back up a 3380. Even though we only back up data that was altered during the day, we think that perhaps it could save us a couple of hours a night."

However, the surveyed users, who run IBM 3081 and 3083 mainframes as well as other systems, said they still wanted to learn more about the 3480s before committing to buy any of them.

At an IBM users group meeting in Atlanta at the time of the announcement, consultant Hugh R. Green, director of IBM large market services for The Gartner Group in Stamford, Conn., said some attendees saw the tape being used in a start/stop role, rather than a data stream role. He noted the product can only reach its full potential in a data stream role, particularly for organizations with large archival operations.

But Green also noted that the scheduled first quarter of 1985 delivery date "is not the strongest indicator" that the product will be readily available to buyers. Green expects the 3480 announcement to force IBM competitors, particularly Storage Technology Corp., to offer cartridge systems even if they have reel-to-reel devices that can match some of the 3480's performance figures.

An observer of the tape market, Don Collier, general manager of the "Freeman Reports" in Santa Barbara, Calif., observed that the 3480's introduction "certainly ensures a healthy future for magnetic tape and rejuvenates the high-end tape market in particular." He said the tape, thin-film heads and cartridge design "will break loose the logjam" that has held back OEMs and plug-compatible manufacturers who have awaited the IBM announcement before releasing their own tape systems.

However, he noted that 3420-type systems "will be around for many years to come" because it is too expensive for large users to transfer their "500,000 reels of tape" to cartridges. He predicted that the gradual transition to the newer product will start with buyers of new systems using 3480s and with established shops buying 3480s for use with new applications and using 3420s with existing applications.

Collier sees the 3480's strong points as its 60% cut in space and power requirements and twentyfold increase in data integrity.

Sperry to offer 'fourth-generation-language micros'

NEW YORK — Sperry Corp. Computer Systems today is expected to introduce here what it termed the industry's first fourth-generation-language microcomputers for either stand-alone use or mainframe connection.

Sperry's Mapper 5 and Mapper 6 microprocessors, the first of a new line of desktop microcomputers, bring the company's Mapper mainframe application development software down to the chip level, said Dewaine Osman, vice-president of the company's Americas Division. Osman said the starting price for the multiuser system is under $40,000. More detailed information was not available at press time.

As stand-alone desktop systems, the Mapper microprocessors become "personal data processing departments" for middle managers and administrative people, Sperry said. They feature color graphics, message sending and related office functions, searches, sorts, merges and arithmetic computations.

The Mapper 5 was designed for Sperry environments and links to Sperry mainframes. The Mapper 6, available for "a slight increase in cost," offers the additional ability to link with IBM mainframes, a spokesman said.

Mainframe-based Mapper data can be updated and shared downline at the workstation level, extracted for local use or executed by remote command, Sperry said. The systems can support up to 16 Sperry UTS display stations or the Sperry Personal Computer, the firm said.

The systems' basic configuration is said to feature an 8-MHz Motorola, Inc. 68000 microprocessor with a discrete virtual memory management unit for virtual address translation. Up to 30 processes are supported, each with a maximum private virtual address space of 4M bytes, Sperry said.

The cabinet housing the processor also houses a 5¼-in., 655K-byte floppy disk drive, a peripheral interface for Mapper mass storage and backup subsystems, an asynchronous port, three dual RS-232 synchronous ports to handle UTS terminals and the Sperry Personal Computer and three more RS-232 synchronous ports to support micro-to-micro and micro-to-mainframe communications.

A mass storage and backup subsystem consists of a fixed disk controller, a 28.5M-byte fixed disk drive, a 45M-byte streaming tape unit or two fixed drives with a total of 57M bytes of storage.

Sperry Computer Systems can be reached through P.O. Box 500, Blue Bell, Pa. 19424.

Private-line, dial-up rates to rise June 13 — or April 3

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — How long data communications users will continue to pay current dial-up and private-line rates was a key question here last week.

The Federal Communications Commission last week ordered AT&T and the nation's local telephone companies to continue until June 13 their present division of revenue contracts, which govern the rates now being paid by the nation's communications users. Without FCC action, the contracts would have expired tomorrow, April 3.

However, Bell Atlantic — one of the seven regional telephone holding companies created by AT&T's divestiture of its operating companies — last week asked U.S. District Court Judge Harold H. Greene to cancel the contracts tomorrow.

If Greene complies with that request, tariffs that incorporate the FCC's new access charge plan would go into effect immediately. Those tariffs charge sharply higher rates for most dial-up and private-line services.

Bell Atlantic contends that continuing the division of revenue contracts is illegal because the decree settling the U.S. vs. AT&T antitrust case against AT&T said, "tariffed access charges shall be the exclusive means for the former Bell telephone companies to receive compensation for exchange access service following divestiture."

Greene, who presided at the U.S. vs. AT&T trial and is now overseeing the settlement, agreed late last year to defer this provision for three months — from Jan. 1, the date on which divestiture officially took place, to April 3 — to give the FCC more time to analyze the access charge-based tariffs that had been submitted by AT&T and the local telephone companies. But at the time Greene granted this delay, he said he was assuming that "the arrangement between AT&T and the operating companies ... will expire in April 1984."

Last week, Larry Povich, an FCC policy spokesman, said that under the commission's rules, the pending tariffs can be deferred until June 13. "Judge Greene has absolutely no jurisdiction in this area," he added.

According to Bell Atlantic, the commission delayed the new exchange access tariffs not for the stated reason — that they weren't sufficiently cost-justified — but "as an accommodation to AT&T's alleged financial condition," refering to an emergency petition filed Feb. 27 by AT&T that requested delay of the new access charge plan and, hence, of the pending tariffs.

AT&T's major concern is that the latest revision of that plan, which defers the residential and single-line user surcharge and revises the fees which competing other common carriers must pay for local exchange access, will increase its costs drastically and result in a substantial revenue loss.

AT&T wants the commission to raise the other common carriers' access charges and lower the former Bell operating companies' authorized rate of return. That rate currently is 12.75%. AT&T proposed a return of 11% to 12%.

If the commission accepts the phone company's proposal, AT&T said it would lower its own rate to the same level authorized for the former Bell operating companies, even if this requires reducing present rates.

In last week's order, the commission announced that it would investigate the need for changing the 12.75% rate of return.

AT&T to drop Accunet Packet Service prices, offer lower speed

By Bryan Wilkins
CW Washington Bureau

WASHINGTON, D.C. — AT&T Communications has filed a tariff to decrease prices as well as offer a lower transmission speed option for its Accunet Packet Service. The changes will become effective May 5 if they are approved by the Federal Communications Commission.

Accunet is currently available at 9,600 and 56K bit/sec. AT&T's request for 4,800 bit/sec service marks the first time the carrier will offer this transmission speed option for data transmission. AT&T hopes this will make packet-switching more attractive to businesses that do not require high-speed transmission rates.

Accunet Packet Service, initially offered last June as the Basic Packet Switching Service, has not met with great customer demand, AT&T Information Systems, Inc. officials admitted. They are trying to expand its attraction by tailoring it to specific market segments, such as insurance firms and the automotive industry.

The newly filed tariffs for Accunet Packet Service reflect monthly charges as well as per-packet charges, AT&T Communications said. For instance, the monthly port charge for 56K bit/sec transmission would drop to $950 from the current rate of $1,200. The monthly port charge for 9,600 bit/sec service would be $550, down from the current $850. The proposed 4,800 bit/sec service would cost $420/mo.

Under the new tariff, filed March 23, the kilopacket rate for every 1,000 packets would be 75 cents instead of $1.35. This rate covers the first 4,000 kilopackets transmitted during normal business hours; the second 4,000 kilopackets would cost 70 cents per kilopacket, and the third set of kilopackets would cost 65 cents per kilopacket. Every kilopacket beyond 12,000 would cost 60 cents.

Transmission rates during nonbusiness hours would be a uniform 30 cents per kilopacket.

A new feature of the service proposed in the tariffs would permit customers to share trunk lines accessing one of the three existing packet-switch nodes already made by AT&T.

AT&T Communications said that the sharing of trunk lines will permit as many as 1,000 data terminals to be addressed on a single access line and up to 511 different messages to be transmitted simultaneously over one access line.

An access line connecting an Accunet Packet Service customer to the AT&T packet switch, as well as the equipment needed to convert terminal data into packets for transmission and deconversion at the receiving end, will have to be obtained by the customer.

Ashton-Tate pits package against Lotus 'Symphony'

By David Myers
CW New York Bureau

NEW YORK — Ashton-Tate last week marched into the integrated applications software arena to battle Lotus Development Corp., signaling the start of a clash between two microcomputer software titans.

At a news conference here, Ashton-Tate unveiled a software package integrating spreadsheet, word processing, graphics and data base capabilities with an "outline," or "electronic table of contents," utility for organizing manuscripts made up of text, graphs and columnar charts.

The package, called Framework for its use of "frames," or windows, is expected to go head to head against Lotus' recently announced Symphony product (CW, Feb. 20). Framework, which requires 256K bytes of random-access memory and two disk drives, will sell for $695, the same price as Symphony, and is expected to be available on the same date, July 2.

David Cole, Ashton-Tate's president, said Framework will initially be available on the IBM Personal Computer and compatible machines, but may be adapted for other hardware manufacturers.

Robert Carr, Framework's product manager, said the package can manage 3,000 10-item data base records, 200 pages of text and 20,000 spreadsheet entries. It can also access the operating system through one window.

Although the Ashton-Tate product does not include Symphony's communications capability, data from the package can be transmitted over phone lines via the operating system window, Carr said. Framework can be coupled with Ashton-Tate's Dbase II software as well as Lotus' Lotus 1-2-3 package and other Ascii files.

The word processing part of the package was described as similar to Microsoft, Inc.'s Word.

Framework also comes with a 140-function programming language, which Carr described as "Basic- or Pascal-like." Even so, Ashton-Tate said Framework is aimed at first-time users.

While the initial reaction to Framework was enthusiastic, it was muted by what many perceived as massive marketing obstacles confronting Ashton-Tate. "It seems Lotus already has the IBM market pretty much sewn up," said Michael Killen, president of San Jose, Calif.-based Strategic, Inc. "I would not want to go head to head with those guys right now."

Ashton-Tate is headquartered at 10150 W. Jefferson Blvd., Culver City, Calif. 90230.

DG gives CEO finance support

WESTBORO, Mass. — Data General Corp. last week introduced what it described as the first large-scale financial management software package integrated with an office automation system.

DG's Comprehensive Financial Operations (CFO) package provides real-time control over finances in an organization while supporting distributed accounting functions in multiple remote locations. CFO is compatible with DG's Comprehensive Electronic Office (CEO) system, which runs on DG's 32-bit Eclipse MV series superminicomputers under AOS/VS.

CFO consists of five modules that can be utilized separately or together. The modules — general ledger and financial control ($48,000), accounts payable ($34,000), purchase order ($38,500), materials management ($32,500) and accounts receivable and credit management ($48,000) — are said to share files interactively.

The CEO office automation system consists of CEO Word Processing; CEO Information Management, including electronic mail, filing and administrative support capabilities; and CEO Decision Support. Both CEO and CFO utilize DG's Infos II file management software.

A spokeswoman said CFO incorporates a layered design that keeps hardware and system software functioning separately from the accounting modules.

Six "personalizers" integrated with the five modules allow users to create, maintain and enhance the standard financial applications. The personalizers include a screen builder that enables users to custom-design system screens; a report builder for user-definition of report parameters; an inquirer feature that is said to provide real-time, interactive display of system information; a validator that allows users to define valid data entering the system; a documenter that ensures that essential documentation stays in real-time synchronization; and a table manager that allows users to update any table or data base used by CFO.

DG's Information Systems Division is located at 4400 Computer Drive, Westboro, Mass. 01581.

User survey: OA more mature than expected

By John Gallant
CW Staff

NEW YORK — Nearly 60% of the nation's largest corporations already have strategic policies governing the acquisition and use of office automation equipment, and that number is expected to rise to almost 85% by 1986, according to a survey released here last week.

The survey — *The Office Automation Challenge: American Business Responds* — combined responses from individuals responsible for planning and purchasing office systems within 834 U.S. businesses, including nearly half the Fortune 500 Industrial and Fortune 500 Service corporations. The study revealed an OA marketplace maturing more rapidly than expected, according to its sponsor, The Omni Group Ltd.

A significantly lower number of small and medium-size companies — firms with fewer than 100 workers — currently have strategic OA policies, the study found. However, it predicted a dramatic increase in that number by 1985, when over 55% of the small and medium-size firms are expected to have OA policies in place.

"Clearly, the most important finding of this survey is that the office automation marketplace is as mature as it is," said Randy J. Goldfield, president of The Omni Group. "Many people believe that OA is a new frontier, but that isn't the case. The study revealed that an area once handled by the office manager or the purchasing department is becoming more professionalized and specialized."

The task of developing OA policies falls on different shoulders based on company size, the survey showed. Among the Fortune 500 group, interdepartmental committees and individual departments with OA responsibility were most commonly drafted as policymakers. Company presidents and office managers often bore the yoke of decision-making within the smaller firms, and, in all but a few organizations, the users of office systems were rarely a factor in policy formation.

But while they may not be a critical component of the policy-making process, users can at least rest easier about keeping their jobs in the face of growing office automation. Staff reduction is the least important factor in the acquisition of OA equipment regardless of company size, the survey indicated. Increased processing speed, reduced transaction costs and equipment compatibility carried significantly more weight in office systems decisions among the corporations surveyed.

Nonetheless, personnel concerns remain a factor in the growth of OA. The survey showed that 72% of the Fortune 500 firms see the avoidance of staff increases as an important factor in purchasing office systems.

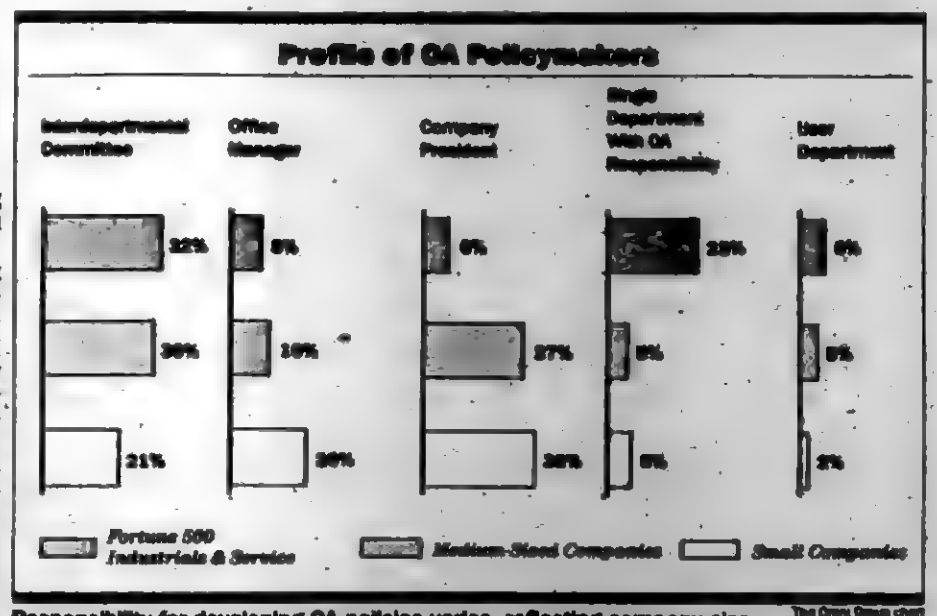
The importance of minimizing staff increases is borne out for small and medium-size companies also, with the survey indicating figures for that group similar to those for the larger organizations (63% and 61%, respectively).

Where are U.S. firms buying the word processors and microcomputers that make up their office systems? Purchasing directly from the manufacturer is the preferred route for word processing equipment, especially among the larger firms. And, although the figures are smaller, direct purchases of micros outweigh retail sales by a two-to-one margin, according to the study.

Respondents listed service, discounts, training and help in long-range planning as the major benefits of dealing directly with the manufacturer.

"The strong preference to buy direct indicates corporations want more than they think retail stores can provide," Goldfield said. Conducted in late 1983, the survey was underwritten by 12 information technology and service companies, including AT&T Information Systems, Inc.; Exxon Office Systems Co.; Hewlett-Packard Co.; Lanier Business Products, Inc.; Syntrex, Inc.; Tymshare, Inc.; Xerox Corp.; Datapoint Corp.; and Philips Information Systems, Inc.

Copies of the survey summary can be obtained free from The Omni Group, 115 E. 57th St., New York, N.Y. 10022.



Responsibility for developing OA policies varies, reflecting company size. The Omni Group chart

Some of most touted OA applications not catching on

NEW YORK — Some of the most highly touted office automation applications have yet to be embraced by corporate users, according to a survey released here last week by The Omni Group Ltd.

The survey indicates, for example, that electronic communications is seen as a key application of office systems by less than one-fifth of the nation's largest corporations, and the figure dips below the 10% level for small and medium-size firms. Similarly, graphics applications were mentioned as an important OA application only infrequently across companies of all sizes.

Data analysis, including the use of spreadsheets, projection and modeling packages, is by far the most important application of office systems among managers and professionals, the survey found. Among support staff, word processing is the most important OA function. Data processing, including transaction processing tasks such as order entry and inventory control, ranked as the second most important application across both types of workers.

One of the most important findings in this area, according to Dr. Warren Waldbrand, director of research for The Omni Group, is that data processing applications — though still ranked second — were seen as a more important use of office systems among small and medium-size U.S. corporations compared with their larger counterparts.

Boom in local nets expected

NEW YORK — Local-area networks will "proliferate substantially in major market segments" over the next two years, becoming the "most volatile area" of the office automation marketplace.

That is one of the findings of *The Office Automation Challenge: American Business Responds* survey released last week by The Omni Group Ltd. The study indicates that more than 40% of the Fortune 500 Industrial and Service companies currently use some form of local-area networks, and that by 1985, that figure is expected to rise to 72%.

The survey shows that a significantly lower number of small and medium-size firms currently employ local-area networks, but the anticipated growth rate in these markets is "enormous." The study did not question respondents as to how extensive they expect their use of local-area networks to be in the future, nor did it ask whether they plan to purchase or develop in-house their local-area networks.

Dr. Warren Waldbrand, research director for The Omni Group, added, "To say that nearly 75% of the Fortune 500 companies will have local-area networks by 1985 certainly doesn't mean that 75% of the people who work in those companies will be tied together through one."

Added Randy J. Goldfield, president of The Omni Group: "It is clear from this study that respondents have a good understanding of word processing equipment and personal computers. But there is a lot of confusion as to the linkage between these tools."

QUICK!

Name the fastest VM dump restore, and the fastest VM sort program.

(SYBACK & SyncSort CMS. What took you so long?)

Call (201) 568-9700.

Meet our super-sonic systems.

syncsort INC.

If you didn't choose SYBACK and SyncSort CMS as the fastest in their categories, *do not* go directly to jail. But read this very, very carefully.

SYBACK, our fast dump restore for VM systems, and SyncSort CMS, the only high-technology sort for VM/CMS, represent a great technological leap forward. No other programs of their type can provide all three of the following positive advantages:

(1) THE FASTEST VM PERFORMANCE: SYBACK and SyncSort CMS make data move like greased lightning. Compared to their "competitors," these programs can save a tremendous amount of computer resources:

- **50% in Elapsed Time;**
- **45% in VTime;**
- **55% in TTime;**
- **75% in SIOs.**

These savings are the result of our exclusive Fluid Buffering Technique (FBT). First developed in OS and DOS sorting, we've now extended the benefits of FBT to VM backups and sorts.

(2) THE BEST VM PRODUCTIVITY: SYBACK and SyncSort CMS have tremendous operational flexibility and user friendliness. They're rich in features designed to reduce human intervention in backup and sorting:

- **SYBACK**—Automatic backup based on CP directory • Stand-alone restore capability • Incremental backup facility • Catalog of backup operations • Multi-tasking and execution under CMS • Interactive command processing • Standard-label tape support • Callable by user programs • DASD to DASD conversion and copying. Much, much more.

- **SyncSort CMS**—Sorts CMS, SAM (OS or DOS), or VSAM files • Can be invoked from COBOL, PL/1 or BAL programs • Dynamically allocates disk space • Selects relevant records for sorting • Reformats records on output • Performs summaries of designated numeric fields • Produces reports with pagination, headings and dates • Can often produce simple reports in one day rather than, say, five. Much more, too.

(3) THE FINEST TECHNICAL SERVICE: Our Technical Service specialist are experts in their individual fields. You can count on fast, efficient, courteous service in both backup or sorting operations. More than 85% of all user requests for service are resolved within 24 hours.

CAVEAT EMPTOR: As with all performance software programs, the best way to find out what SYBACK and SyncSort CMS can do is to benchmark them yourself against your present programs.

That should help you make up your mind *fast!*

Syncsort Incorporated 560 Sylvan Ave., Englewood Cliffs, N.J. 07632

AT&T offers two sets of Unix-based superminis

By John Dix
and Tom Henkel
CW Staff

NEW YORK — AT&T brought out its first commercially available computers here last week, unveiling a family of superminicomputers that has been adopted from its large telephone switching systems along with a line of mid-range superminis based on newer technology developed by Bell Laboratories and cast in silicon by what used to be Western Electric Corp.

Available immediately, both sets of superminis in the so-called 3B processor family — the high-end 3B20 and the mid-range 3B5 — have a 32-bit architecture and come bundled with the Unix System V operating system.

The 3B20 superminis are built on a processor that the former Western Electric has employed in its large Electronic Switching Systems for some time. Using bit-sliced, bipolar chip technology and 64K-byte random-access memory chips, the 3B20 is available in three models, the 3B20S, 3B20A and 3B20D.

Pushing the systems' purported reliability, AT&T claimed that all 3B systems will experience only 10 minutes of downtime per year.

The 3B20S is a single-processor supermini that is touted as being nearly twice as reliable as other commercial computers and capable of withstanding temperature ranges of 32 F to 122 F. Supporting up to 100 users, the 3B20S performs at a rate of roughly one million instructions per second.

The $230,000 uniprocessor comes with 2M bytes of internal memory, a 300M-byte, removable-media disk drive, a 16K bit/in. tape drive, eight asynchronous ports, a CRT and a printer.

AT&T claims that 550 Model 3B20S superminis are presently being used by the former Bell operating companies to support office automation programs and data processing tasks.

With the addition of a growth module, the 3B20S can be upgraded to the 3B20A, an attached-processor system. The 3B20A costs 30% more than the single-processor system, but offers nearly double the performance of the 3B20S, supporting a maximum of 150 to 180 users. The 3B20A has 4M bytes of main memory, but otherwise, at $330,000, comes with the same peripherals as the uniprocessor.

The A model uses parallel processing, with both processors performing operating system calls independently, AT&T Technologies said. The 3B20A is the only system in the 3B20 product group that is not presently used within AT&T or any of the former Bell operating companies.

The top of the 3B20 line is the 3B20D, although neither 3B20S nor 3B20A users can upgrade to this system. The D model is a dual-processor supermini intended for transaction processing applications such as banking and financial services. It can stay on-line during maintenance, software updates and system administration, AT&T Technologies said.

The performance of the 3B20D system is similar to that of the uniprocessor 3B20S because one of the two processors is kept as a hot standby and not used unless the other processor falters.

A 3B20D uses the same processors and peripherals as the attached processor 3B20A, but comes with a 340M-byte disk and costs $340,000.

The 3B5 family of mid-range superminis announced last week by AT&T Technologies includes the 3B5/100 and 3B5/200, which bracket Digital Equipment Corp.'s VAX-11/750 in terms of performance.

Both systems use AT&T Technology Systems Group's WE·32000 32-bit microprocessor and that manufacturer's 256K-byte random-access memory chips.

The 3B5/100 is said to support a maximum of 30 users and the 3B5/200 a maximum of 60 users. As with the 3B20 series, neither of the 3B5 computers has special air conditioning or power requirements. Diagnostics are firmware-based and are automatically executed when the system is turned on, AT&T reported.

A basic 1M-byte 3B5/100 costs $57,000 with a 48M-byte hard disk, an asynchronous interface and an 8K-byte cache memory.

A 2M-byte 3B5/200 with an I/O accelerator and extended bus as well as the 48M-byte disk, asynchronous interface and 8K-byte cache memory runs for $73,000.

AT&T'S NEW PROCESSORS

System / Characteristics	3B20S	3B20A	3B20D
Relative Performance[1]	80	95	95
Mips[2]	1	1.8	1.8
Memory Size in Bytes (Minimum-Maximum)	4M-12M	4M-12M	4M-16M
Purchase Price[3] (Memory Size)	$230,000	$330,000	$340,000
Lease Price (Lease Term)	None	None	None
Machine Cycle Time (Nsec)	Not Available	Not Available	Not Available
Channels (Minimum-Maximum)	3-16	Not Available	Not Available
Cache (Buffer) Size	8K	12K	16K
Bus Architecture	Yes	Yes	Yes
Price per 1M Byte Of Main Memory	$4,900	$4,900	$4,900[4]

1. CW estimates based on vendor-supplied information. Relative performance ratings are based on an IBM 370/158-3 equaling 45. These numbers are designed to put the processor into perspective with other systems; they do not constitute a buyer's guide. All systems are not alike; they use different operating systems, instruction sets and architectures and, therefore, cannot be directly compared. In addition, actual relative performance may vary with the application, peripherals and software.
2. CW estimates.
3. For a basic configuration.
4. For a dual-processor configuration, users must install memory in 2M-byte increments, which cost $8,900.

4. Includes processor, console, power supply, systems software and a minimum tape and disk configuration.
5. For the processor only.

CW Chart

Many vendors offer systems that compete in the same general performance range as AT&T's new processors; the above chart includes representative models from three of the top vendors in the high-end superminicomputer market. For a more complete listing of superminis, see *Computerworld's* annual Hardware Roundup [CW, Aug. 8].

AT&T from page 1

vendor, David C. Moschella, an industry analyst with International Data Corp. of Framingham, Mass., noted that AT&T's market entrance will have a "limited effect because it is not yet addressing the end-user market.

"While it is clear AT&T will eventually address that market," Moschella said, it will not do so until it has competitive office software products.

"High tech, high price" is how David L. Terrie, director of office systems research at The Yankee Group of Boston, summed up the announcement. AT&T and its products are "not in the price/performance range of any of its competition, including [Digital Equipment Corp.]," Terrie said.

An AT&T spokeswoman said that AT&T intends to discount the products according to industry standards.

AIM appoints two new board members

CHICAGO — The Association of Information Managers (AIM) has appointed two new board members, Glenn Dean and David Martin.

Dean is marketing director of Data Line Service Co. of Covina, Calif. Martin is executive vice-president of the Provident Bank of Maryland in Baltimore.

AIM is a national professional organization that provides management and technical skills to individuals who plan, develop, implement and operate automated support systems. It is based at Suite 2221, 111 E. Wacker Drive, Chicago, Ill. 60601.

AT&T's 32-bit supermicro a multiuser, desktop unit

By Eric Bender
CW Staff

NEW YORK — AT&T Technologies, Inc.'s 3B2/300 supermicro, unveiled here last week, is a 32-bit desktop system with a base price of $9,960. Based on AT&T's proprietary WE 32000 microprocessor and running under the Unix System V operating system, the 3B2 can act as a powerful single-user system or support up to 18 users.

Jack Scanlon, vice-president of AT&T's Computer Systems Division, noted that the 3B2 offers performance comparable to minicomputers available a few years back and said he expects the new system to have a major impact on the multiuser desktop market. He predicted initial sales would be for computer-aided design and manufacturing, engineering tasks and small business uses.

The 3B2, now shipping to first customers, is housed in a compact desktop unit and weighs about 30 lb. The system features 512K bytes of random-access memory (expandable to 2M bytes), a single 720K-byte floppy disk drive and a 10M- or 32M-byte hard disk drive. The base price of $9,960 does not include terminals.

Add-on components include automatic dial/answer facilities, draft-quality dot matrix printers, a letter-quality printer and plug-in cards.

The 3B2 is said to be fully compatible with the other 3B products introduced here last week and to connect with them via AT&T's new 3BNet local-area network, also announced last week (story at right). AT&T said that when its PC Interface is offered, in the third quarter, the supermicro will be able to function as a Unix host for personal computers.

Several industry analysts commented favorably on the 3B2's price and performance characteristics, speculating that the AT&T label will help sales because buyers will not be worried about AT&T's staying power. Most suggested that the system would not compete directly against current IBM offerings, but instead against minicomputers and supermicros from Digital Equipment Corp., Data General Corp. and others.

"The 3B2 seems reasonably close to our product line," said James Campbell, president of Fortune Systems Corp., a supplier of multiuser Unix-based systems built around the Motorola, Inc. 68000 chip. However, AT&T's new systems will be "a very powerful endorsement" for Unix-based systems from other vendors, Campbell said.

President of Altos Computer Systems, Inc., David Hanna, said, "We expected the announcement, and I'm delighted. A lot more application code will be developed for Unix now that AT&T has blessed it with hardware."

AT&T's Scanlon claimed that during the last year, AT&T's strong push behind Unix System V has moved it beyond "academics and technical gurus" to acceptance as an industry-standard operating system.

However, observers generally agreed that the new AT&T machines still will be short on application software. "There's a requirement for broad-based applications from AT&T," said George Colony, president of Cambridge, Mass.-based Forrester Research, Inc. Colony predicted that sales will be slow until AT&T offers "office automation products, Unix tool kits and maybe some vertical applications."

Many observers expect AT&T to launch other lower end microcomputers later this year, and the "300" designation on the new system was seen supporting that expectation. "If there's one thing missing in this announcement, it's a personal computer," Colony said.

AT&T local net quintuples throughput of Ethernets

By Phil Hirsch
CW Washington Bureau

NEW YORK — A high-speed, Ethernet-compatible local-area network was unwrapped here last week by AT&T Technologies, Inc.

Dubbed 3BNet, it has five times the throughput of Ethernet-type local-area networks already on the market, while stealing significantly fewer processing cycles from attached host processors, according to Vice-President Jack Scanlon, who heads the company's Computer Systems Division.

Scanlon said 3BNet is available immediately to value-added resellers and users capable of developing the related application and interface software. Value-added resellers, which include many of the recently divested Bell operating companies, will add application and interface software, and possibly additional hardware, to the new network to meet the needs of specific types of users.

The main applications of 3BNet, Scanlon said, are computer-to-com-

'Intellect' tied to SQL/DS under VM/SP, DOS/VSE

By John Gallant
CW Staff

WALTHAM, Mass. — Artificial Intelligence Corp. (AIC) last week announced two additional versions of its Intellect natural-language query system. The new versions reportedly provide an interface to data bases maintained by IBM's SQL/DS under the VM/SP and DOS/VSE operating systems.

According to AIC, the newest versions of Intellect were designed to enable users to query SQL/DS data bases under VM/SP using CMS or DOS/VSE with IBM's CICS teleprocessing monitor. An optional interface to IBM's Presentation Graphics Facility (PGF), which allows users to produce a variety of charts and graphs, is also available with both versions of Intellect.

The Intellect natural-language query system gives users the capability to access, retrieve and display information resident on an IBM mainframe in conversational English using a flexible lexicon that can be updated and customized to suit unique environments, an AIC spokesman said. Intellect's lexicon consists of over 400 common English words and phrases that apply to all data bases defined by the user, he said.

The latest versions of Intellect are intended to enhance the software's usefulness as an information center tool, AIC said. In June, IBM announced that it would market Intellect for its DOS/VSE, MVS and VM environments — a move that industry analysts viewed at the time as an attempt to beef up the offerings for the industry giant's strongly marketed information center concept [CW, June 20].

The AIC spokesman said that in its information center role, Intellect acts as a front-end supervisor to a variety of data base, statistical analysis, graphics and spreadsheet packages available for the IBM Personal Computer and compatible microcomputers. AIC claims to have installed more than 200 copies of Intellect in the mainframe arena in the past two years.

AIC said the new versions of Intellect offer a number of built-in features, such as the capability to handle European-format date reporting and new documentation. The documentation includes an Intellect reference card outlining the software's processes, commands and capabilities and the "Guide to Implementing Intellect," which covers planning, resource scheduling, application selection and user training.

The new versions, dubbed Intellect DOS/SQL/CICS and Intellect VM/SQL/CMS, are available immediately. Intellect DOS/SQL/CICS is priced at $49,500, and Intellect VM/SQL/CMS is priced at $69,500. The PGF option is priced at $15,000.

AIC is based at 100 Fifth Ave., Waltham, Mass. 02254.

3BNET from page 9

puter file transfer and similar jobs that require large quantities of information to be moved quickly. An AT&T Technologies spokesman added that its major use, aside from offices, will be in engineering, computer-aided design and manufacturing and factory automation.

Two 3BNet interfaces are available. One is a $7,000 three-card set for AT&T's newly announced 3B20 and 3B5 superminicomputers; the second is a $3,000 single-card interface for AT&T's 3B2/300 supermicro.

"3BNet's major advantage over existing networks is that it is intelligent and self-maintaining. All the protocol, flow control and maintenance overhead is deloaded from the connected host computers," Scanlon said. The result is that 3BNet requires "a fraction of the host computer load" needed by competing Ethernet-type systems.

Scanlon added that 3BNet's throughput, end-to-end, between application programs in attached host computers is about 500K bit/sec. He claimed this is five times greater than the throughput provided by competing contention-based local-area networks.

The new AT&T network accommodates any computer or other terminal device that supports Levels 0 and 1 of the IEEE 802 Ethernet specification, the spokesman said. Through attached host processors, it can be linked to other networks, including Datakit, a lower speed, wider area network introduced earlier this year by AT&T Technologies.

A "rich set" of higher level protocols — up to Level 7 of the International Standards Organization's Open Systems Interconnection model — is available to 3BNet users, the spokesman reported, adding that "some software modifications" at the host level may be necessary before non-3B computers can work on the 3BNet. He explained that AT&T has enhanced the IEEE Ethernet specification in some respects. Notably, the user can employ packets up to 4,000 bytes long rather than the 1,500 bytes specified by the IEEE 802 committee.

According to the 3BNet specifications released by AT&T Technologies, the coaxial cable-based network has a 10M-bit transfer rate. The maximum coaxial segment length is 500 meters, and up to 100 taps are permissible per segment.

WANG from page 1

vendor spokesman.

Up to 20G bytes of data can be stored on disk drives attached to the VS 300. This is possible by attaching varying combinations of up to 32 disk units. These include two disk drives announced by Wang along with the VS 300: a 340M-byte fixed media disk drive with a data transfer rate of 2M byte/sec and a 76M-byte removable media disk drive with a data transfer rate of 1.2M byte/sec.

Up to 15-microprocessor-driven I/O controllers can be used to direct workstations, printers, tape drives, disk drives, the firm's Wangnet local-area network and telecommunications links. By offloading peripheral control functions from the CPU to the I/O controllers, internal throughput of the CPU is improved, the Wang spokesman said.

Further, the VS 300 is available with a floating-point accelerator designed to improve throughput in scientific applications using Fortran, Basic or PL/I programming languages, the firm said.

The VS 300 can be equipped with an optional battery backup device that offers the user power for up to 90 seconds after a power failure. Diagnostic features for the supermini are incorporated into a Support Control Unit, which allows the user to perform both local and remote diagnostics. Remote diagnostics can be carried out over a switched network, Wang said.

The VS 300 will be available next January. A basic configuration, including a CPU with 4M bytes of main memory, the enhanced release of the VS operating system, console, workstation, serial I/O controller and assembler, costs $170,000. The 364M-byte disk drive costs $28,000, and the 76M-byte removable media disk unit costs $12,000. The optional floating-point accelerator costs $10,000, and the optional battery backup unit is priced at $7,000.

Wang announced the VS 300 from its corporate headquarters at One Industrial Ave., Lowell, Mass. 01851.

Half of firms polled plan second-quarter DP hiring

By Edward Warner
CW Staff

CLEVELAND — Half of the companies polled by a recruiting firm in a national survey plan to hire new data processing staff during the second quarter, and only 5% plan to reduce their staffs.

The quarterly survey, which polled executives with DP hiring responsibility in 424 firms, was conducted by local branches of Management Recruiters International, Inc.'s Compusearch Division. Compusearch's first-quarter survey indicated that 55% of respondents planned to hire.

The survey did not, however, ask how many people each of the respondents was planning to hire during the coming quarter.

Compusearch director Marc Blessing attributed the survey's indication of growth in DP hiring to what he called a changed perception on the part of top corporate managers, a change that, he said, came in part because of the competitive edge data processing gave their firms in the recent recession.

"I think [the survey] reflects the direction that data processing is headed in," Blessing said. "It reflects the surface benefit of data processing and that data processing is no longer considered an overhead expense, but an investment in the company."

More proliferation

Blessing also credited the proliferation of microcomputers in offices with encouraging DP hiring and said demand exists for data processing staffers who can manage the coming transition to office automation.

Blessing noted that the survey showed the greatest hiring growth in the New England and Middle Atlantic states, where 70% of the executives surveyed expected to hire new data processing staff.

'[The survey] reflects . . . that data processing is no longer . . . an overhead expense.' — Marc Blessing, Compusearch.

But, he added, "There are tremendous opportunities throughout the country."

The Southwest region, an area including Texas, Oklahoma, Arkansas and Louisiana, had the poll's lowest level, with 26% of surveyed executives planning to hire.

Blessing blamed this on that area's economic dependence on oil and gas prices.

Asked in the latest survey whether they would be willing to work two to three days at home using computer equipment that would link them with their offices, 36% of the executives surveyed said they favored the idea, and 48% opposed it.

The survey focused on data processing executives in all industries. When DP executives working only in the data processing industry were asked if they favored working at home, 52% favored the idea.

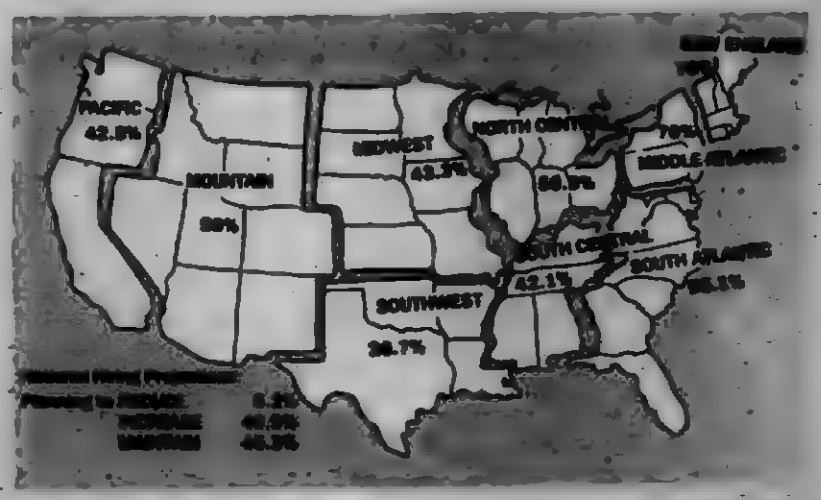
Introverted nature

Blessing said the favorable responses might result from what he called the introverted nature of many data processing workers and their high level of task-orientation.

The survey is the 11th in a series of quarterly polls taken by Compusearch. The surveys have previously shown a high degree of accuracy, compared with later government reports, according to Management Recruiters International spokeswoman Nancy Valent.

"We've seen a parallel between what we're doing and what's happening out there," she said.

Copies of the survey are available at no charge from Management Recruiters International, located at 1015 Euclid Ave., Cleveland, Ohio 44115.



Compusearch Inc.

Second-quarter 1984 hiring projections for data processing staffs are listed as regional percentages of companies planning to increase staff size.

Source code control is only one step in software configuration management.

Softool's Change and Configuration Control (CCC™) takes you all the way to *full* configuration control!

CCC automates: Management of changes and configurations, control over who makes what type of changes and where, tracking of trouble reports, reconstruction of previous versions, management reports, archiving, and all the remaining "steps" to total configuration control.

CCC is interactive and friendly. It supports all programming languages, and comes with on-line tutorials.

Available now! Over 1000 Softool products are installed worldwide.

CCC is supported on the DEC VAX, DG MV, Gould S.E.L., Honeywell 6000 (Level 66 and DPS 8), HP 9000, and IBM 370, 30XX and 43XX computers.

There is more. CCC is a stand-alone component of SOFTOOL®. An integrated Programming Environment (PE™) is also available.

If you want true configuration control, where all components of a given release can be managed as a unit, there is only one choice: CCC.

Call for more details or a hands-on demonstration.

See us at booth #1002, Depot, Boston, April 3-6

Will Easytrieve-Plus prove a minus for current users?

CW AT PULSE

By Paul Gillin
CW Staff

NEW YORK — What does the introduction of Easytrieve-Plus mean for current users of Pansophic Systems, Inc.'s popular Easytrieve software?

That was a question some users were trying to answer at the Pansophic Users Learning and Sharing Exchange (Pulse) meeting held here last week.

The users questioned Pansophic's somewhat ambiguous announcement of Easytrieve-Plus in January. Although billed as an enhancement to Easytrieve, the product is basically a renamed version of Pro/Grammar, a programming productivity language introduced by Pansophic in February 1982. Pansophic announced that Easytrieve customers would receive Easytrieve-Plus as a maintenance enhancement and that Pro/Grammar would no longer be offered as a separate product.

The announcement "totally confused us," said William Remski, a DP auditor at General Motors Corp. in Detroit. "I'm always skeptical of something being given away for nothing. We were also told Pro/Grammar was not an end-user product, and I think the information center is the way of the future. We figured Pansophic was gravitating away from the end user."

With several hundred users now conversant in Easytrieve, GM feared that the Pansophic announcement would require massive retraining. "The logic structures in Easytrieve-Plus and Easytrieve are entirely different," Remski observed.

Dale Scheer, administrator of corporate audit at GM, added that "there have got to be a lot of programs that are incompatible with Easytrieve-Plus. We were told there were no plans to make that conversion easy." As a result, Remski noted, "We've got to stay with Easytrieve."

Steve Miehe, a team leader at Life Investors, Inc., a Cedar Rapids, Iowa-based insurance company, agreed. "I don't think [Easytrieve and Easytrieve-Plus] are similar at all," he said. Miehe added that he believes Pansophic should provide a compatibility mode that allows the new version to run existing Easytrieve programs. "I think Pansophic is expecting Easytrieve to die," he said, "but I think they'll be surprised at how long it hangs on."

However, Pansophic's president and chief operating officer, David Eskra, said the company believes migration to Easytrieve-Plus "is in the best interests of all users. The more you wanted to do with Easytrieve, the harder it became," he explained.

Eskra admitted that no conversion aids will be provided to allow users to move Easytrieve code to the new product. But he said that the command and logic structures of Easytrieve-Plus are "about 85% similar" to those of Easytrieve and that migration is not a major chore.

"Of course, we will continue to support Easytrieve," Eskra said. Migration to Easytrieve-Plus "will be made more desirable by the addition of attractive enhancements to the new product." But he added, "We can't continue to enhance Easytrieve." While Pansophic will still support the old product, it will cut back on Easytrieve training unless customers indicate that training is still needed. "We're not like IBM in that we announce new products and then kill off old products," he said.

Cobol becoming a casualty of insurance firm's productivity tool

CW AT PULSE

By Paul Gillin
CW Staff

NEW YORK — A batch programming productivity tool is in such widespread use at a Cedar Rapids, Iowa, insurance company that "as an unofficial rule, if someone wants to write in Cobol, he has to have a pretty good reason," a team leader in the DP shop said here last week.

Life Investors, Inc. uses Pansophic Systems, Inc.'s Easytrieve-Plus (formerly Pro/Grammar) for about 75% of its batch programming, according to Steven Miehe, the team leader. Miehe was interviewed at the Pansophic Users Learning and Sharing Exchange (Pulse) conference here.

Life Investors recently converted from Burroughs Corp. equipment to IBM hardware and now runs an IBM 3033 mainframe under IBM's MVS operating system with Vsam files, TSO and ISPF (Interactive System Productivity Facility) and between 50 and 75 on-line terminals. Other Pansophic products in use at Life Investors include Easytrieve, MIS/OL (Management Information Systems/On-Line), Panaudit and Panvalet.

Investors Life acquired Easytrieve-Plus early last year as part of its conversion. The company is now installing several major applications packages. While most of the systems programming staff is working on conversion and installation, those who are writing new code primarily use Easytrieve, MIS/OL and Easytrieve-Plus, Miehe said.

Miehe, who has been an assembly language and Cobol programmer and data base administrator, said Easytrieve-Plus is one of the few tools he has seen that does not sacrifice flexibility for productivity, although he noted that programs that require extensive customization can probably be done about as quickly in Cobol.

"You do have to adjust the operation of your shop somewhat," he said. "Whereas in the past you had to write up report layouts or spec sheets, we now use a lot of standard reports. If the user wants a report to [meet] exact specifications, he has to be ready to pay for the extra time."

Standard reports can be generated in as little as five minutes, he said, and unlike Cobol, Easytrieve-Plus can be used by some end users. "We started by giving Easytrieve to users and keeping Easytrieve-Plus for ourselves," he recalled, "but we found quickly that sophisticated users wanted to do things that could be better done in Easytrieve-Plus. We actually have some end users writing more Easytrieve-Plus code than our DP people."

However, Miehe added that he has used Easytrieve-Plus for some complex coding. For example, he wrote one production release application that is used in moving an application to production. The software enables the programmer to specify program calls and other resources used by the application and then builds a set of JCL and a history file to prepare the program for production. The code is used by operations to move the application into production.

The software, which formerly would have been written in Cobol or assembler, was written entirely in Easytrieve-Plus, Miehe said.

Easytrieve-Plus offers several improvements over Cobol, according to Miehe. An automatic input feature runs through program logic every time a file is read, eliminating worries about end-of-file coding. The report writer is more powerful than Easytrieve's, and the product includes "some very sophisticated match/merge type of logic." All work files and reports go out to a single IBM OS data set, saving JCL, and Easytrieve-Plus has a facility that allows multiple job steps to be performed within a program.

Miehe noted that unlike Easytrieve, Easytrieve-Plus uses a structured programming language that is similar to PL/I. Calls to subroutines from packaged applications can be placed within Easytrieve-Plus code, and the software offers the flexibility to create both executable code and object code modules, simplifying testing, he said.

All this adds up to as much as a 75% cost savings by programming in Easytrieve-Plus rather than Cobol, Miehe said.

"Some programmers believe they can write faster in Cobol — and that may be true on the first program," he said. "But I haven't gone back to Cobol since we've had Easytrieve-Plus."

IBM selects
Management Decision Systems
as value added remarketer
for IBM 4300
with
EXPRESS.

IBM has selected Management Decision Systems, with its industry-standard decision support software EXPRESS, as a Value Added Remarketer for IBM's 4300 computer family. The agreement enables Management Decision Systems to package its powerful decision support software with IBM's 4300 series. Now, it is easier than ever before for major corporations to meet the increasingly critical need for integrated planning and analysis.

Offering you the total decision support solution, Management Decision Systems' EXPRESS combines data base management with extensive analysis, reporting, graphics, and statistics capabilities. Backed by quality installation, training, and customer support services, EXPRESS meets all your needs for applications development and micro-mainframe integration.

With this new agreement, there has never been a better time to use the best available information technologies as your unique strategic weapon in today's world of data overload. Put the power of the IBM 4300 and Management Decision Systems on your side — and develop the winning edge.

Management Decision Systems + IBM 4300 = the total decision support solution.

For more information on what this agreement can mean for you, contact:

Pansophic's Gener/ol outbenches Cincom's Mantis

CW AT PULSE

By Paul Gillin
CW Staff

NEW YORK — In a test that few DP shops can afford to emulate, Pansophic Systems, Inc.'s Gener/ol application development system took on Cincom Systems, Inc.'s comparable Mantis software and won.

The two products were pitted against each other by Amer-Cal, Inc. of Arlington Heights, Ill., a $3.5 million service bureau that includes separate divisions for office services; letter, label and list processing; data processing; and software support. In a session at the Pansophic Users Learning and Sharing Exchange (Pulse) conference here last week, Amer-Cal Vice-President Lonnie Lanzer described the process that led to the benchmark and Amer-Cal's subsequent decision to write all its new on-line applications in Gener/ol.

Exponential growth has led Amer-Cal to upgrade its CPU capacity seven times in the last four years, Lanzer said. The company now runs two IBM 4341 processors under IBM's DOS/VSE and VM/SP operating systems with 16 dedicated communications lines and 185 on-line terminals at customer sites nationwide.

When Amer-Cal upgraded to 4300 series CPUs five years ago, it decided to use application development systems instead of Cobol in order to bypass traditional development cycles and long coding times. Such traditional approaches tend to frustrate the development effort by forcing the user to decide what he doesn't like about an application only after it has been written, Lanzer said.

CW Photo by P. Gillin
Lanzer

Amer-Cal considered some of the most popular application development systems before choosing Mantis in 1980. Early experiences were overwhelmingly successful, Lanzer said. For example, an on-line order entry system that had 70 on-line and 125 batch programs using 17 IBM Isam files was converted from Cobol to Mantis in just 10 man-weeks. The original application had taken 39 man-months to write.

Mantis was also used extensively for prototyping. In four years, Amer-Cal has written over 6,500 on-line Mantis programs.

With daily on-line usage growing from 2,500 transactions in 1980 to 40,000 transactions in 1983, however, the company was constantly on the lookout for new productivity tools, Lanzer stated. Last November, Amer-Cal selected Gener/ol, its first Pansophic product, to benchmark against Mantis.

Gener/ol offers identical features for naming conventions, program function and size, screen design layout, help aids and menu-driven execution. "But that's where the comparison ends," Lanzer said.

The application selected for benchmarking was a high-volume accounts receivable system containing a menu for 13 different functions and multiple versions of the program to suit different users. In both the data entry and display functions, the programs handle multiple pages of a screen and 34 different client entries. In the data entry program, all fields must be validated and, when keying errors are detected, all error fields must be highlighted. In the display program, the records displayed are retrieved, sorted into a different sequence and stacked before display.

Amer-Cal wrote both programs using the most efficient code it could create, Lanzer said. The result was a 30% to 50% reduction in CPU execution time for the Gener/ol version of the application over a "mirror image" written in Mantis.

Specifically, Gener/ol required 207 program lines for data entry and 71 program lines for display with sort compared to Mantis figures of 334 and 201 lines, respectively. Response time for data entry, including validation, adding records to client batch and updating batch totals, was 90 seconds compared to 121 seconds for Mantis. Response time for the display function was seven seconds in Gener/ol, 17 in Mantis.

Another major Gener/ol benefit was seen in reduced I/Os, largely as a result of Gener/ol's ability to read forward and backward and its sort feature, which eliminated the need to build a work file and read it back, Lanzer said. A typical data entry procedure required 82 I/Os in Gener/ol vs. 211 in Mantis. A display function consumed 53 I/Os against 233 in Mantis.

In all, Lanzer claimed, "Gener/ol has everything Mantis has plus additional features and large performance improvements." Some of the additional features she found most helpful were generation of compiled code, sort facilities, array handling, backward reading of IBM Vsam files, unrestricted program size and redefinition of data between numeric and nonnumeric fields.

"For the first time in four years, we can anticipate our CPU power needs remaining stable for more than a few months," Lanzer stated. In addition to committing all new, on-line development to Gener/ol in the future, Amer-Cal has elected to rewrite a major piece of Mantis-developed software for the copier dealer industry in Gener/ol. The application, which includes over 500 programs, is slated to be finished in July and will be done by a team of only three programmers.

Series/1 user migrates via 3033

CW AT PULSE

By Paul Gillin
CW Staff

NEW YORK — Going from an IBM Series/1 minicomputer to an IBM 4341 by way of an IBM 3033 mainframe may seem a roundabout way of doing things. But Hohenberg Bros. Co. of Memphis, Tenn., had little choice when it made that conversion two years ago.

Hohenberg's Series/1 was seriously overloaded with more than 500 programs, according to David M. Deutsch, a systems programmer. What was worse was that the programs were written entirely in IBM's EDL, which is unique to the Series/1. And none of the Hohenberg programmers was fluent in another common business programming language.

Hohenberg decided to handle the conversion from the Series/1's EDX operating system to the 4341's DOS/VSE operating system using the 3033 corporate mainframe under the OS operating system at the headquarters of its parent company, Cargill, Inc., in Minneapolis. The conversion also entailed rewriting the Hohenberg program library in PL/I.

In an interview at the Pansophic Users Learning and Sharing Exchange (Pulse) meet held here last week, Deutsch described why the convoluted tactic made good business sense and how Pansophic Systems, Inc.'s PAN No. 1 utility of its Panvalet library management software enabled Hohenberg to save money.

Fortunately, Cargill had a staff of programmers who were conversant in both EDL and PL/I. Between the time that the 4341 was ordered and the time it was delivered, Hohenberg shipped about 375 EDL programs to Minneapolis, where seven programmers analyzed and rewrote them in PL/I on the 3033. The programs were then stored in a Panvalet library on the 3033.

The 4341 was delivered to Cargill in April 1982. Deutsch explained that the decision to deliver there rather than Hohenberg was made because it was cheaper to run the conversion at corporate headquarters than to fly a team of programmers to Memphis. Although only about three-quarters of the program library had been converted at the time of delivery, Hohenberg decided to finish the rewrite on the 3033 and then dump the whole library onto the 4341 at once.

The transfer was accomplished by dumping the Panvalet source library to tape and executing PAN No. 1, inserting PAN No. 1 control cards as "bookends" around the programs to act as delimiters. The control cards, in turn, are recognized by IBM's DTS/Util, a utility that runs under IBM's ICCF (Interactive Computing and Control Facility) on the 4341.

Deutsch said that without the use of the two library utilities, Hohenberg would have had to rekey about 34.5 million characters of code into the 4341. Realistically, such a process would have cost a minimum of $20,000, he said.

Ever wish there were about five more of you?

Multiply programmer productivity with the Programming Environment (PE™) from Softool.

With PE you compose substantial portions of an application program from prefabricated code, and produce finished software that is fully checked out, documented and standardized!

Many *PROVEN* tools. PE is an integrated set of proven software tools that literally multiplies programmer effectiveness. It is like having another programming staff . . . on-line! Tools available include: structured languages, source code auditor, source code documenter, interface documenter, error detectors, libraries of prefabricated code, testing aids, tracing aids, optimizers, flow analyzers, conversion tools . . . and much more.

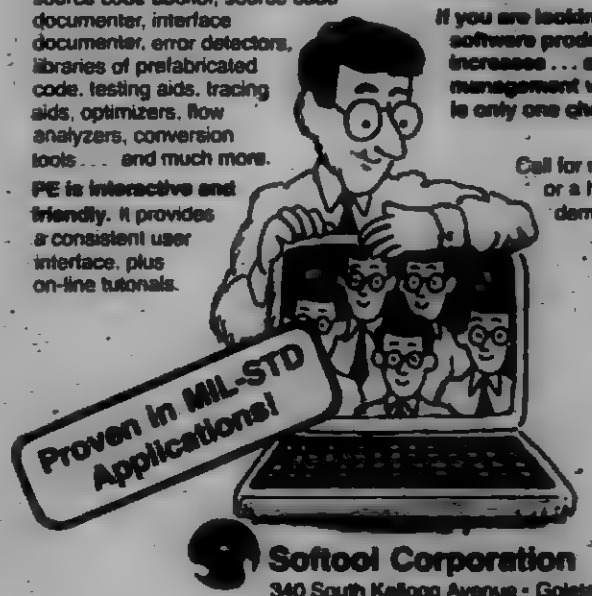
PE is interactive and friendly. It provides a consistent user interface, plus on-line tutorials.

PE supports both FORTRAN and COBOL.

Available now. Over 1000 Softool products are installed worldwide. PE is supported on the DEC VAX, DG MV, Gould S.E.L., Honeywell 6000 (Level 66 and DPS 8), HP 9000, and IBM 370, 30XX and 43XX computers.

There is more. PE is a stand-alone component of SOFTOOL®. A complete Change and Configuration Control Environment (CCC™) is also available.

If you are looking for true software productivity increases . . . and for management visibility, there is only one choice: SOFTOOL.



Call for more details or a hands-on demonstration.

Reagan gives DOD power to review computer exports

By Bryan Wilkins
CW Washington Bureau

WASHINGTON, D.C. — President Reagan has given the U.S. Department of Defense (DOD) the power to review exports of computers, test equipment and microchip manufacturing parts to 12 noncommunist countries widely suspected of being shipment points to the Eastern bloc.

The decision to give the review power to DOD has prompted concern from American computer manufacturers of the products affected, who fear that delays in obtaining export approval will mean lost sales to foreign competitors. The American Electronics Association said it was "disappointed" by the action.

The six commodity categories that will be subjected to DOD review if an exporter seeks to ship them to any of the 12 countries are:

- Machinery and equipment for the manufacture of electronic equipment, components and materials and related test gear. This includes semiconductor manufacturing items, software, lasers and digitally controlled automated equipment.
- Electronic measuring, calibrating, counting, testing and time interval equipment, whether or not it incorporates frequency standards. This category also includes digital test instruments with user-accessible programming capability.
- Electronic computers, including those that have been "ruggedized" for military purposes, and data communications switching gear such as packet switches.
- Computers equipped with CRT terminals, not including printers and paper readers that run at speeds less than 2,500 char./sec. This category does not include peripherals that contain their own microprocessor controls.
- Silicon compounds used in chip manufacture.
- Crystal sapphire substrates, which are also used in chip production.

Undersecretary of Commerce for International Trade Lionel Olmer has predicted that the DOD review will triple the review work load for DOD, which was already reviewing all exports to communist countries.

The U.S. Department of Commerce declined to reveal the 12 countries singled out for the license review, but officials confirmed the countries include Switzerland, Austria, Sweden, Finland, Liechtenstein, South Africa, India, Hong Kong and Singapore.

The Reagan order does not give DOD review power over distribution licenses issued to companies for a broad group of products. Instead, DOD will initially review only individual export licenses.

However, the order does state that DOD will have the power to review distribution licenses in the future if it proves it can efficiently administer the review of the individual licenses.

Meanwhile, a House-Senate conference last week began hammering out the differences between two bills authorizing the renewal of the Export Administration Act, which was due to expire last Friday.

Calif. execs sentenced for trying to smuggle disk equipment to Bulgaria

By James Connolly
CW Staff

LOS ANGELES — The owner of a California firm has begun serving a three-year federal prison term after pleading guilty to charges that he tried to ship $750,000 worth of computer disk manufacturing equipment to Bulgaria.

Edward F. King, owner of Printemps Corp. of Yorba Linda, Calif., was sentenced and fined $20,000 by U.S. District Judge Lawrence T. Lydick here last month after King pleaded guilty to charges of conspiracy and illegal exportation. Printemps' chief financial officer, Louis R. Klements, pleaded guilty to conspiracy and was placed on probation for five years and fined $5,000.

According to a federal prosecutor, Printemps shipped two disk polishing devices to Bulgaria and tried to ship two coating devices in 1982 and 1983. King allegedly acted as a go-between and bought the equipment from a California manufacturer at the request of two Bulgarians and Hendrik Wasmoeth of the Netherlands. Wasmoeth and the Bulgarians were indicted with King and Klements in November 1983, but are believed to be outside the U.S.

Assistant U.S. Attorney William F. Fahey told the court King was employed as a consultant by Wasmoeth on behalf of the Bulgarians in their attempts to buy the equipment from a firm here. The equipment was to be used to build a computer manufacturing plant in Bulgaria, Fahey said.

When the company here failed to obtain export licenses, Fahey said, King decided to obtain the equipment himself. He shipped the first two pieces of equipment through Holland to Bulgaria in 1982. The coating equipment was seized by U.S. Customs agents at Los Angeles Executive Airport in January 1983.

Fahey charged that King's agreement called for him to ship $750,000 worth of equipment and said that the equipment was "licensable by the Commerce Department." He said Printemps failed to obtain the appropriate licenses.

"King's motive was clear: greed," Fahey said at the sentencing. "The equipment was obviously something the Bulgarians were very interested in and willing to pay top dollar for." Fahey said King's conduct was "designed to aid the Soviet bloc country in balancing the technological scales with the U.S."

Report slams studies linking VDTs, health risks

By Lynn Haber
CW Staff

SANTA MONICA, Calif. — Contrary to recent reports that video display terminals are health hazards, a study released here by The Koffler Group claims there is no scientific evidence that VDTs pose any threat to the health or safety of users.

"The VDT Health Debate and the Importance of Research Methods" reviews six VDT-related studies. They include two by the National Institute for Occupational Safety and Health (Niosh); one by Dr. Arthur Frank and the Newspaper Guild; a study by Starr, Thompson and Shute of Bell Telephone operators; a report by the Canyon Research Group, Inc.; a study by DeGroot and Kamphius done with telephone information operators in Denmark; and a report by the National Research Council.

Those studies were selected because they have received significant press attention and caused a lot of "sensationalism," according to the author of The Koffler Group's report, Dr. Karen Kessel. Kessel is editor of "The Office Systems Ergonomics Report" — published by Koffler — and vice-president of research for the company.

"When I went back to look at some of those studies, to my horror I discovered they were terrible. They were not responsible, and you couldn't derive anything from them," Kessel said in a recent telephone interview. Kessel, whose academic background is in experimental psychology, cited as an example a 1981 Niosh study. "This study was basically done at the request of the unions, which already felt that there was a VDT problem. So, in other words, they were loading the dice.

"The researchers went into a situation where there was excellent reason to believe that people were already reacting negatively due to computers, but nobody knows why. There could have been a million variables that could have accounted for that, everything from the unions wanting more power to who knows what."

Niosh response

Contacted for her comments on the Koffler report, Barbara Cohen, one of the researchers involved in the Niosh study, said the health hazard evaluation was initiated by a consortium of five unions. "Any employee, any union, can request a health hazard evaluation if they feel there's a health hazard in their work place," Cohen said. "The mission of Niosh, as a government agency under the [Department of Health and Human Services], is to assure safe working conditions for every man and woman in the U.S."

She added, "Most people that know the government know Niosh's work [and] know that it is a neutral agency. It must be a neutral agency to do the studies."

Another recent study Kessel targeted in her report was "Effects on Health Following Occupational Exposure to VDTs," carried out by Dr. Arthur L. Frank with the Newspaper Guild. According to Kessel, this study was so bad "that it made the Niosh studies look wonderful."

Kessel said she was "actually quite angry after reading that study because that is exactly the kind of sensationalism that everybody hears about. Nobody I know reading the newspapers would be hearing the other side of the coin. That study, in my opinion, was so bad [that] not only can't you derive anything from it, but the researcher was terribly irresponsible. . . . If you can't do science right, then don't do it at all."

Among Kessel's 16 complaints against the Frank report were her contentions that Frank discussed VDT radiation testing in his study, yet never actually investigated it; that he used union members both as subjects and as volunteers to collect data; and that he used a "classic case of a biased sample."

A question of participation

"Frank said that only 40% of those who could have participated in the study actually did so. My question is, 'What were the other 60% doing?' Just on that alone, we could throw out his study," Kessel said.

Frank, currently a professor and chairman of the Department of Preventative Medicine and Environmental Health at the University of Kentucky College of Medicine, said in a telephone interview that his study reached no conclusions. It simply reported data and suggested, based on that data, that more research needs to be done on various subjects, according to Frank.

"The study states that this was a hypothesis-generating study," he noted. "I said at the outset that I wasn't looking to prove anything. I was looking for possible associations that needed to be followed up — that's what a hypothesis-generating study means."

Findings and problems reported

The questionnaire used in the study, according to Frank, was developed while he worked at New York's Mt. Sinai hospital in collaboration with behavioral scientists, occupational physicians and eye doctors after reviewing related literature. "Not only did I report my findings, but I reported what the potential problems of the study were."

Was there a potential for bias in the study? Replied Frank: "Because we didn't get the distribution that one would have expected — that one would have anticipated — then there is some bias. But I think our statements in the paper reflect that and that we were aware of that."

Copies of the review are available for $35 each from The Koffler Group, which can be reached at Suite 200, 3029 Wilshire Blvd., Santa Monica, Calif. 90403.

Editor of report critical of press coverage of VDT health studies

SANTA MONICA, Calif. — A report recently released here suggests that negative health and safety reports regarding VDTs have been enhanced by press coverage.

Moreover, the negative reports have been marked by poor scientific research methods, a problem compounded by the trade press, which "often treats ergonomics as a sensational issue or fad," charged the "Office Systems Ergonomics Report," edited by Karen Kessel. "Many articles contain blatant errors and misconceptions that are treated implicitly as fact and then perpetuated by decision makers, many of whom should know not to base decisions on what they read in the press."

Kessel is author of "The VDT Health Debate and the Importance of Research Methods" carried in the newsletter. She acknowledged her outspokenness on the VDT health research issue in a recent telephone interview and cited additional reports which she said support her views on VDT research.

"One study that was excellent that I did report on was done by Starr, Thomson & Shute for AT&T Bell Laboratories. Now there's the difference between good research and bad research," Kessel maintained. "These guys used appropriate controls. They were attempting to eliminate all kinds of biases, all kinds of controls that it's normally difficult to control for."

According to Kessel, the Bell study found no health differences between VDT users and "paper people," workers who do the same task as VDT users, but use traditional office equipment in their work.

Another report, by Jayne M. Schurick, Martin G. Helander and Patricia A. Billingsley of The Canyon Research Group, Inc., which examined about 64 studies done in the VDT area and is also covered in the Kessel report, also concluded that the studies were poor, according to Kessel.

"I believe that ergonomics is important. I believe that you need ergonomics. I do not believe that the problems that have been attributed to VDTs have any foundation in fact," Kessel concluded.

Here are a few good reasons why you should make Local Data your protocol converter company.

Local Data's comprehensive line of local and remote protocol converters have been used around the world to make async-to-IBM communications simple and economical.

DATALYNX™/3274.
DataLynx™/3274 remote async ASCII protocol converter supports SNA/SDLC or BSC protocols. 80 types of ASCII async terminals can emulate IBM 3278 display stations. RS-232C ASCII async printers can emulate IBM 328X printers.

DATALYNX™/3780.
DataLynx™/3780 async ASCII-to-IBM 3780, 2780, 2770 and 3741 protocol converter supports EBCDIC BSC protocol on one channel and async ASCII devices on the other two channels. Features include transparency, mini/micro support and free file transfer program.

INTERLYNX™/3278.
InterLynx™/3278 allows the attachment of low-cost ASCII CRT terminals or p.c.'s to 3274/3276/4701 and 45XX integrated adaptor Type "A" coax ports. InterLynx/3278 enables the user to use async CRT's on IBM systems and switch to async applications under terminal control.

FILELYNX™/3278.
For micro-mainframe file transfers.

INTERLYNX™/3287.
InterLynx™/3287 allows attachment of ASCII printers to IBM Type "A" coax ports or 3274/3276/4701 controller and 4321/4331 CPU's.

SNA LU1 SCS and LU3 capability are standard with the InterLynx/3287. Features include parallel and serial ports and front panel set-up.

For more information call today.

"Your Lynx to IBM."

"In your development center, ADS/OnLine will increase productivity and reduce your company's applications backlog." —Don Heitzmann*

**Don Heitzmann is Cullinet's Director of System Software Development. Don joined Cullinet seven years ago. His early efforts were in design and development of IDMS-DC and he is now responsible for the complete IDMS database product line. Don is a graduate of Princeton University with a B.S. in Electrical Engineering and a Masters in Architecture.*

Using ADS/OnLine Cullinet created the best applications software ever built.

The Application Development System, Cullinet's fourth generation language, became available in 1981. ADS/OnLine was the key element in our database software system needed to address the application software business in a whole new way.

We set out to develop advanced financial and manufacturing applications; applications designed in the 1980's all built using this fourth generation language. Today, Cullinet offers the finest financial and manufacturing applications available, featuring both horizontal and vertical integration. Horizontal integration means that all applications share a common database so redundancies and inconsistencies are eliminated. Vertical integration means all applications are built using ADS/OnLine and advanced database technology so they are easier to install, tailor and maintain.

Using ADS/OnLine, we developed advanced applications much faster than if we used traditional methods. In your development center, ADS/OnLine can increase productivity and reduce your company's backlog.

ADS/OnLine eliminates up to 70% of the lines of code in a typical COBOL program. This can result in a dramatic increase in programmer productivity. In addition, ADS/OnLine is easily learned by COBOL programmers, so your programming staff can become more productive in less time.

Applications can be built more efficiently with ADS/OnLine because it is a non-procedural language. The developer simply paints the screens on a terminal and fills in the blanks to define the applications program. Plus, automatic editing and automatic error handling detect input errors with no code written at all. And the complete integration of ADS/OnLine, with all Cullinet Database facilities, not only ensures control over the application development function, but also guarantees the performance necessary to run these applications in day-to-day operations.

ADS/OnLine has been a key to our success in applications software. It could do the same for you in establishing new information systems and eliminating your applications backlog in the 1980's and 1990's.

Attend a comprehensive seminar explaining this advanced fourth generation language and Cullinet's other database software products. To participate in one of the 700 Cullinet seminars scheduled internationally, send in the coupon or call 1-800-225-9930. In MA, 617-329-7700.

The fourth generation moves into the mainstream

An interview with Focus creator Gerald Cohen

After years of only limited acceptance, fourth-generation languages are becoming a mainstay in many large data processing installations. But the debate continues over whether they are yet efficient and powerful enough to take on the burden of high-throughput production applications.

One of the most successful fourth-generation languages is Information Builders, Inc.'s Focus. Now nine years old, Focus claims a base of more than 1,200 installations and more than 100,000 users. Last year it became the first major fourth-generation language to be ported to the IBM Personal Computer.

Information Builders President and founder Gerald Cohen has more than 20 years of experience in language design. Previously he was vice-president of Mathematica Products Group, Inc., where he designed the original Ramis language, which is now one of Focus' major competitors.

Cohen was interviewed recently at Computerworld's offices by CW Senior Editor/Software Paul Gillin.

Q "Fourth-generation language" has become a buzzword. Please define it and differentiate it from "application generation."

Fourth-generation procedural and nonprocedural languages are used to generate applications rather than general procedural languages such as Cobol and PL/1. The difference is that their objective is a very large order of magnitude improvement in the speed with which a person can construct and perform a significant data processing function. I almost can't differentiate them from application generation.

Q In recent product literature, you emphasize decision support functions within Focus. Is this a change from earlier years?

I think it's a reactive circumstance. Sixty-five percent of our users are still doing traditional application development in Focus. When IBM introduced the information center, it was just an extra market for us. Only a third of our applications are in information centers.

Q Fourth-generation languages have been dogged by the image that they're not suitable for large-scale production applications. Is there any validity to that criticism?

Yes and no, but this is a moving target. What couldn't be done two years ago might be done today. But not all fourth-generation languages are the same. Some can't handle it, and that tends to tar the industry. It's not necessarily size that's the issue, sometimes it's logical complexity. We can do very complex applications and notions which are difficult to handle even in common programming languages.

It is true that computer resources are more heavily used by fourth-generation languages. But the most serious problem we find is that when users start using a fourth-generation language, they find that where previously they served 50 or 100 users, they can now service 300 users. We have sites that have 1,000 users. . . . We're working on the area of internal efficiency; that's one of our long-term goals. But the nexus of the problem is that you now have 1,000 potential users, and if they use it at the same time, you've got a dilemma. The information center generally is on another piece of hardware because of that. That's why IBM is so into [the information center concept].

Q So you're willing to pay the hardware price?

I don't think it's a significant hardware price. I contend that in many situations, a fourth-generation language is as efficient as if you wrote in another language.

You've got to recognize that most information systems have a built-in element of change. If you factor in the amount of time it takes to compile, test and link these systems vs. doing it in a changing Focus system, I'm not sure the computer resources are more. Sure, in a flat-out run we might lose that. But I'm saying the total measurement is not accurate.

Q In large installations, what sort of guidelines do you give DP management for what the end users can and cannot do?

Companies that go into new tools have to reorganize the way they go about delivering applications. Previously, they had a rule book that laid out the steps they were going to take. With the advent of tools such as Focus, these organizations are rewriting that method. They're looking, perhaps, for a quick preliminary study, followed the next day by a prototype system, followed by sample outputs, followed by sort of an evolutionary development.

These organizations also have to decide what set of tools to use for an application. If an application has a lot of change, clearly you go to the new tool. If the application is relatively static, one possibly should invest in a Cobol program.

Q For vendors such as yourself who have sold to the mainframe market for years, what impact will the personal computer have?

One of the reasons we jumped into the micro area so fast is that success sometimes is our customers' undoing. You can't service 1,000 users on one computer. The only solution is to distribute that computer power.

The trend today on micros is toward larger memory. We're going to single-user mainframes. When that happens, we want to divide the processing so you do some on each.

Q What sorts of problems does this present?

The No. 1 problem today is communication with the mainframe. It's a mess. IBM generally sets the standards in most things, but they don't set it in communications.

The major problem that has to be solved is a generalized way to communicate through either a central processor or to each other. We don't think the local-area networks are here yet, and we don't think the proper method of linking micros to mainframes is here yet.

Q What is going to be that breakthrough?

I think the breakthrough will be the setting down of a standard. Then all the vendors can concentrate on doing it better.

Q What are the relative advantages of micro-based application builders?

The micro has a degree of ease and intimacy that doesn't exist on the mainframe. The micro has really changed our perception of how we ought to be dealing with users. That lesson is influencing our mainframe development too. Since we introduced PC/Focus, we've changed the entire feel of the mainframe product to be more like a micro-based product.

Q Why has the mainframe software market been so quiet the last couple of years?

One reason is that IBM is a great dampener. They claim they're going to be in all sectors of the market. Consequently, there have been very few major product introductions in the mainframe market.

Another reason is that customers want service. In the mainframe marketplace, the entry fee is no longer just an author who writes a product. People want vertically integrated companies that will provide them with the tools and the services for using those tools.

Q Is there really any opportunity for a small company to enter the large system software market any more?

Yes, with utility-type products that don't require the support. But [with] any product that requires support, we're past the point that a start-up company is going to be in the running.

Q That gives the users a more limited choice. They're stuck with you.

Yes, but we're stuck with them also, in the sense that our major activity is in improving customer support services. In some respects, it's a great benefit to the DP organizations we deal with. They're getting stronger organizations that give them better service.

Q What kind of competition have you been encountering from application generators?

The application generators such as [Cincom Systems, Inc.'s] Mantis and [Oxford Software Corp.'s] UFO will generally be used in a CICS type of environment. The emphasis is mostly on data capture and file updating and not on the use of the data after that. We won't do that quite as well as them, but we will do not only data capture, but also a sophisticated job of reporting from that data. If your problem has a lot of logical complexity, you just can't do it in a UFO or a Mantis. We'll coexist very nicely with them.

Q What new capabilities are most often demanded by your users?

We're being pulled in several directions simultaneously. On one end, friendly facilities for the new users are being demanded.

On the other end, we're being pushed for facilities that [handle extremely exotic situations, such as how to calculate when a piece of data is missing].

INTERNATIONAL REPORT
CW International News Network

AUSTRALIA

MILSONS POINT — Burroughs Corp. has reportedly surprised the banking industry here by beating both Hogan Systems, Inc. and Anacomp Australia, Inc. out of a plum contract with the State Bank of New South Wales. The $7 million order is said to have been won on the merits of Burroughs' Banking Information Software and the company's ability to provide its own hardware.

■

CROWS NEST — In response to McCormack & Dodge Corp.'s announcement of a real-time, on-line integrated financial system called Millennium:SDT [CW, Feb. 13], an Australian software vendor is claiming it leads McCormack & Dodge, Software International Corp. and MSA, Inc. with a system it has been selling for five years. The EDP Department Pty. Ltd. boasts three users of its real-time integrated Financial Management System (FMS), which was designed for large Burroughs Corp. systems.

■

MELBOURNE — Nixdorf Computer Pty. Ltd.'s pricing and "positive attitude" reportedly helped it beat out IBM for a significant contract here from the Roy Morgan Research Center Pty. Ltd. According to Peter Gant, senior executive at Morgan, "The Nixdorf staff was far more willing to help us," so his company ordered roughly $600,000 worth of Nixdorf Dual 8890 systems to replace its aging IBM 370 line.

■

MILSONS POINT — An Australian Department of Defense contract valued at over $1 million was awarded to Techway Pty. Ltd., the Australian distributor for Elxsi International Co. The department's Aeronautical Research Laboratory will become the first Australian user of the high-speed Elxsi multiprocessor.

BRAZIL

RIO DE JANEIRO — The Brazilian Society for Scientific Progress, comprised mainly of computer scientists and engineers, has launched a campaign to reserve the Brazilian market exclusively for Brazilian vendors. The current Department of Informatics policy in favor of market reservation is coming under debate in Congress in April, the opening of the Brazilian legislative year.

CHINA

GUANGTONG — Aihua Electronic Co. Ltd. has established a microcomputer production line to assemble and test Altos Computer Systems, Inc.'s 586 series of multiuser, multitasking 16-bit microcomputers. Aihua is the second Chinese company to import Altos systems. The first was the Shaoguan Radio Factory, which has been importing hundreds of Altos 586 kits for domestic assembly and sale.

FINLAND

HELSINKI — Nokia Data defeated some 80 foreign competitors to pull down the biggest export contract ever won by this country's information technology industry. The company's 16-bit Nokia PC microcomputer has been selected by telecommunications giant Northern Telecom, Inc. for its office automation and small business system product line, which will reportedly also include an extensive network of minicomputers and digital telephone exchanges. Production of the Nokia PC is expected to rise to 20,000 units annually, double the present level. The 16-bit Nokia PC features an Intel Corp. 80186 microprocessor and a 15-in. display screen. Northern Telecom plans initially to market the system in Europe, with emphasis on the UK and West Germany.

FRANCE

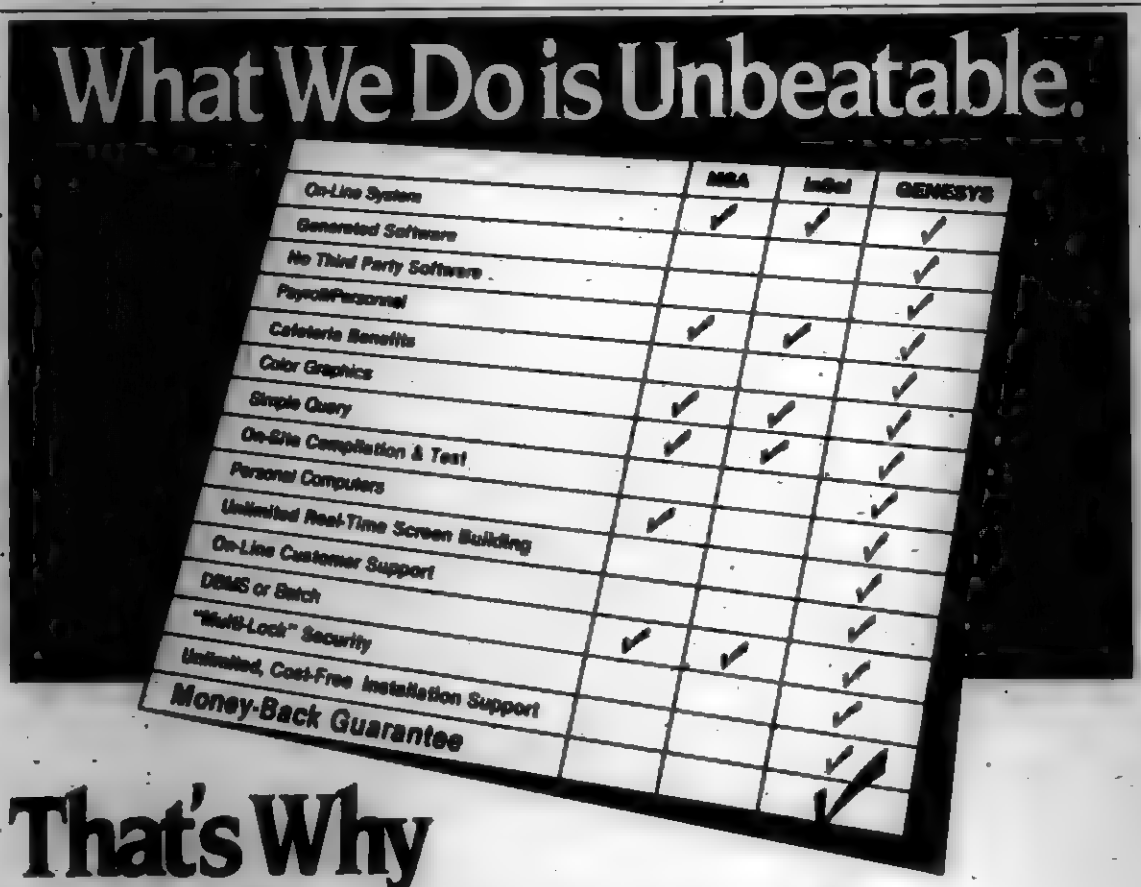
PARIS — The newly consolidated group Bull, which is comprised of CII-Honeywell Bull, Bull-Sems and Transac, has reported combined revenues of almost $1.4 billion, an increase of 21% over last year. The growth was attributed to the companies' accelerated development of distributed data processing and office automation products, which are said to be compatible with other vendors' products. Bull has a total work force of 26,000 people in some 70 countries.

JAPAN

TOKYO — Nippon Electric Co. Ltd. has announced two microprocessors slated for delivery in June. The 8-bit V20 and the 16-bit V30 are based on Cmos technology and are said to be compatible with systems based on Intel Corp. 8086 microprocessors. The products feature a dual data bus configuration, according to the vendor.

■

TOKYO — Hitachi, Ltd. has enhanced the main memory of its M-220 series of mainframes and unveiled an 8-in. 620M-byte version of its relational data base system RDB1. The M-220's main memory was extended from 8M bytes to 16M bytes by using 256K-byte random-access memory chips, according to the vendor spokesman.



That's Why We Fully Guarantee it!

Only One Human Resource Management System is good enough to be fully guaranteed. Genesys'. Our own people developed all of our software and systems. Our own people will also install our system, compiling and testing all our programs for you. Then our people will stand behind their work with a no-strings, money-back guarantee.

Genesys is simply unbeatable. Most Human Resource Systems contain the raw data you need for management reports, government compliance and to let you know "Is she promotable?". But you have to do a lot of work preparing data to get the information you want because they've added third party software.

Not so with Genesys. All our software is completely integrated and menu-driven. No matter what you need to know about Payroll, Personnel or Cafeteria Benefits, it's easy to get precisely the information in exactly the format you want. Just one keystroke gives you selective search, decision support, PC integration and color graphics. Real-time, from any office, anywhere in the country. With by far the tightest, most flexible security available.

We're so confident you'll be successful with Genesys we'll give an unconditional guarantee. How can you beat that? If you'd like more information on the Genesys HRMS or would like to attend an Executive Seminar near you, call Norman Bushee at (617) 685-5400.

APRIL SEMINAR SCHEDULE

April 3 – Charlotte, NC
April 4 – Raleigh, NC
April 5 – Tampa, FL
April 10 – Vancouver, BC
April 10 – Buffalo, NY
April 11 – San Jose, CA
April 11 – Rochester, NY
April 12 – Syracuse, NY
April 12 – Riverside, CA
April 17 – Providence, RI
April 18 – New Haven, CT
April 18 – Oklahoma City, OK
April 19 – Albany, NY

Report urges DP managers to aid in designing offices

By James Connolly
CW Staff

BOULDER, Colo. — Information systems managers need to play a greater role at the planning stages if the office building of the future is truly to be an "intelligent building," according to a report recently released here.

The report warned that plans for new construction and reconstruction must allow for computer-related factors such as miles of cabling, lighting that will not cause CRT screen glare, decentralized air conditioning and constantly changing office layouts.

"The Orbit Study," completed in the UK last year and reprinted here by Cross Information Co., urged that building designers consult at the earliest stages with information systems managers and make greater use of electrical and mechanical engineers.

The study of how 10 organizations used information technology focused on technology's direct impacts — such as cabling, heat and space — and the indirect impacts — for example, how information technology means flexibility in working hours and locations.

Variety of interests

"Above all, the effects of information technology vary depending on whose interests are involved," the report observed. "What suits the manager may not please the worker. What catches the fancy of the architect may not recommend itself to the ergonomist. . . . So many interests are involved that conflict is inevitable."

The report also noted that most of the technology that will have the greatest impact on office design over the next 10 years already exists and that "futuristic developments" are likely to affect only a minority of organizations.

Within 10 years, one out of three office workers could be equipped with electronic workstations, meaning there will be more equipment in the office, the report said. It added that soon the growth of support systems will leave office buildings with only 50% usable space for office workers.

It also emphasized that rapidly changing business environments will decentralize or kill many established companies and create many start-up companies, which means frequent changes will be made in office buildings' space allocation, services and interior design. Few office buildings will have a single tenant, and those companies that are sole occupants are likely to need communications capabilities with satellite offices.

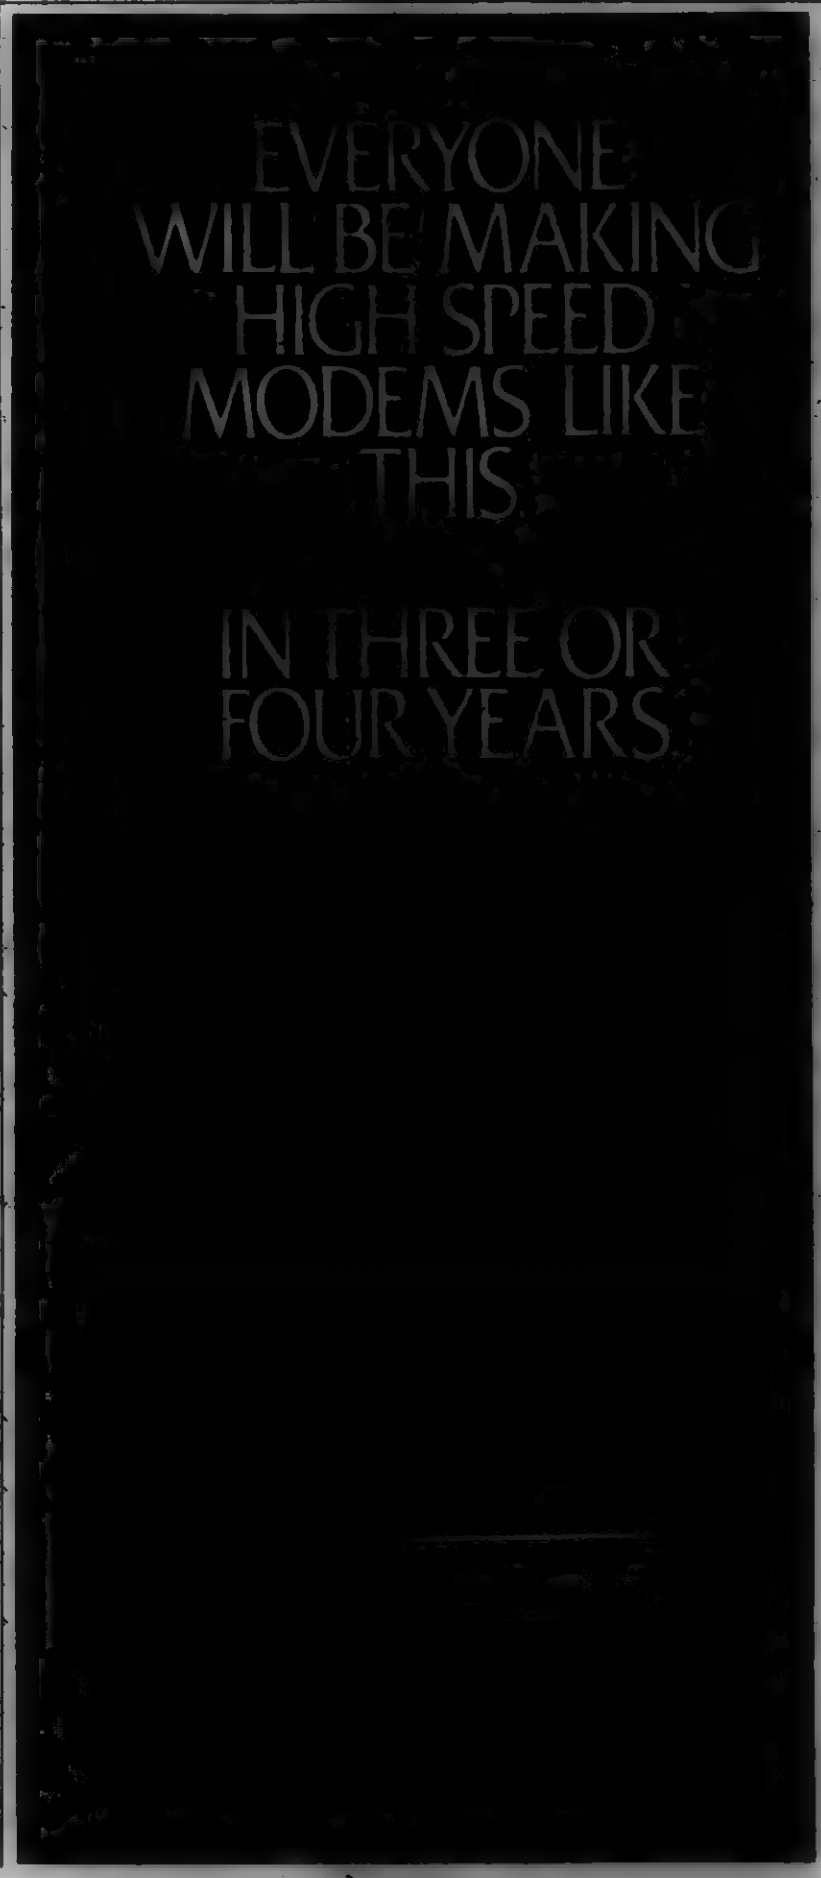
The report recommended that designers allow for cellular space allocation, rather than open offices, and increased space for support and ancillary services. Designs should also allow for dispersed rather than centralized computer rooms and the appropriate floor load levels, according to the report.

It also recommended large, dispersed vertical ducts, which would take up at least 2% of available floor area, to separate power, telephone and signal cable.

Air conditioning capacity should be expandable, which will mean greater demand for servicing access and a subsequent minimum floor-to-ceiling height of 2.8 meters.

According to the report, buildings with the ability to handle information technology will be easier to let in a tight market, while "marginal buildings" will lose their value within five years if they aren't renovated. It also said that new and refurbished buildings might be easier to market as shells, with the services and interior scenery fitted to customer specifications.

The 108-page "Orbit Summary Report" is available for $400 from Cross Information, Suite B, 934 Pearl, Boulder, Colo. 80302.



How did Codex come up with the 2600 Series, a new generation of modems running at speeds from 4800 to 16,800 bps that's so much more advanced than the competition?

By designing a revolutionary VLSI-based signal processing architecture teamed with the powerful Motorola MC68000 microprocessor.

A design that incorporates a unique Adaptive Rate System, which continuously adjusts the transmission speed of the Codex 2660 to the maximum rate the line will support. Allowing you to optimize throughput all the way up to 16,800 bps, without having to lift a finger.

A design that ensures data reliability with Trellis Code Modulation (TCM)—a significant advancement over uncoded modulation techniques in common use today.

In multipoint applications, the Codex 2640 can even handle mixed 9600, 7200 and 4800 bps inbound rates. So each drop can operate independently at maximum speed and efficiency.

Of course, with the Codex 2600 Series, network control is standard. So you can monitor line and modem performance from the front panel or from a central Codex DNCS system. Plus there's an optional downline-loading feature that lets you conveniently modify or enhance the functionality of remote, unattended modems.

The Codex 2600 Series.

In three or four years, our competitors will probably have modems just like them.

If you'd rather not wait, contact Codex today. We'll send you detailed information about these 2600 features and more. Much more.

Call 1-800-821-7700 Ext. 666. Or write: Codex Corporation, Dept. 707-66, 20 Cabot Boulevard, Mansfield, MA 02048.

"First Chicago is launching a whole world of new banking services with ***Tandem NonStop Computer Systems.***"

At The First National Bank of Chicago, providing responsive on-line financial services for our customers is a major corporate priority. An important part of that commitment is the global implementation of core applications on Tandem NonStop Computer Systems.

Utilizing common data base structure on systems distributed throughout the world provides immediately useable information uniquely suited to internal reporting and accounting. Included are such sensitive items as foreign exchange and money market transactions, loan contracts and SWIFT transfers. We call this system F.I.R.S.T. (First Chicago International Real-time System for Transactions).

Tandem systems also support our installed and expanding consumer and commercial funds transfer, balance reporting, and cash management systems, which move billions of dollars for our customers daily. Our Cash Station ATM switch is an excellent example. The modular nature of the Tandem solution enables us to sustain and improve quality by adding such capabilities incrementally, where and when they're needed.

The Tandem systems are on-line in sixteen financial capitals around the world. And they are very reliable. We continue to be impressed with the systems, the support and with our employees' enthusiastic acceptance. They are helping us improve customer service.

The NonStop System. The only computer on the market today that can provide an integrated network of up to 255 processor systems, supporting thousands of terminals in an on-line, transaction-based environment.

Tandem. Fully supported by worldwide sales, training, service and manufacturing organization.

For more information on the Tandem application at First Chicago and a copy of our brochure, "Solutions in Banking," contact your local sales office or Tandem Computers Incorporated, 19333 Vallco Parkway, Cupertino, California 95014, U.S.A. Toll Free 800-482-6336

He tracks mass media's changing image of computers

By John Gallant
CW Staff

CAMBRIDGE, Mass. — Beneath the image of the computer in mass media is an underlying fear of technology and the people who control it, according to David Goodstein.

"There is a basic fear that is always reflected in visualizations of the computer in films and television. That fear is the centralization of authority in the person of the specialist who can control this fantastic tool. People who don't understand computers are afraid of them and of those who program them."

Goodstein is the director of the Technopolis Foundation, an organization devoted to researching the impact of technological change on society. The group is exploring that topic via its film series entitled *Thinking Machines: Images of the Computer in Mass Media*, at the Cambridge Institute for the Arts and Sciences here.

"Twenty years ago, when computers required almost an entire building to support them, it did not seem very likely that within our lifetimes they would become part of our mass culture," Goodstein said in a recent interview. "But the computer has come to portray technology in mass media, and technology has a bipolar image, depending on the political and economic climate. In rough times, technology is portrayed as a monster. In better times, technology is the benevolent savior."

Goodstein said computers have customarily been portrayed as massive, complex machines, usually under the power of a lone — often mad — creator or completely beyond mankind's control. The image is evident, he observed, in such films as *Alphaville* by Jean Luc Goddard, George Lucas' early work entitled *THX-1138* and Stanley Kubrick's striking *2001: A Space Odyssey*.

Another theme woven throughout early images of the computer is that of the "hacker's girlfriend." Explained Goodstein, "That's where the programmer falls in love with the computer, or the computer falls for the programmer and creates all sorts of problems. That was a perfect visualization of what computers were seen as in the 1950s and '60s. Those were the days when hackers were not yet culture heroes, and programmers were regarded as peculiar and almost a part of the machines they were so obsessed with."

'Blinking and smoking'

In their starring roles, computers have also exhibited some interesting, though not very accurate, features. "Tape drives and blinking lights are the two great images of the computer in mass media. They are the visible manifestations of computing machinery, though not really typical of most installations. These machines also could perform a number of rather specialized peripheral functions like spitting out sparks and emitting smoke."

Is the computer's image in mass media changing? Goodstein said yes, but not necessarily for the better.

"The image has become more benevolent, but not much more realistic. The computer is a standard fixture in a number of television series, like *Knight Rider* and *Automan*, where it is even portrayed as a superhero. But it's still the image of the blinking lights, and that's not how it is. People don't quite know how to portray computers because there's nothing really to look at."

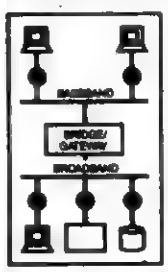
The image of those who control computers has undergone a drastic revision, however. "The new theme is that of the Whiz Kids. The 1980s have made the hackers culture heroes, and we have the media to thank for that. No matter how powerful it is, IBM was never going to make heroes out of data processing people. That runs against the corporate grain."

LAN.
THE DECISION TO WAIT AND SEE JUST PAID OFF.

Now there is a company that can satisfy your LAN needs both today and ten years from today. A company with flexible solutions backed by over 20 years of networking experience.

Codex.

In the 4000 Series LAN, we offer a system that lets you configure and control the precise mix of LAN technologies that suit your company needs.



A system, for example, that lets you combine a broadband backbone for data, video and voice applications, and less expensive Ethernet baseband feeders to support individual work areas.

A system that supports a wide array of industry standard interfaces. So you can connect practically any vendor's equipment.

Later, when your needs for internetworking and network management expand, those needs can best be met by the company that has literally written the book on adaptive routing, network management, protocol intervention, and statistical multiplexing.

Codex.

We just made the decision to get into local area networking a safe decision to make.

For more information, call 1-800-821-7700, ext. 879. Or write: Codex Corporation, Dept. 707-79, 20 Cabot Boulevard, Mansfield, MA 02048.

National Crime Prevention computer center set to open

By David Gross
CW Staff

WASHINGTON, D.C. — The National Crime Prevention Council is establishing a computerized system to help police departments, citizen groups and others seek information on crime prevention programs.

The council has enlisted the support of the U.S. Department of Justice, several private, nonprofit foundations and Digital Equipment Corp. in developing the Crime Prevention Center, which organizers say will be the first such program in the nation.

"This is absolutely a ground-breaking effort in the whole area of crime prevention," said Jean O'Neil, assistant program manager for the council. The system is scheduled to begin operating in July.

Made up of some 90 members representing local and state governments and law enforcement agencies . . . the council is probably the nation's largest repository of information about local crime prevention programs . . . It administers the [coalition's] campaign, which features a trench-coated dog named McGruff and the slogan, 'Take a Bite Out of Crime.'

Made up of some 90 members representing local and state governments, law enforcement agencies, organized labor, business and civic groups, the council is probably the nation's largest repository of information about local crime prevention programs, such as neighborhood watch, officials said. It administers the Crime Prevention Coalition's national campaign, which features a trench-coated dog named McGruff and the slogan, "Take a Bite Out of Crime."

The council has been receiving an increasing number of requests for information. "By utilizing current computer technology, the center will meet one of the most pressing needs in today's crime prevention field — the need for specific and detailed information on programs that work," said Assistant Attorney General Lois H. Herrington.

Up until now, O'Neil said, the council has relied on paper records and staff members' powers of recall to respond to requests for information. That procedure is slow and consumes too much staff time, she said.

With a computerized system, the council hopes to respond more quickly and accurately to requests for information about crime prevention programs. The data bases will be used to establish nationwide information about crime prevention programs, identify successful programs and help local groups contact promising projects in their region.

"The council is a very small organization, yet it has the potential to help a large number of people," O'Neil said. "Without these systems, we can't help these people."

Sometime in the future, she said, the data base may be made accessible through remote terminals and a dial-up communications network. An $8,600 grant from DEC was used to fund partially the purchase of DEC hardware and software. The council purchased two Decmate II business systems, including two 10M-byte Winchester disks; word processing software; an LQP02 letter-quality printer and an LP-100 dot matrix printer. The center also obtained Condor Computer Corp.'s Condor 3 data base management software.

Other private contributors to the program are the Edna McConnell Clark Foundation, the Florence V. Burden Foundation and the Hyde & Watson Foundation.

Labor department, union settle on six-month test period for robot

PITTSBURGH — A grievance filed with the Federal Labor Relations Authority was withdrawn recently after a federal agency here agreed to a union demand that it address the human side of automation.

The grievance was filed last July by Local 644 of the American Federation of Government Employees to protest the replacement of four nonunion, unskilled laboratory workers by a robot at the Labor Department's Mine Safety and Health Administration (MSHA) [CW, Nov. 28].

According to the president of the local, Richard Clougherty, the complaint charged the Labor Department with failing to inform the union that the robot would be installed and sought to secure the employment rights of the four workers, who, Clougherty claimed, had been reassigned busywork.

Bargaining table

After the complaint was filed, "management came to us," Clougherty said, and agreed to sit down at the bargaining table.

As a result, MSHA has agreed to a six-month test period for the robot, which is used to test dust samples from mines, a job that Clougherty called "dirty and terrible."

During the six-month test period, no employees will be affected.

Negotiating options

If a decision is made to keep the robot, management has agreed to negotiate with the union the future of any displaced workers.

Options include retraining and transferring workers to another government facility.

Clougherty is convinced the union won. "Our intent all along was to protect the rights of these workers, not to stop technology," he maintained.

A Balans® chair is ergonomically designed to let you sit naturally at a computer workstation. In fact, it has become one of the most popular workstation chairs in the country. It helps improve your posture and relieve other strain and pressure that normal sitting puts on your back and neck.

This specially designed Balans Original by Westnofa is a "Limited Edition" model. It features a black Norwegian wood frame and black, heavy-duty wool seat and leg supports. It is the only Balans Original available in a "high tech" look.

Where else would you expect to find a "Limited Edition" Balans Original than The Back Store.™

Choose from the "Limited Edition" Balans Original or other popular colors, each specially priced at $198 including shipping and handling charges to anywhere in the Continental USA.

'Electronic Peace Corps' dream of Virginia author

By Edward Warner
CW Staff

If David Rothman's dream someday becomes reality, an engineer in a Third World nation could get his calculations for a hydroelectric dam checked by an expert in the U.S. — using a system that would transmit the data for about $1.

Rothman's dream is an adjunct to the U.S. Peace Corps that he calls the Electronic Peace Corps, which would link the computers of Third World nations to those of experts in the U.S. and provide referrals of Third World questions to expert volunteers in the U.S. The Electronic Peace Corps would rely on the advances taking place in international data transmission, especially packet-switching technology, but like the Peace Corps itself, its goal would be to promote Third World self-sufficiency.

Rothman, an Arlington, Va., author of computer books, said his plan for an Electronic Peace Corps arose from discussions on Third World communications with science fiction novelist Arthur C. Clarke, who is helping to organize a high-tech training center in Sri Lanka.

Rothman's ideas may not be so farfetched. Already, a 14-year-old international aid organization has begun operating a similar service, called Carinet, for 10 Third World nations, most of them in Africa (see related story).

Rothman, however, envisions the Electronic Peace Corps as a federally-funded effort, one that would give "the U.S. more bang for the buck on its foreign aid [spending]" by allowing Peace Corps workers and overseas representatives of the U.S. Agency for International Development (AID) to get accurate answers to local problems.

Using lap-size portable computers, those AID workers could link with U.S. computers to get market projections before farmers plant crops. They could also give a local doctor expert advice on a difficult case or help with the establishment of food distribution networks.

Peace Corps spokeswoman Mary Mead, however, questioned the widespread applicability of an Electronic Peace Corps in the Third World because "in a lot of those places, there isn't even electricity." But she added, "I don't mean to suggest that it's a bad idea," pointing out that the agency has taken no official position on the proposal.

Rothman, though, claimed that the elite of Third World nations — the people with whom U.S. experts would work — have access to telephones and, hence, international communications. The big need in the Third World, he said, is for small computers and, more importantly,

The Electronic Peace Corps would rely on the advances taking place in international data transmission . . . to promote Third World self-sufficiency.

the installation of packet-switching equipment, which dramatically reduces the cost of data transmission to rates as low as $1 per 1,000 words.

Right now, "the problem is the phone bill. Telex can be awfully expensive, too. And the mail takes forever," Rothman said.

As a result, he continued the doctors, engineers and planners in the Third World are reluctant to take their problem cases to the experts in the U.S. That's too bad, Rothman said, because there are many experts in the U.S. who have already shown an interest in lending their knowledge toward solving Third World problems. A nonprofit group called Volunteers in Technical Assistance has, with AID funding, gathered a group of 5,000 volunteers who offer advice on everything from communications to soap making.

A good place for the U.S. to try out an Electronic Peace Corps, Rothman said, would be Sri Lanka, where, he estimated, introduction of packet switching would cost between $20,000 and $25,000. That, he added, is roughly the price of paying and providing for two Peace Corps workers annually.

Naren Chitty, a counselor at the Sri Lankan embassy in Washington, D.C., agreed. "We applaud the concept," he said. "We don't see any electronic imperialism in it."

Chitty said he felt political considerations would not be an issue, at least for Sri Lanka, because "technology is potentially neutral." He said an Electronic Peace Corps would greatly help the educated members of his nation's work force become involved with high technology.

Need general accounting software for IBM System/38?

We've simply solved your problem.

LAWSON ASSOCIATES has solved it with the first general accounting software specifically designed for IBM System/38. Not merely compatible, but state-of-the-art to fully utilize your computer's capabilities. Compare. You won't find a total software solution like it anywhere else.

DESIGN FEATURES: They include: on line systems using data base management; menu driven, user friendly programs written in RPGIII, the System/38 language; and integrated modules. Their benefits: ease of installation and use, plus maximum employee productivity.

INTEGRATED MODULES: Those available include: General Ledger and Report Writer/Accounts Payable/Accounts Receivable/Fixed Assets/Payroll/Personnel/Purchase Order/Order Entry/Inventory Control

SERVICE FEATURES: Fully documented and supported. Onsite training and implementation. One year warranty. Available now for immediate installation.

For more information, please call or write:
Lawson Associates, 2021 East Hennepin Ave., Minneapolis, MN 55413

LAWSON ASSOCIATES
WE SIMPLY SOLVE PROBLEMS

IBM and DEC Merger Announced

Term-Tronics Creates With the Power to Join

In the beginning the Computer Universe was a lonely place. There was IBM and only IBM. Then others entered the field, major competitors such as DEC. Today, each of these Computer Age Titans commands an impressive following.

But because no one has a monopoly on desirability, there arose a knowledgeable user population which sought the best of both worlds. To serve this astute and growing audience, Term-Tronics was born.

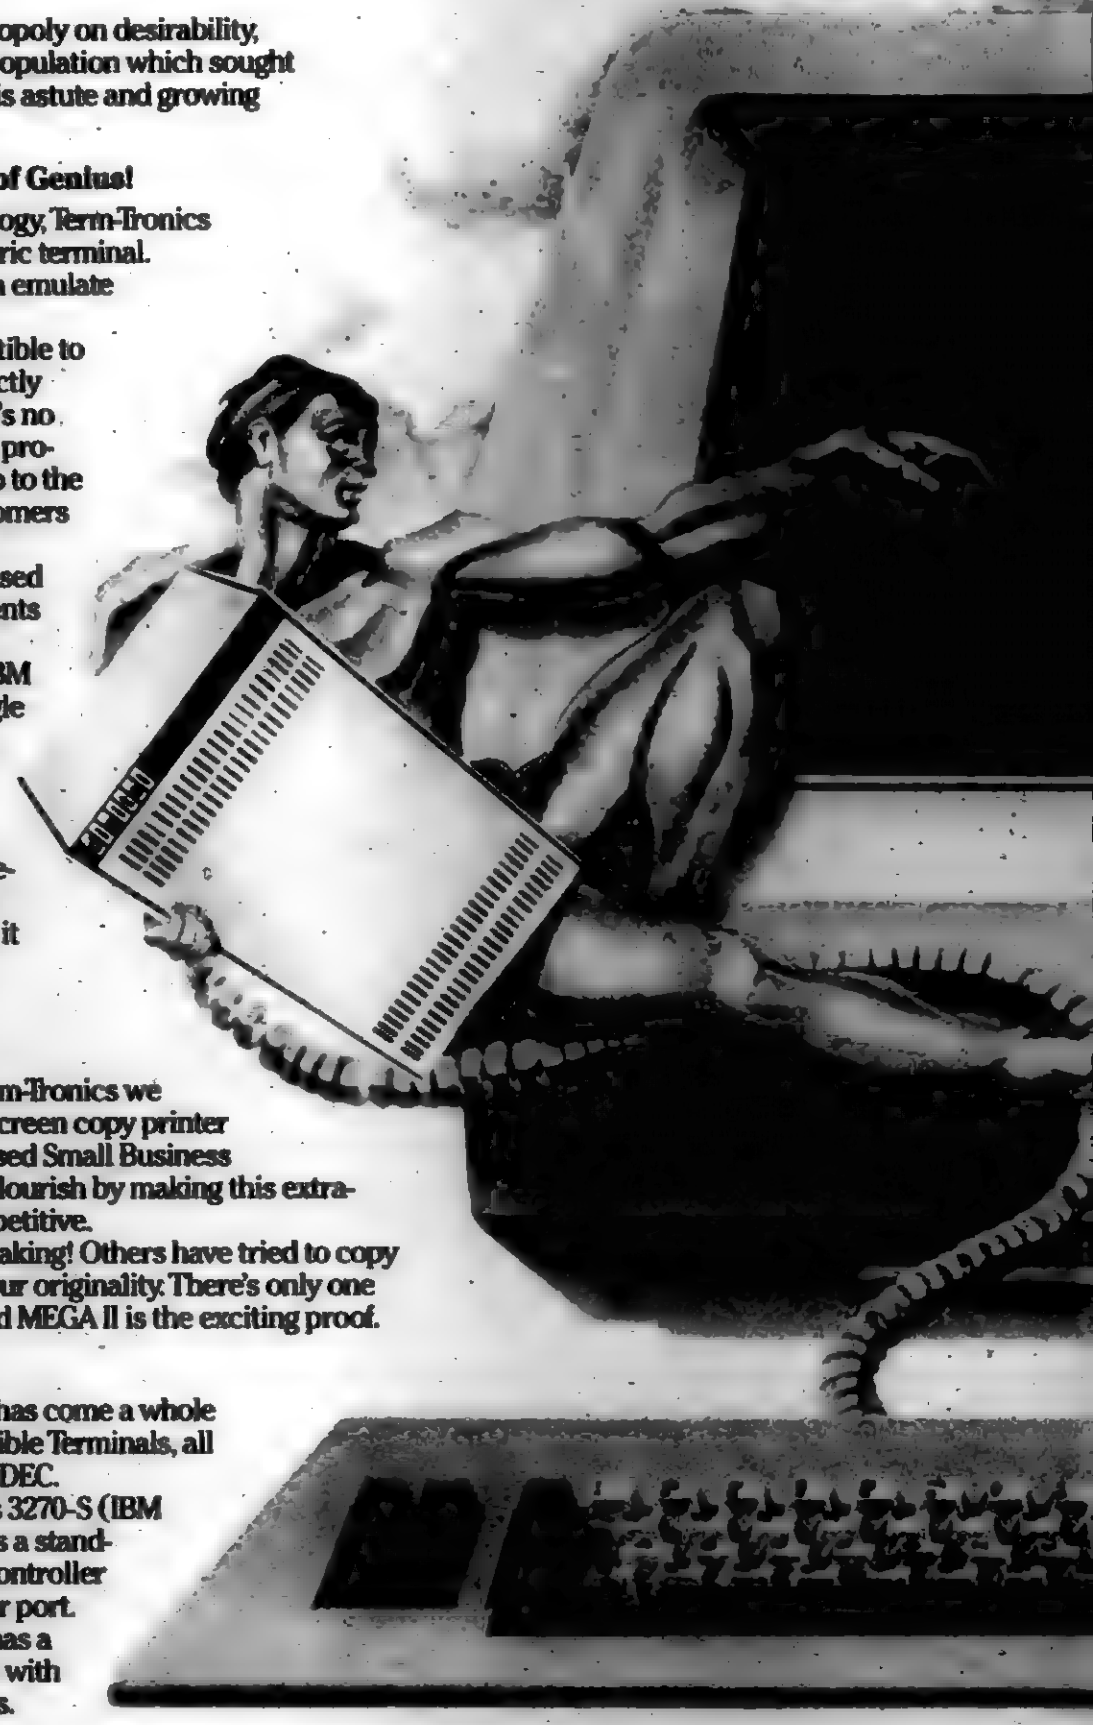
Multi-Host Capability -- a Stroke of Genius!

Utilizing breakthrough technology, Term-Tronics created MEGA II, the first truly generic terminal. With a single keystroke, the unit can emulate IBM or DEC.

MEGA II is coaxial plug-compatible to IBM 3278* and 3178* and plugs directly into IBM's 3274* controller. So there's no longer a need to be concerned with protocol incompatibilities. That adds up to the kind of peace of mind that has customers walking on clouds.

What's more, MEGA II can be used in either local or remote environments with SNA or BSC communications.

Incredibly, MEGA II emulates IBM 3278 Models 2 through 5 with a single keystroke. The multi-host MEGA II is DEC VT-100* compatible. It also can emulate other asynchronous terminals simply by loading new emulations into the terminal via telephone, and all in 10 minutes or less! Another heavenly advantage is that it requires no additional equipment.



Putting the Finishing Touches on the Masterpiece

But we didn't stop there. At Term-Tronics we went on to add support for a local screen copy printer and an RS232C port for a CP/M® based Small Business Computer. Then we finished with a flourish by making this extraordinary unit remarkably cost competitive.

The results have been earth-shaking! Others have tried to copy our achievements but they lacked our originality. There's only one Master of Data Communications and MEGA II is the exciting proof.

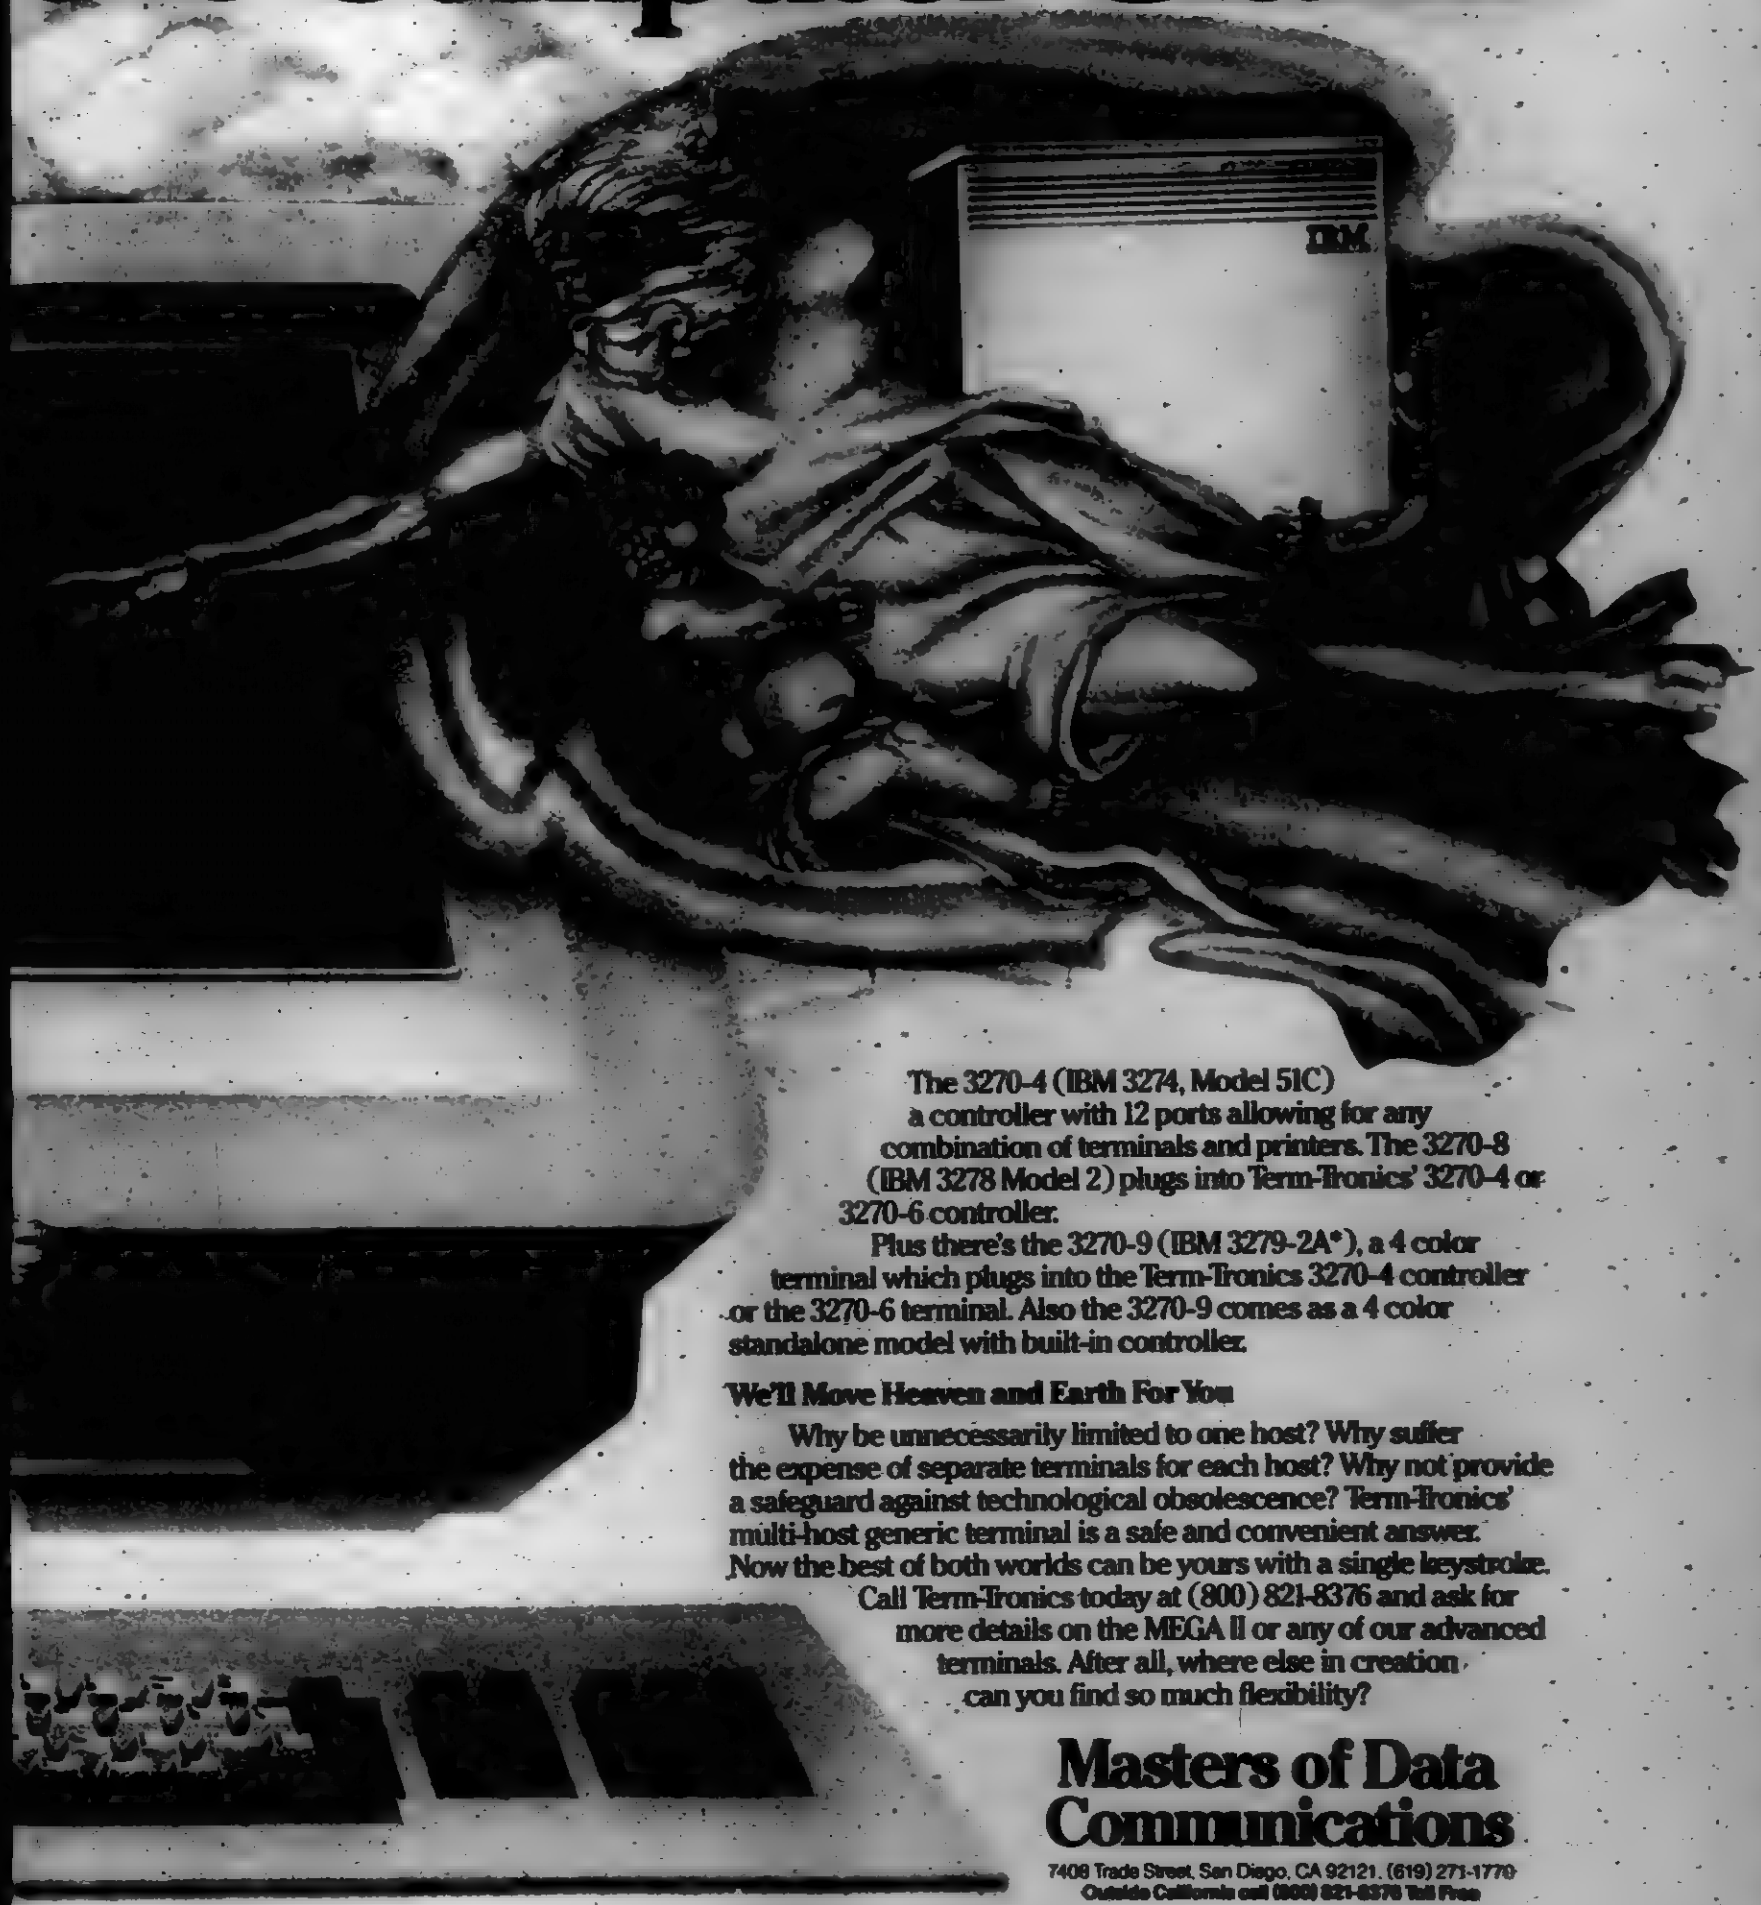
The Golden Age of Terminals

From the same creative minds has come a whole series of remote BSC mode Compatible Terminals, all of which can be upgraded to talk to DEC.

These include the Term-Tronics 3270-S (IBM 3275* or 3276* compatible) which is a stand-alone terminal featuring a built-in controller and a separately addressable printer port. The 3270-6 (IBM 3276) which also has a built-in controller and can interface with 3 additional terminals and 4 printers.

Term-Tronics

a Multi-Host Terminal the Computer Giants.



The 3270-4 (IBM 3274, Model 51C) a controller with 12 ports allowing for any combination of terminals and printers. The 3270-8 (IBM 3278 Model 2) plugs into Term-Tronics' 3270-4 or 3270-6 controller.

Plus there's the 3270-9 (IBM 3279-2A*), a 4 color terminal which plugs into the Term-Tronics 3270-4 controller or the 3270-6 terminal. Also the 3270-9 comes as a 4 color standalone model with built-in controller.

We'll Move Heaven and Earth For You

Why be unnecessarily limited to one host? Why suffer the expense of separate terminals for each host? Why not provide a safeguard against technological obsolescence? Term-Tronics' multi-host generic terminal is a safe and convenient answer. Now the best of both worlds can be yours with a single keystroke.

Call Term-Tronics today at (800) 821-8376 and ask for more details on the MEGA II or any of our advanced terminals. After all, where else in creation can you find so much flexibility?

Yes, SAS can handle large production applications

By Fred [illegible]
CW Staff

HOLLYWOOD BEACH, Fla. — Can large-scale production applications be built using SAS Institute, Inc.'s line of SAS software products? The answer to that question is a resounding "yes," according to Judith H. Mopsik, program director at CRI, Inc. in Bethesda, Md.

Mopsik

Speaking to a large crowd at the SAS Users' Group International (Sugi '84) meeting here recently, Mopsik told how a team of seven programmers working part time built a 50,000-line application for the Bureau of Labor Statistics almost entirely in SAS. The application is an important part of the statistics used to compute the Consumer Price Index, she said.

The application took a total of two years to create, but coding, testing, integration and transition into production took only 12 months, Mopsik said.

The application is modular, maintainable and easy to modify, with changes appearing transparent to the user, she added. It includes built-in test and verification procedures, including a routine that analyzes log statements and prints out those procedures that are consuming the most CPU time. It also has facilities to produce custom reports and transaction files to update the data base, she noted.

The application was developed with heavy dependence on the system development life cycle approach, Mopsik said. SAS was used in nearly every phase of development, including requirements analysis, the writing of system specifications, systems design, program design and coding, prototyping, unit testing, system testing and documentation.

In the analysis phase, SAS was used to produce sample frequencies and statistics to present to users. "We can show users we understand what they want, and they gain confidence in us," Mopsik said.

SAS was used regularly in structured design and analysis to create process descriptions that were eventually translated into SAS procedures and data sets. "Data flow elements were later used as variables throughout the system design," Mopsik said. "Users can review the variables, and the data flow diagrams can translate easily into a systems design. We could take the data steps and the procedural steps and match them to the functional specifications."

The system had to be modular to ease updates and maintenance. Although many users do not believe SAS lends itself to modularity, Mopsik noted that "routines like subroutine calls and pass parameters can be done using the macro facility.

"Once you begin to understand the macro facility, you can begin to do many things you thought could only be done in traditional programming languages," she said.

As part of the procedure of translating systems design to programming specifications, the group formulated programming conventions. For example, a macro command was always preceded by two underscores and an array by one underscore. Every DO . . . END statement was also required to contain a comment field.

"I don't want to take anybody's creativity away, but we have to realize that this is a volatile industry, and we have to have some standards," Mopsik said. "It's better to spend your time solving the problem."

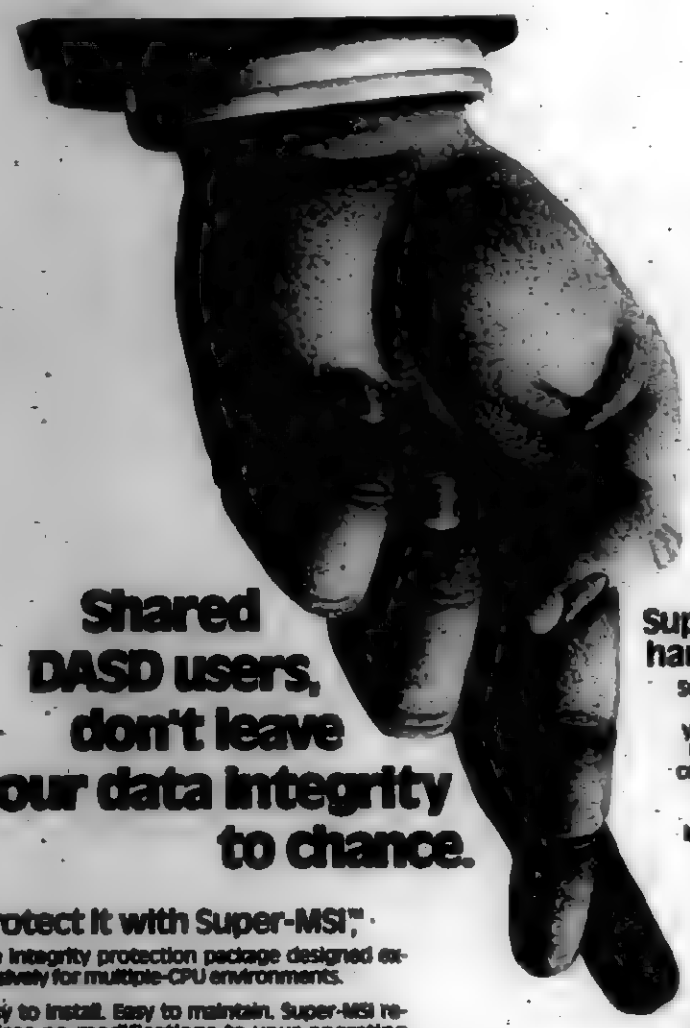
Program flowcharts were created with extensive use of structured walk-throughs and peer review to avoid duplication of coding effort. The fact that a detailed system design already existed enabled the senior programmer/analysts to turn the routine programming over to junior staff.

The group then began prototyping and benchmarking to identify potential weaknesses in the system. "An SAS prototype can be tested and coded quickly," Mopsik remarked. She said the software's "Proc" statements provide good facilities to produce interim reports and screens. "You can also easily create new variable structures because these aren't embedded in SAS."

The staff also used the "Proc" statement frequently in unit testing by embedding it in programs and conditionally printing both before and after testing. Test reports and subset selections were printed for user signoff during the test period. "As soon as you're ready to go into production, you can just go in with a text editor and delete the test prints," she said.

System testing was made easier by use of the "Proc" statements, which allowed users to verify sample reports and statistics before the code was put into production.

If the system development life cycle method is followed carefully throughout design and coding, documentation is a breeze, Mopsik commented. "You have system design and flowcharts, you automatically have usage instructions for system-level macros, and you have SAS coding conventions," she noted.



Shared DASD users, don't leave your data integrity to chance.

Protect it with Super-MSI™,
the integrity protection package designed exclusively for multiple-CPU environments.

Easy to install. Easy to maintain. Super-MSI requires no modifications to your operating system and can be implemented in an active system in as little as ten minutes—assuring complete data integrity from the moment it is installed.

Super-MSI guarantees data integrity.

No complicated job scheduling. No elaborate control schemes. No software changes. Super-MSI spans inter-system activity to give "unified system" integrity to your entire multi-system complex.

Super-MSI preserves integrity under MVS, MVS-SE, MVS-SP, SVS, MVT, VS1 and MFT systems.

Super-MSI prevents data destruction.

Inadvertent modification, simultaneous access . . . Super-MSI stops the damaging data abuses that multiply in a multi-systems environment. Prevents the errors that can so easily occur—and too often go undetected—when users operate in a multi-systems complex.

Super-MSI eliminates hardware RESERVEs.

Super-MSI completely protects your data integrity and frees your systems of RESERVEs and RESERVE lock-outs. Super-MSI converts selective RESERVEs to logical controls that securely protect your data without inhibiting system throughput.

Super-MSI does more.

As part of the CGA family of single-image software for multiple-CPU sites, Super-MSI works together with MSM®, our Multiple Systems Manager which manages tape and disk storage devices and GCD®, our Global Console Director which consolidates consoles, cutting costs and streamlining operations. The result is a unified single system image that is transparent, flexible and powerful. Use them together or in any combination. CGA's multiple systems software is a must for large users.

More than 1,000 CGA single-image software packages are in use around the world, preserving data integrity and helping multiple-CPU sites hum like they're supposed to. Call today. Set up a free trial of Super-MSI, GCD or MSM.

Speak software. Talk to CGA.

EDITORIAL

AT&T move leaves questions

AT&T may have answered some questions on Wall Street with its announcement last week of a range of processing and communications products. But the presentation did little to answer the big question: Does the telecommunications giant have the capabilities to become a major player in the data processing equipment market?

In some respects, the unveiling of AT&T's products was impressive. In other respects, however, it left many doubts that AT&T, with one wing free of the shackles of government regulation, can duplicate IBM's dynamic technological and marketing strides.

Not surprisingly, AT&T's lineup seems to offer the most potential in the area of communications. The offering of its Unix V operating system on each product level, from the low-end to the high-end, provides possibilities for efficient and less expensive uploading and downloading among various products. Similarly, the reported ability to interface Microsoft, Inc. MS-DOS-based microcomputers to the AT&T 3B2/300 supermicro — and, one would assume, to other AT&T products down the road — must be attractive to decision makers who have invested capital in the IBM Personal Computer and look-alikes.

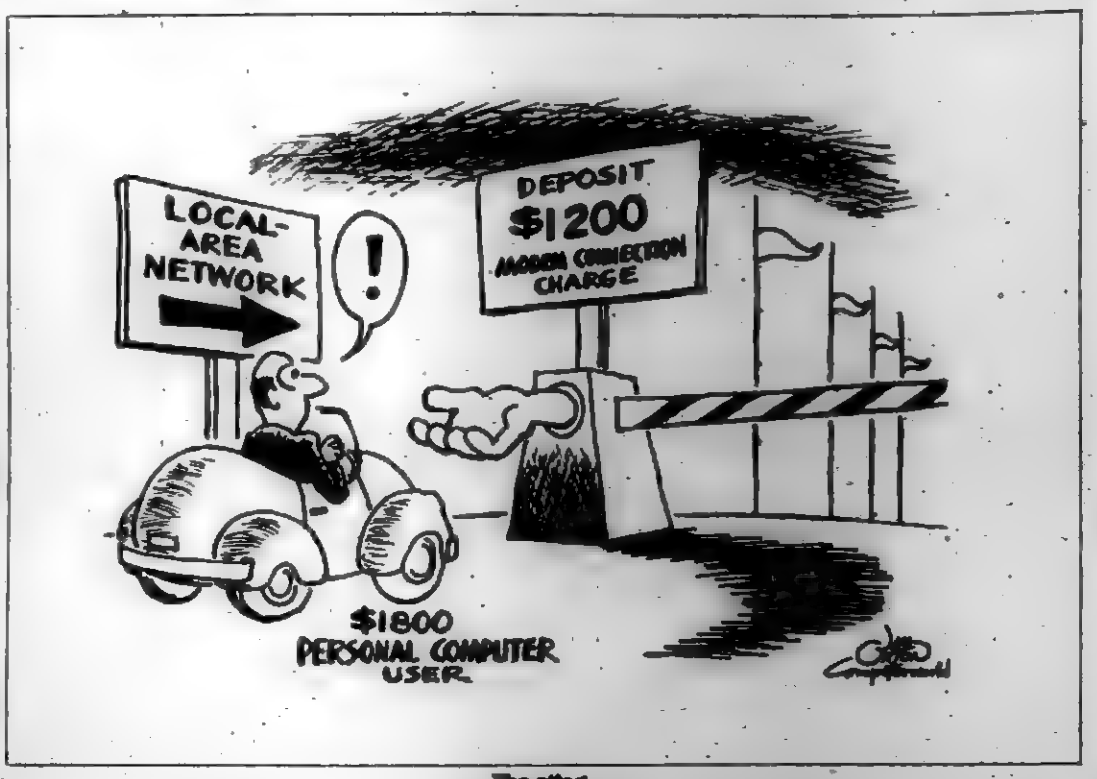
On the other hand, the DP world is probably going to be quite underwhelmed by AT&T's offerings in the supermini arena. There is little that appears to be technologically new, or even slightly advanced, among AT&T's superminis. It's questionable whether the world needs another imitator of Digital Equipment Corp., which itself is expected momentarily to announce a new high-end product.

Then there is the question of a viable line of mainframe products. Will AT&T enter this still very crucial equipment area, or has it instead drawn a line over which it will not step? To compete effectively against IBM, there are those who believe AT&T has to enter the mainframe market and complete its product hierarchy.

Another area of concern is that AT&T appears to have opted in great measure for the value-added remarketer route to bring its superminis to the market, for the time being, anyway. That's fine for addressing vertical markets, but it hardly has an immediate impact on the general-purpose computing market. This route ignores the question of whether AT&T can actually compete with IBM's renowned marketing forces on DP turf.

AT&T's 3B2/300 supermicro is an attractive product and stirs interest in future micro offerings. But it's just a matter of time before a flood of multiuser, supermicro/mini offerings appears from many vendors.

It almost seems that AT&T's strategy is one of depending on the acceptance of Unix to drive acceptance of AT&T hardware. Given the extent of interest in Unix at the present time, that may be a good strategy, but it would also seem to be a strategy with some risks — unless AT&T comes up with a potent hardware strategy or networking breakthrough to carry Unix to further heights.



The sting

LETTERS

Yes, Cbema may be biased, but it's in support of open trade

I agree with Charles P. Lecht's comments in his article "U.S. computer industry: 1984" (CW, Jan. 9) that reducing electronics trade with Japan would have severe and negative consequences for both the consumer and technological advances. Unfortunately, he identifies the Computer and Business Equipment Manufacturers Association (Cbema) as being in favor of trade restrictions.

Nothing could be further from the truth. Our long record of support for "free trade" measures stands as our clear defense. We may, as Lecht charges, be "biased," but it's in support of open trade, including imports of goods from Japanese companies, many of whose subsidiaries are our members. We're certainly not opposed.

Understanding all the hoopla surrounding CRT-related hazards

Having been in data processing for many years and utilizing CRTs for many hours at a time, I never paid very much attention to the hoopla about CRT-related hazards and ill effects. I had never had any problems. Of course, when I think of it now, I never spent more than a few hours at each sitting.

Recently, my partner and I were developing a computer-based training course for a client. We started spending eight to 15 hours straight, inputting and testing the course. After just a few days of this rigorous schedule, we began experiencing backaches and eyestrain.

Now I pay attention to all the articles on VDT use.

'The Federation': Year Two

LIGHT
ON SCIENCE
Charles P. Lecht

"Call me a techno-romantic, a sci-fi nut, but I found myself thinking that, by Jupiter, there I was attending the first meeting of 'The Federation' as it would be instantly recognized by 'trekkies' everywhere" — " 'The Federation': Year One" (CW, Sept. 19).

It wasn't easy to get to Salishan Lodge in Gleneden, Ore., on Monday, March 12. For one thing, airplane traffic throughout the country was disrupted by wintry storms. Devil-may-care comments from fatalistic passengers on the final approach to Portland, Ore., betrayed the strain of those who flew across America to get there; overemotional reunions with luggage confirmed it. In comparison, the subsequent drive of some hundred miles along a blustery coastline at night to reach Salishan seemed an anticlimactic, almost ethereal, experience.

You get the idea: One really had to love science to justify going to the Oregonian winter hinterlands to join a hundred-plus blustery American and foreign scientists attending a conference titled "Experiences in Applying Parallel Processors to Scientific Computation" — everyone there did.

Organized by two of our nation's leading scientific research centers, Los Alamos National Laboratory (LANL) and Lawrence Livermore National Laboratories (LLNL), both under the U.S. Department of Energy, the conference was opened by Bill Buzbee of LANL, who exercised flawless leadership in corralling its attendees into the hall before 8 a.m. for Tuesday's opener (Buzbee's a Ph.D. mathematician/scientist from Rising Star, Texas, where corrallin' comes more naturally than talkin').

Buzbee was helped by George Michael of LLNL, whose spirited enthusiasm for supercomputer happenings derives from long and wizened experience in their development and usage.

These supercomputer superstars and their colleagues deserve our praise and admiration for the diligent and serious (but definitely not humorless) manner they exhibited in attending to the conference agenda: No one sloughed off.

The conference's attendees included scientists representing such prestigious government organizations as Sandia, the National Aeronautics and Space Administration and the U.S. Ballistic Research Laboratory; premiere high-technology companies such as IBM, Cray Research, Inc., Control Data Corp., Microelectronics Computer Co., Intel Corp., Goodyear Research, Fairchild Camera & Instrument Corp., Denelcor, Star and Elexi; universities like the University of Oregon, New York University, the University of California, University of Illinois, Stanford University, Cornell University and University of Michigan; and foreign organizations such as Fujitsu Ltd., Nippon Electric Corp., the European Center for Medium Range Forecasts and so on. Even the White House and *Scientific American* were represented.

Megaflopsniks, megalipsniks

The conference provided an opportunity for our supercomputer scientists, whom I call megaflopsniks and megalipsniks, to share their experiences in making and using the most powerful scientific calculating and decision-making devices known to man. (A megaflops is a million floating point operations per second; a megalips is a million logical inferences per second.) Newly emerging systems are producing gigaflops and gigalips (a billion floating point operations per second and a billion logical inferences per second, respectively) speeds, although no one has reached 10 billion yet, and almost all now operate in the mega range.

You might naturally wonder why in the world anyone would need to do, say, 10 billion operations per second — that's roughly equivalent to the rate we would achieve if all the people on Earth operated desk calculators at 2½ calculations per second (floating point, to boot).

Since some calculations on even 10 gigaflops machines may take hours, for example, in computing meteorological forecasts, the idea of the entire world's population thusly consumed to achieve the same results only begins to suggest the magnitude of computation in just one system to which we aspire. Many are required to solve the scores of problems facing our megaflopsniks and megalipsniks as they apply their skills in fields like meteorology, genetics, nuclear, space, robotics, you name it, all problems of very practical consequence to us all. Let's face it: Massive problems require powerful computers for their solutions and powerful brains of the human variety, too.

While there was no shortage of the latter at Salishan Lodge, the very fact of our convening was in itself testimony to a serious shortage in computer systems powerful enough to carry out the vital computations we must perform to handle the problems facing our scientists. The conference explored how to get more power from our largest scientific research systems, such as Cray Research's Cray X-MP, by creating networked clusters of these to work on a single problem by attacking its constituent parts in parallel to obtain results faster and/or otherwise unobtainable by a single processor.

Concept of granularity

To help provide us with the impression that we can begin to understand why so many computations must be performed in finding the solutions to the problems addressed by these scientists, I offer the concept of granularity as it relates to perception in our physical world. The supercomputer is, thus, not unlike our vision-aiding micro/telescope in bringing the otherwise unseeable into focus. The finer the granularity of the lens, the more effective our instruments become. And the finer we subdivide their spatial targets, learning all we can about each subdivision, the more we know of the whole.

So may we conceptually apply granularity in our supercomputer world. For better focus of our "supertool's" powers in piercing the unknown, we subdivide its problem-space into grids of ever-diminishing unit size to learn all we can about each. Overriding in our motivation to do this is our quest for temporal stability and completeness of formulas — both essential to obtaining results in any experiment. Unfortunately, subdividing a space into ever-smaller units and computing the same amount of data for each creates exponentially growing and, ultimately, massive volumes of data.

The formulas being dealt with frequently address problems in which almost infinitesimal changes in time may bring about the need for the formulas' massiest reconstitutions. The degree to which these mathematical equations can remain stable over time — in application to a particular physical situation — brings tremendous returns in almost all aspects of problem solving: speed, easier mathematics and so on. This kind of "divide to

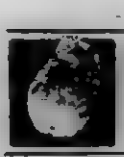
Eulogy for a defunct systems firm



HUMAN
CONNECTION
Jack Stone

The following ran several days in *The Washington Post* classified pages under "Auctions": "To satisfy the creditors of the bankrupt Balance Computers organization, an auction will be held to sell off its assets . . . including a wide range of personal computers, software and accessories."

Pupil: Why didn't Balance make it? On appearances, at least, it had everything going its way, offering a variety of personal systems at the retail level plus what was reputed to be fairly decent staff support. Although it had some branch offices, it seemed to be expanding in a sensible way.

Master: In analyzing business failures, you must always remember that the real reasons may be those far afield from what you might think, reasons such as personality clashes, reneges by investors, criminality and so on, none of which we are aware of in this case.

But if history is any guide, we can presume that the classic retailing problem developed at Balance, wherein the cost of sales greatly exceeded projected product and service revenues, whereupon cash flow problems developed, and creditors pressured the company into liquidation.

Pupil: Then why doesn't IBM have difficulties in its retail operations? Everybody knows it has enormous overhead, especially very well-paid staffs in both its development and marketing facilities. Doesn't it have the same kind of problems?

Master: Ah, you have fallen into the trap of drawing conclusions on surface appearances and not delving into all the available facts. Indeed, IBM advertises at the retail level, and, of course, IBM operates its own product centers. But because of IBM's policy shifts for the Personal Computer product line — divulging technology secrets to software developers and selling its machines to other retailers at a discount — it should be more properly characterized as a hardware wholesaler than as a retailer.

As a first consequence, its costs of software development are relatively small compared with manufacturers who have built their own in-house staffs. In fact, IBM's staff does very little original Personal Computer software development; instead, it functions primarily as a software systems tester who selects, validates and assures standards conformity of the best software products around.

As a second consequence, and perhaps even more important, the bulk of the Personal Computer marketing costs is borne by the independent retailers who service the public, which I define to be home users and small business customers. You must also appreciate that the vast majority of the sales of IBM Personal Computers are made by IBM salesmen in their traditional marketplace: large organizations, such as the Fortune 5,000, educational institutions and government agencies, who typically buy in large, sometimes extravagant, quantities. In conclusion, IBM's overall cost of sales of IBM Personal Computers are made by IBM retail sales price is fairly low when compared with the independent retailer who services accounts that buy in small quantities.

In other words, when measured in terms of profitability, the major market for Personal Computers at the current time and in the near term is in the large organizations, where it has traditionally been for the computer industry.

In contrast, retailing computers — or any product for that matter — to the public results in a much narrower profit margin. Therefore, a national firm with an established business base and many branch offices that offers a broad range of products probably has the best chance of success in this marketplace, although there is always room for newcomers with a better retailing idea and the wherewithal to follow through with it. Obviously, Balance management thought it had such an idea, but the business didn't work out the way they planned it.

VIEWPOINT

TWO from page 33

conquer" approach to providing, say, the forces at any point in time, at any location in a medium caused by explosive, aerodynamic, mutative growth and other such change presents us with the need for massive memories to contain the data for deeply subdivided media and, of course, massively powerful processing equipment to handle it.

By cleverly organizing the mathematical equations and decision-making processes that relate to the proper solution of these equations so that parts may be worked on by one or more uniprocessors in parallel (that is, simultaneously), it has been found that for just about all classes of problems, computations so executed provide us with resultant power that is greater than that represented by the simple addition of the individual powers of the parallel processor's constituent parts.

On the surface, this presents us with the paradox of the whole being greater than the sum of its parts; organization, of course, makes the difference. Employing parallelism in doing anything gets it done faster.

Yet another type of organization is of importance, too. There seems to be power multiplying relationships between the physical form of these electrical/metallurgical/chemical devices and the manner and form of the mathematical expression of the problems they are to solve.

It is easy to relate arrays of processors to matrices perhaps, but what about polynomial equations that are worked on by clusters of processors whose physical organization literally portrays an embodiment of the topological forms of such equations, as if these were being written in a new, weird script by giants from whose pens flow equations in media composed of transistors, capacitors, circuits, boards, steel and cable.

This is the first in a three-part series.

The $95,000 coupon.

Mail this and save $95,000 on your next Plug-Compatible Business System.

It's true.

What our new USX44 gives you for $267,000, you'd have to pay $362,000 for from IBM.

This includes hardware, operating software and installation (within 30 days). You get additional virtual storage and separation of on-line, batch and test workloads. All with the insurance of a fail-soft system.

How do we do it? By having the USX44's duplex processor CPU's custom-built exclusively for us, while its Disk, Tape and Printer components are all made by Storage Technology Corporation. Which happens to be our parent company.

And because we're a single-source-supplier, you always have just one single number to call for hardware maintenance and software support: The Global-Ultimacc 24-hour/7-day Hot Line.

What's the bottom line? When you're about to outgrow your present system, you can either spend a lot more money than you have to, or you can talk to us.

We're making some claim here: More power for less money. Can you afford not to call us on it?

Our number is 800-624-0041. In NJ, call 201-445-5050.

LETTER

What about those who didn't comment?

While reading Ken Moyer's In Depth article, "A report from Vienna: Which way Cobol?" [CW, March 12], I was stirred to action by the comments attributed to Jerry Garfunkel, noted lecturer and educator on Cobol and other languages.

Garfunkel wants us to believe that since 100,000 people didn't oppose the draft standard, that they must agree. Perhaps he would also have us believe that since 100,000 drunk drivers didn't have accidents, drinking and driving are a good mix.

I'm also struck by the thought that a draft standard that gets just slightly more than 6% of comments in favor should be on very shaky ground. What about the 100,000 who didn't submit comments? I didn't submit any comments. I've been involved with Cobol as a user for most of Cobol's life, starting with the 1401 implementation of the language and its two-hour or longer compiles. I served a few years on Codasyl on what was then called the "Programming Language Committee." At the time that Ansi-74 was out for comments, I wrote most of the comments submitted by Burroughs Corp. Like most other comments, they were ignored.

Of the 100,000, many didn't think comments would be taken seriously; most are unaware of the contents of the draft standard; and very few would know where to send comments. Now that's a breeding ground for apathy..

I firmly believe in the necessity of growth and progress for the continued life of Cobol. Without such progress, we'd still have "PICTORIAL" and "IF condition AND ALSO IF condition . . ." Unfortunately, Ansi "standards" have included untried syntax and semantics and omitted some excellent language concepts because Codasyl wears blinders.

The 100,000 did not vote "yes" any more than the seven abstentions in the article voted "no."

Chris Coddington

UNIX. An ideal has been realized.

Some say UNIX is the operating system of the future. We say, why wait till then? Because you can get it right now on a full range of HP computer systems.

Yes. It's running on our MC68000-based machines and our powerful 32-bit systems, so you can pick the right computer for the job.

And since our HP-UX operating system is an enhanced version of the industry-standard UNIX operating system, you can take advantage of the growing array of applications software available. You can also use the extra features of HP-UX, such as graphics and networking.

The UNIX operating system is only one of the high-powered operating systems we offer. And we put our full service organization behind all of them. We're ready to answer questions and to work with both end users and OEMs to find the best solution for any particular application.

There's never been a better time. Let HP help bring your computing ideal to reality. Sound interesting? Call your local HP sales office right now about the UNIX operating system. Or write to Hewlett-Packard, Attn. Pat Welch, Dept. 003194, 19447 Pruneridge Ave., Cupertino, CA 95014. In Europe, contact Henk van Lammeren, Hewlett-Packard, Nederlands B.V., Dept.003194, P.O. Box 529, 1180 AM Amstelveen, The Netherlands.

Productivity. Not promises.

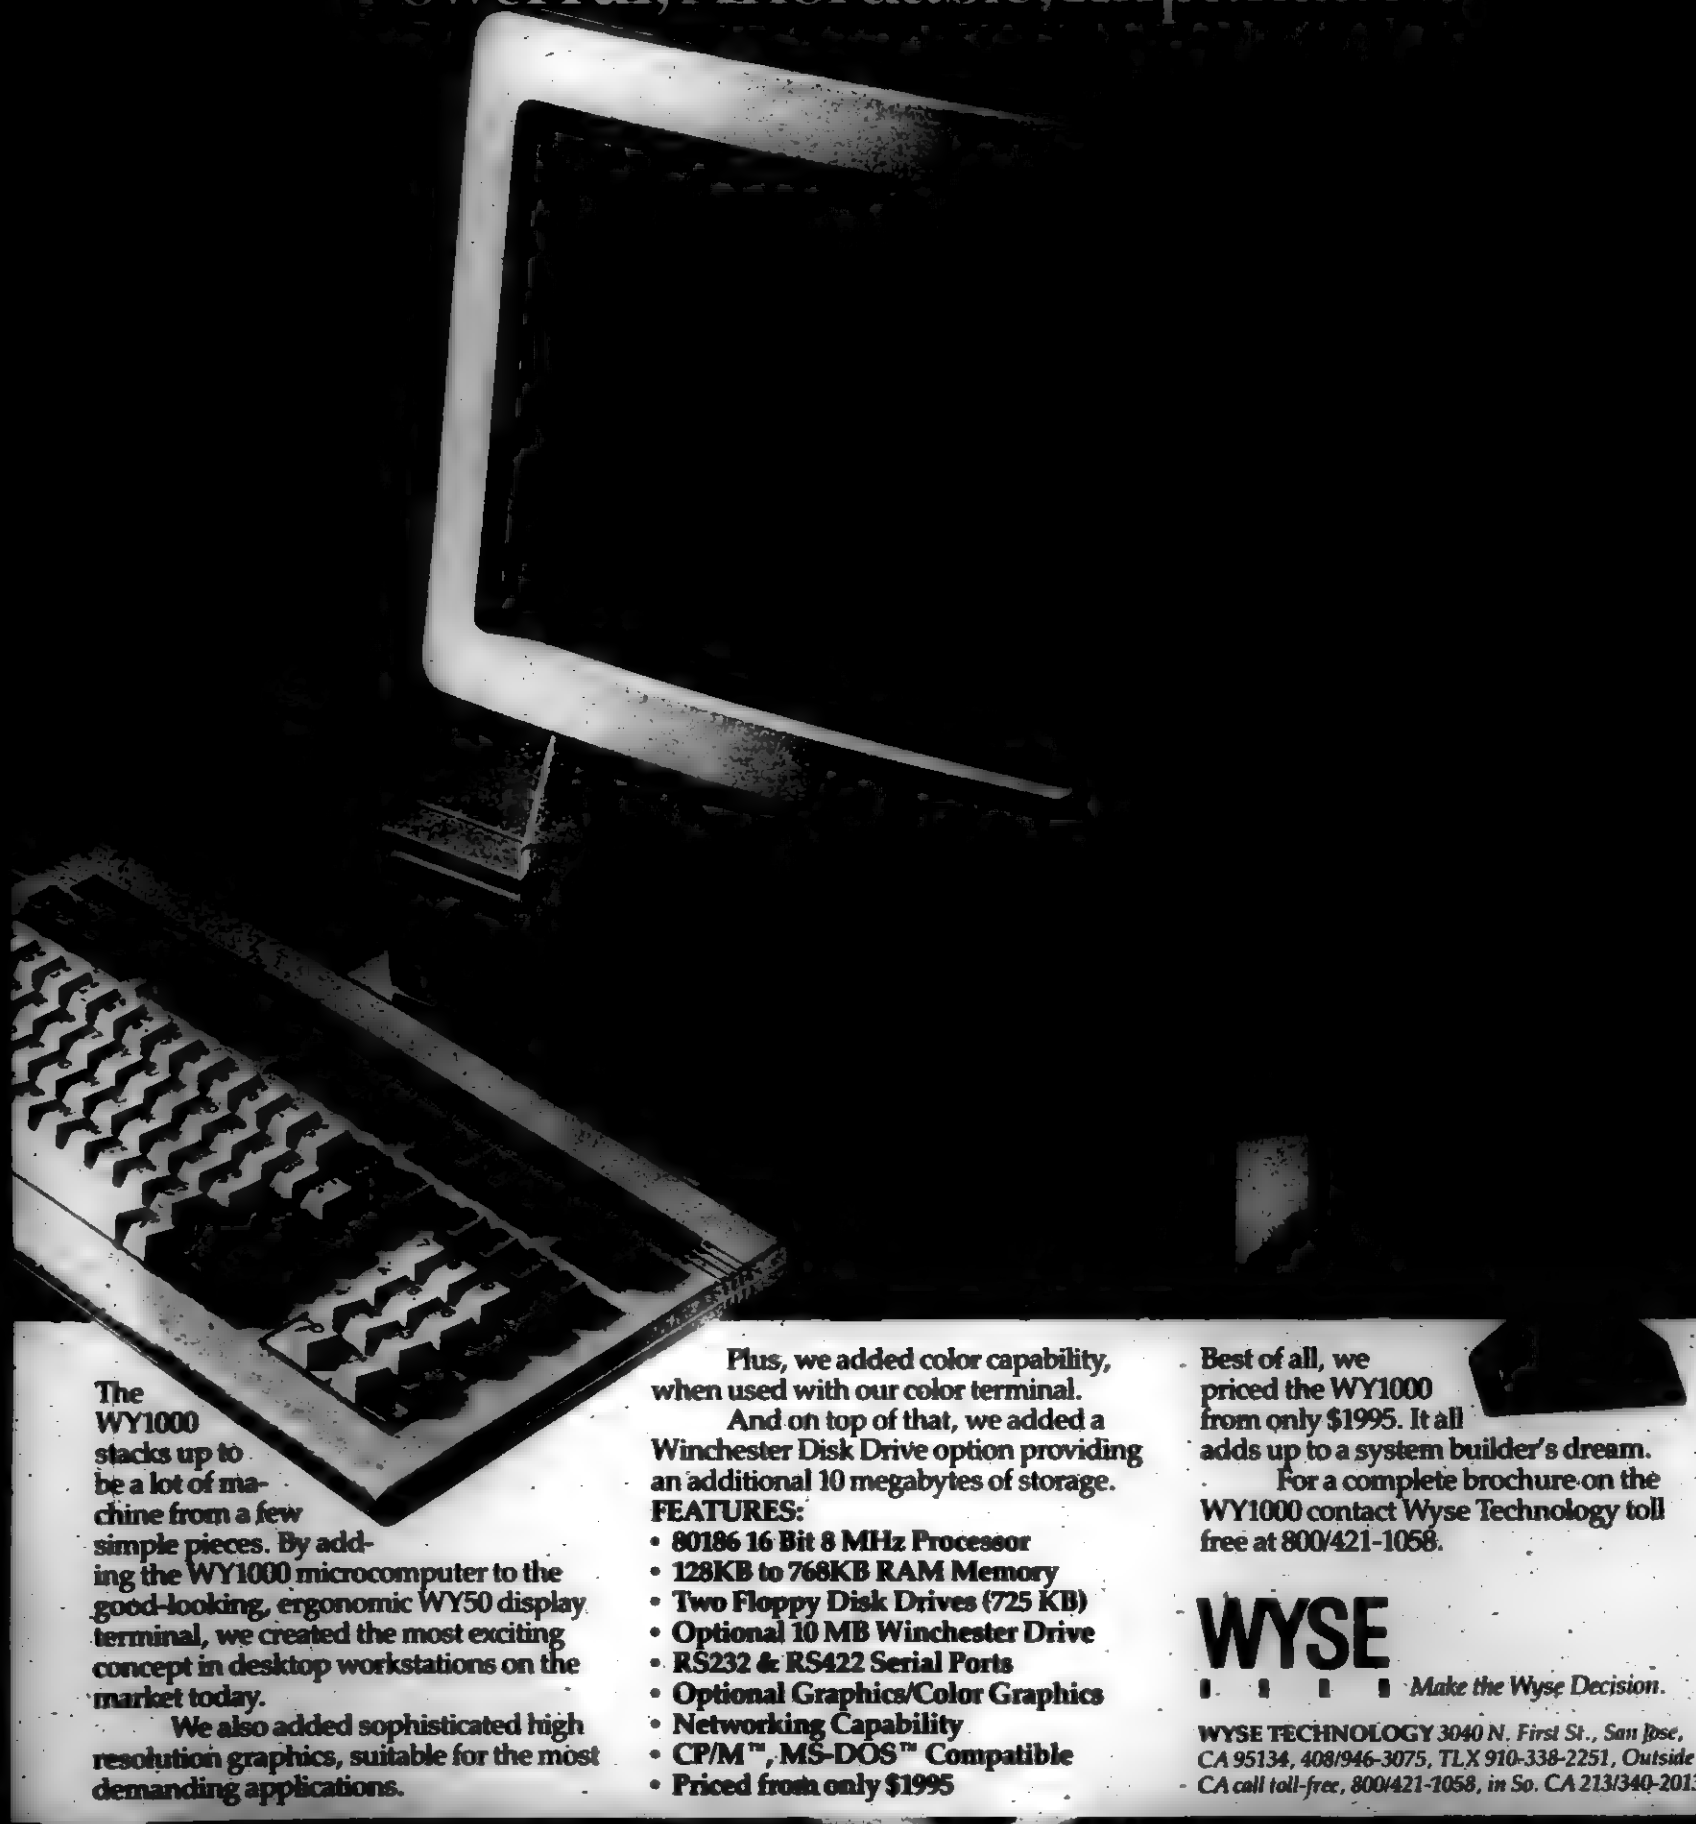
HEWLETT PACKARD

UNIX is a trademark of AT&T Bell Laboratories.

The New WY1000 Microcomputer

BUILDING BLOCKS

Powerful, Affordable, Expandable



The WY1000 stacks up to be a lot of machine from a few simple pieces. By adding the WY1000 microcomputer to the good-looking, ergonomic WY50 display terminal, we created the most exciting concept in desktop workstations on the market today.

We also added sophisticated high resolution graphics, suitable for the most demanding applications.

Plus, we added color capability, when used with our color terminal.

And on top of that, we added a Winchester Disk Drive option providing an additional 10 megabytes of storage.

FEATURES:

- **80186 16 Bit 8 MHz Processor**
- **128KB to 768KB RAM Memory**
- **Two Floppy Disk Drives (725 KB)**
- **Optional 10 MB Winchester Drive**
- **RS232 & RS422 Serial Ports**
- **Optional Graphics/Color Graphics**
- **Networking Capability**
- **CP/M™, MS-DOS™ Compatible**
- **Priced from only $1995**

Best of all, we priced the WY1000 from only $1995. It all adds up to a system builder's dream.

For a complete brochure on the WY1000 contact Wyse Technology toll free at 800/421-1058.

WYSE

Firm tries SAS/OR in R&D conversion project

FIRST USER

By Paul Gillin
CW Staff

HOLLYWOOD BEACH, Fla. — A company that relies heavily on research and development for its competitive edge cannot afford to waste time on projects that may take years to turn a profit.

With that in mind, Ciba-Geigy Corp. recently undertook a project to convert its 10-year-old, Fortran-based R&D planning model running in batch to something that was interactive, easier to modify and maintain and able to produce more flexible output.

In so doing, the company became the first user of SAS Institute, Inc.'s SAS/Operations Research (SAS/OR), a product that uses linear programming and Critical Path Method procedures to schedule activities that make up a project life cycle. Ciba-Geigy already employed most of the SAS product line, and SAS/OR seemed ideal for the application, according to Patricia Hermes of the operations research department in management services.

Interviewed here last week during the SAS Users Group International (Sugi '84) meeting, Hermes said she is using SAS/OR to build a model that will use Critical Path Method to model life cycles and project their profitability. The project won't be completed until later this year, but Hermes said initial indications are that development will proceed smoothly.

The application will be used by a small

Avatar TC3278 gets micro-to-mainframe link ability

HOPKINTON, Mass. — Avatar Technologies, Inc. has enhanced its TC3278 Terminal Converter to provide microcomputer-to-mainframe link capabilities.

The additional software reportedly gives the TC3278 micro-mainframe file transfer capabilities in IBM CMS, TSO and CICS environments using DOS/MV, OS/MVS or VM/370 operating systems. IBM files are accessible to all TC3278 units as a shared data base, providing users with shared data resources through the existing IBM 3270 terminal network without the installation of a local-area network.

The TC3278, which connects coaxially between the terminal and the IBM 3274/76 cluster controller, offers both a nonintrusive line mode, allowing direct connection to the host, and a local mode for file transfer, personal computing and software terminal connection to the host. Connected to the cluster controller, the TC3278 is compatible with IBM Binary Synchronous Communications and Systems Network Architecture/Synchronous Data Link Control environments.

Included are Basic; Microsoft, Inc.'s MS-DOS; Digital Research, Inc.'s CP/M; Micropro International Corp.'s Wordstar; Sorcim Corp.'s Supercalc; and other utilities, the vendor said.

Prices for the file transfer software are a one-time charge of $500 for the IBM host environment and $200 for software for each TC3278 from Avatar, 99 South St., Hopkinton, Mass. 01748.

Steps to take in designing a subject data base

OUTLINE
William H. Inmon

In this second part of a two-part series, William Inmon discusses special steps that must be taken in designing a subject data base for a decision support environment.

Although availability and performance are worthwhile objectives in the decision-support environment, they are not the issues that they are in the operational environment. Instead, the issues in the decision support environment are the consistency of data, the applicability of data and the refinement and replacement of data.

The consistency of data in the subject data base environment becomes an issue because it is common to extract data from subject data bases, refine and analyze the data and then combine the data with other data bases. Then the data may be extracted again, reanalyzed and so forth. After two or three generations of extraction and analysis, the relation of the data to the subject data base begins to be clouded.

This ambiguity can be minimized by extracting data only from the subject data base. Second- and third-generation (and thereafter) extractions are not allowed. They must be directly derived from the subject data base.

Data applicability

Data applicability within subject data bases occurs when a subject data base exists, but is unable to be related to other subject data bases or to be used for more than limited purposes.

As an example, an accounts subject data base exists, but is unable to be

SAS User Feedback Award winner takes activist stance

HOLLYWOOD BEACH, Fla. — Valued user or nitpicker? H. Mark Bercov says he is both. A senior systems analyst at Gulf Canada, Ltd. in Calgary, Alberta, Bercov has probably called SAS Institute, Inc. 100 times in the last year to suggest enhancements or to ask questions about SAS products. Such persistence earned him the SAS User Feedback Award presented recently at the SAS Users Group International (Sugi '84) conference held here recently.

Bercov is responsible for SAS support for the DP department and about 200 users at Gulf Canada. He also codes SAS programs primarily in the engineering and planning section of the department. Bercov's activity as a SAS user emerged in part from a disagreement with company policy. The company uses a variety of software productivity products including SAS; Inseo, Inc.'s Tell-a-graf and Disspla; and Information Builders, Inc.'s Focus product.

"I think we're making a mistake because we're asking users and developers to learn several protocols and conventions," he said. "I think the company should standardize on one product, and my choice is SAS."

As reasons, he cited SAS's "moderately good" graphics and data storage capabilities and "very good" data manipulation and full screen features. He added that SAS is also "relatively bug free, and that's very important to the end user."

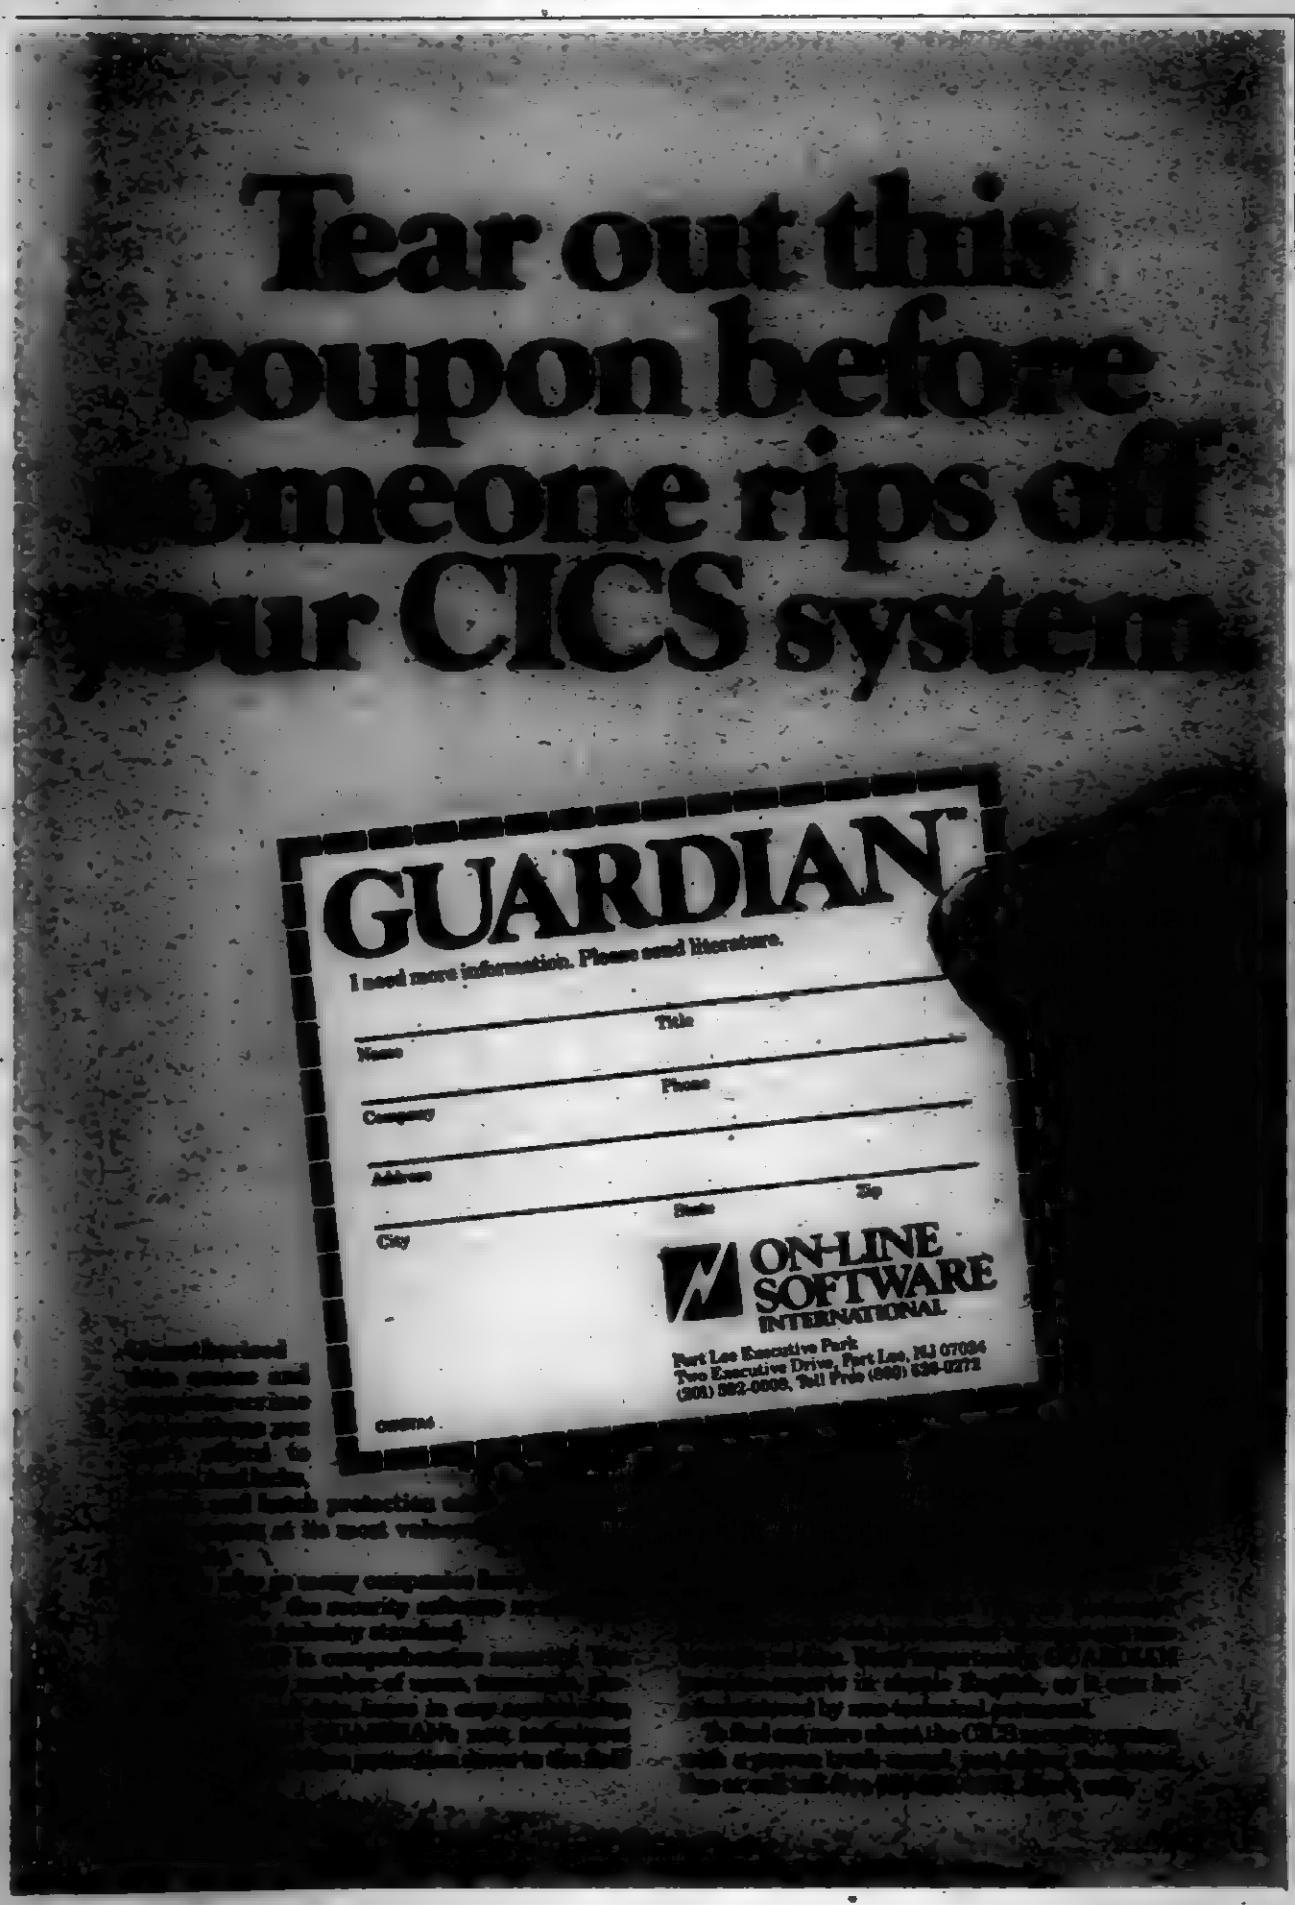
In light of his faith in the product, Bercov commented that "we as users have a responsibility to attempt to communicate what we want done with the product and where it's weak." In that capacity, he acts as a funnel for suggestions from users to the institute. Among the suggestions he submitted in the past year were a request for multiple graphs on a page in SAS/Graph and procedures for saving macro facilities before log off. "I use my judgment, of course," Bercov noted. "Some users have asked for a full inverted list data base in SAS. In general, I don't ask for things that are ridiculous."

'Stubborn perfectionist'

However, Bercov does characterize himself as "a nitpicker, a stubborn perfectionist." In previous jobs, he has been equally active in voicing complaints and suggestions to vendors. Some vendors, like Honeywell, Inc., have been receptive to his comments, while others, like Digital Equipment Corp., have been less responsive. SAS, he said, accepts his frequent calls with a good-natured protest. He added that SAS has implemented more of his suggestions than any other vendor.

But Bercov admitted that he is unusual in his activism. "People responsible for other products in the shop don't feel the same way I do," he said. He wishes more users were as vocal. "You have to have the guts to write a letter or telephone the company," he said. "I'm quite confident they'll receive suggestions very well."

Bercov pointed out that a user can't expect to make enlightened recommendations all the time. "I make a bunch of dumb suggestions, but that doesn't upset me," he said. Asked if he ever worried about becoming a nuisance, he responded, "I don't worry about being a pain. That's SAS' problem, not mine."



©Sperry Corporation, 1982

A sure cure for the problem of information bottleneck.

Programming backlog is the source of the problem. Eliminate it, and you eliminate the bottleneck.

Which is precisely what Sperry has done with the MAPPER™ System.

With MAPPER, you work with the computer directly. You ask questions in plain English. And you get immediate answers.

And if the information you get raises other questions, you can ask them right away. With no delay for programming. Or reprogramming.

MAPPER is that powerful. It allows you to manipulate information in almost any way you want. And, interesting to note, it can even help your programmers become more productive.

AN AFFORDABLE SYSTEM.

You don't have to be a large company to have a MAPPER System. MAPPER can be scaled to the real and present needs of just about any size company. The cost of a MAPPER System makes it practical for even a department within a company to own its own system. Or you can time-share through a Sperry service bureau.

What you get for your money is a whole new order of efficiency in your day-to-day management tasks. Because you'll have the information you need right at your fingertips. Literally.

SEEING IS BELIEVING.

We've made some promises here that may sound extravagant. But if anything, our claims are on the conservative side. And to prove it, we offer you the opportunity to see a demonstration of MAPPER at work.

800-547-8362

But first, you might want to look over our MAPPER brochure. A copy is yours for the asking. Call toll-Free: 800-547-8362 (9 a.m. to 5 p.m. E.S.T.). Or send us the coupon.

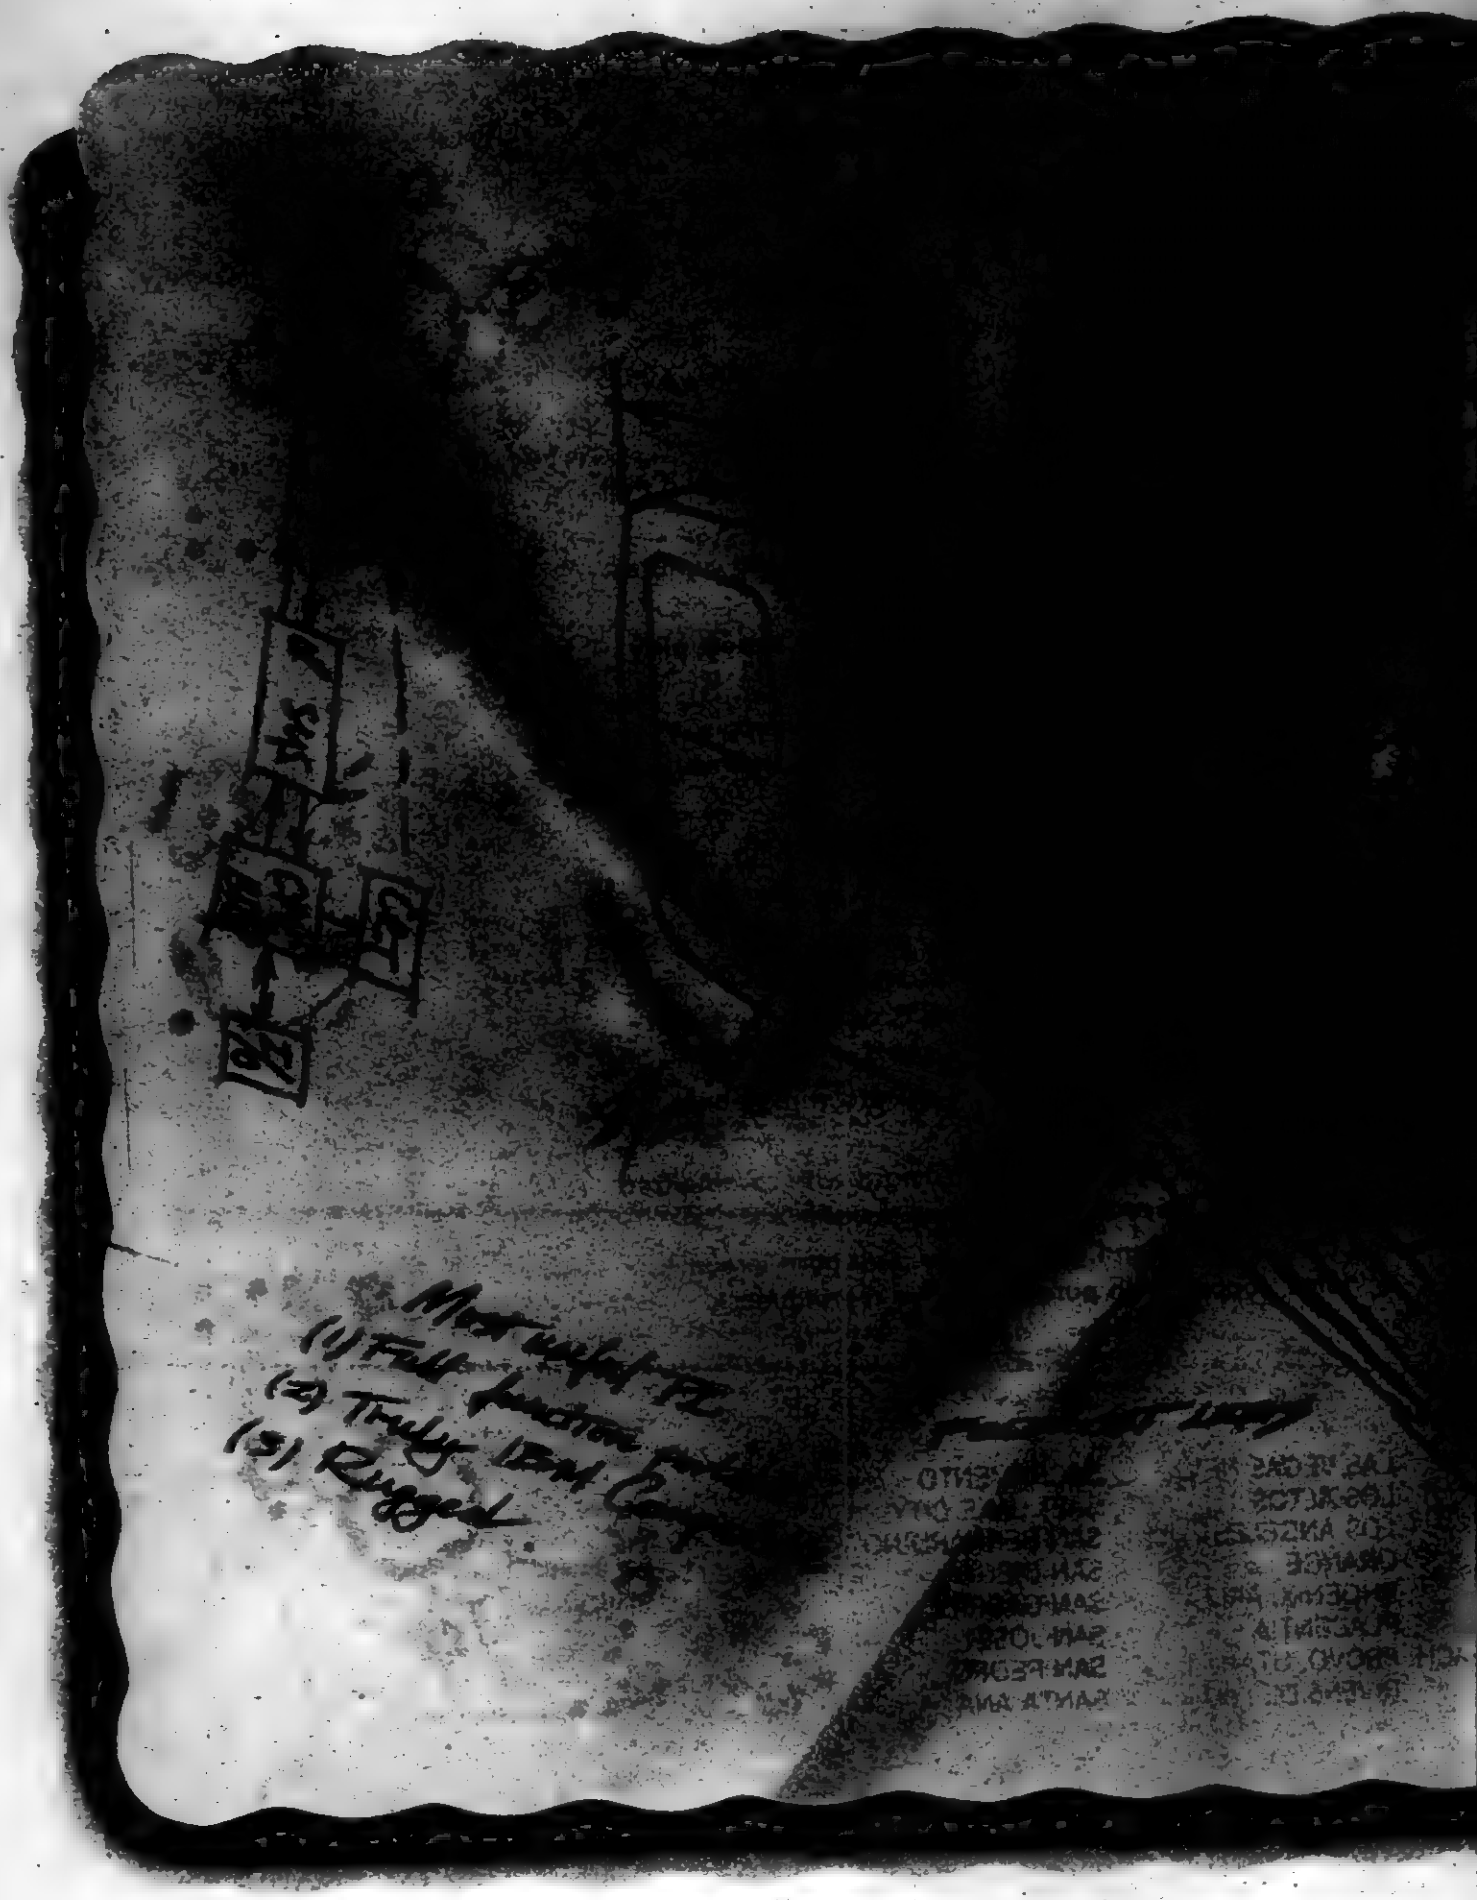
SPERRY



A picture worth $111,000,000.

Not long ago, three businessmen met in a coffee shop to talk about an idea for a new personal computer. They made a rough design on the back of a place mat.

A lot of companies were already making personal computers, but they thought theirs just might work better.

The next year, they sold $111 million worth of their new computers, the COMPAQ® Portable and the COMPAQ PLUS™. No company in America had ever grown that fast. Why?

Simply because they offer, in a rugged, portable package, more capability than most other PC's. They're truly IBM®-compatible, so all the most productive software runs as is. They display high-resolution text *and* graphics on the same screen. And they grow. Expansion slots take IBM-compatible boards, and a kit converts the COMPAQ Portable into the COMPAQ PLUS with its integrated ten-megabyte disk drive.

How does the future look? We look at it this way: If we came this far on the back of a place mat, just think of what we can do now.

For the location of your nearest Authorized Dealer, call 1-800-231-0900.

©1984 COMPAQ Computer Corporation. COMPAQ® is a Registered Trademark and COMPAQ PLUS™ is a Trademark of COMPAQ Computer Corporation. IBM® is a Registered Trademark of International Business Machines Corporation.

COMPAQ®

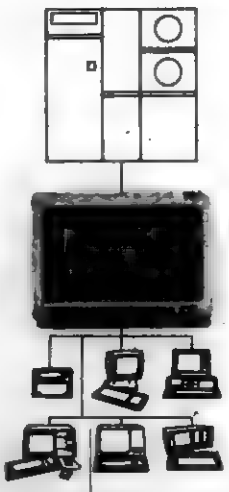
It simply works better.

EVERYONE WHO WANTS TO USE THE COMPANY MAINFRAME RAISE YOUR HAND.

Introducing power to the people.

Better known as the Data Pipeline™ from Intel.

It's based on our iDIS™ Database Information System. A powerful, integrated package of hardware and software with multi-user capability built right in. And now, through iDIS, just about any pc or terminal can easily share data with just about any mainframe.



Our Data Pipeline™ allows practically any pc to share data with practically any mainframe.

With the iDIS Pipeline, you'll be able to establish and manage your pc-to-mainframe connections in a way never before possible. Yet you'll still be able to offer department users a fair degree of independence. Since iDIS comes with all the software they need. Starting with the Xenix® operating system, built around a relational DBMS. Plus the Multiplan® spreadsheet, word processing, electronic mail, and a forms/menu development tool.

The iDIS Pipeline is powerful, too. Each one will handle 5 full-time users, or between 12 and 15 on dial-up. And you can even network with other iDIS systems. But you're always in control. You decide which data are accessible, and extract only those to your iDIS system. Users then access their data sets from iDIS's hard disk.

Actually, using the iDIS Pipeline is a lot like giving users their own little mainframe.

Which is a lot better than giving them yours.

It's also a lot cheaper.

Less than half the cost of a direct pc-to-mainframe connection.

It's also fully supported and serviced from one responsive source. Us. Best of all, it's available now.

For more information about how our iDIS Data Pipeline can help you manage the revolution in your office, call us at 800-538-1876; in California, 800-672-1833. Or write Intel, Lit. Dept. H-18, 3065 Bowers Ave., Santa Clara, CA 95051.

Of course, if you're undecided about what to do you can always ask for a show of hands…

intel

** According to the Gartner Group, who took the time to figure out all the hidden costs, each direct pc-to-mainframe connection costs approximately $22,000. Xenix® and Multiplan are trademarks of Microsoft Corporation. © 1986 Intel Corporation.

SOFTWARE & SERVICES

Tandem, MIS Information Systems sign market pact

CUPERTINO, Calif. — Tandem Computers, Inc. and Santa Clara, Calif.-based MIS Information Systems, Inc. have announced an agreement to market jointly the MIS Batch software system.

Under the terms of the agreement, a Tandem spokeswoman said, MIS Information Systems will license MIS Batch directly to Tandem Non Stop supermini/computer users and will provide support and service for the system.

MIS Batch reportedly schedules and manages the execution of batch-oriented programs on Non Stop systems.

The software is said to operate in a fault-tolerant mode to ensure reliable execution of tasks on a single Non Stop processor or across networks of Non Stop systems. MIS Batch reportedly also allows users to display the status of all batch jobs in process, and it provides a complete log of activities.

The package is also said to share system resources with on-line transaction processing applications as required.

MIS Batch is compatible with existing applications that run under Tandem Non Stop system software products, the spokeswoman said. MIS Batch licenses for $18,600 for the first system and $9,300 for each additional system.

More information is available from Tandem Computers, 19333 Vallco Pkwy., Cupertino, Calif. 95014.

SYSTEMS SOFTWARE

COMPUTER ASSOCIATES INTERNATIONAL, INC.
CA-Jasper/JA Release 2.1

Computer Associates International, Inc. has introduced an enhanced version of its performance evaluation software that reportedly includes more than 100 new reports on system activity, utilization and performance for IBM OS/MVS installations.

CA-Jasper/JA Release 2.1 features more than 130 reports covering computer performance and utilization, the vendor said. In addition, 27 trend graphs are provided on a monthly basis for planning purposes. The graphs give an historical view of the past year and an automatic projection for the next six months for areas such as work load turnaround time, idle time, paging rate and TSO usage.

Regular monthly reports include system summary graphs, typical job profiles, significant changes, TSO summaries, printer forms usage, job class summaries, disk utilization graphs, tape utilization graphs, system trends and production summary graphs.

A three-year lease for CA-Jasper/JA Release 2.1 is priced at $17,000.

Computer Associates International, 125 Jericho Tnpk., Jericho, N.Y. 11753.

AUTOVATIVE COMPUTER EXTENSIONS, INC.
Graphics printing support

Autovative Computer Extensions, Inc. has announced the addition of IBM 3287 graphics printer support to its ACX-PM Printer Manager for IBM's VM/SP operating system.

Users of SAS Institute, Inc.'s SAS/Graph Release 79.6 or higher and IBM's Graphical Data Display Manager can spool and manage graphics output as well as text output through the added graphics printing support, a vendor spokesman said. According to the vendor, users can set and alter spool file characteristics and purge, forward space and back space print files.

ACX-PM Printer Manager requires VM/SP Release 2 or higher. Its first-year license fee is $5,000.

Autovative Computer Extensions, Suite B, 5120 Belmont Road, Downers Grove, Ill. 60515.

COMPUTRONICS, INC.
Enhancements to AMLC Status

Computronics, Inc. has announced an enhanced version of its AMLC Status software for Prime Computer, Inc. superminicomputer systems.

The enhanced version reportedly features a command that summarizes the current configuration of each Prime asynchronous multiline controller (AMLC) line on the system.

The enhanced software reportedly also includes the capability to display system idle time for any user. The software involves a change to the Prime operating system, Primos. Source code for the change is provided with the order, a vendor spokesman said.

Prices for AMLC Status start at $250, the vendor said.

Computronics, 130 N. Ash, Wood Dale, Ill. 60191.

DATASTREAM COMMUNICATIONS, INC.
Software options

Datastream Communications, Inc. has announced four software options for its 874 Systems Network Architecture (SNA) controller for remote IBM 3270 network operations.

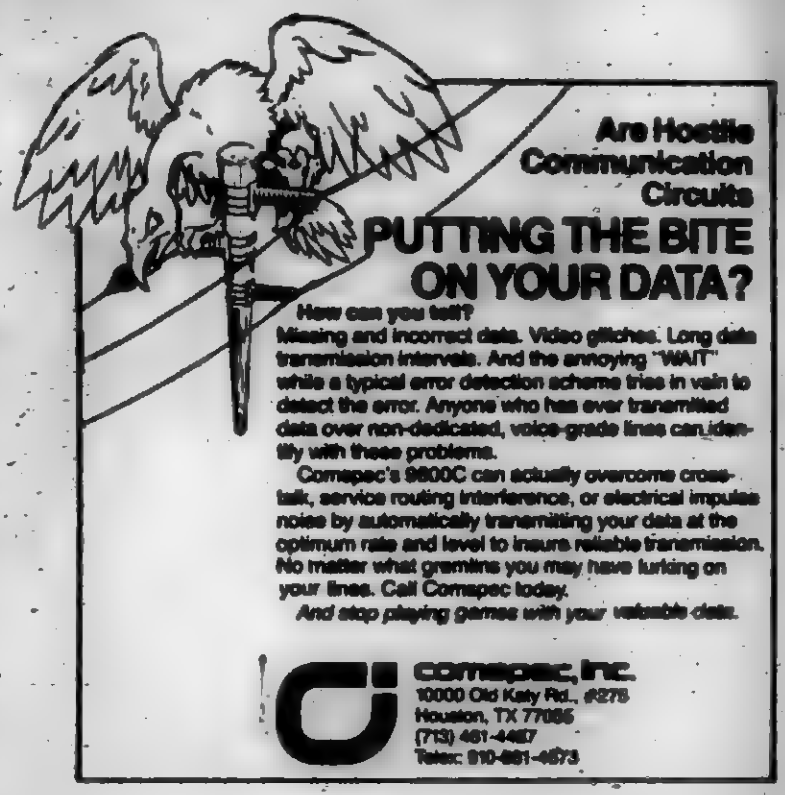
The options, which reportedly widen the scope of 3270 access and user integration, include CRT Attached Printer Support (Caps), which allows a serial printer attached to a CRT or personal computer to access the IBM host computer via a single connection to the Datastream controller.

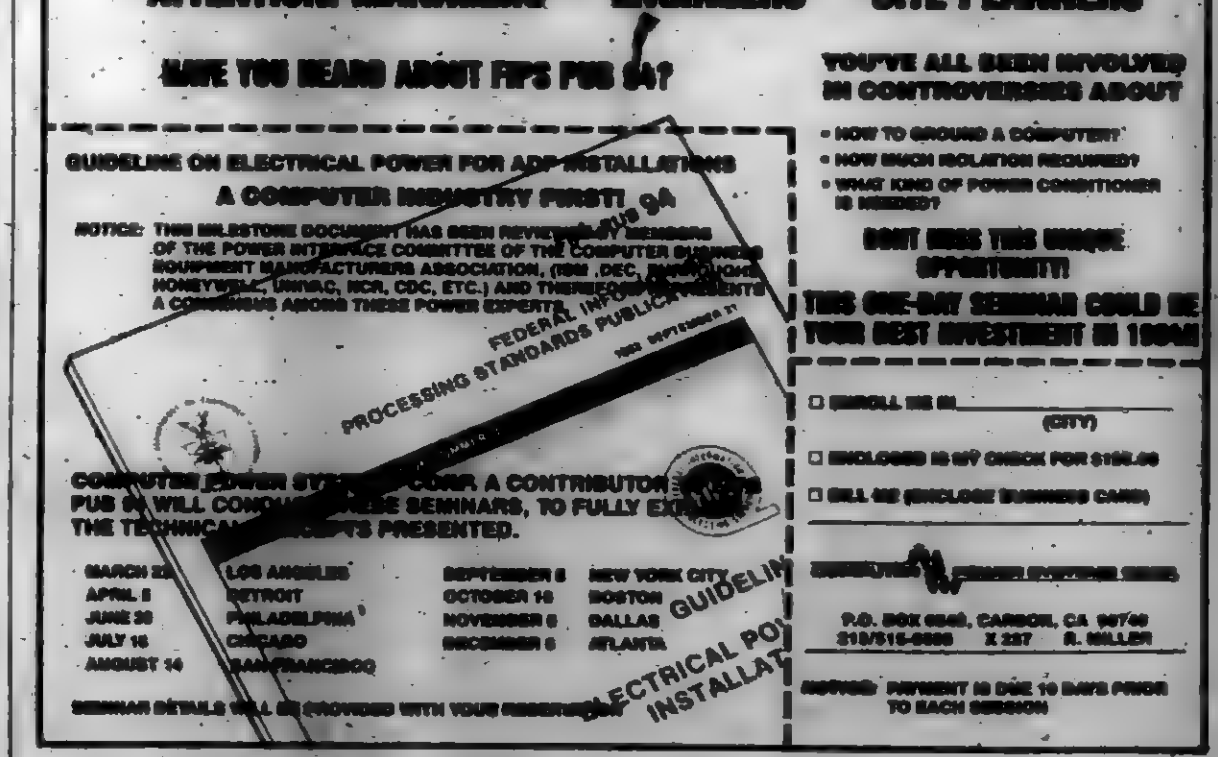
Another option, the Multiple Session feature, reportedly allows a terminal user to maintain two or more sessions with the host from the same terminal. A graphics option allows selected Ascii-compatible terminals, including Datastream's Display Stations, to perform graphics processing on a host running SAS Institute, Inc.'s SAS/Graph package.

A Keyboard Printer feature allows interactive access to 3270 applications with the application-oriented keyboard printers frequently used in time-sharing or remote locations, according to the vendor.

The options are $100 each per system.

Continued on page 66





SOFTWARE & SERVICES

Continued from page 45

tem. System pricing will vary depending on the base system's number of ports and system memory expansion required for multiple sessions and caps, the vendor said.

Datastream Communications, 2520 Mission College Blvd., Santa Clara, Calif. 95050.

PRODUCTIVITY AIDS

ADVANCED TECHNOLOGY INTERNATIONAL, INC.
Super PDL

Advanced Technology International, Inc. has introduced a software design program for use with Digital Equipment Corp. VAX-11 superminis under the VMS operating system.

Super PDL features a structured design language, design analysis facilities and full documentation capabilities, according to a vendor spokesman. The menu-driven software is said to include a full screen structured editor to create, update and modify module definitions and descriptions and abstract data type definitions.

The software reportedly can be used simultaneously by designers working on discrete parts of the same project. Design analysis is provided by a consistency processor that alerts the user to possible design inconsistencies, the spokesman said.

Super PDL is priced at $15,000.

Advanced Technology International, 350 Fifth Ave., New York, N.Y. 10018.

APPLICATION PACKAGES

SOFT PRO SYSTEMS, INC.
Fixed asset package

Soft Pro Systems, Inc. has announced the fixed asset package for users of Wang Laboratories, Inc.'s VS systems.

The system was designed to allow the Wang VS computer to assist in asset management. It provides for information for asset acquisitions, transfers, retirements and adjustments; protects the annual depreciation expenses for the life of the asset, uses the actual depreciation method or a simulated depreciation method; and produces a summary report showing the current depreciation of all assets before reporting to the Internal Revenue Service. A second report produces a facsimile of the IRS Form 4562 (depreciation and amortization). Several versions of each report may be produced.

The system is priced at $2,000, the vendor said.

Soft Pro Systems, 4121 MacDonald Ave., Richmond, Calif. 94805.

DATAPLOTTING SERVICES, INC.
D-Pict/Meta

Dataplotting Services, Inc. has introduced a utility program called D-Pict/Meta, which is said to aid graphics composition.

The program is said to allow several charts or graphs to be positioned at one time in a display that can be transferred to paper, overhead transparency film or 35mm slides. D-Pict/Meta reportedly allows graphics components to be shifted, scaled, rotated and windowed in any order so that users may experiment with designs.

D-Pict/Meta is available for three groups of computers, all at prices effective April 1. It is available for the Prime Computer, Inc. Model 9950 and Data General Corp. Eclipse MV/10000 at $3,500. It is available for the Digital Equipment Corp. VAX-11/750 and VAX-11/780, Prime Models 450 through 850 and the DG Eclipse MV/8000 at $2,500. It is also available for DEC's VAX-11/725 and VAX-11/730, Prime's Model 2250 and DG's Eclipse MV/4000 for $1,500.

Dataplotting Services, 235

SOFTWARE & SERVICES

Duncan Mill Road, Don Mills, Ont., Canada M3B 3K9.

EXECUTIVE TECHNOLOGY DATA SYSTEMS, INC.
Payroll system

Executive Technology Data Systems, Inc. (ETDS) has announced a payroll system for the IBM System/34 and System/36 that reportedly offers custom-designed checks, multicompany and multistate processing, multiple pay rates per employee and job cost and departmental allocations.

According to the vendor, the system integrates with either the ETDS general ledger system or its accounting system. It can be used for multiple payroll cycles, and payroll reimbursement can be included with the payroll check.

The system runs under IBM's SSP operating system.

The payroll system is priced at $2,900.

ETDS, Suite 108, 26104 Orchard Lake Road, Farmington Hills, Mich. 48018.

STRATUS COMPUTER, INC.
MCBA software

Stratus Computer, Inc. has announced the availability of a set of accounting application packages for its Stratus/32 continuous processing superminicomputer system.

Manufactured by MCBA, Inc., the MCBA accounting package consists of five programs. The central application is general ledger, which can be used in conjunction with the accounts receivable, accounts payable and payroll applications. The package also includes order entry and billing, which interfaces with the accounts receivable application.

A permanent license for each program is priced at $8,000.

Stratus Computer, 17 Strathmore Road, Natick, Mass. 01760.

DATATREND, INC.
Datacalc Version 3

Datatrend, Inc. has announced Datacalc Version 3, an electronic spreadsheet for use with Digital Equipment Corp.'s Datasystems.

Datacalc Version 3's features include columns and rows that can be sorted in ascending or descending order or moved to new locations; an automatic consolidation feature that allows for consolidation of several spreadsheets into one; on-line Help capabilities; and a "find and replace" capability, the vendor said.

New function and display formats include hidden columns, negatives in parentheses and blank on zero. Other new functions include table lookup, weighted average and loan payment calculation.

Datacalc Version 3 is priced at $495 for DEC's RT-11 operating system and $1,795 for the VAX/VMS operating system.

Datatrend, 395 Ironwood Drive, Salt Lake City, Utah 84115.

DIGITAL EQUIPMENT CORP.
Advanced Legal Software

Digital Equipment Corp. has announced that a law practice management application package is now available for its Decmate II business computer.

Advanced Legal Software is said to enable lawyers to perform time and billing, trust accounting, financial reporting and calendar and docket control. The package is targeted to offices containing up to 20 staff attorneys, a vendor spokesman said.

BIM-EDIT vs. IBM ICCF:

Higher productivity is the better deal.

When you compare program editor capabilities, there's no comparison between BIM-EDIT and ICCF. BIM-EDIT has more than 25 features that ICCF can't match. Time-saving, productive features like:

- fast, automatic recovery after CICS failure
- much less virtual and real storage required
- library backup without interrupting on-line users
- concurrent library member addition and deletion from batch and on-line
- immediate logoff from any point, including mid-edit session
- logon returns immediately to logoff point and status
- log session maintained per user of commands and responses
- line block group commands — copy, move, delete (cc-cc, mm-mm, dd-dd)
- easy switching between concurrent edit and display sessions
- access to all system commands from any screen or session
- high-speed, highly functional, POWER spool queue access
- spool access, edit, other session types, all use same scrolling commands
- multiple commands for one or multiple sessions may be entered at any time regardless of session type or position
- may end an edit session without permanently effecting the member
- hierarchical library directory structure
- edit lines up to 256 characters wide
- support for 3270 models 2, 3, 4, and 5
- dynamic adjustment of screen size support
- exit routines
- member name length up to 32 characters
- access control by sub-library, member, or access type
- Help screens
- implied objects of commands (uses last referenced member name)
- library directory always in alphabetical order

Compare the features. Compare the price ($4000 purchase, $2000 yearly, or $800 monthly). You'll agree, the higher productivity of BIM-EDIT is the better deal.

BIM has more than a dozen other VOS/VSE system software products, also performs systems programming consulting, and provides computer time services on a 4331-2 system.

Decision support offered based on SAS software

FIRST LOOK

HOLLYWOOD BEACH, Fla. — Four decision support products based on SAS Institute, Inc.'s SAS software were unveiled by Info Tech at the recent SAS Users Group International Conference.

Among the four is DS/QL, a query and retrieval language similar to IBM's SQL that is said to combine SQL-like relational features with SAS manipulation capabilities. Features of the nonprocedural language, Info Tech said, include English-like queries using SELECT ... FROM ... WHERE expressions; retrieval of data using both the SQL and SAS languages; unlimited nesting of queries; improved data access; display statements; and compatibility with Info Tech's Decision Support/Data Base Facility (DS/DB) SAS data base enhancement, also announced last week.

Any combination of SAS steps and procedures may be used with any combination of DS/QL queries and display statements, according to an Info Tech spokesman. The product costs $4,500 for a first-year license, with an annual renewal fee of $900.

Manipulating big data bases

According to Info Tech, DS/DB is appropriate for manipulating multirelation data bases that are too large for SAS to handle. DS/DB provides direct-access facilities for SAS data sets and, when compared with similar SAS facilities, reduces disk I/Os and CPU time required to retrieve observations on large-scale SAS data sets, the spokesman claimed.

The product's SAS Data Set Cluster is a collection of three SAS data sets that define the target data set and the key variables used to subset the data. The Proc DB Build statement is an SAS procedure to create data set clusters. The Proc DB Search is an SAS procedure to select observations from an SAS data set cluster using random-access techniques and query optimization.

DS/DB is priced at $6,000 for the first year, with an annual renewal fee of $1,200.

The third product announced last week, DS/GEN, is a set of interactive system definition, generation and evolution tools for the development, installation and maintenance of decision support applications.

DS/GEN can be used to define data bases using a data dictionary; create an interface for the data collection phase; organize information from the data dictionary to create data bases; create design and analysis documentation; load, update and maintain the decision support system (DSS) data base; and prototype with automatic restructuring of the DSS data base during migration or enhancement. It costs $7,500 for the first year, $1,500 for an annual renewal.

The final product, Decision Support Dialog Manager (DS/DM), is a menu-driven system that allows a nontechnical user to perform functions of data management and analysis and system management using full screen IBM Interactive System Productivity Facility panels. The user does not have to learn operating system or terminal commands, IBM JCL or SAS programs, the spokesman claimed.

The product is available for $9,500 for the first year and $1,800 for each subsequent year. Package prices are also available for combinations of the products from Info Tech, which can be reached through P.O. Box 14545, Gainesville, Fla. 32604.

SAS/OR from page 39

group of R&D scientists in Ciba-Geigy's agricultural products division. Each user will be prompted by the system to build a data base of estimated completion times and cost variables for different parts of a project.

The program will rely upon statistical capabilities within SAS to relate the elements of the data base and come up with an orderly flow of events through the life cycle. In order to model a proposed project, the R&D scientist answers a series of screen prompts interactively, filling in about 150 variable components that go into making up that project's life cycle. All screens are being built using SAS' Full Screen Product, Hermes said.

The output will be in the form of a Critical Path Method schedule showing the start and stop dates for the project and the completion times for each component. The planning model will also produce a set of financial figures showing the effect of different cost and pricing variables on project profitability. The financial routines will probably be written in either SAS' new FS Calc spreadsheet product, Execucom, Inc.'s Interactive Financial Planning System or in standard SAS code, Hermes said.

Because the application is on-line, variables can be changed and the model rerun to test the effect of different scenarios, much like a "what-if" financial model.

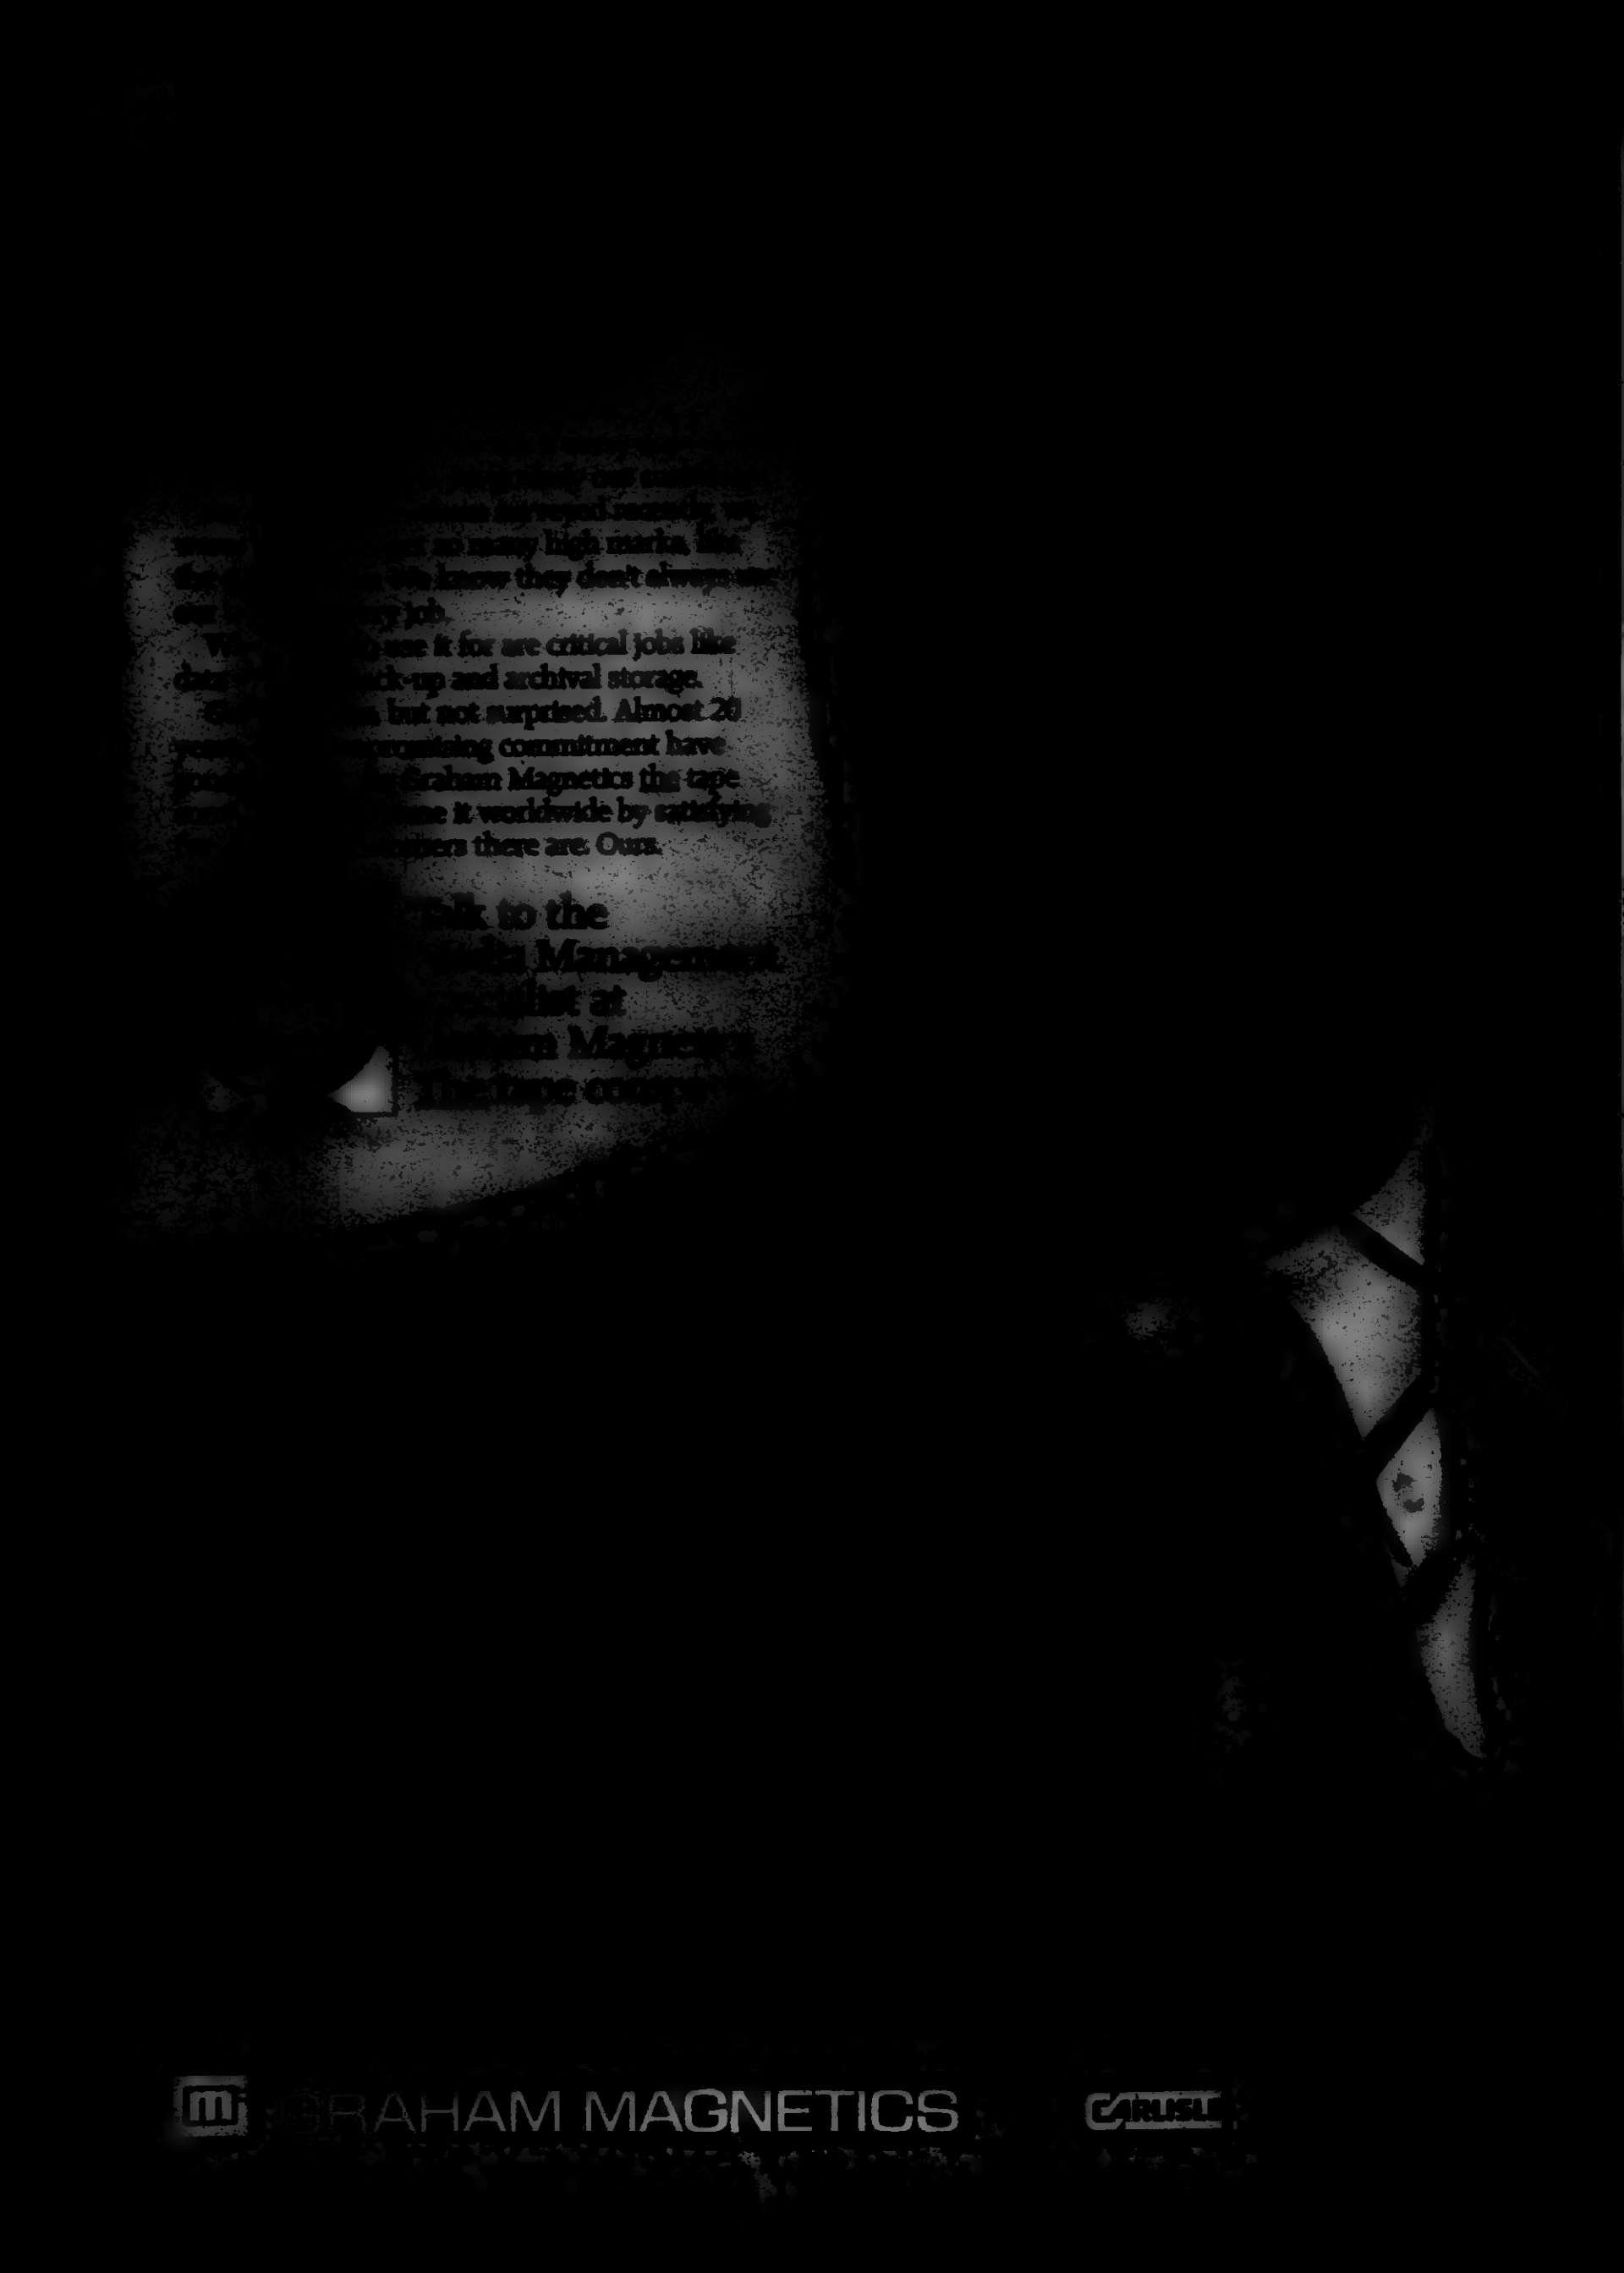
The application will even run a series of models based upon a set of costing figures chosen at random and clustered around the cost estimates. "The basic question it answers is, 'Is this the best way to spend our money?' " Hermes said. "It tells — before the project starts — if the investment is worth it."

Hermes said she recommended SAS/OR for the project largely because of its compatibility with the entire SAS line. In addition, the product is "very easy to use," she said. "I wrote a basic [Critical Path Method] routine in about two hours.

"Every new SAS product follows the old rules," Hermes noted. "Also, your output is in the form of an SAS data set, which you can then manipulate to your satisfaction. In most cases, the user isn't happy with a canned data set."

The product also uses a command structure similar to other SAS products and allows SAS routines to be embedded in SAS/OR code.

SYSTEMS FOR DP MANAGEMENT



GRAHAM MAGNETICS
CARLISLE

SOFTWARE & SERVICES

Continued from page 67

The software, manufactured by Advanced Legal Software, Inc., features password protection, five types of fee categories, multiple billing rates and both monthly and deferred billing arrangements.

The software is available now for $2,195.

DEC, 146 Main St., Maynard, Mass. 01754.

SPSS, INC.; MCMASTER UNIVERSITY
SPSS-X Information Analysis System

SPSS, Inc. and McMaster University of Hamilton, Ontario, have introduced versions of the SPSS-X Information Analysis System software for the Hewlett-Packard Co. HP 9000 microcomputer and the SCSS Conversational System software for the HP 3000 superminicomputer.

SPSS-X contains file handling and reporting facilities and includes more than 40 statistical procedures to organize, summarize and display data, according to a vendor spokeswoman.

SPSS-X on the HP 9000 reportedly accommodates nested or hierarchical files such as those found on the U.S. Bureau of the Census data tapes, enabling users to use census data for applications in marketing research or demographic analysis, the spokeswoman said.

A first-year commercial license for SPSS-X costs $6,000, according to the spokeswoman, with annual renewals available for a price of $4,500.

SCSS, a conversational and interactive version of SPSS-X, is an integrated, stand-alone system for data analysis and information management. It is said to feature a number of statistical capabilities, such as univariate statistics, cross-tabulations, t-tests, scatter plots, correlations and factor analysis.

SCSS for the HP 3000 is priced at $6,000 for a first-year license and $4,000 each year for renewals.

SPSS, 444 N. Michigan Ave., Chicago, Ill. 60611.

TRAINING

ETA INTERNATIONAL
Video education courses

ETA International has announced a video education course covering the joint use of Cullinet Software, Inc.'s IDMS data base management system and IBM's CICS teleprocessing monitor in application programming and execution.

The course is comprised of five video sessions, including video graphics, examples, narrative text and reinforcing exercises. Among the areas covered in the course are the IDMS/CICS problem program environment, terminology, program coding and compilation techniques.

The course costs $3,500.

The vendor also introduced a second video course that addresses the systems design, programming and run-time of applications using Cullinet's Applications Control Facility. The course is priced at $4,000.

ETA International, 7 Wells Ave., Newton, Mass. 02159.

DATA from page 39

related to a marketing data base. It is easy to say that the data modeler should have recognized the relationship and should have designed the relationship into the system from the outset, but not all relationships are cost-effective to maintain.

The modeler may well have recognized the relationship, but the occurrence in which the relationship is used is so obscure that creating and maintaining the relationship is not cost-effective. Therefore, data may well exist in a subject data base that is unable to be applied to other subject data bases.

The final issue of subject data bases is refinement and replacement of data.

Oftentimes, subject data bases are accessed and data stripped off.

The data that is stripped is then analyzed separately, perhaps by reordering or resummarizing.

The result is a refinement of the data that is useful to at least one user.

While this refinement is a worthwhile activity and represents a new and valid view of the data, there are several problems.

Several problems

It is very difficult to make the refinement available to other users. For example, a user extracts data from the mainframe environment into the personal computer environment.

There the extracted data is refined and analyzed and produces meaningful results for the user. The problem is: How does the user make the refined data available to other users?

Replacing it in the subject data base is not an answer in most cases, because the refined data now represents a different view of the data. Creating a new data base is not the answer because the new data base most likely is redundant with the subject data base.

So, there is no easy answer for the issues of refinement and replacement.

Careful implementation

While subject data bases unquestionably are a worthwhile objective in the integration of systems, they must be carefully implemented.

If the result of the modeling effort that produced the subject data bases is not extended into the realm of tangible data bases, then there is no purpose in modeling systems.

The implementation of subject data bases is especially relevant to the on-line and decision support environments.

Centralization of data, implemented improperly, hinders on-line performance and availability.

Centralization of data must be carefully implemented to achieve data consistency, data applicability and data refinement.

Inmon, a director at Coopers & Lybrand in Denver, is a noted author on the subject of data base design and a regular contributor to Software.

CAN YOU HELP US FIND THIS HEWLETT-PACKARD EQUIPMENT?

We want to buy the following Hewlett-Packard equipment, new or used, and have exhausted known sources:

HP 3480D *Digital Voltmeter, preferably with Options 001 and 004.*

HP 3484A *Multifunction unit, preferably with Options 041, 042, and 043.*

HP 5321B-K21 *Digital clock.*

HP 5327B *Timer/Counter/DVM, preferably with Options H31, 004, and 011.*

HP 10542A *Remote programming interface cable.*

If you have any or all of this equipment which we might buy, please call:
R. A. Arens, (314) 925-5983.
Or write:
R. A. Arens, Dept. S411, Building 98,
McDonnell Douglas Astronautics Company, Box 516, St. Louis, MO 63166.

MCDONNELL DOUGLAS

DEC TO IBM SNA

Now available...full SNA capability for your DEC computer! Comboard/SNA gives your terminals access to IBM interactive applications. Data can be transfered between systems transparently, all in the complete fully supported package, from Software Results.

Comboard/SNA is a proven and reliable, single-board, 256KB communications computer that plugs into your DEC Unibus. Teamed with Comboard software, the system is a cost-effective solution to troublesome SNA communications problems.

Comboard/SNA allows your DEC to emulate an IBM PU Type 2 communications node. You have a full gateway into your SNA without the trouble of passing through a secondary network.

For further information, fill in the coupon below or call Software Results... the leader in DEC to IBM communications.

OUR PRODUCTS COME STANDARD EQUIPMENT:

You're involved in deciding who handles your company's communication and information management needs.

And you're hearing a lot of talk about information processing. Communications networking. Systems management. And the like.

But you don't hear enough about good old-fashioned service. Which is a critical omission.

At AT&T Information Systems, we know that it takes first-rate professional service for your system to do what it's supposed to do. Which is to help you and your people make the right decisions at the right time.

Service is our most important product.

Our Account Executives aren't just trained in our business—they're trained in yours.

They'll work as your partners. Determining your needs. Developing a plan to help you meet them. Making sure that everything they recommend will help your company run even better than it's running now.

Our Technical Consultants will work closely with the Account Executive to design and implement a system that's right for your company.

And our Systems Technicians will not only take care of maintenance and repair, they'll work with the Technical Consultants—helping you change and expand your system when the time comes.

A century of service.

After more than 100 years of serving our customers, AT&T has developed the most

WITH THE FOLLOWING

experienced and professional service staff in the business.

No matter where you're located, we'll be there to work with you, with more service centers than anyone else.

The fact is, we have more trained service specialists than some of our competitors have total employees. And this service—before, during, and after the sale—is as much a part of what we offer as our products.

A full line of products.

We have a complete line of products and systems that can be custom-fit to your company. Everything from a dependable small-business phone system to the most sophisticated, fully integrated communication and information management system in the industry.

In short, AT&T has all the equipment your company needs to make the right decisions. As well as a commitment to service that's second to none.

If you'd like to know more about how AT&T Information Systems can serve your company, call 1-800-247-7000.

WHEN YOU'VE GOT TO BE RIGHT.

AT&T releases interface option

AT&T Information Systems, Inc. recently proposed a private branch exchange (PBX)/computer interface that is significant in its design similarities with international standards efforts, but that presently lacks the support of other switch manufacturers needed to make it important for here-and-now problems.

Much of that support has already been pledged to the Computer-to-PBX Interface (CPI) developed last year by Northern Telecom, Inc. and Digital Equipment Corp. and proposed as a standard to the Electronic Industry Association.

The two proposals, which are incompatible, specify the type of control signaling and data formats used to connect a PBX to a computer via the domestic telephony standard 1.54M bit/sec trunk interface.

As the first effort to standardize the interface, the Northern Telecom/DEC duo gained a lot of early support, including the endorsement of Rolm Corp., Mitel, Inc. and Intecom, Inc. and commitment from Wang Laboratories, Inc., Data General Corp. and Prime Computer, Inc. Northern Telecom claimed that 50 CPI licenses have been granted so far.

But now that AT&T has released specifications for its Digital Multiplexed Interface (DMI), some computer vendors seem more than willing to hedge all bets by endorsing both proposals, as Wang and DG have done.

See AT&T page 58

Bank contracts Rolm hardware

To replace existing systems in over 700 branches

By John Dix
CW Staff

SANTA CLARA, Calif. — In evidence of the fact that data handling capabilities still play second fiddle to vanilla-voice capabilities for private branch exchanges (PBX), a large bank here said that it has no immediate plans to switch data with the new systems it is installing.

Rolm Corp. announced last week a major contract with Bank of America National Trust and Savings Association to replace existing communications systems in more than 700 branch locations and regional centers in California.

The deal, valued at $15-$19 million, calls for Rolm to install switching equipment — its own PBXs and some key systems procured by Rolm from outside sources — in each of the bank's locations to replace existing Centrex services and a few small Northern Telecom, Inc. switches. So equipped, each location will then be tied into the bank's statewide Electronic Tandem Network.

James J. Sobczak, Bank of America's vice-president of telecommunications services, said that roughly half of the bank locations would install key systems while the other half would be putting in Rolm CBXs, including Rolm's recently introduced CBX-II.

He estimated that, on the average, the key system installations would support up to 20 users, and the CBX-II sites would have 80-100 lines. All told, the entire system will reportedly support 25,000 telephones.

Interestingly, Sobczak said that the bank has no immediate plans to use the PBXs in the new system to switch data, although he doesn't preclude that the need may materialize. Instead, voice management considerations have led to the decision to install the switching hardware.

See PBX page 58

Lemcom device targets small SNA users

Supports remote 3270s without 3705, 3725

PHOENIX — Lemcom Systems, Inc. recently introduced a device that enables smaller users of IBM Systems Network Architecture (SNA) who don't have a 3705 or 3725 communications processor to support remote 3270s.

The Virtual Local Controller (VLC) reportedly supports all features of both dial-in and dedicated Synchronous Data Link Control 3270s by making them appear to a host system as local SNA 3270s.

Teleprocessing software is therefore not required. Remote SNA 3270s are configured as if they were connected to an IBM 3705 with a network control program. Application programs require no modification and run under standard Vtam, the vendor reported.

Line speeds up to 56K bit/sec are supported by the device, which is said to be modular for ease of maintenance. The VLC provides internal diagnostics, an on-line tracing capability and a dial-up connection to a service center permitting remote configuration, system diagnosis and software updating.

Prices start at $15,973 and vary depending upon configuration.

Lemcom Systems is located at 2104 W. Peoria Ave., Phoenix, Ariz. 85029.

Local-Area Networks/56

Speaker outlines key factors for selecting local-area nets

By Phil Hirsch
CW Washington Bureau

LAS VEGAS — Two key considerations in selecting a local-area network are determining whether the application can tolerate transmission delay and deciding how much and how variable the delay can be.

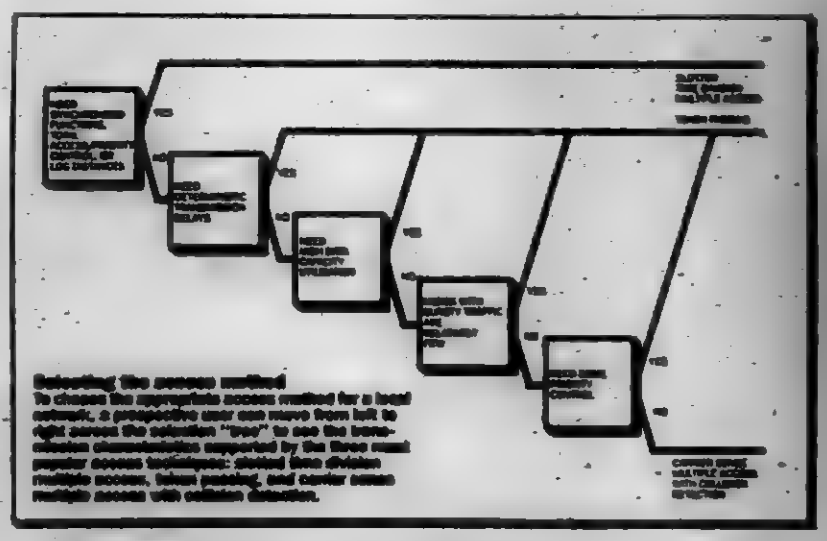
So said Howard Frank, consultant and president of network designer Contel Information Systems, Inc., who spoke at the recent Interface '84 conference here.

Frank explained that if no delay is allowable, a dedicated channel scheme employing frequency, time or space division access is a likely option. If some delay can be accepted, but it cannot vary — often the case in synchronous data transmission — a polled access scheme like token passing would be more suitable. Where delay can be variable, contention-based systems such as carrier-sense multiple access might be employed.

The final choice of access method depends on a number of other considerations, Frank said. For example, dedicated channels are wasteful if the traffic is bursty and the terminal population is large. Polling schemes encourage high throughput by preventing message collisions, but as the number of users grows, the time and expense of managing the access allocation process also grow.

Contention-based systems sidestep this management problem, and schemes for minimizing interference among contending terminals are available. But if the network serves many terminals and contention is frequent, throughput can be reduced drastically, Frank said.

Frank presented a diagram (see figure) showing the main factors to consider in choosing among dedicated, polled and contention-based access schemes. A second diagram (see page 56) showed that the choice of transmission medium — twisted pair, baseband or broadband coaxial cable — depends mainly on distance, the desired bit rate and the amount of voice and video in the traffic mix.



Selecting the access method
To choose the appropriate access method for a local network, a prospective user can move from left to right across the selection "tree" to see the transmission characteristics supported by the three most popular access techniques: slotted time division multiple access, token passing, and carrier sense multiple access with collision detection.

One of Frank's major points was that because transmission media, access methods and topologies are well defined, the two biggest problems with local-area networks are internetwork management and managing communications between remote terminals and host-resident communications control or application software.

Because "standards" in this area are proprietary, Frank explained, incompatibility will tend to persist as a problem.

Another complication Frank noted is that the interface connecting a terminal to the local-area network bus, ring or loop may contain all, some or none of the logic needed to implement internetwork and terminal-host protocols. Thus, the user cannot determine just by comparing prices whether a particular interface — usually referred to as a bus interface unit or

See NETWORK page 56

YOU CAN ADD A SECOND IBM® 3270 PERIPHERAL IN MINUTES.

Now you can take any existing coaxial cable in use with a single controller and DOUBLE the cable's capacity immediately. Every cable that is installed can now drive two devices. That's right, TWO peripherals running over ONE cable. We call it the "Coaxial Doubler™".
One Doubler connects two ports of the controller to the shared cable. The other Doubler connects the shared cable to two peripherals.

A real breakthrough! The Coaxial Doubler, our littlest multiplexer, requires no external power connections and comes with a five year warranty. Installation time? Five minutes.
We're so sure you'll like the Doubler that on an introductory basis we'll send you a $490 Doubler pair on a no risk, 30 day, trial.

VOICE/DATA COMMUNICATIONS

T-BAR, INC.
Wideband VSM

T-Bar, Inc. has announced the Wideband Virtual Switch Matrix (VSM) data communications switch, which supports the 256K-bit data rate line cards of IBM's 3725 front-end processor. The Wideband VSM supports digital data rates up to 300K bit/sec.

The matrix switch allows up to 128 attached terminals or devices to be connected simultaneously to 128 data communications equipment ports in any configuration.

The switch is said to be compatible with CCITT V.35, AT&T's Dataphone Digital Service and X.21 as an option.

The modularity of the switch will reportedly allow switch expansion even when on-line. A typical 32 by 32 switch is priced at $56,000.

T-Bar, 141 Danbury Road, P.O. Box T, Wilton, Conn. 06897.

PROTOCOL CONVERTERS

LOCAL DATA, INC.
Versalynx/3278

Local Data, Inc. has introduced a protocol converter that allows IBM 3178 and 3278 displays to emulate a variety of Ascii terminals.

The Versalynx/3278 provides the synchronous IBM terminals with an interface to RS-232C asynchronous ports in addition to their normal coaxial cable connection to an IBM controller.

IBM display users can switch between the IBM control unit and an external Ascii system, access dial-up computer services using autodial modems and access IBM control units on a dial-up basis using conventional facilities or through a voice/data private branch exchange. The price is $695.

Local Data, 2701 Toledo St., Torrance, Calif. 90503

MULTIPLEXERS/MODEMS

MICROCOM, INC.
8X/1200

Microcom, Inc. has announced the 8X/1200, a 1,200 bit/sec error-correcting modem. The modem reportedly enables communication between dissimilar devices that use the Microcom Networking Protocol.

The modem operates at both 300 and 1,200 bit/sec. Attached devices may operate at user-selectable speeds different from that of the modem. An autodial/autoanswer feature stores up to nine telephone numbers, a company spokesman said.

A stand-alone model is priced at $800.

Microcom, 1400A Providence Highway, Norwood, Ma. 02062.

LOCAL-AREA NETWORKS

METAPATH, INC.
Robin

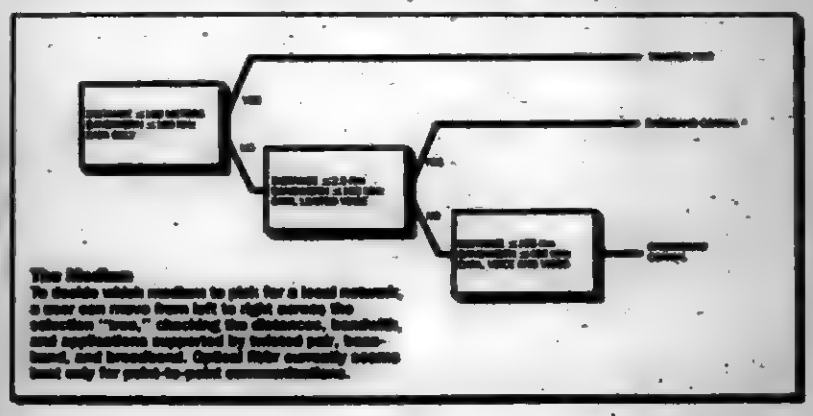
Metapath, Inc. has introduced the Robin, a microprocessor-controlled desktop data switch which it claims permits any RS-232 device to communicate with any other RS-232 device.

The product can reportedly link dissimilar personal and mainframe computers, terminals and peripherals in a local-area network while eliminating centralized controllers, switches and print servers.

Up to 225 switches can be installed on one coaxial cable with 900 serial ports and 225 parallel ports. A bridging feature allows multiple Robin networks to be connected over any distance.

The signaling rate is 2M bit/sec with a maximum aggregate user data rate of 1.8M bit/sec. Single quantity price is $1,950, according to a spokesman for the vendor.

Metapath, 73 Lincoln Centre Drive, Foster City, Calif. 94404.



The Medium
To decide which medium to pick for a local network, a user can move from left to right across the selection "tree," checking the distances, bandwidth, and applications supported by twisted pair, baseband, and broadband. Optical fiber currently seems best only for point-to-point communications.

NETWORK from page 85

media access unit — is a good buy, Frank said.

To avoid the pitfalls, he advised users to define their requirements before choosing their local-area network. He also said the user should assume that whichever local-area network he acquires will have to be modified, both initially and over time.

The technical capability of the supplier is, therefore, important, particularly where adequate in-house support is not available.

Announcing the birth of the *Personal* Information Center™— a new concept in intelligent data access for your company's end users. And you're invited to a FREE, half-day Seminar to learn all about this innovative *first* from Informatics.

At this free Seminar you'll see how the *Personal* Information Center can help you:

- Manage and control the confusing proliferation of hardware and software in your Information Center.
- Integrate your Information Center with today's mainstream DP and IBM® Personal Computer tools.

But that's only the beginning. At the Seminar there will be a lively discussion of such vital Information Center issues as...

- Selecting appropriate hardware and software for your users' needs.
- Offering immediate versus deferred processing.
- Using production data bases or duplicating files.
- Balancing unlimited data access with system security concerns.

The Seminar will also address the entire issue of the micro-mainframe connection, and many more topics of immediate interest to data professionals like you.

Plus, we will introduce Informatics up-to-the-minute solutions to your Information Center needs, including reporting and inquiry systems and micro-mainframe integration tools.

The *free* Personal Information Center Seminar is being offered in or near your city. But attendance is limited. So, mail the coupon or call toll free today to reserve your place at this valuable *free Seminar.*

Pre-register for the *free* Personal Information Center Seminar and get a free bonus. We'll send you a reprint of the *Computerworld* article, "The Micro/Mainframe Link," by Merritt Lutz.

Mail this coupon or call toll free...

PBX from page 85

Rolm reports that the configuration will be optimized to take advantage of least-cost routing, the process by which the switch selects the least costly manner of switching each call, for example via a Wats or private line.

Additionally, a charge-back system will be implemented whereby "call-costing data will be used to allocate expenses to cost centers," Rolm reported.

The company also said that it has "committed to establish a data base solely for Bank of America that will be used by both Rolm and the bank for ongoing system service and project management."

A centralized "trouble-shooting" center will be formed to receive and process self-diagnostic data from each bank, Rolm said.

AT&T from page 85

It remains to be seen if the PBX manufacturers that have pledged support to CPI will follow suit, and only time will tell which camp the rest of the industry will fall in behind.

If AT&T Information Systems is not able to sway the support of other important PBX manufacturers or at least entreat them to support both interfaces, its efforts will be crimped. This is because AT&T Information Systems' interface only works with the company's digital PBX, the Dimension System 85, of which only a few hundred have been installed.

On the other hand, Henry Thelossen, Northern Telecom's director of product line management, estimated that the universe for the CPI interface — which includes the installed base of switches from Northern Telecom, Rolm, Mitel and Intecom — is 20,000 sites.

But industry support seems to be CPI's single strongest suit, and the industry is just beginning to study the new AT&T Information Systems interface. Dick Moley, Rolm vice-president of marketing, reported that Rolm is now evaluating DMI and said that when the decision to support CPI was made, it was the only game in town.

If, upon study, Rolm and the other PBX manufacturers find appealing in DMI what Hewlett-Packard Co. did, those pledged to CPI might start singing a different tune.

HP, once a CPI supporter, has changed its allegiance to AT&T Information Systems because of design similarities between DMI and international standards efforts. Bob Coackley, section manager for telenetworks at HP, said that CPI was previously supported because it was the only thing going at the time.

As outlined by Coackley and others, Northern Telecom/DEC's CPI proposal subdivides a 1.54M bit/sec channel into 24 56K bit/sec channels. Each of these channels has in-band signaling, which is achieved by using the least important bit in every byte to carry for signal information. This reduces the usable byte size to seven bits and limits channel speeds to 56K bit/sec.

Common channel

AT&T Information Systems' DMI, on the other hand, uses a common channel signaling technique, whereby signal information from each of 23 individual channels is multiplexed into a single 24th channel.

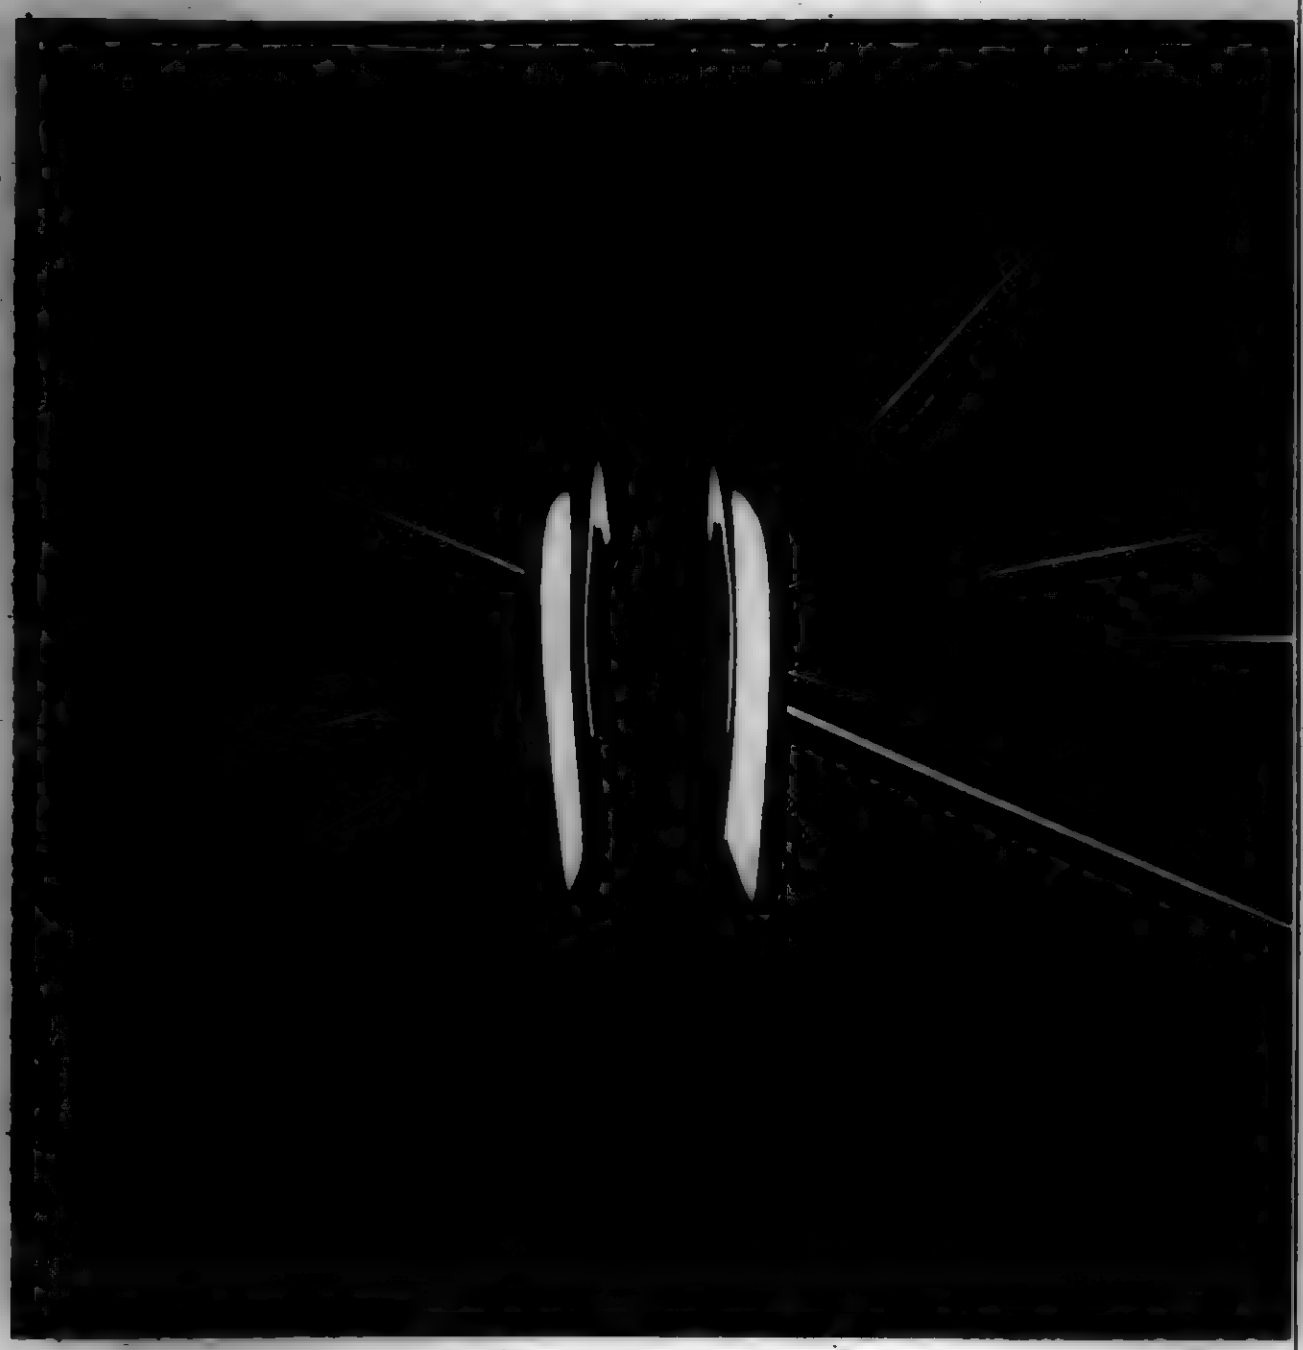
This is important for two reasons: It enables the use of eight-bit bytes and channel speeds of 64K bit/sec; and, according to Jim Day, director of systems engineering at AT&T Information Systems laboratories, it makes the interface look "virtually the same as a [PBX DS1] trunk interface."

Common channel signaling is probably most important because it is the approach being studied by the ITT Consultant Committee for use as an interface standard in the Integrated Services Digital Networks (ISDN) effort.

That part of ISDN that specifies a PBX/computer interface standard is expected by most to be established within two years.

"CPI does not give us a logical stepping stone to ISDN," Coackley said. "DMI does."

This makes HP's interface design efforts somewhat "future-proof," he continued. "We won't have to discard interfaces as we move to ISDN."



When we thread the needle, communication costs less.

The 3M Videodata® Broadband System carries thousands of messages on a single cable. It's an information utility that's cutting communication costs for 250 companies worldwide.

One cable is threaded through a factory or any spreadout institution. Up to 10,000 information sources can be connected. Computers, word processors, TV monitors and more can handle data simultaneously and never interfere with each other.

Our system can cut installation and expansion costs in half compared with the cost of routing and re-routing conventional two-wire hookups.

Hearing the needs of the information age has helped 3M pioneer over 600 products for the voice, video and data communication field. We make everything from computer diskettes to high-speed translators that put computer data on microfilm.

And it all began by listening.

3M hears you...

SYSTEMS & PERIPHERALS

IBM unveils CRT versions

RYE BROOK, N.Y. — IBM has announced two prepackaged versions of its 3279 color and 3280 monochrome CRT terminals, which are said to offer users the ability to adapt the units to various keyboard configurations.

Called the 3179 and 3180, the units are said to occupy 30% less space, are 35% lighter and use 20% to 50% less power than earlier 3270 series terminals. In addition, the units come with what IBM said are the most frequently ordered options on 3278 and 3279 terminals.

Among these is a modifiable keyboard with layouts that can be defined by the user. This, IBM said, can be useful for users in organizations that have varied keyboard requirements, such as airline scheduling or inventory control applications. The feature allows users to customize one basic unit instead of placing orders for special keyboard arrangements.

A spokesman said the 3179 and 3180 can be used in place of most of the 3270 line. The 3270 series terminals will still be offered, however.

Using a 3274 or 3276 control unit, the 3179 color monitor can be used with the 8100 distributed processing system. It can also be attached to any IBM mainframe designed to operate under 370-era systems software. Examples of such systems include the 4300 line and the 3080 series of processors, IBM said.

The 3180 uses a 15-in. screen and comes in two models. The Model 1 can be used in the same environment as the 3179. The Model 2 can be attached directly or through a 5294 remote-control unit to IBM's smaller System/38 and System/36 processors, the firm said.

The 3179, which uses a 14-in. screen, and the 3180 Model 1 cost $2,295. The 3180 Model 2 costs $2,195. Shipments of the 3179 began this month. Deliveries of the 3180 Model 1 will begin in May, and the 3180 Model 2 will be available in June.

IBM announced the terminals through its Information Systems Group, located at 900 King St., Rye Brook, N.Y. 10573.

HP plotter touts automatic paper feed

PALO ALTO, Calif. — Hewlett-Packard Co. has announced what it reports is the first graphics plotter with automatic cut-sheet paper feed and a measurement-plotting instrument for laboratory graphics.

Designed to allow business, engineering, science and manufacturing users to produce up to 99 copies of multicolor charts, the HP 7550A is an 11- by 17-in. plotter featuring 31½ in./sec plot speed and 6g acceleration.

According to the company, the plotter includes a replot feature that draws up to 99 copies of an original graph without rerunning the program.

It can reportedly be used as a source of hard-copy graphics in the computer room, for viewing sections of larger plots in computer-aided design and manufacturing, in engineering and science laboratories, as a peripheral in business applications and in production for generating unattended plots for automatic test systems and for process control.

The 6g acceleration reportedly can cut plotting time in half, compared with the standard 2g rate. The plotter features an LCD and front-panel function keys that replace the hard-switch settings used on other plotters.

It allows use of fiber-tip, roller-ball and liquid-ink pens in eight-pen carousels and use of 20 international character sets in two fonts.

The unit features an addressable resolution of .025mm and a mechanical resolution of .006mm and uses a single serial

See PLOTTER page 64

Burroughs airs configurations for its B1900

DETROIT — Burroughs Corp. has introduced two packaged models of its B1900 series of small business systems, called the B1900 Business Partner (B1900-BP) and the B1900 CMS.

The B1900-BP is a single-processor configuration that includes the necessary hardware and systems software to form an applications development system. Included in the package is Burroughs' logic and information network compiler. The packaged system, including a B1965 CPU, 1M byte of main memory, a microprocessor-controlled I/O subsystem, a Burroughs ET100 terminal, a 650 line/min printer and a 130M-byte disk drive, costs $122,000, Burroughs said.

The B1900 CMS configuration features object code compatibility with applications developed on other Burroughs systems using the firm's CMS operating system, including the B80, B90, B800 and B1900.

The basic configuration of the B1900 CMS includes a 6-MHz central processor with 8K bytes of cache memory. A minimum main memory configuration of 512K bytes, which is expandable to 2M bytes, is offered.

Also included is a 130M-byte, removable-pack disk drive, an I/O subsystem controller, a communications processor, dual-line adapter, terminal and line printer. The base configuration costs $70,000, the vendor said.

The latest two models are also said to incorporate features not available on the original B1900, announced last October. Among these are an integrated diagnostic subsystem called Burroughs On-Line Test and a remote-access capability.

Burroughs made the announcement at its corporate headquarters, which is located in Burroughs Place, Detroit, Mich. 48232.

Japanese sparking supercomputer competition with U.S.

By James Connolly
CW Staff

Much has been said about the government-sponsored efforts by the Japanese to develop a new generation of computer systems set to equal or surpass the capabilities of those offered by U.S. manufacturers. Most of the Japanese development efforts have been centered on two general fronts: supercomputers and artificial intelligence processing systems.

HITACHI

Now in the third year of a 10-year development project, the Japanese have been able to show concrete results to their research. Three of the leading Japanese computer makers have announced supercomputers which appear to compete with Cray Research, Inc., Control Data Corp.'s spin-off ETA Systems, Inc. and Denelcor, Inc. — all leading U.S. manufacturers.

Details of the Japanese supercomputers are still fuzzy. But industry watchers report that in recent months, the first supercomputers produced by Hitachi Ltd. and Fujitsu Ltd. have been installed at test sites. A third Japanese manufacturer, Nippon Electric Corp. (NEC), expects to deliver its first supercomputer in early 1985.

NEC

The Japanese companies have promoted their high-end machines as providing optimum performance levels ranging from 500M floating-point operations per second (Flops) to 1.3G Flops, significantly faster than the 100M- to 800M-Flops performance range claimed by the U.S. manufacturers. While the U.S. supercomputer makers have vowed to develop a 1G-Flops processor by 1987, some researchers are skeptical that the Japanese processors can achieve their performance claims. And few researchers have had the opportunity to run benchmarks on the Japanese systems.

One of the big differences between the Japanese supercomputer vendors and the U.S. manufacturers is that the three Japanese firms are offering machines which are still basically experimental. The three major U.S. manufacturers all have installed systems. Long-time supercomputer maker Cray Research has installed nearly 70 processors since 1976. CDC claims it has installed 22 processors, and Denelcor has installed six.

FUJITSU

Benchmarks run on the Fujitsu VP-200 and VP-100 and the Hitachi S-810/20 showed the three machines generally exceeding the performance of the fastest American-built machines, the Cray XMP and the CDC Cyber 205, according to consultant Dr. Sydney Fernbach of the San Jose, Calif., area. Fernbach based his opinion on benchmarks recently run by supercomputer experts from the Lawrence Livermore Laboratory in Livermore, Calif., and the U.S. Navy Postgraduate School in Monterey, Calif.

In the Livermore Laboratory benchmark, a Cray XMP single processor performed at 53M Flops, while the VP-100 was rated at 80M Flops and the VP-200 at 131M Flops, Fernbach reported.

In the Navy Postgraduate School's benchmarks, the Fujitsu machines ran "a little faster than the Cray," Fernbach said.

Announced in 1982, the VP-100 has been installed at the University of Nagoya and is being installed at the University of Kyoto. The higher performance VP-200 apparently hasn't been installed outside of Fujitsu facilities, Fernbach observed.

Hitachi's S-810/20 at the University of Tokyo became operational in December, he said.

He added that less is known about the Hitachi machines, other than the fact that the S-810/20 did

TURNKEY SYSTEMS

ELECTRONIC REALTY ASSOCIATES, INC.
ERA Command

Electronic Realty Associates, Inc. (ERA) has announced a professional real estate management computer system that reportedly combines word processing, financial spreadsheet and a real estate brokerage management system with multiuser and remote capabilities.

ERA Command is built around a Control Data Corp. CPU, which features the Intel Corp. 8086 16-bit microprocessor. Standard memory is 512K bytes, expandable to 1M byte. All memory has byte parity error detection, ERA said, and a proprietary memory management system allows separate control of each 4K-byte block of memory.

A variety of peripherals may be used with the system, including double-density, 5¼-in. floppy disk drives, hard disk drives and magnetic tape. The operating system is Microsoft, Inc.'s Xenix.

Software provided in the basic ERA Command system includes Microsoft's Multiplan financial spreadsheet, which provides financial management, a 63-col., 255-row accounting system and some forecasting capabilities; the Altos Computer Systems, Inc. Horizon word processing system, which includes a 40,000-word spelling checker and mail/merge capabilities; and the ERA Real Estate Blueprint for Success real estate management program.

Blueprint tracks listings and runs mortgage qualifying data for prospects, calculates individual and average days on market, analyzes salability of individual and overall listings, tracks individual and overall agent performance, handles office projections and analyzes short- and long-term trends.

Basic ERA Command hardware includes CDC's CPU, terminal and keyboard, 727-40 daisywheel printer, cables and starter kit. Optional equipment includes a tractor feed for printers, additional terminals, printers, tape drive and modems.

The cost of the basic ERA Command system is $10,500; lease arrangements are also available.

Electronic Realty Associates, 4900 College Blvd., P.O. Box 2974, Shawnee Mission, Kan. 66201.

SUMMAGRAPHICS CORP.
Enhancements to Icon

Summagraphics Corp. has announced it has enhanced its Icon Series computer-aided design (CAD) system to incorporate the use of color-raster graphics. The Icon Series reportedly is for use in printed-circuit board, architectural, engineering and construction design.

Icon Series software is said to permit users to preview, create, edit, store and recall graphics at a workstation. The Icon Series workstations are said to be self-contained and to incorporate an integral digitizer with menus and two tilt-and-swivel monitors.

The Icon Series CAD system is available for the Data General Corp.

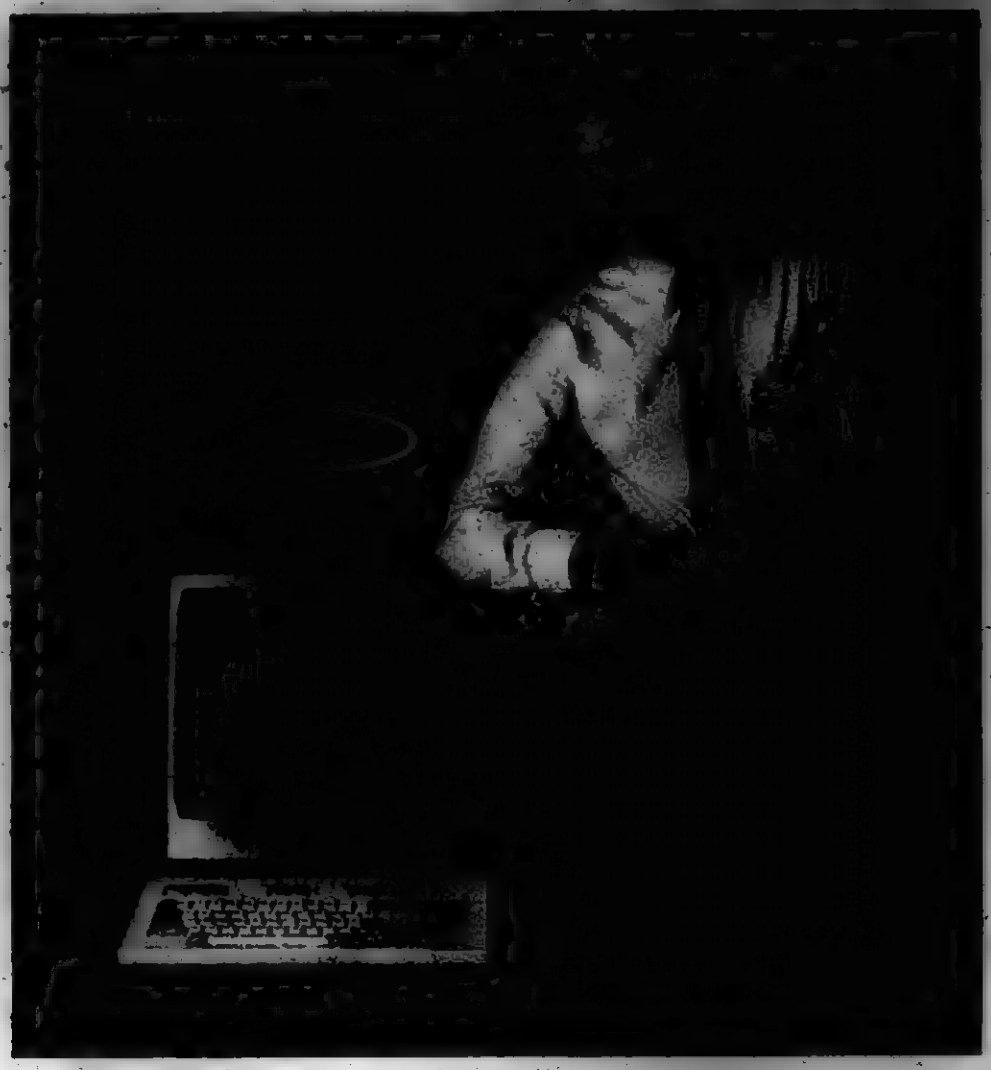
HOW THE TERMINALS THAT GIVE YOU SO FEW PROBLEMS CAN WIND UP GIVING YOU NONE AT ALL.



While we at Teletype Corporation like to talk about our terminals' remarkable record for reliability, we have to admit that every once in a while you just might have a problem with one.

But if you contract with Teletype's Product Service Organization, getting good service is no problem at all. That's because no one can service our full line of CRTs and teleprinters as well as our service technicians. Each one of them is a company-trained, job tested professional who must continually meet our expectations—and yours.

Help is never more than a phone call away since our technicians are on-call 24 hours a day, 7 days a week. And with our network of 100 offices nationwide, we're able to provide fast response time, even to remote areas. You can contract with us for response times as low as 2 hours, or less, as your needs dictate.

But at Teletype, we feel there's something more important than fast response time. And that's fast restoral. So when our technicians call on you, they'll have the necessary test equipment and original Teletype® parts to get your terminals up and running in no time flat.

We'll even help solve problems before they occur with scheduled preventative maintenance. You can also choose our installation service option that includes everything from getting your terminals on-line to user orientation. It's all a part of our Full Service Maintenance Agreement.

So to keep your problems from becoming big problems, write Teletype Corporation Product Service Organization, 2330 Eastern Ave., Dept. 2800-A Elk Grove Village, IL 60007. Or call toll free at 800-323-4226, ext. 300. (In Illinois, 1 800 942-4192, ext. 300.)

WHAT TO LOOK FOR IN ON-SITE TRAINING

With all the technical training options around today, it's hard to figure out which company will offer the most professional, reliable on-site training. Here's Sys-Ed's checklist of key benefits that will make your training investment really pay off.

ARE THESE BENEFITS INCLUDED?	SYS-ED	OTHERS
• Qualified training consultant for needs analysis and skills inventory?	YES	NO
• Comprehensive, coordinated curricula of CICS, IMS, VSAM, TSO ISPF or MVS JCL training?	YES	NO
• Complete range of training for the IBM environment, including IDMS, DATACOM, ADABAS and FOCUS?	YES	NO
• Ongoing technical support?	YES	NO
• Satisfaction guarantee?	YES	NO
• Additional charge for customized training?	NO	YES
• Thousands of solid references?	YOU BET	?

If you ask other training companies the answers to these tough questions, you'll probably make the decision thousands of decision-makers like yourself made: to get your training from The Computer Education Professionals at Sys-Ed.

Write Sys-Ed or call 212-889-3386 for more information about the range of on-site course options. By the way, we also offer public, regional and consortium courses.

____ Tell me about your on-site training.
____ I'd like a schedule of your public courses in my area.
✓ Be sure to let me know about the Sys-Ed Multi-Course Discount and your Satisfaction Guarantee!

Desktop Generation computers. A four-workstation, black-and-white monitor configuration costs $149,000. A four-workstation color monitor configuration is available for $180,000.

Summagraphics, 777 State St. Extension, P.O. Box 781, Fairfield, Conn. 06430.

DATA STORAGE

COMPUPRO SYSTEMS, INC.
Disk 1A

Compupro Systems, Inc. has introduced a floppy disk controller that utilizes direct memory access (DMA) arbitration to handle any combination of up to four 8-in. or 5¼-in. drives.

Disk 1A is based on a third-generation, large-scale integration floppy disk controller chip and is designed for high-level industrial, commercial and scientific microcomputer systems, the company said.

Disk 1A provides for 24-bit DMA addressing across 64K-byte boundaries, with data transfer throughout to 16M-byte memory. The product supports IBM 3740 single-density formats or System/34 double-density soft-sectored formats. Its price is $695.

Compupro Systems, 3506 Breakwater Court, Hayward, Calif. 94545.

JUPITER SYSTEMS
J18, F84, F474 disk drives

Jupiter Systems has introduced a series of disk drives designed to increase the storage for the J12, the vendor's high-speed graphics workstation.

According to the vendor, the J18, F84 and F474 Winchester drives offer 15M bytes, 67.4M bytes and 352M bytes of formatted capacity, respectively, providing the local mass memory needed for solids modeling and image processing applications. The local memory of the Motorola, Inc. 68000-based Jupiter 12 reportedly can be expanded from 256K bytes to 4M bytes.

Two of the J18 disks can be mounted within the J12 cabinet, while the larger models form a separate module. Prices range from $3,000 to $20,000. The disks are available for immediate delivery.

Jupiter Systems, 2126 Sixth St., Berkeley, Calif. 94710.

TERMINALS

MEAD-HATCHER, INC.
2022LP, 2025LP CRT workstations

Mead-Hatcher, Inc. has announced the addition of two models to its Ergo-mate line of CRT workstations.

The 2022LP accepts keyboards up to 22 in. in width, while the 2025LP accepts (word processing) keyboards up to 25 in. in width. Either can be used with existing furniture or mounted on a custom support stand to provide an ergonomically correct stand-alone workstation, the vendor said.

Both models have CRT platforms 2½-in. high. The price for the 2022LP is $115; the 2025LP is $125.

Mead-Hatcher, 752 Military Road, Buffalo, N.Y. 14216.

TERMINAL DATA CORP.
Videomate VMT-1010

Terminal Data Corp. has announced a high-resolution, raster-scan display module designed as a building block for high-resolution image display terminals.

The Videomate VMT-1010 is said to be a full-page, high-resolution raster scan, 15-in. monitor offering flicker-free images of documents, raster graphics and other high-resolution or high-density raster scanned data.

The single-quantity price is $1,740, while the OEM, 1,000-unit price is $695. It is available now.

Terminal Data, 21221 Oxnard St., Woodland Hills, Calif. 91367.

GRAPHICS SYSTEMS

ADVENT SYSTEMS, INC.
Formula One

Advent Systems, Inc. has introduced a microcomputer-based graphics workstation that allows users to create camera-ready documents using as many as 1,500 different characters and symbols.

Called Formula One, the system features a high-resolution, full-page screen with 65 to 128 line/page and up to 250 char./line, plus a 1-mil (one-thousandth of an inch) precision printer with user-selectable draft, memo, letter or typeset quality printing at speeds ranging from 20 to 390 char./sec.

According to the company, the images on the screen, which may contain combinations of up to 1,500 different characters, scientific symbols or a mix of text and graphics, are duplicated exactly on the printed page.

Both the display and printer can access up to 16 different fonts, each containing 96 characters or symbols.

Formula One can be used with most 16-bit microprocessors operating under either Digital Research, Inc.'s CP/M 86 or Microsoft, Inc.'s MS-DOS. The display/printer station plus the image processing software is priced at $9,995 in single quantities.

Advent Systems, 400 Amherst St., Nashua, N.H. 03063.

BOARD-LEVEL DEVICES

GENERAL ELECTRIC CO.
CCM3 communications module

General Electric Co. has announced the CCM3 communications module for its Series Six line of programmable controllers.

The CCM3 allows interfacing to Fisher Controls' Provox instrumentation systems via Fisher's type DH6005 programmable controller interface unit. Up to eight GE Series Six controllers can be connected to a programmable controller interface unit. A total of 64 registers of data (either analog or discrete values) can be communicated to the Fisher unit from the Series Six controllers, the vendor said.

The Fisher system can also change values in the Series Six controllers. Available in April, the CCM3 is priced at $1,500, according to a company spokesman.

GE, Programmable Control Department, P.O. Box 8106, Charlottesville, Va. 22906.

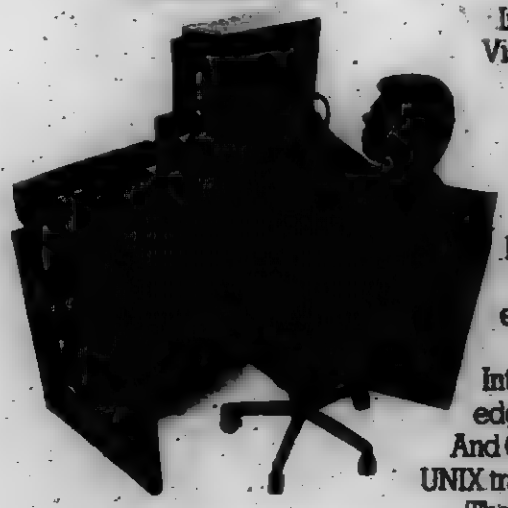
THE LONG & SHORT OF NEW UNIX™ INTERACTIVE VIDEO TRAINING.

Independent study results show that student recall and retention improve up to 26.3% with interactive video.

Users report reductions of 40-66% in training time with interactive video.

What way to train UNIX is the best way to train UNIX? Live classroom instruction? Passive video? Or interactive video?

Studies show there is no faster, more effective, training method than interactive video.



Introducing the first UNIX Videodisc Training Curriculum. Vision.

It combines the power of the computer, the speed of a laser disc and the personality of live classroom instruction. Vision Interactive Videodisc Training captures and holds a student's interest in a way no other medium can.

Students learn by doing. So they learn faster, comprehend better and retain information longer. They spend less time away from the job. And are more productive once they return.

Because Vision training is targeted, you can choose just the Courses you need for your employees. And students learn only what they need to know to do the job. Now.

What's more, Vision was developed by Interactive Training Systems, the acknowledged leader in interactive video training. And Computer Technology Group, a leader in UNIX training.

The result? UNIX training so fast, so effective and so affordable, we back it with a full 30-Day Money-Back Guarantee.

Plus, if you lease all three Vision Curriculum courses for one year, we'll give you the use of an IBM PC, laser videodisc player, color monitor and Interactive Training System Controller. Absolutely Free.

Take advantage of our Free Introductory Offer. Send in the attached coupon. Or call us at 1-800-227-1127. Don't wait too long; you'll get caught short.

FREE INTRODUCTORY OFFER!

☐ Please have a representative contact me immediately.

☐ Please send me more information about Vision, the UNIX Interactive Video Training Curriculum.

PLOTTER from page 58

computer port.

The HP 7550A is priced at $3,900 and can be delivered four to six weeks after receipt of order.

The company's measurement plotting system is the HP 7090A, which is designed to combine the benefits of digital plotters, waveform and X-Y recorders and data acquisition systems into a single laboratory graphics device.

As a low-frequency waveform recorder, the HP 7090A reportedly provides 1K words by 12 bits of buffer memory and a 30K sample/sec analog-to-digital converter on each channel. Slew response is said to be 3 kHz.

As an analog X-Y recorder, it is said to offer three high-sensitivity, high common-mode rejection rate inputs for X-Y or Y-T recording, 41,000 calibrated sensitivity ranges and zero offsets, 2g constant acceleration and 50 in./sec slewing speed.

According to the company, it also can perform as a plotter when connected to a controller or smart instrument. It includes 42 HP-GL graphics language instructions and draws at 29½ in./sec, the company said.

Output can be plotted on 11- by 17-in. paper and 8½- by 11-in. paper and transparency film. As a component in a data acquisition system, it reportedly can send data to a controller at a streaming rate of up to 250 sample/sec.

Available six weeks after receipt of order, the HP 7090A is priced at $4,400. More information is available from HP, located at 1820 Embarcadero Road, Palo Alto, Calif. 94303.

JAPAN from page 59

perform in the area of 100M Flops, faster than the American machines, but slower than Fujitsu's.

"It's still pretty good performance. I didn't expect Hitachi to be at a lower level than Fujitsu, but it is still premature to say that one machine is superior to the other," Fernbach said.

He also stressed that with software modifications, the Cray XMP was able to reach 100M Flops in a later test.

Peak performance

Still a year away from production, the NEC SX-2 supercomputer is billed as being capable of 1.3G Flops and the NEC SX-1 supercomputer at 570M Flops. Hitachi claims a peak performance of 630M Flops for the S-810/20 and 315M Flops for the S-810/10. Fujitsu claims a peak of 500M Flops for the VP-200 and 250M Flops for the VP-100.

While the Japanese manufacturers are marketing their supercomputers in Japan now, or in the NEC case planning to market them, it may be several years before they are sold in the U.S., reported Dr. John Riganati, chief of computer systems for the National Bureau of Standards.

He noted that each of the three Japanese companies claims to have a one-third share of the Japanese supercomputer market, estimated at 100 potential installations.

Fernbach noted Fujitsu, said to be negotiating with Amdahl Corp. regarding an American supercomputer distribution network, may use that type of agreement to beat Hitachi to the American marketplace.

Riganati said the Japanese products appear to be on schedule and added, "They appear to be producible. They aren't made with the hard, custom wiring that Cray had to go through."

Riganati said, "In general, the machines appear to do considerably better than anything in the American marketplace today. But I would not say the Japanese are ahead. They have built machines, which have to be taken seriously, using state-of-the-art technology."

Advantage in software

Riganati and Fernbach concurred that two of the advantages that the Japanese hold are in the area of software and that the machines are IBM-compatible.

They noted that Cray founder Seymour Cray, who is working on what are expected to be faster successors to the XMP and Cray 1, limited the company's market by relying on customers to develop their own software.

But Cray and ETA Systems, which traditionally has offered more standardized software than Cray, don't offer IBM compatibility. For the Japanese, IBM compatibility means the ability to rely on an IBM mainframe as a front-end machine, using standard IBM software.

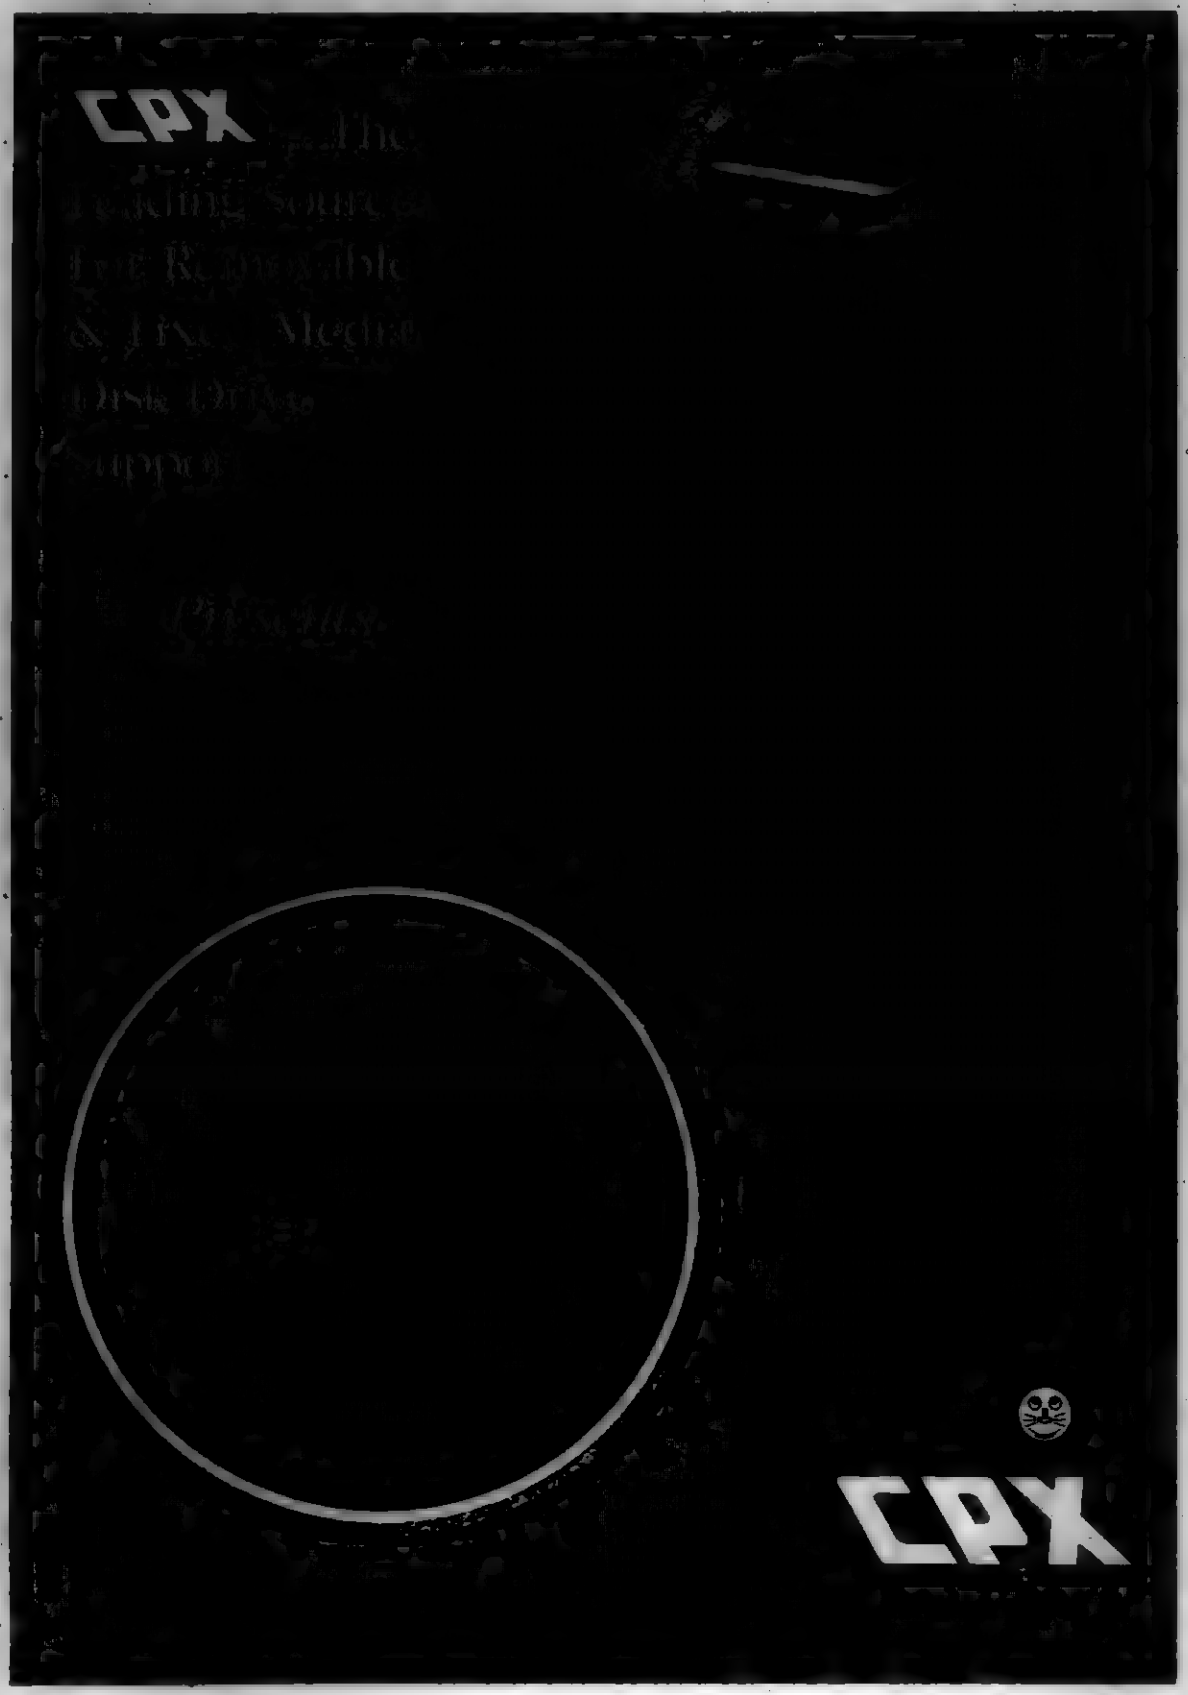
Riganati and Fernbach noted that the compatibility feature may make Japanese supercomputers more attractive to IBM shops such as businesses, rather than just government agencies or researchers. That compatibility may speed IBM's move into the supercomputer market, Riganati said, adding that IBM has a significant 15% to 20% scientific base.

The industry observers also said the Japanese companies, particularly Fujitsu, appear to have made better use of software in the vector portion of the processors.

"They were able to go in and put in better vectorizing routines than we have done," Fernbach said, noting that some of the Fujitsu edge came from its researchers' work at the University of Illinois, work that he said American companies failed to use to full advantage.

What remains unknown, however, is how the Japanese supercomputers will be priced in the U.S.

Riganati and Fernbach said they expected the systems to be "in the ballpark" with their American competitors. That would mean prices in the range of $15 million to $20 million, depending upon the configuration, according to Fernbach.



IN DEPTH

ILLUSTRATED BY RICHARD TERHART

Third-party liability insurance: protection in case of computer error

By Paul Cottrell and Barry D. Weiss

All computer-age businesses can apply a three-step management program to insure properly the risks they face. Such a program will often include consultation with computer-knowledgeable legal counsel, risk management consultants and underwriters.

Step 1 is to define the risks. For example, programmers, systems analysts and other design-oriented professionals may face negligence or malpractice claims if a program malfunction causes injury to either their clients or third parties. The case law in this area is still extremely unsettled, but even unfounded claims can require substantial defense costs.

As the standards of professional practice for these computer specialists become better defined, injured parties will try to hold these specialists to a higher "professional" standard of care — much like doctors, accountants, architects and lawyers. Hardware and software manufacturers face possible product liability claims as well as contract-based claims from dissatisfied or injured users or third parties. Again, much of the case law in this area is unsettled, but the incidence of user suits is well documented. NCR Corp., for example, was found liable in a number of multimillion-dollar user suits.

Few insurance brokers appreciate the new and unusual risks accompanying computer use. Nevertheless, armed with a rudimentary understanding of policies available as well as the risks to cover, the DP manager or vendor can now find adequate coverage to ensure financial survival.

Step 2 is risk reduction. Risk reduction is the attempt to minimize the risk that your enterprise will bear should a loss occur. It has two parts. First, wherever possible, allocate the foreseeable risks through contractual risk-shifting devices. In the vendor-user area, the now common disclaimers of warranty may effectively place certain risks entirely on the user.

Vendors should beware, however, that courts have been extremely sympathetic to the claims of unsophisticated purchasers who sue a vendor whom they allegedly relied upon for expertise. Again, NCR has been held liable in many instances even though it sold equipment under contracts with express disclaimers of warranty.

If a court finds that a disclaimer was not truly part of the bargain, it may not enforce it. Likewise, indemnity or "hold-harmless" clauses can be used. However, as with disclaimers, caution is advised because many courts will not enforce broad indemnity clauses. Users must also be aware of the many risks they face when contracting for a system purchase. For example, sophisticated purchasers of software will insist on a source code escrow deposit to cover the risk that the vendor will not be able to honor its maintenance or updating agreements.

The second part of the risk reduction process is to minimize the damage potential of risks that cannot be allocated to others. For example, duplication of important data media and off-site storage of the duplicates will greatly minimize the damage potential of injury to the on-site media.

Minimize damage potential

The second part of the risk reduction process is to minimize the damage potential of risks that cannot be allocated to others. For example, duplication of important data media and off-site storage of the duplicates will greatly minimize the damage potential of injury to the on-site media.

Step 3 in the risk management program is to make contingency plans for those risks that cannot be shifted to others or completely eliminated through risk reduction planning. These contingency plans must provide for the financial stability of the enterprise in the event of loss. Such planning will almost always include some forms of insurance. The planning may also provide that those to whom you have contractually shifted certain risks will, in turn, provide adequate insurance for the contractual liability that they have assumed.

This is a very conservative approach, but it does give greater assurance that injured third parties will have an insurance fund from which to satisfy potential claims. If they do not, and the primary third-party defendant has insufficient resources, the risk shifting entity may be the only "deep pocket" to which a claimant can look. For example, the fact that a programmer agrees to indemnify a software house against any claims for negligence brought by third-party purchasers will be of little value when the programmer goes bankrupt. But if the programmer has insurance to cover the risks for which he agreed to indemnify, then the software house is assured of adequate financial protection.

As to your own financial planning, larger entities may prefer to set up in-house self-insurance plans. However, such planning requires a high degree of sophistication, resources and, usually, outside risk consultants. Most enterprises will seek various forms of insurance to protect the company's assets.

There are several different forms of insurance on the market today. Some companies offer comprehensive data processing insurance; others offer "errors and omissions" or computer "malpractice" policies. They are being issued by firms such as Shand, Morahan & Co. of Evanston, Ill., St. Paul Fire & Marine Insurance Co., The National Union Fire Insurance Co. of Pittsburgh (a subsidiary of American International Group) and The Chubb Corp. In each instance, these policies are similar in that they define the risk insured so as to provide coverage where traditional policies would not.

To date, there does not appear to be any published court opinion construing the coverage language of this new generation of policies. Nonetheless, there is a fast-growing market.

Common coverage problems

Even as the insurance market begins to recognize and to respond to the peculiar needs of the computer industry, there are still many specialized perils where it is difficult to acquire coverage. And even where coverage is available, there is little uniformity in language among the various policies on the market. Moreover, few brokers appreciate the new and unusual risks accompanying computer use. Nevertheless, armed with a rudimentary understanding of the insurance policies available, as well as the risks he needs to cover, the contemporary DP manager, vendor or professional can now find adequate coverage to insure his financial survival.

The current market for computer insurance (often referred to as

"electronic data processing insurance") includes several different kinds of coverage. Property insurance (often called first-party insurance) covers the direct physical losses resulting from fire, flood or other physical peril. Most home owners policies, for example, will cover a home computer if it is not used primarily for business purposes. If it is, you must look to the specialized market for computers where companies such as Chubb, St. Paul Fire and Marine and Central offer coverage. However, a home owners' policy will not cover loss due to power surges.

Finally, another specialized insurance market is now developing: coverage for unauthorized computer access. This area is being spearheaded by Shand, Morahan & Co. Here, the traditional coverage labels begin to break down since the unauthorized access policy offered by Shand includes both property coverage and liability coverage.

Liability insurance (also called third-party insurance) covers claims brought against the insured by third parties. Liability insurance traditionally breaks down into two subgroups — comprehensive general liability (CGL) coverage and professional liability coverage (the latter often referred to as "errors and omissions," or E&O, insurance).

History and structure

The reasons for this breakdown have to do with the history and structure of the insurance industry and the actuarial differences between the various risks covered. CGL policies are typically written for businesses to provide coverage for ordinary lawsuits (for example, someone slips and falls on the premises), and specific peril insurance can be added on where needed (for example, a manufacturer will add products liability coverage). Broadly speaking, E&O coverage arose to protect professional service concerns such as architects, accountants and lawyers.

Obviously, only certain businesses need certain coverages. An auto repair shop, for example, doesn't need E&O coverage. But there are questions peculiar to the computer industry that have not been clearly resolved, and there is confusion in the insurance market where some of the same risks are addressed both by policies labeled as CGL as well as some labeled E&O. The problem emphasizes the need for DP managers to review carefully the actual insurance language rather than rely on more labels. The DP manager should be aware of these potential problem areas when reviewing individual policies in any of these categories.

Finally, the coverage question is made more complicated by the attempts of some companies to blend or integrate separate coverages into a comprehensive insurance package. For example, St. Paul is offering an "integrated" policy package that includes property, CGL and E&O coverage.

Property coverage

Property or first-party coverage is the traditional insurance that any individual or firm might purchase to provide financial reimbursement for property loss. DP risk managers must consider property coverage for computer hardware, peripherals, software programs, data and storage media. Most traditional property policies do not cover "intangibles" such as software and data. Specialized DP property policies do cover these items. Companies writing in this area include St. Paul, Chubb, Central and Aetna Life and Casualty Co.

While this new generation of policies has been specially written for computers, a careful review of policy definitions is still recommended for any given DP facility because the perils that are insured and the exclusions will vary. For example, timesharing and service bureau DP facilities that process data for others may need property coverage not only for loss to their own data but also for their client's data. This risk, of course, is a liability risk that may also be covered by CGL or E&O. But traditional CGL policies exclude "contractual liability" coverage. Again, a careful review of coverage language with your broker is essential.

Once definitional coverage issues are resolved, users must cope with valuation problems. It is difficult (and sometimes impossible) to determine the "value" of certain electronic data. For example, what is the value of time records in the computerized billing system of an accounting firm whose revenues are based on an hourly fee basis? Is it the cost of reproducing those records or the dollar value of the billings lost?

Most DP policies will only cover reproduction costs unless you "value" your data in your policy and obtain specific dollar coverage. A special endorsement to the policy for "valuable papers" may be needed. DP property policies also make available such traditional coverages as accounts receivable endorsements, business interruption insurance and additional (or extra) expense coverage (the additional expense being the cost of recreating the records).

One final word about coverage issues: Careful review of what risks are covered under a property policy is crucial. Insurers generally offer two basic modes of property risk protection packages: first, "defined risk" policies, which only cover the specific risks mentioned; and second, "all-risk" or "blanket" protection, which covers any risk except those specifically excluded. Understandably, insurers charge a lower premium for defined risk coverage. However, many DP insureds have learned the hard way that the traditional

Applied Health Care v. Minicomputer

In a recent case dealing with computer risk insurance, Applied Health Care Systems, Inc. brought suit against Minicomputer Technology, Inc. Applied Health sought recovery of $1.5 million in damages stemming from Minicomputer's introduction of a faulty controller into Applied Health's data processing system.

Applied Health was in the business of providing processing services to health care facilities in Chicago. These facilities used Applied Health's system for storing and retrieving patient care and billing records.

Under an oral contract with Applied Health, Minicomputer Technology, a California corporation, had installed four controllers in Applied Health's in-house data processing system in April 1980.

When the system failed and substantial receivables were lost, Applied Health lost many of its customers and was eventually forced to terminate its business operations. Applied Health sued Minicomputer on the grounds that the controllers were defective. Specifically, it was alleged that a wiring connection caused the malfunction leading to random losses of customer billing and patient care information.

Minicomputer manufactured, marketed and sold both hardware and software products. In the suit brought by Applied Health, Minicomputer was subject to a claim based on a hardware component.

CGL policy

When sued, Minicomputer tendered the defense of Applied Health's claim to its insurance carrier, Centennial Insurance Co., under a Comprehensive General Liability (CGL) policy issued by Centennial to Minicomputer. CGL coverage is a standard policy coverage that all business entities secure to protect themselves for the defense and payment of claims by third parties, that is, parties other than the insured and insurance company. These policies were designed to provide coverage for liability exposure arising from personal or bodily injury and tangible property damage.

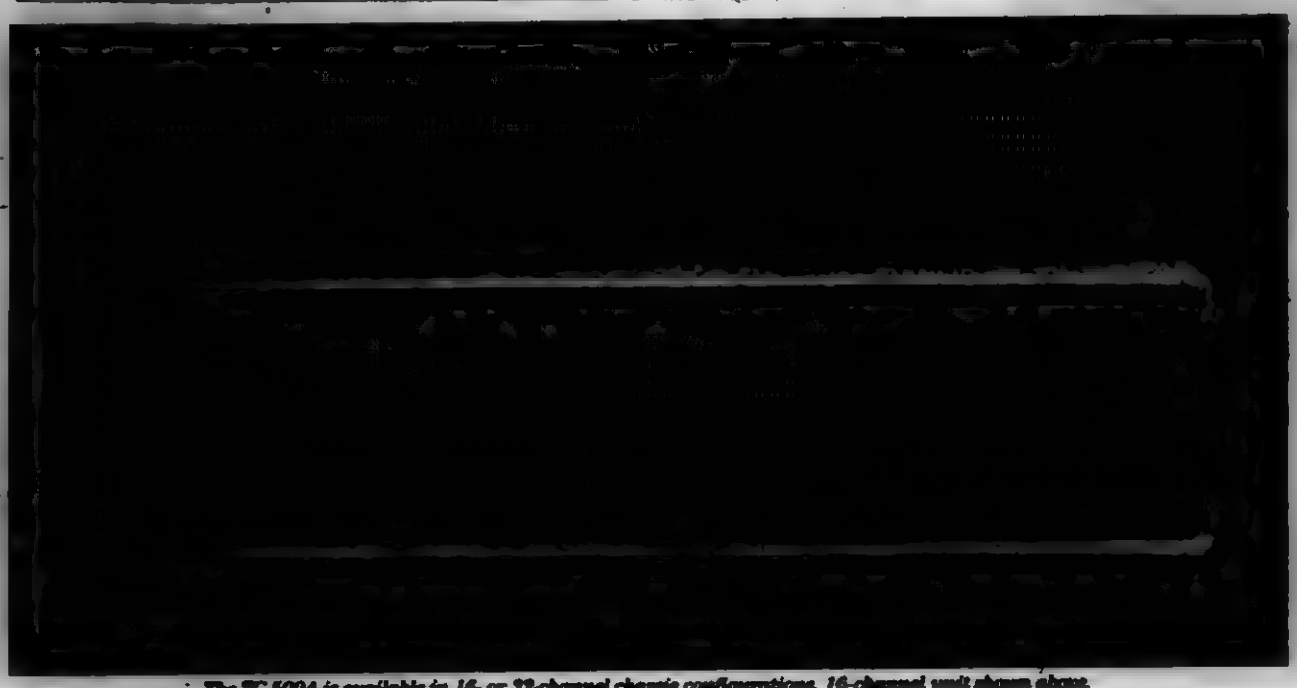
Centennial declined to accept Minicomputer's tender of defense because, in its opinion, loss of computer data was not an injury to *tangible* property. The CGL policy's definition of property damage was as follows:

- Physical injury to or destruction of tangible property which occurs during the policy period, including the loss of use thereof at any time resulting therefrom, or
- Loss of use of tangible property which has not been physically injured or destroyed, provided such loss of use is caused by an occurrence during the policy period.

Centennial argued that coverage under its CGL policy did not apply because the allegedly faulty controllers did not cause "property damage" since information stored in a computer data base is not "tangible property."

Centennial also asserted that even if "property damage" had occurred, the loss would not be covered because of its CGL Policy Exclusion *(m)*. That exclusion provided that the insurance coverage would not extend:

- *(m)* to loss of use of tangible property which has not been physically injured or destroyed resulting from:
- A delay in or lack of performance by or on behalf of the named insured of any contract or agreement, or
- The failure of the named insured's products or



The TC-500A is available in 16- or 32-channel chassis configurations. 16-channel unit shown above.

COMDESIGN INTELLIGENT STATISTICAL MULTIPLEXERS:

MORE FEATURES FOR YOUR COMMUNICATIONS DOLLAR

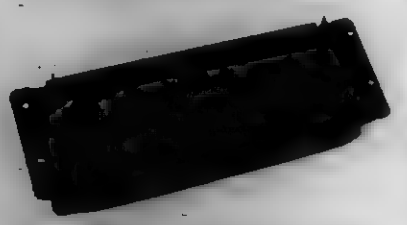
An attractive price and a long list of features make ComDesign's TC-500A Intelligent Statistical Multiplexer a great value. In fact, it would be hard to beat this multiplexer for data concentration, error control and throughput.

But that's not all.

The advanced intelligence of the TC-500A also gives you the complete system control you would expect only from an expensive network processor.

IT'S FLEXIBLE

Compatible with virtually any host computer, the TC-500A can connect up to 32 terminals, printers, personal computers, or other CPU's over one phone line.* With all the performance of a direct connection. Just select the exact channel configuration you need. The TC-500A supports all popular speeds, flow control conventions, and special character formats.



The TC-500A's unique firmware module, Flexpak, permits easy in-the-field software upgrades and access to latest ComDesign software releases.

Free application engineering and support is available to all customers from ComDesign's highly-qualified "data comm doctors."

EASY TO USE

The TC-500A is also surprisingly user-friendly. For starters, you never have to flip DIP switches or figure out complicated codes. As a matter of fact, the TC-500A is menu driven, in plain English. All commands are simply entered via the convenient front panel or through the supervisory CRT.

A NETWORK CONTROL CENTER TOO

The TC-500A's multiple microprocessor based architecture makes it powerful enough for network control and management functions. From either end of the network, you can monitor and test the entire system or its individual components, perform complete reconfiguration or change any operating parameter.

And, should anything ever go wrong, the TC-500A's extensive self-diagnostic capabilities make it easy to pinpoint the problem and effect immediate corrective action.

Add it all up, and we think you will agree, that the TC-500A will give you more for today's *and* tomorrow's communications dollar.

A case study of liability insurance

work performed by or on behalf of the named insured to meet the level of performance, quality, fitness or durability warranted or represented by the named insured.

Both the exclusion and the CGL policy definition of "property damage" were (and still are) standard clauses in comprehensive general liability policies issued by most major insurance carriers. But, as demonstrated here, this standard language is inadequate for computer-related risks.

Using these two arguments, Centennial informed Minicomputer that it would neither defend Minicomputer against Applied Health's lawsuit nor pay any settlement or judgment should Minicomputer settle or be found liable to Applied Health. Centennial also filed a separate declaratory lawsuit asking a federal court to rule that it had properly denied coverage and that it had no duty to defend or indemnify Minicomputer.

But the federal trial court ruled that Centennial had to defend and indemnify Minicomputer. Centennial appealed this ruling, and while the appellate court held that Centennial did have a duty to defend Minicomputer in the Applied Health litigation, the question as to whether the CGL carrier had a *duty to pay* for any judgment entered could not be decided until trial.

A jury would then determine the nature of the damages and thereby indirectly determine whether the claim was within the coverage perimeter of the CGL policy.

The Centennial case illustrates some of the risks that businesses bear whenever they fail to provide appropriate coverage for data processing liability exposure. For example, the customers of Applied Health ran the risk that their receivables would be destroyed by a faulty computer or program.

Applied Health ran the risk that it would be sued by its customers if it used a defective computer or computer program. And, of course, Minicomputer ran the risk that it would be sued by its customers, and it also ran the risk of incurring legal fees in suing its insurance carrier over the scope of its coverage. Without adequate insurance coverage, these entities have substantial liability exposure. Indeed, Applied Health was allegedly forced out of business.

Liability carriers ordinarily assume two duties. First, the carrier agrees to defend any covered lawsuit filed against the insured. Second, the carrier agrees that if the insured is found liable, the carrier will pay or indemnify the insured for any damage judgment or settlement.

Inadequate insurance coverage exposes businesses to substantial legal defense costs plus uninsured or potentially uninsured contingent liabilities. The carrier's duty to pay, of course, does not become effective until the underlying lawsuit is resolved (a process that may take several years). The carrier's duty to defend protects the insured from the risk of catastrophic legal expense, irrespective of whether the claim is meritorious. The duty to defend and the duty to indemnify or pay are altogether separate obligations.

Returning to our case example, Minicomputer was fortunate that the court held that California law governed the duty-to-defend question. Under California law, the insurer's duty to defend goes beyond the "four corners" of the complaint. A court will also consider any allegations that might have been made under the circumstances.

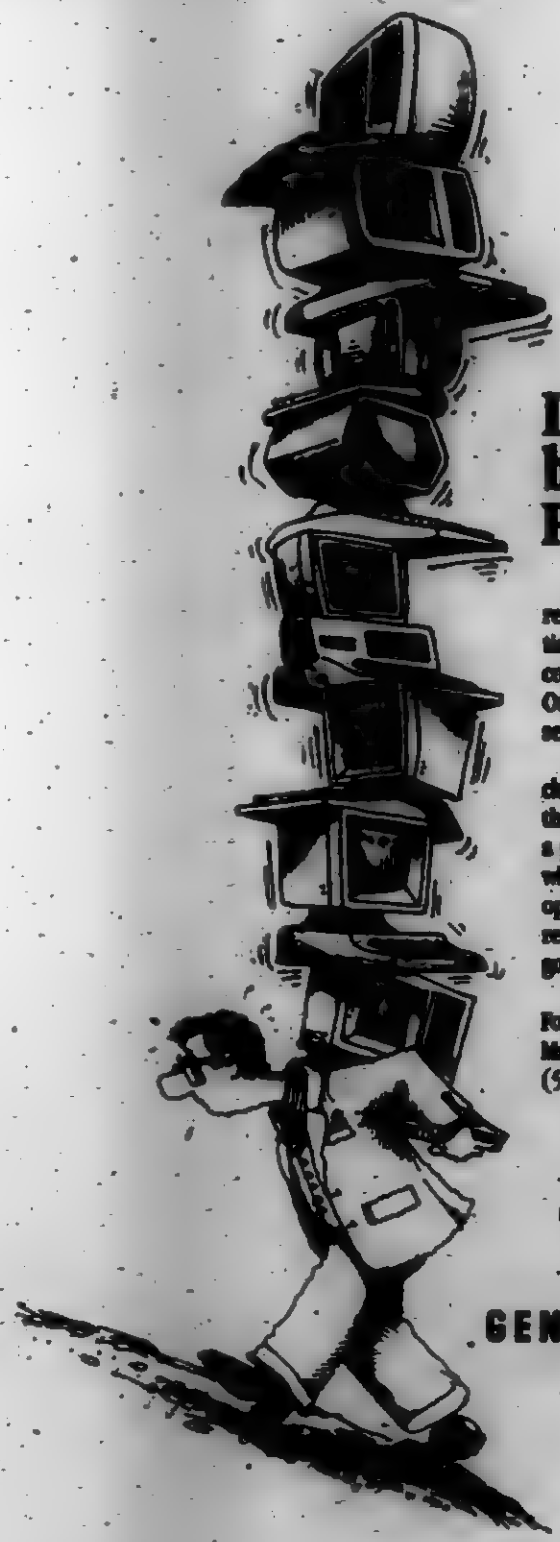
Accordingly, Centennial was obligated to defend Minicomputer against Applied Health even though Applied Health had not actually alleged "tangible property" damage in its complaint, since such a loss might have been alleged given the other material allegations.

Contingent Liability

Even though the court's ruling meant that Minicomputer had coverage for its defense costs, Minicomputer still faced considerable exposure. Since Centennial's duty to indemnify or pay Minicomputer for any judgment in favor of Applied Health could not be resolved until the underlying suit had ended, Minicomputer still carried a potentially uninsured contingent liability. Minicomputer was also stuck paying its own costs litigating the duty-to-defend question against Centennial.

Had California law not applied to the case so that Centennial would not even have a duty to defend, then Minicomputer would have had even greater exposure. Under Illinois law, for example, an insurer's duty to defend is narrower.

Regardless of what state law governed all of Minicomputer's risk could have been eliminated with proper insurance coverage. As it was, Minicomputer's CGL policy language did not clearly cover the risks Minicomputer faced.



Let us bear your PC burden.

General Electric now offers relief for busy managers of information systems: complete service for your company's personal business computers. On-site right where they are, or at GE service centers from coast to coast.

With GE as your service source, you choose any one of several service options that's best for you. For example, we have a program that provides you with a loaner while your PC is at our service center. If you opt for on-site contract servict, we can respond fast, day or night, if something goes wrong.

So take a load off your shoulders. For more information, call Rob Rackowski, Manager—National P.C. Service Sales, (518) 385-4092.

Put GE on your PC.

GENERAL ELECTRIC

(Continued from ID/3)

risks that were "defined" have not anticipated the susceptibility of delicate hardware and software to such risks as power supply malfunctions (such as power surge) and atmospheric or environmental conditions.

Sophisticated DP risk managers can now identify the reasonably foreseeable DP risks and manage such risks through a combination of physical controls — such as surge suppressors and environmental control systems — and defined coverages. Although most of the new-generation computer policies are written on an alleged "all-risk" basis, the exclusions must be examined carefully.

St. Paul, for example, will generally only cover certain mechanical and electrical breakdown risks if you implement proper physical controls. Physical controls ranging from Halon or carbon dioxide discharge systems to complex disaster recovery plans are, at the least, recommended components of a comprehensive risk management plan. These controls will likely decrease the actuarial risk for your facility and thus yield significantly lower premiums to insure your property.

Liability coverage

Liability coverage contains definitional problems similar to those contained in the property line. First, any business entity should have CGL. The question is whether the firm's current CGL coverage is adequate and, if not, whether a different type of policy should be procured.

The traditional coverage provided by the old form CGL policies is inadequate for data processing users because of the problems illustrated in the Centennial Insurance Co. decision (see related story on ID/4). The decision showed that since the traditional CGL coverage language is keyed to "physical injury to or destruction of tangible property," it may not provide coverage for claims arising from loss of data or injuries due to defective software design. Newer policies, such as those issued by St. Paul, Chubb and Shand, address this problem by redefining the coverage.

There are three basic analyses to be reviewed regarding any liability insurance policy. First, how is coverage defined (for example, tangible or intangible, claims-made or occurrence basis). Second, what do the exclusions take away (no coverage for punitive damages or claims based on securities violations). Third, what are the limits of coverage (for example, catastrophic losses may not be insurable, and the insured's risk manager must devise a plan to manage catastrophic losses).

Common coverage questions

Is it a claims-made or occurrence policy? Traditionally, both CGL and E&O policies were written on an "occurrence" basis. This meant that the liability carrier would cover any lawsuit that resulted from an "error" that "occurred" during the policy period (usually one year with the possibility of annual renewals). But as the courts kept expanding the potential liability of manufacturers and others so that they might be held liable today for "errors" committed 20 years ago, the insurance carriers turned more and more to a new type of policy — the "claims-made" policy.

Roughly speaking, this policy only insures you against claims actually made against you during the policy period no matter when the error giving rise to the claim took place. To the carriers, this new claims-made insurance allowed their actuaries to predict their loss potential better. With the long "tail" of exposure inherent with occurrence policies (and the ever-expanding liability imposed by American jurisprudence), the insurance industry simply could not properly plan its own financial risks.

Today, nearly all business computer coverage is written on a claims-made basis. Accordingly, even if your company dissolves or is acquired by others, you may need to provide for insurance coverage some years after if your prior coverage was on a claims-made basis.

Application forms

Another common coverage problem concerns the insurance application. Given the newness of these coverages (and the lack of any substantial loss experience), the carriers are understandably nervous about the risks they are assuming. Indeed, this probably accounts for the fact that there are only a handful of carriers in the market. Accordingly, the applications for these policies are usually lengthy and quite detailed. But it is absolutely essential to give accurate information on these application forms. Any misinformation, even if inadvertent, might be used by the carrier later on to disclaim liability. The law on this issue varies greatly from state to state, so it is wise to review carefully your data input.

The duty to defend and the duty to pay a loss are the two primary duties of a liability carrier under an insurance policy. The duty to defend is uniformly construed to be much broader than the duty to pay. In other words, you may be sued on two counts, but only one count asserts liability of the type insured by your policy.

The carrier will most likely defend the entire lawsuit, but it will do so under a reservation of its right to deny any duty to pay the loss if you are found liable under the count that is not covered. This is a standard practice in the industry; it is perfectly legal and proper so that there is little that you can do about it. You should only be aware of it. In most instances, if there is any merit to the

THE ENCRYPTOR™
Data Security at An Affordable Price

If your microcomputer data looks like this, it's not secure.

Your confidential reports, client or customer files, and other critical business information can be tampered with or stolen.

With THE ENCRYPTOR™ products, your data looks like this — and it's totally secure.

Only individuals with Encryptor keywords can process your data.

claimant's position, the carrier will reach a settlement prior to judgment as to any count, and the reservation issue never becomes a problem.

Many other coverage problems have already been discussed in another context. For example, with property insurance, you want to know what perils are covered: Is power surge loss covered?

Those problems can also arise in terms of liability insurance: Will the liability policy cover claims made against you for loss through power surge of data in your computer, which is vital to a third-party client? If the power surge had nothing to do with any "negligent act, error or omission" on your part (this is the standard E&O coverage language), is it covered?

Uninsurable risks

There are some risks that are simply uninsurable — either by law or because there is no market. Punitive damages, for example, are now held to be uninsurable as a matter of law in many states. Damages in law courts are basically of two types — compensatory and punitive. Compensatory damages are insurable, and these are the damages meant to recompense the claimant for the actual loss he suffered.

On the other hand, punitive damages are meant to punish you, the defendant, for some repugnant intentional act.

The imposition of such damages has nothing to do with compensation to the injured plaintiff. To the plaintiff, it is a windfall. In Illinois, for example, punitive damages are not insurable no matter what the policy language says.

Furthermore, many policies exclude such coverage (for example, Lloyd's, St. Paul's and Shand's unauthorized access policy).

Even though the concept of a deductible is common, make sure you understand whether the deductible applies to defense costs. Some policies have a high deductible. Of course, if you are defending a claim that has little merit, this may not be a problem unless the deductible applies to defense costs. Sometimes this item is buried in a separate and convoluted section defining "claims expenses," in which the deductible clause itself merely gives a seemingly innocuous reference to "claims expenses."

Attorneys' fees today are high. And the fees likely to result from sophisticated litigation over the esoterica of computer programming (particularly where there is little or nothing in the casebooks to help guide the court) may in themselves be a catastrophic loss.

Common exclusions

There are several common exclusions in almost every liability policy. Usually the carrier will not cover liability that you assume by contract (for example, Lloyd's and Shand). This, of course, points to the other side of the coin regarding the first two steps of the risk management plan outlined earlier.

Any good risk management plan must provide for the continuing review of all contracts to make you understand the risks you have assumed by contract. Hold-harmless clauses and indemnity agreements pervade today's business world (in effect, everyone is trying to pass the buck).

Some of these assumptions of risk will be covered by traditional CGL policies (clauses in building lease agreements, for example, are often covered by CGL policies); most others are not. You may need to seek separate contractual liability endorsements for your basic CGL policy or find some other means to plan for the risk of loss you have assumed.

Other common exclusions include patent and copyright infringement (Shand), dishonest or fraudulent acts (St. Paul, Lloyd's) and preparation of tax returns or balance sheets (Lloyd's — of course, this might be covered by an accountant's E&O policy).

The exclusion for fraudulent acts is especially important for systems vendors. Vendors typically disclaim warranties in their standard contracts, but disgruntled users can avoid contractual limitations if they prevail on a fraud theory. Courts in some states, particularly California, have adopted relatively lenient standards for proving fraud in computer contract cases. Insurance cannot help vendors deal with this potential liability.

Typical limits

There are really no "typical limits" in this new field. You must decide what is appropriate. Consultation with experienced brokers or risk management consultants will provide you with a fairly good understanding of the amount of insurance you need.

Obviously, the risk of exposure to costly liability claims is a hazard that all of those in the industry bear — both producers and users. To manage this risk, some planning and allowance for financial coverage must be addressed. For very large companies, self-insurance or risk retention programs may be the answer. However, for the vast bulk of those faced with this exposure, prudent business acumen dictates that insurance coverage be sought.

SAS/GRAPH, Tektronix 4105 and 4695...

Your Low-Cost Graphics Solution

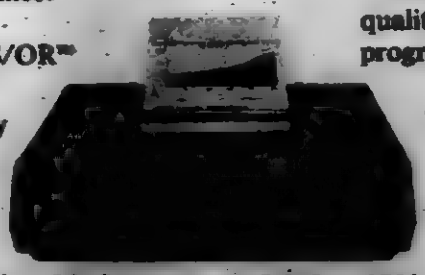
Since its beginnings, SAS Institute Inc. has provided you a "state of the art" software system. Now the Institute and Tektronix, Inc. give you a low-cost graphics solution—SAS/GRAPH,™ the Tektronix 4105 and 4695.

With SAS/GRAPH, you can produce sophisticated charts, plots, maps and three-dimensional displays with just a few simple statements. SAS/GRAPH can help you analyze data and results, and discover trends. Then you can add colors, titles, footnotes, company logos and other information to present your results to others.

What's more, SAS/GRAPH is integrated with the SAS System, so you can:

- use the data management, statistical analysis and report writing tools in SAS®
- enhance your forecasts and financial reports produced with SAS/ETS™
- clarify your data entry, editing and spreadsheet applications in SAS/FSP™
- graph planning schedules produced in SAS/OR™
- display data accessed with SAS/IMS-DL/I.™

SAS/GRAPH lets you preview your display on one device, then replay it on another without re-analyzing your facts and figures. The new Tektronix 4105 Computer Display Terminal gives you the perfect tool for previewing your display. It's fast, easy to use and reliable. A "joy disk" built into the keyboard of the Tek 4105 allows you to move the cursor easily. You can communicate with the host system without interfering with the display on your screen. A special option lets you position the display at or near your eye level or tilt the display up or down, right or left.



At $3995, the Tek 4105 puts high-quality, color graphics at your fingertips.

When you're ready to print your display, push a button on the Tek 4105 keyboard. Hard copy is quickly produced on the new Tektronix 4695 Color Graphics Copier. You can use roll or sheet paper, or make transparencies. It's your's for just $1595.

In VAX™ environments, SAS/GRAPH and Tektronix communicate via asynchronous ASCII protocol. In IBM environments, the new Tektronix 4970 SNA/SDLC Cluster Controller allows for easy host interfacing of up to four graphics devices.

SAS/GRAPH, the Tektronix 4105 and 4695—high-quality graphics for less than the cost of a new programmer.

To learn more about SAS/GRAPH, call or write SAS Institute Inc., Box 8000, SAS Circle, Cary, NC 27511-8000. Telephone (919) 467-8000. Telex 802505.

For information on the Tek 4105 and 4695, call or write Tektronix, Inc., PO Box 1700, Portland, OR 97208. Telephone (800) 547-1512. In Oregon: (800) 452-1877. Telex 910-467-8708.

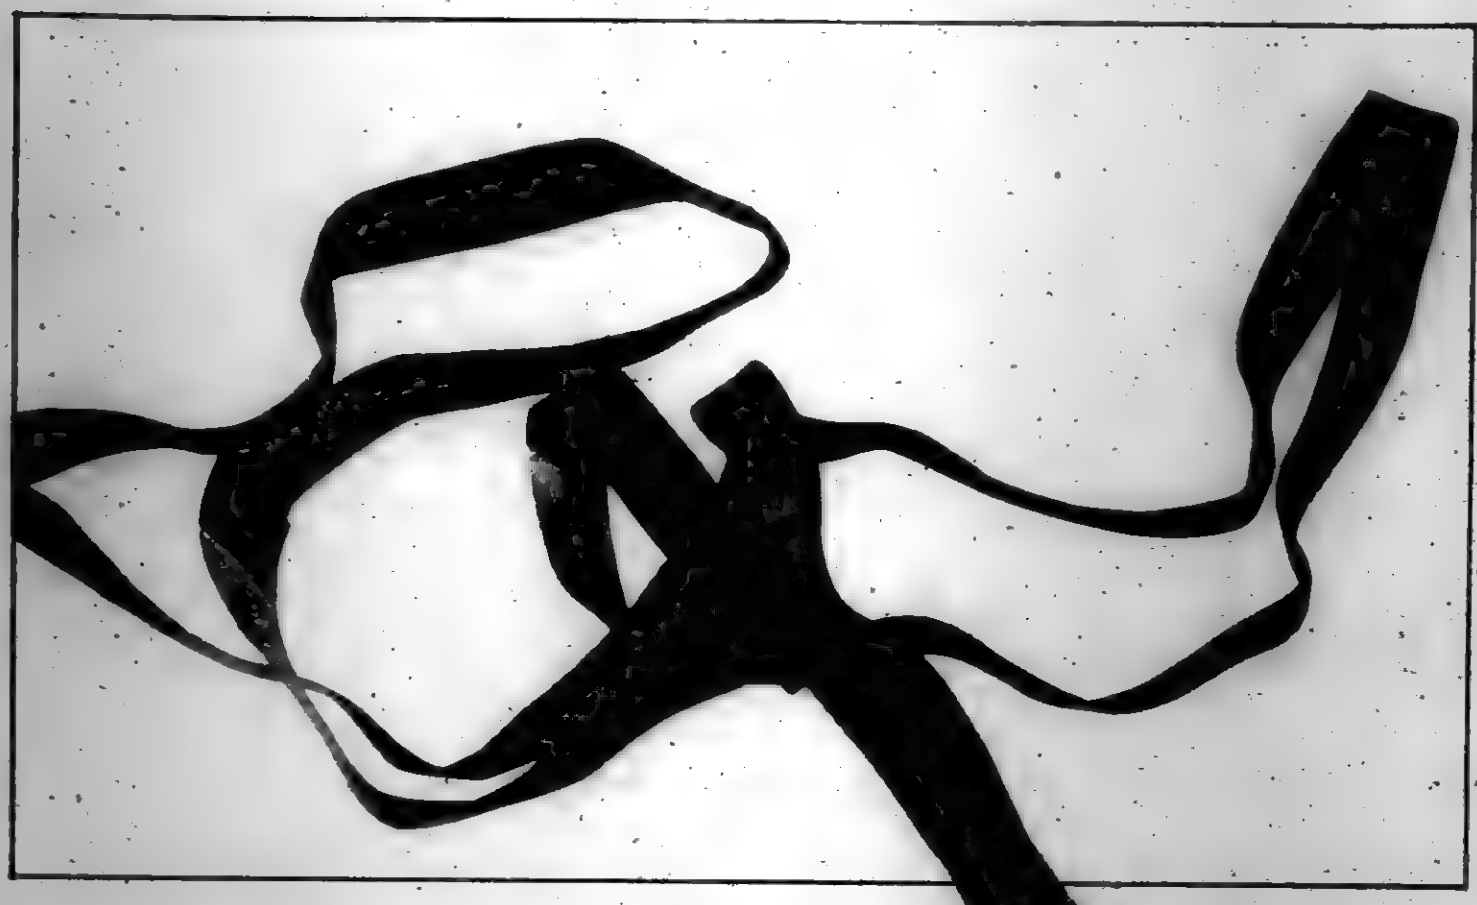
IN DEPTH



A simple measure of software complexity

By Lem O. Ejiogu

Every science must have its own method of investigation built on a sound foundation that is empirical, justifiable and verifiable. Software metrics, too, can benefit from this principle. A complex aggregate of tools, ideas, methodologies, programming languages and varieties of applications go into the development, design, manufacture and maintenance of software. The combinations impose another level of complexity on software.

Despite the amalgam of thoughts and practices, it is possible to select some significant variables to model a measure of software complexity that can be simple, empirical, verifiable and generally applicable.

Scientific investigations traditionally concentrate on critical factors surrounding a phenomenon and build a theory on them. For instance, the tree is used to abstract certain properties of natural relationships, as in genealogy, chain reactions or organizational personnel structures. In software engineering, the tree models data structures and control structures. In a sense, it empirically describes the thing we do.

This time-honored mathematical tradition of modeling with a tree will be extended here first to reveal some attributes of software structure and then to derive a simple model for measuring software complexity. Unlike its counterparts, this model will be applicable to every piece of

What software engineering needs is a metric that can appeal to all software practitioners, irrespective of programming environment or educational background.

software, new or existing. In a nutshell, we have a tool to measure the complexity of every piece of code, large or small.

Software complexity is the first consideration in measuring programmer productivity. Beyond it come other software measures such as structuredness, correctness and reliability.

Conventional measures of software complexity have so far proved unsatisfactory, and many have unsound logical foundations. One of them, lines of code (LOC), is generally discredited. It is biased in favor of programmers who do not optimize their codes. The other, Halstead's Software Science (actually a variation of LOC), does not give the practitioner any intuitive notion of complexity, structuredness, correctness or reliability; nor of whether software is structured or not. In addition, many of its formulas are founded on unproved assumptions.

The Cyclomatic Complexity Measure relies on graphs of software modules. The graphs, also devoid of structured foundations, can become cumbersome for large systems. This measure, too, has received a very limited application.

Empirical studies in the natural sciences have demonstrated that a proper and rational description of a phenomenon can be best approached through abstracting its natural properties or behaviors rather than imposing artificial attributes that might be the product of incomplete human observations. The model advocated here will, unlike its counterparts, be above bias. It is indeed universal, because not only does it apply to every piece of software, it can be used anywhere by anyone who works in software development.

In addition, the model is very easy to compute and may even be automated. Only three variables drawn from the attributes of the tree need be multiplied and the inverse/reciprocal taken. The reason for this reciprocal again follows from the natural property of the phenomenon called complexity. As the size of a system grows, our ability to comprehend its parts diminishes greatly; this growth and its impact on us are inverses to each other. We interpret this experience as the degree of complexity that the system imposes on us.

In the familiar mathematical language of limits, we say that our measure tends to zero as the size gets very large (or tends to infinity). Therefore, this reciprocal expresses our experience naturally and realistically.

But first, in order to avoid any ambiguity or confusion, we remind the reader that there are at least five categories of software complexity:

1. Structural complexity has to do with the natural expression of the topological relationships of a system's components. This theme will be explored here. Structural complexity is more than just the effects of control paths; it is the global attribute of every software module.

2. Computational complexity concerns the relative difficulty of accomplishing arithmetic/logical computations of algorithms on data. This complexity is not an immediate attribute of software, but of algorithms.

3. Logical complexity has to do with the relative difficulty of logical decisions or flows and branches within a system. This is a diminutive or localized structural complexity.

4. Conceptual complexity has to do with the psychological perception or the relative difficulty of undertaking or completing a system; one may also include diversity of human and material resources.

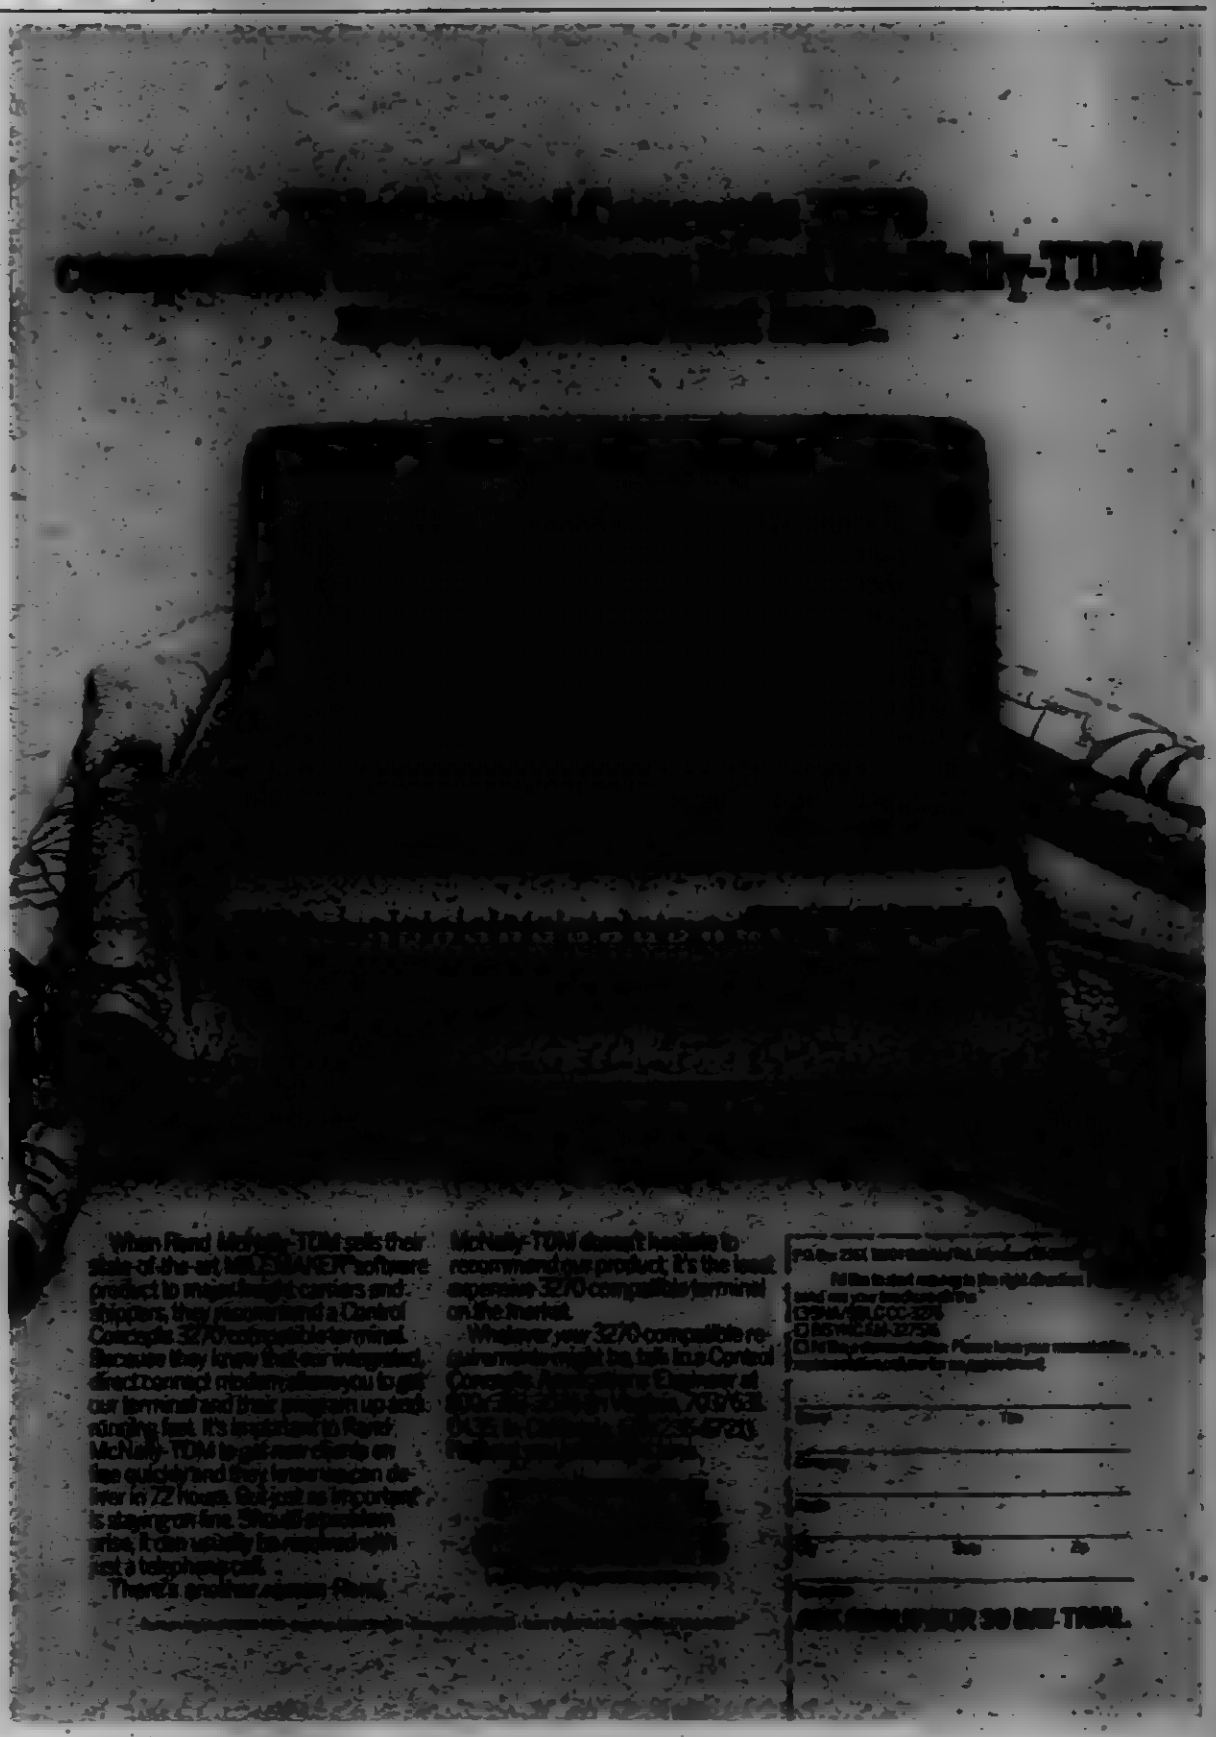
5. Textual complexity has to do with the static analysis of (program) source texts; this condition influences readability. The number N of potential programmer's errors varies as the number W of mental discriminations. Halstead used this psychological assumption to establish the relation $N = k W^{4/3}$, where k is a proportionality constant.

The model advocated here will, unlike its counterparts, be above bias. It is indeed universal, because not only does it apply to every piece of software, it can be used anywhere by anyone who works in software development.

With this preamble, we shall draw our notion of structural complexity from that of Pierre Teilhard de Chardin as the quality a "thing possesses of being composed (a) of a larger number of elements, which are (b) more tightly organized among themselves. In this sense, an atom is more complex than an electron, a molecule more complex than an atom. . . ." The concepts "number of elements" and "tightly organized" can be expressed in a tree structure.

Failure to qualify software complexity as structural, computational or logical will only aggravate the current confusion about what to measure or count.

Some researchers confuse software complexity and software structuredness. Some even treat structuredness as a subattribute of complexity. On the contrary, the two topics are distinct except that complexity affects structuredness. As a subject of its own, like computational complexity, software structuredness is a problem of design — it is defined at design while structural



complexity is "absolute" with a system. It is the relation of conglomerates of thoughts expressing the functional composition of the system. Structuredness is measured differently, though using the same design blueprint as for structural complexity.

An advanced understanding of structuredness based on formalized metrics holds the key to what is meant by "well-structured." Beyond, it offers us another model comparison of software productivity. We can independently verify the work of the designer.

But a potential reason for the choice of the tree as an abstracting mechanism, besides its place in mathematical tradition, is the meaning of its nodes. A node ordinarily represents an aggregate of thought.

Failure to identify completely all the nodes of a system's tree or even carefully or completely refine them is a major cause of software hazards — sporadic failures, frequent need for maintenance, prolonged and unsatisfying testing, stubborn and agonizing debugging and delayed, costly delivery.

Essentially, it represents a unit of activities or functions. In this way, a node is a central idea for processing data; it enables us to concentrate on a particular activity while postponing or "ignoring" others temporarily, only to return to them, one at a time, after "satisfactorily" completing the current node of activity.

But more important for purposes of control and management, the picture of a pattern of nodes is easy to remember in contrast to masses of lines of code or operators and operands. Such a picture gives us a sense of the structure of a system or object. The human mind remembers regular patterns or events better than amorphous or unorganized masses.

Our natural powers to handle complexity are limited, and the mind actually handles information one piece at a time. The practice of concentrating on one node before going to another is strongly emphasized by the advocates of structured programming. These ideas of modeling software metrics based on the hierarchical tree of nodes originated from my recent research in structured programming. They are a consequence of the structured revolution.

It seems that we have resigned ourselves to a complacency of structured coding, structured design and structured analysis, using chief programmer teams and walk-throughs. The true consequences of structured programming have yet to be revealed through intensive research. One such consequence is the set of empirical structure metrics (including an unbiased formula for programmer productivity) that would enable us advance and control software productivity, thus creditably earning the prestige of software engineering. Without effective metrics, software engineering lacks the technical discipline due it. The discovery and availability of effective software metrics are crucial for measures of programmer productivity.

It is false reasoning that "any method" is better than none. On the contrary, a poor method has the potential to blind or demoralize the creative search for an effective method. This is the possible impact of the several conventional unsound metrics now being used as measures of programmer productivity — from lines of code to function points; from counts of operators and operands to the hypothetical "on the scale of X," where X may be 10 or 30 or 911.

It is remarkable that although software science claims to measure algorithmic or computational complexity, it actually measures textual complexity, which has nothing whatsoever to do with programming effort, since it does not measure the complexity of computing associated with the operators and operands. It merely counts them; it does not explain how bugs are related to operators or how to use its formulas to verify a design or coding.

Of course, the controversy still rages over what to count — a defect inherited from unsound definition. This misconception of its advocates is misleading because the ability to read (and, hence, identify operators and operands) is not the ability to analyze or design or code a program. The latter are some of the factors that concern programmer productivity. Readability is less significant (except for maintenance) since a non-programmer can read a program; it is no wonder some researchers are using these formulas of software science to study English texts or computational linguistics.

One further benefit of the tree-node methodology is its refinability. A node as an aggregate of thoughts or activities can be refined to uncover its elementary members or subunits. This refinement can be carried out repeatedly so that eventually, the ultimate monadic functions (lowest-level units of activities) are identified in their succession of details.

Failure to identify completely all the nodes of a system's tree or even carefully or completely refine them is a major cause of software hazards — sporadic failures, frequent need for maintenance, prolonged and

THE SOFTWARE SHUFFLE ENDS.

You have better things to do than to run from one computer show to another searching for your software needs.

INFO/Software puts an end to all the running around.

INFO/Software is the complete, across-the-board Show for business software. Exclusively software. Especially for corporate executives.

No matter what kind of software you want, or what kinds of hardware you have, you can go to one Show to see, test and compare the entire spectrum of applications and operating systems.

Mainframe software. Minicomputer software. Microcomputer software. And software services.

Your program will be easy to find, thanks to INFO/Software's unique Software Information Center. Just tell the attendant what kind of program or business system you want, and the model of your computer. In moments, you'll get a printout listing the names, booth locations and product descriptions of INFO/Software exhibitors who have the programs and services that meet your needs.

Alongside the most complete software Show will be the best source for managerial solutions to your complex software problems: the INFO/Software Conference.

Software News Editor, Ed Bride is Conference Chairman and the roster of Conference Advisors includes some of the best minds in the computer industry:

Dr. John H. Bennett,
Corporate Director,
United Technologies

Bruce Coleman,
President,
Informatics General Corporation

Frank Dodge,
President,
McCormack & Dodge Corporation

Ray Epich,
Vice President/MIS,
Northwest Industries

Dave Ferris,
Software Industry Consultant

Martin A. Goetz,
Vice President,
Applied Data Research, Inc.

Gilbert H. Hoxie,
Chairman,
Context Management Systems

John Imlay,
Chairman,
Management Science America, Inc.

James Magee,
Partner,
Arthur Andersen

Alan Perlman,
MIS Manager,
Northwest Industries

Larry Welke,
President,
International Computer Programs, Inc.

They'll be speaking on the most relevant, most timely, most important topics that affect executive's business software decisions. Topics like "Micro-to-mainframe: access vs. security"... "Integrated mainframe applications: what do they mean to the end user?"... "Information Center Operation"... "Business Graphics"... "Overseas Operations: selecting software"... plus a software CEO Panel Discussion and more. The INFO/Conference will, of course, cover the entire spectrum of mainframe, mini, and microcomputer software, operating systems and applications.

So end the software shuffle. Come to INFO/Software. The one Show that brings all your software needs together.

mentifying testing, stubborn and agonizing debugging and delayed and costly delivery.

What is more reassuring is that a well-known principle does exist for carrying out and verifying this process of refinability: the principle of inequivalence. It is common experience that the software activities of UPDATE, VALIDATE and READ are inequivalent. Each belongs to a distinct equivalence class of activities and is, therefore, representable as a node.

The most useful aspect of the model of software complexity offered here is its feedback effect on software productivity. The practice of using LOC leads to redundant coding, besides giving a false sense of largeness. By our new definition, any (average) practitioner can independently verify the measure obtained; that is, the nodes approach can rationally lead us to justify and verify the things we do. For any system, we can identify and qualify each unit of thought.

This feedback effect has some psychological, practical results. How can a software metric help us understand and produce better software? There are several answers to this question. Among them is effective control — manifesting itself best in complete refinement of nodes. The ultimate purpose of hierarchical refinement is to identify *all* the sequences of details (functions and nodes). With this measure of complexity, a walk-through session can gain added importance. There, a design blueprint will be verified for completeness of refinement, as well as for correctness of requirements specifications against the corresponding code blueprint. Each algorithm of each node may be further isolated and verified.

This is disciplined control of productivity. When these metric influences are considered for design applications, software productivity will be enhanced. The practice at some centers of compliminting a volume table of contents (Vtoc) with flowchart or decision table methodologies is a signal that the target system has not been completely refined.

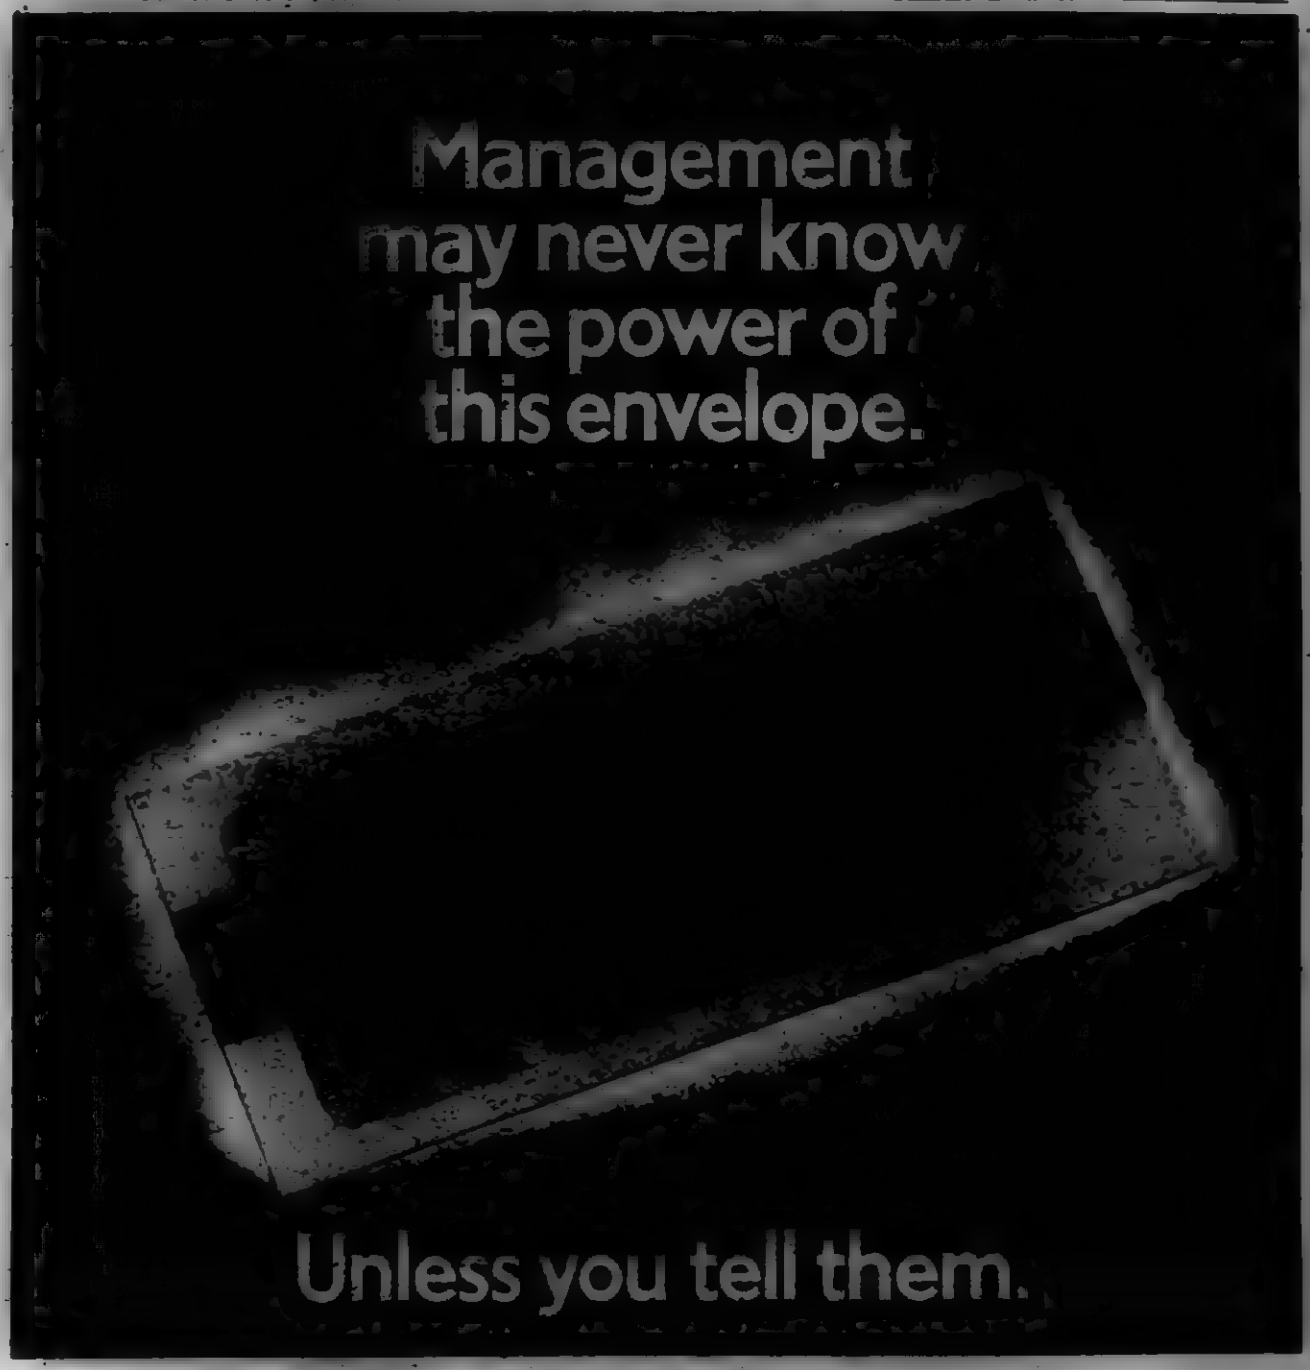
In addition, this metric can provide rich information about the quality of software design. In particular, it will enable us to gain confidence about how well-structured the software design is. A simple test of a well-structured design is to have the derived blueprint correspond node-for-node with the generated blueprint of the same system.

But a more critical feedback effect is cost control. It can be argued that software cost is strongly influenced by some modes of complexity, especially structural and computational, and less significantly by logical and conceptual. The use of LOC is very crude, at best, since software size is determined by structural complexity.

Just as the cost of an electronic device is the sum of the costs of its constituent components rather than of masses of wires and resistors and capacitors, so also may software cost be seen as the sum of costs of its constituent nodes, rather than of masses of LOC or operators and operands. The number of nodes depends on the variables: Level, L, explosion number, E, and monadicity, M. For instance, the cost of an UPDATE/VALIDATE node can be established on the bases of number of refined nodes and their corresponding I/O elements.

When this principle is thoroughly grasped, the malaise that currently grips software forecasting will

By our new definition, any average practitioner can independently verify the measure obtained; that is, the nodes approach can rationally lead us to justify and verify the things we do. For any system, we can identify and qualify each unit of thought.



You don't have to tell management how easy it is to implement *E-COM* service. That can be your secret. Tell them instead about the power of an E-COM service mailing. How letters can be sent right from the company computer. How the Postal Service prints, folds, inserts, seals and delivers these letters for you. How the distinctive blue envelopes of E-COM service lend visibility and impact to your mailing.

Since you're the one who gets E-COM service up and running, you have three options—all of them easy. First, you can write the system interface yourself. It takes about a day, and Postal Service consultants are standing by to give you any help you need. Second, you can buy a dedicated interface from a third-party vendor. Third, you can access E-COM service through an independent communications carrier, without bringing the system in-house at all.

As part of the D.P. department, you're in a unique position to tell your management about the power of E-COM service. So find out more. Send us the coupon you see here. You may never again get so much credit for so little work.

*Electronic Computer Originated Mail

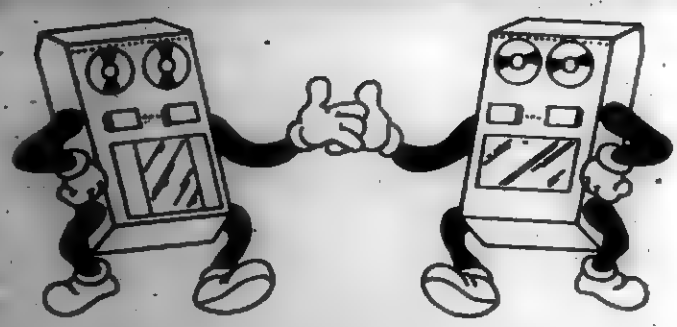
OUR SWITCHES MAKE YOUR IBM SYSTEMS WORK LIKE A TEAM!



If you have more than one IBM or plug compatible processor, Digital can help you get the most for your hardware investment. Our switches allow you to achieve backup and peripheral configuration flexibility at a fraction of the cost you're probably thinking.

Whether you have two processors or more, Digital has a switch to suit your requirements.

- Model 4101 The lowest priced matrix switch on the market.
- Model 3421 The only manually operated channel switch in the industry.
- Model 3455 A remote controlled channel switch designed for underfloor installation.

gradually fade away. For then, we can experimentally construct hypotheses using our new software structure about the potential size and cost of a software project (in development) against some background of tentative estimate of nodes and corresponding cost assignments — perhaps emulating the methods of the Simplex algorithm. This technique can be used at the start of a project, whereas in current practice, no technique exists for software forecasting until after coding.

In this simple model for software (structural) complexity, three attributes of a tree structure are used for abstraction:

1. L — level, or the maximum of the heights of nodes above the root node. L measures the reality of deep nesting of nodes.

2. E — explosion number, or effect of rotation of branches of the root node. E measures the circumorthogonal "weight" of complexity. The explosion number we use is the sum of all nodes at level 1; and these nodes are the immediate twins of the root node.

3. M — monadicity or totality of leaves of a tree (signifying the intensity of refinement). The leaves are the only nodes without explosion numbers. M is summed through all explosion numbers. M measures the "bushiness" of the tree (system). In order to count a node exactly once, we constrain M = 1 at L = 1.

From applications experience, as the level increases (tall tree), the more complex the system and hence more difficult to design or code. The same psychological effect is experienced with E, the number of branches of the root (these are the nodes at level L = 1). Monadicity, a measure of "bushiness," imposes on us a similar effect.

These three effects in a sense multiply our intuitive feeling of complexity. Therefore, we interpret this sense of complexity as:

Image of software complexity, C = L x E x M.

Finally, using the ideas of reciprocal discussed above, we define (in terms of degrees) the "complexity" imposed on us by the system as:

Degree of software complexity, $D_c = 1/C$.

Simplicity is the strength of comprehension.

A good metric must somehow describe what it measures; it must give us an intuitive feeling of the object being measured.

A critical asset of this methodology is the lack of ambiguity about what to measure or count. When a design blueprint is used for measure, the nodes are explicit; but when a code blueprint of a system is used for measure, the nodes are implicit. However, they can be derived explicitly. For instance, in the Ada programming language, the following are qualified nodes at their various points of description: PROCEDURE, PACKAGE, SUBROUTINE, FUNCTION and so on. For Cobol, the Procedure Division is the root node; other nodes are section name and paragraph name. Each programming language has its own "tokens" of nodes. Moreover, for each module, we can sketch a blueprint of them. In neither language is data structure a candidate node, since the data structures are variously associated with the nodes as input and output elements.

For a software design generated or produced according to function decomposition methodology, the

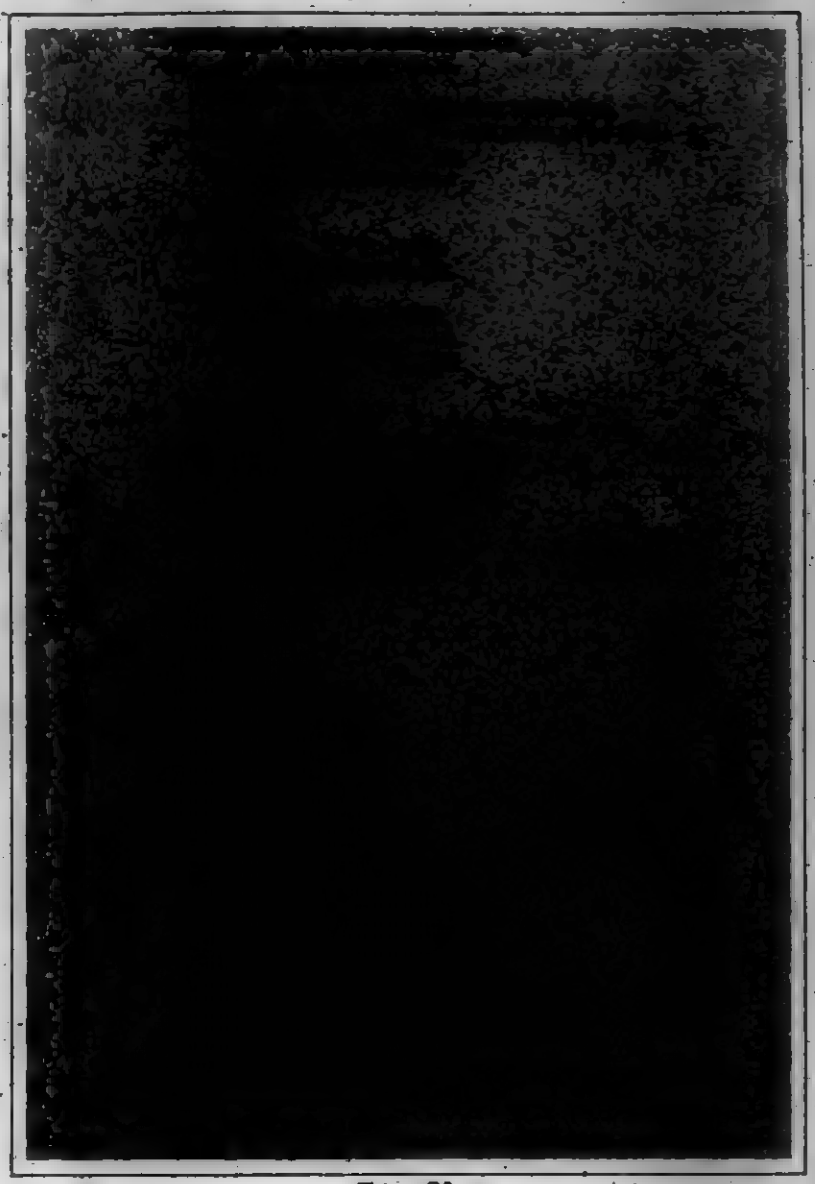

Figure 3A

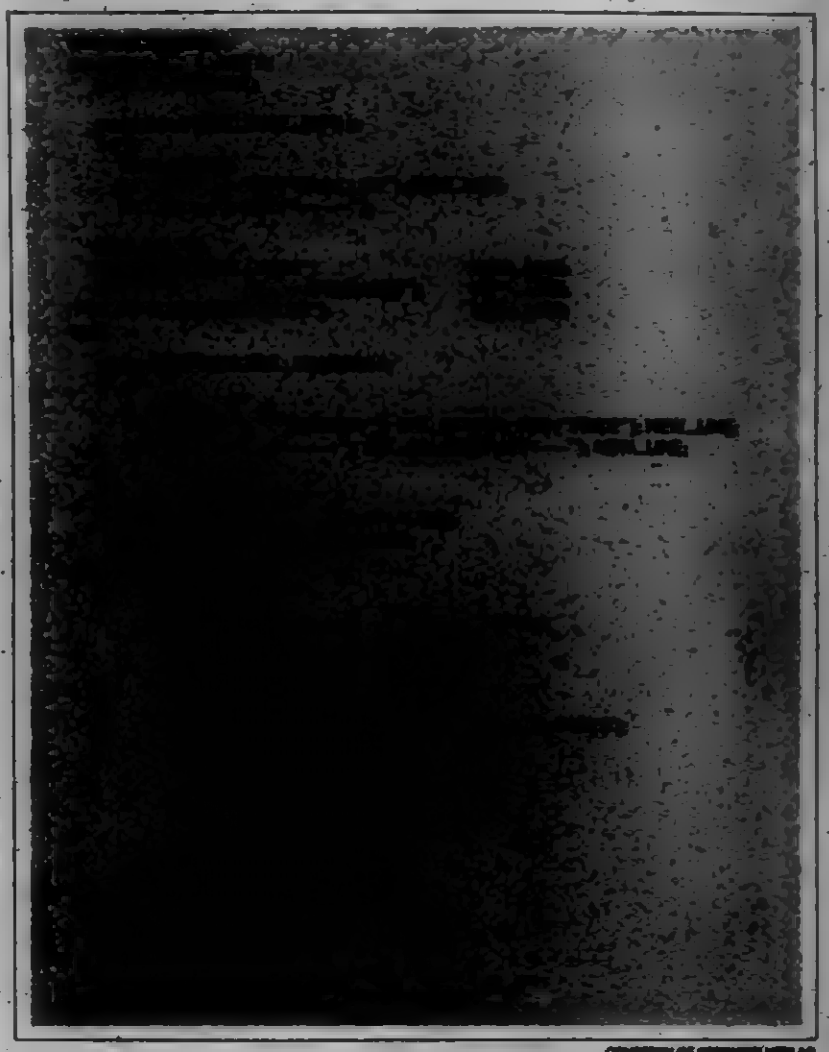
nodes are easy to identify on the design blueprint or similarly. On the other hand, for other methodologies and including existing software, we can derive a blueprint of tree hierarchy of nodes as follows: Plot the pattern of nodes using the tips described above [Ada, Cobol and so on] by following the PROCEDURE CALLS or nestings of PERFORM labels.

In essence, if in a certain PROCEDURE CALL or PERFORM paragraph there is a PROCEDURE CALL or PERFORM statement, then the latter is plotted as a child node of the former PROCEDURE CALL or PERFORM paragraph. In this way, the plot shows how the system was refined at design and how it presently operates. Each PROCEDURE CALL or PERFORM paragraph is treated as a single-entry/single-exit path. But the code blueprint can justify or refute the adherence to this structured principle. This is another feedback effect of this measure. For example, an EXIT-in-the-MIDDLE degrades structuredness.

Finally, apply the above simple formula to the derived design blueprint to compute the degree of complexity by counting L, E and M, respectively. In this way, we can measure the structural complexity of every piece of software as well as

Figure 3B



COURTESY OF BYTE/MCGRAW-HILL

Figure 4

compare two or more pieces.

This formula is unbiased, consistent, verifiable and invariant. Like structured programming, it does not depend on any programming language or computing environment or design methodology. Besides, it is simple and easy to use for both programmers and managers alike, and it does not require paperwork as do other methodologies for measuring programmer productivity. Its unequivocal elegance is that besides giving us a picture of what is measured, it is exactly based on what we do and not on how we are disposed.

An effective metric has other desirable qualities, especially for software engineering. A good metric must somehow describe what it measures; it must give us an intuitive feeling of the object being measured. This intuitive feeling comes from the perception of the nature of the object — more specifically, its structure. In other words, we must first understand the structure of the entity being measured. There is no way to measure anarchy.

But a more profound desirable attribute of an effective metric is the potential for comparison. If, for instance, a metric measures distance, it must permit us to confirm that Boston is farther from Chicago than Buffalo. If it measures electric power, it must show consistently that over the same time interval, a steel manufacturing plant consumes more power than a candy store. The metric proposed here for software complexity satisfies this comparison criterion because the total number of nodes, N, depends on L, E and M. Any variation in any factor reflects on D_e. Therefore, we can compare two or more pieces of software.

Furthermore, the metric enables us to know equivalent (or isomorphic) systems, irrespective of their types of application or programming language. Two systems are isomorphic if they have the same number of nodes per corresponding (levelwise) parent. A metric that does not guarantee formal comparison is simply useless.

If two pieces of software differ in structural aggregation, the costs associated with them also differ in economic evaluation. Software costs remain a critical driving force for research into software metrics. Such metrics must, therefore, have the intrinsic potential for comparing software. The potential for comparison is mutually associated with the need for universalism of application.

Those metrics founded on structured programming principles have the best hope of universal acceptance since structured programming is independent of programming languages and environments. Its basic principles are invariant.

We shall give two categories of examples — one using the original hierarchical tree (design) blueprints; and the other (examples 3 through 5) the derived hierarchical tree (from code) blueprint.

Example 1. One-level tree. Let us consider three different cases.

Case A (Figure 1A): The tree has only one node. L = E = M = 1. Therefore, C = 1 and $D_e = 1/C = 1$. This is a very rare case, showing the least complexity.

Case B (Figure 1B): The tree has four nodes. L = 1; E = 4; M = 1 (by constraint; this approach avoids counting any node twice for E and M). Therefore, C = 1 x 4 x 1 = 4; and $D_e = 1/4 = 2.5 \times 10^{-1}$.

Case C (Figure 1C): The tree has five nodes. Thus, L = 1; E = 5; M =

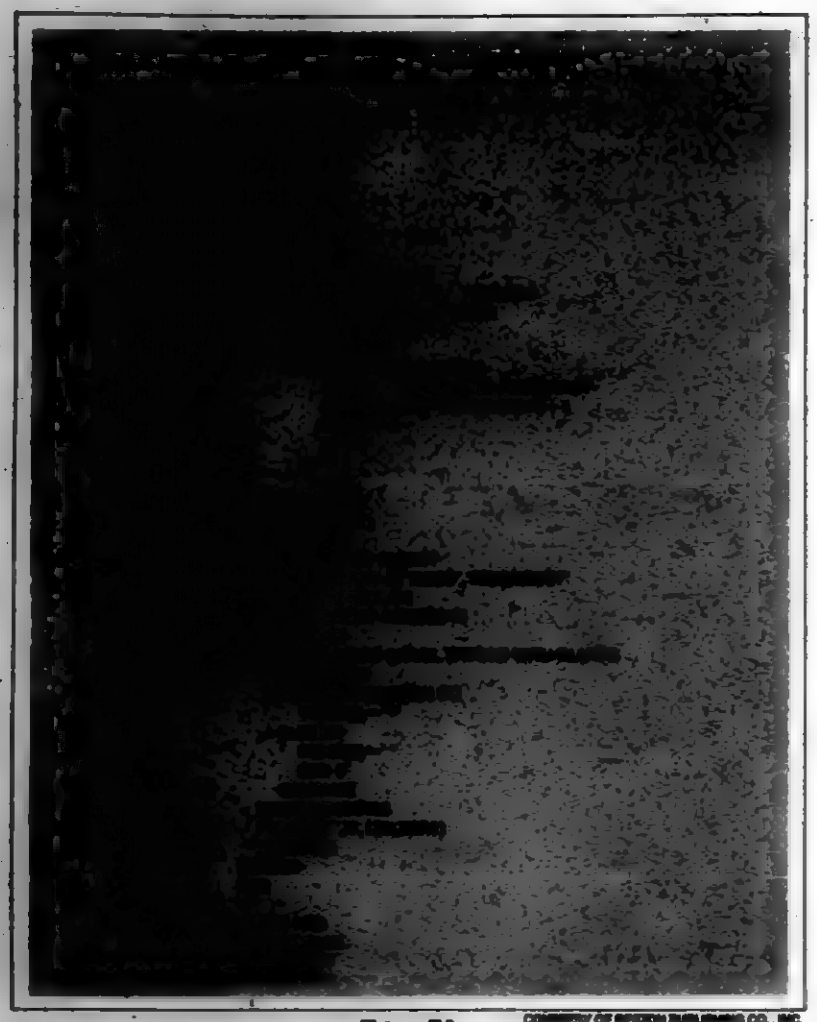


Figure 5A

COURTESY OF PRENTICE PUBLISHING CO., INC.

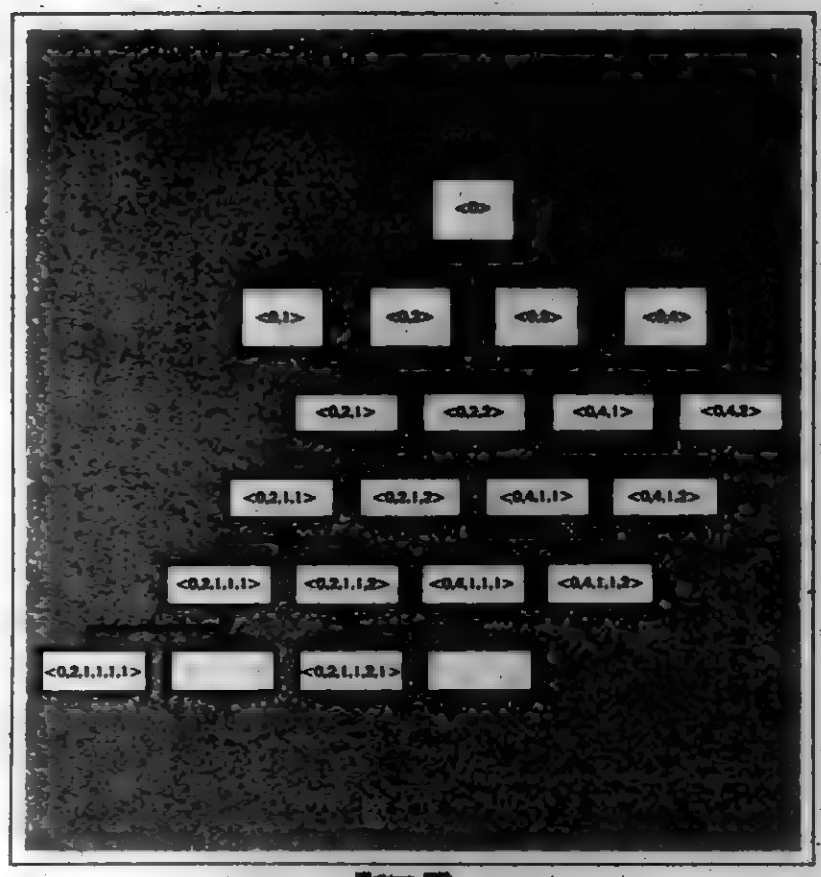

Figure 5B

1. Therefore, C = 1 x 5 x 1 = 5; and $D_c = 1/5 = 2 \times 10^{-1}$.

Example 2. Multilevel tree. In Figure 2, L = 3, E = 4 and M = 4 + 4 + 4 + 4 = 16. Therefore, C = 3 x 4 x 16 = 192 and $D_c = 1/192 = 5.208 \times 10^{-3}$.

The only practical hint for deriving hierarchical trees from code blueprints is a fair adherence to good structured coding and breaks in boundaries of thought as expressed in the statement instructions.

Example 3: Derived tree of a Cobol module. In this example, only the structure labels and key control instructions are excerpted (Figure 3A). The derived hierarchical tree is Figure 3B.

Using the formula, L = 3, E = 5 and M = (2) + (3) + (4) + (5) = 14. Therefore, C = 3 x 5 x 14 = 210; and $D_c = 1/210 = 4.76 \times 10^{-3}$.

Example 4: Derived tree of an Ada module. The structure of Ada modules is a classic style of node abstraction. Procedure, package, function, subprogram, task and so on are valid candidates for nodes. Essentially, the tree representative of the Ada module is simply a natural derivative of the generated hierarchical abstraction, provided it is properly logically organized.

Figure 4 is a sample Ada module (from *Ada Programming, an Introduction*, by Henry Ledgard, 1981), and Figure 1B is its equivalent derived tree. Notice each procedure with its begin-end constitutes a node; also, the first declaration of procedure (PRICE_LIST) is the root node to these other procedures. The annotated nodes are, by procedure:

<0>: Root node, R = PRICE_LIST.

<0,1>: Explosion No. 1, A = PRINT_TITLE_INFO.

<0,2>: Explosion No. 2, B = PRINT_COL_HEADERS.

<0,3>: Explosion No. 3, C = PRINT_PRICES.

<0,4>: Explosion No. 4, D = MAIN_PROGRAM.

Since the derived tree is as in Figure 1B, D_c is as computed in Example 1, Case B. This is another feedback effect, this time obtained from the principle of isomorphism. The design (if possible, derived) blueprints of two or more modules or systems have the same structural form, irrespective of the type of application (including programming languages).

Note: In some modules, each maximal subtree may be refined into other child subtrees. In this case, the complexity grows, but the computational formula remains invariant.

Example 5: Structured Fortran. Fortran, much criticized for inflexibility to structuredness, can nevertheless benefit from this new philosophy. The derived hierarchical tree in Figure 5B is based on a coded example from Figure 5A (*Fundamentals of Structured Programming Using Fortran With SF/K and WATFIV-S*, by R.C. Holt and N.P. Hume, 1977).

The key words: DO, IF, DOWHILE, PRINT, READ, WRITE and so on are the abstracted nodes.

A useful aid to identifying twins from the same parent node is to use correct structure coding — all twins are aligned on the same column, assuming well-structured coding. This technique also applies to many other scientific languages. This is one more example of feedback from this metric philosophy — an improvement over structured coding. From Figure 5B, the following measures are true: L = 5; E = 4; M = 0 + (6) + 0 + (4) = 10. Therefore, C = 5 x 4 x 10 = 200; $D_c = 1/200 = 5.0 \times 10^{-3}$.

Dataproducts Daisywheel Printers

MICROCOMPUTERS

Omninet goes low-cost

SAN JOSE, Calif. — Corvus Systems, Inc. has introduced two product lines designed to create lower cost versions of its Omninet local-area network for personal computers.

Omninet is the most popular micro local-area network, according to Corvus, which claims an installed base of more than 7,500 networks serving over 70,000 computers and peripherals.

Corvus' new Omnishare network product allows an IBM Personal Computer or Personal Computer XT hard disk drive to emulate a Corvus disk system and create an inexpensive Omninet. The firm's new Omnidrive Winchester drives, expected to replace most of the Corvus line of hard disk drives, include built-in local-area network interfaces.

Omnishare permits users to decide how much space on the Personal Computer XT disk will be dedicated to the host computer's stand-alone applications and how much space will be shared by other Personal Computers and XTs on the network, Corvus said. The emulator program runs as a background task on the host computer, allowing an application program to be run in the foreground.

Omnishare features most characteristics of a standard Omninet, except that disk storage is limited to that of a single XT, according to Corvus. The Omnishare package, selling for $795, consists of emulation and Constellation II software, an XT transporter card, Omninet cable and a manual. Shipments are expected to begin next month.

The firm said its new 5¼-in. Winchester drives "are the first disk drives designed specifically for use with a net-

See CORVUS page 76

Compupro adds system

HAYWARD, Calif. — Compupro, Inc. has announced System 816/F, a multiuser Intel Corp. 80286-based system that Compupro claims is twice as fast as those based on Intel 8086 and Motorola, Inc. 68000 chips.

The system features Intel's 80286 and 80287 microprocessors, 512K bytes of random-access memory (expandable to 1M byte), 12 serial ports, one Centronics Data Computer Corp. printer port, one parallel port, 1.5M bytes of hard disk storage and Digital Research, Inc.'s CP/M 86 and MP/M 86 operating systems. System 816/F costs $14,995, and first shipments begin this month.

Initially, the company is targeting sales to firms developing products for 80286-based systems. "The system will be used primarily for the development of new systems," said William Godbout, Compupro's president.

The company plans to add Unix capabilities to the product. "Currently, there isn't a version of Unix for the 80286," Godbout said. "It's a chicken-or-egg situation. Software companies need hardware to develop the operating system, and hardware companies need the software for their machines.

"When Digital Research develops Unix 5, sometime later in the year, we will offer it to our users," Godbout added.

System 816/F can easily support 10 users, according to the vendor. "One could go above that depending on the system needs, but it will not support 25 users," Godbout said. Users can tie stand-alone CP/M machines into the system.

Godbout estimated that the company will sell about 1,000 systems this year.

Electronic mail net lets micro managers share data

By Edward Warner
CW Staff

BOSTON — The Micro Manager's Association (MMA), a 225-member group based here, last month went on-line with its Executive Communication Network (ECN), an electronic mail system that will allow members to share information about microcomputers.

The ECN will provide users with an electronic mailbox and access to a general bulletin board and a special bulletin board covering their particular industry, according to MMA founder Marty Butler. Users will reach the ECN through their microcomputers and post their questions about micros, peripherals, local-area networks and micro software on the appropriate bulletin board. They will receive responses from others on the network via their electronic mailbox.

The ECN, which costs $150 annually to join, fits the MMA's purpose of "preventing people from having to reinvent the wheel" by letting managers working with micros share their knowledge, Butler said. Most MMA members, he noted, are known as vice-presidents for information systems or MIS directors, not as microcomputer managers, but they still are responsible for integration and management of the small computers in their firms.

Butler, a former software salesman, formed MMA in July 1983. The group now includes members from 85 Fortune 500 corporations, he said.

The Boston chapter, the largest, has no dues, but derives its funding from sponsoring conferences and from the ECN membership fee. Branches of the association also exist in New York and Los Angeles. The New York chapter has annual dues of $24, and the Los Angeles chapter charges $2 per meeting, Butler said. A Detroit chapter also is being formed.

The MMA is planning its first national conference, "Microforum '84," for June 14 in New York. The meeting, he said, will bring micro hardware and software vendors face-to-face with a panel of users representing the finance and insurance industries. "We want to let [vendors] know where the Fortune 500 stands on data

MICRO BITS/THOMAS MADRON

Should you buy a multiuser system or a local-area network?

When multiple microcomputer workstations with resource sharing are required, should we buy a multiuser system or link several micros with a local-area network? No answer to this question is completely satisfying, but there are some issues we can consider.

There are two main types of multiuser systems. One consists of a relatively powerful micro supported with a multiuser operating system, such as Unix, which allows concurrent access by more than one user. Alternatively, several single-user micros — each on a single board — can be packaged together with a single hard disk and related support services in a centralized system accessed through multiple terminals.

The alternative to these methods is to link several single-user microcomputers with a local-area network, one that allows a high degree of connectivity among nodes with limited geographic scope. One example is Ethernet, originally developed by Xerox Corp. and currently marketed by several manufacturers.

Frequently, the impetus for the acquisition of either a multiuser micro system or a network of micros is the need for several workers to share data, communicate through electronic mail or make more effective use of high-cost peripherals.

Impinging on the decision, especially in a large organization, are requirements for access to central computing facilities or integration in a larger network. Problems to be confronted include response time; the presence or absence of a single point of failure; and the impact of a failure on the system, centralized or decentralized support and cost.

In a recent report, Strategic, Inc. of San Jose, Calif., gave the allegedly higher cost of several micros supported by a local-area network as a reason for choosing a multiuser, multiprocessor system. Strategic quite rightly pointed out that an IBM Personal Computer/local-area network solution is not the only one that should be considered.

However, the recent introduction of the Personal Computer Cluster Program suggests the conceptual direction being taken by IBM. Certainly other micro manufacturers are making local-area networks available. Meanwhile, independent makers of these nets are scrambling for the micro market.

The local-area network marketplace includes baseband manufacturers (such as Corvus Systems, Inc., Datapoint Corp. and Xerox) and broadband manufacturers (such as 3M Corp. and Sytek, Inc.), with broadband suppliers in something of a catch-up race. All of these manufacturers either have personal computer products in place or are attempting to get such products out the door. The broadband local-area networks are especially appropriate in large organizations where the problem is connecting not only micros but minis, mainframes, terminals and a variety of other devices.

To clarify the local-area networks multiuser issue, we must remember two reasons why large organizations acquire micros: to boost productivity and to reduce reliance and resource consumption on central mainframes.

When micros are fully distributed, they should not only lead to pro-

Programming tools unleashed for Intel-based systems

NORWOOD, Mass. — Four programming tools designed for use in Intel Corp.'s 8086/8088-based systems running under Microsoft, Inc.'s MS-DOS, IBM's PC-DOS and Digital Research, Inc.'s CP/M 86 have been introduced by Phoenix Software Associates Ltd. The packages reportedly include a full screen text editor, a dynamic debugger, an object module linkage editor and a library manager.

P-Mate86 is a full screen, single-keystroke editor with automatic disk buffering for backward and forward paging; 10 auxiliary buffers that can be edited individually or used as scratch pads for cut-and-paste operations; horizontal scrolling for editing lines up to 250 characters long and a macro command language, according to the vendor.

P-Mate86 also offers automatic word wrap, text formatting, global or local setting of margins and tab stops and indents and can be configured for most popular video terminals or memory-mapped displays, the company said.

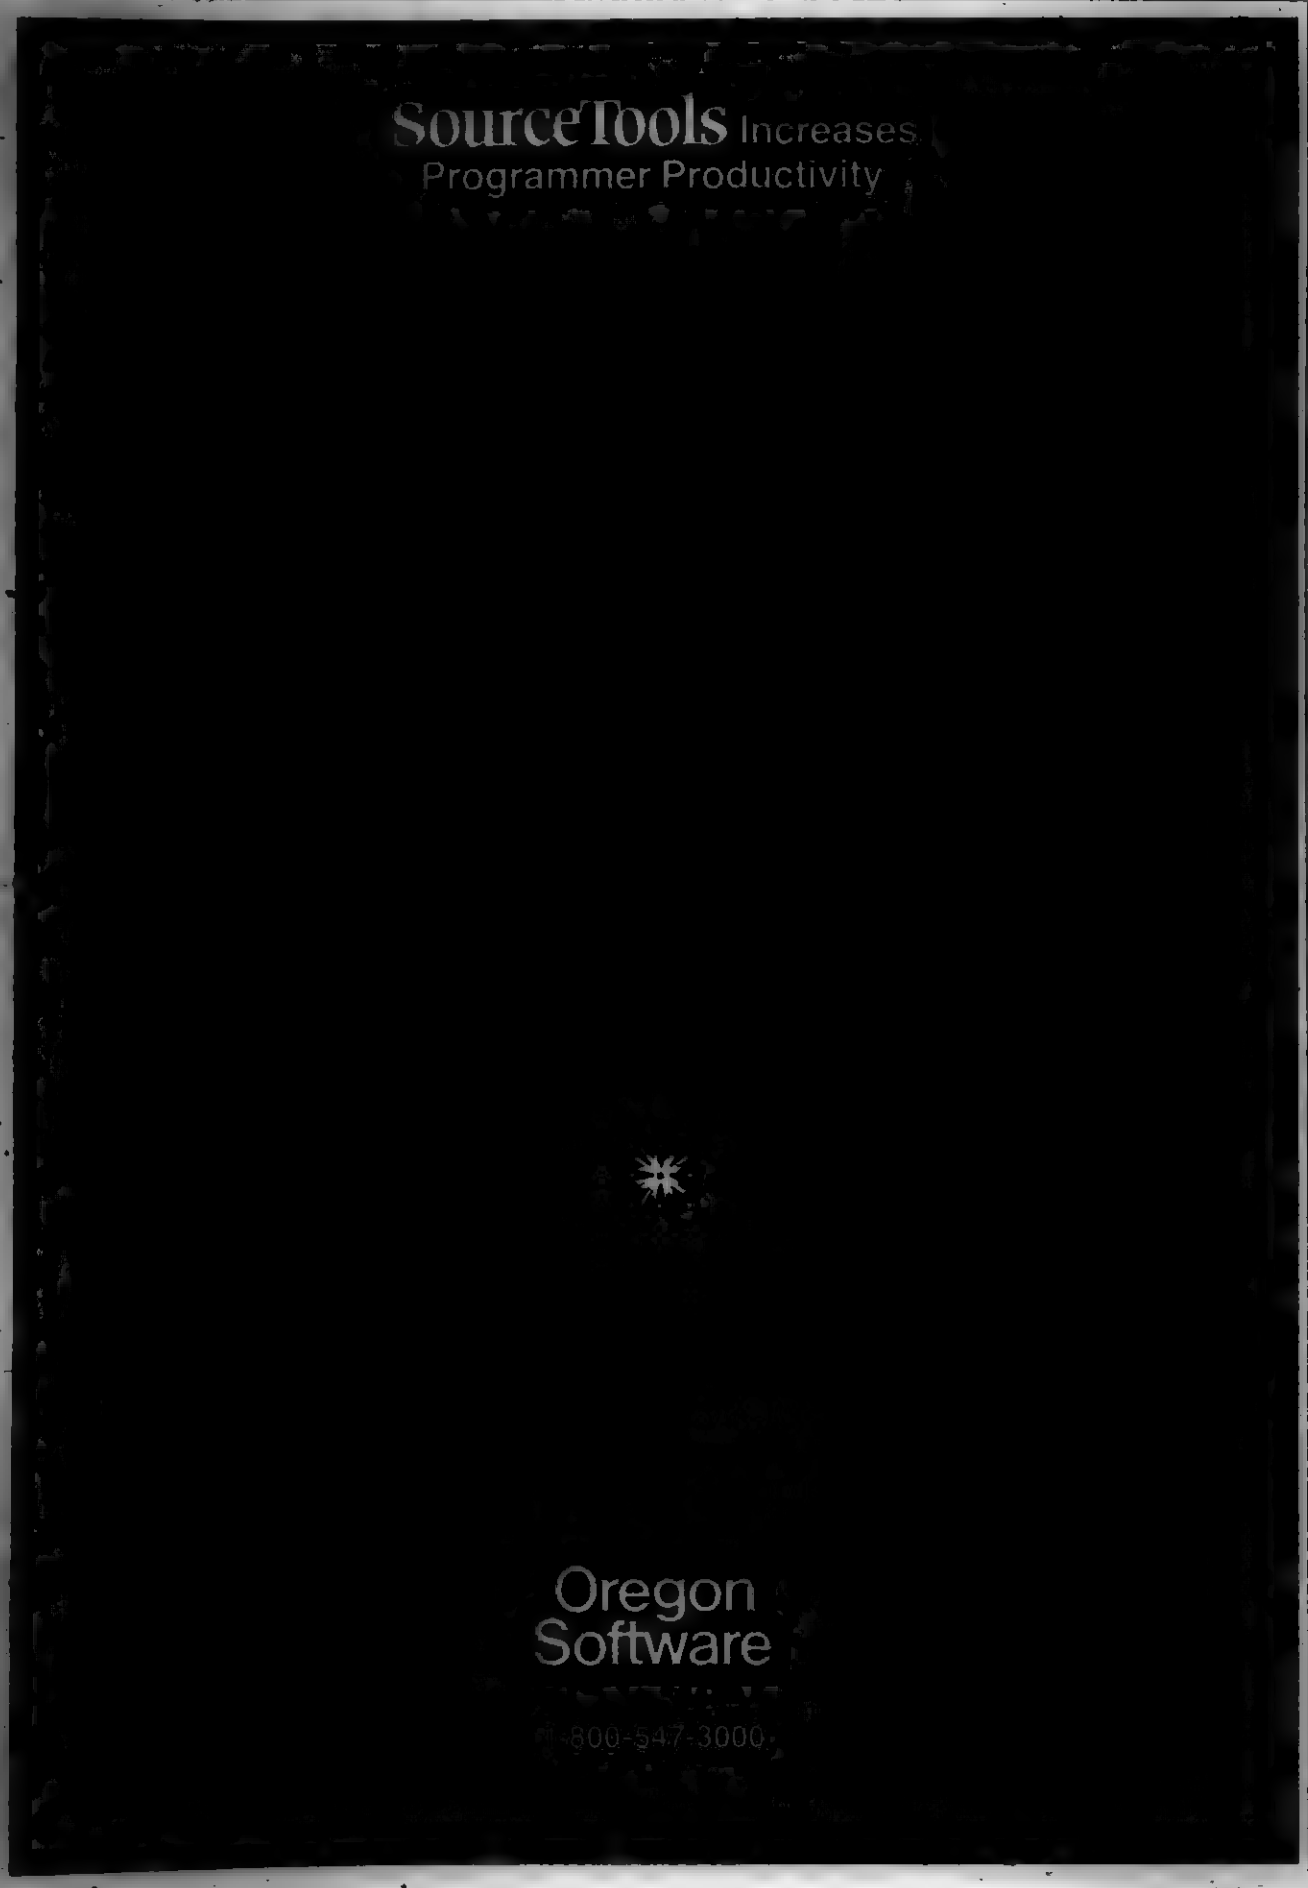
P-Fix86, Phoenix Software's symbolic debugger for MS-DOS, features windowed full screen display, in-line assembler and test evaluation at break points. The debugger can load the map produced by the P-Link86 linkage editor and uses the symbols and line numbers within the program under test. It is said to allow the data display to be interchanged with the screen of the program under test and provides windows for program data and file examination.

P-Link86 is a linkage editor that handles output from Microsoft and IBM compilers and assemblers, as well as others such as Lattice, Inc. or Computer Innovations, Inc.'s C. Overlays may be specified, with no modification to the applications program, to reduce program memory requirements and may be combined into one or more disk files, the company said.

P-Lib86, an object library manager included as part of the P-Link86 package, handles libraries built according to the Intel or Microsoft format. P-Lib86 can build libraries from scratch, delete modules from existing libraries, merge libraries and produce cross-reference listings, the company said.

Prices for the Phoenix software programming tools are P-Mate86, $225; P-Fix86, $245; P-Link86 (including P-Lib86), $395; and P-Lib86, $125.

More information is available from Phoenix Software Associates at Suite 260, 1420 Providence Highway, Norwood, Mass. 02062.



Etherseries enhanced, price cut

MOUNTAIN VIEW, Calif. — 3Com Corp. has announced one price reduction and two enhancements to products in its Etherseries.

The price of Etherlink, the company's Ethernet interface and user software for personal computers, has been reduced from $950 to $795.

Ethershare software now supports a single IBM Personal Computer as both a network server and workstation; a dedicated server is no longer necessary.

A new Etherstart product, a chip that is inserted onto a networking board, permits an IBM Personal Computer to function on the network without a local disk drive and controller.

The Ethershare software is priced at $595; the Etherstart chip costs $100. All products are available immediately, the company said.

More information is available from 3Com, P.O. Box 7390, 1390 Shorebird Way, Mountain View, Calif. 94039.

IF YOU MISS CW OFFICE AUTOMATION IN THE NEXT THREE MONTHS, LOOK AT THE ISSUES YOU'LL BE MISSING.

JUNE.

Microcomputers.

TI options allow Professional to talk to IBM CPUs

By Paul Kunsmanwski
CW Staff

HOUSTON — Introducing optional communications products that allow its Professional microcomputer to talk to IBM mainframes, Texas Instruments, Inc. hopes to loosen the stranglehold that the IBM Personal Computer holds on the Fortune 1,000 market. "The Professional has been designed to work in IBM's sizable installed base," said Jerry Rycaj, Professional product marketing manager.

Last month, Texas Instruments announced Professional enhancements that include a coaxial interface for IBM 3278 and 3279 display terminal emulation, a 3270 Systems Network Architecture software package to mimic IBM 3276 display stations and a 3101 terminal emulation package.

IBM communication protocols will play a key role in future product developments, according to Steve Beverian, product manager for the Professional. "We will develop products to emulate other 3200 series products," he added.

The company is selling the communications products through retail, value-added reseller and direct sales channels. "Most of our retailers have a direct sales force calling on large accounts," Rycaj said. "Our [value-added resellers] target specific vertical markets."

Rycaj listed three reasons why a large company would buy the Professional rather than the IBM Personal Computer: better graphics, a well-designed keyboard and easy expansion capability. "The Professional uses the same chassis for expansion, something that the IBM Personal Computer does not do," he noted.

Rycaj claimed that a number of large companies have signed volume purchase agreements with Texas Instruments, but refused to list specific customers.

SYSTEMS

KAYPRO CORP.
Kaypro 2 price cut

Kaypro Corp. has announced that the price for the Kaypro 2 has been cut from $1,595 to $1,295.

The Kaypro 2 features two double-density disk drives with 400K bytes of storage; a 9-in., 80-col. by 24-line screen; Zilog, Inc.'s Z80 microprocessor; and Digital Research, Inc.'s CP/M operating system, the vendor said. The microcomputer bundles Perfect Software, Inc.'s Perfect Word, Perfect Filer and Perfect Calc software. Users can have Micropro International's Wordstar word processing program instead of Perfect Word.

Kaypro, 533 Stevens Ave., Solana Beach, Calif. 92075.

PERTEC COMPUTER CORP.
Model 4210

Pertec Computer Corp. has introduced Model 4210, a microcomputer that uses Pick & Associates, Inc.'s Pick operating system. The system runs Pertec's Sabre software, a series of application packages designed for Pick.

Model 4210 features 256K bytes of random-access memory (RAM), a 10M-byte hard disk, a Motorola, Inc. 68000 microprocessor, four serial ports and an 800K-byte floppy disk drive.

Options include upgrading to a multiuser Model 4220, 1M byte of RAM, 80M bytes of Winchester disk storage, 12 serial ports and a streaming cartridge tape drive, according to the vendor. Model 4210 reportedly can be part of a 36-device network.

Model 4210 costs $9,400.

Pertec Computer, 17118 Armstrong Ave., Irvine, Calif. 92713.

POLYMORPHIC SYSTEMS, INC.
Poly 8/16

Polymorphic Systems, Inc. has announced a single-user, dual-processor microcomputer that utilizes Intel Corp.'s 80186 microprocessor and Digital Research, Inc.'s Concurrent CP/M 86 operating system.

A spokesman said Polymorphic's Poly 8/16 micro features a two-board set that includes an 8-bit Zilog, Inc. Z80 processor with 64K-byte random-access memory (RAM) running Digital Research's CP/M 80 on the system master card, plus a 16-bit 80186 with 256K-byte RAM running the multitasking Concurrent CP/M 86 on the slave board.

The Poly 8/16 micro includes the Z80 master card

Our Word Is A Promise

GROW YOUR OWN CICS PROGRAMMERS.

The CICS programmers you need may already be working for you—because SysEd training makes even non-CICS programmers immediately productive in a CICS environment.

SysEd's challenging, "hands-on" training lets you upgrade your present programming staff, and saves the time, effort and expense of hiring new personnel.

Our experienced instructors specialize in using real-life programs and design problems. Whether the course is Command Level, Macro Level, Internals, Application Design or VSAM, we encourage students to bring in their own projects to enhance the workshop sessions.

Courses can be held at your company on your computer or at SysEd's fully-equipped classroom/computer facilities in New York City, Chicago, San Francisco and Dallas.

For information, call Dave Shapiro (212) 889-3366.

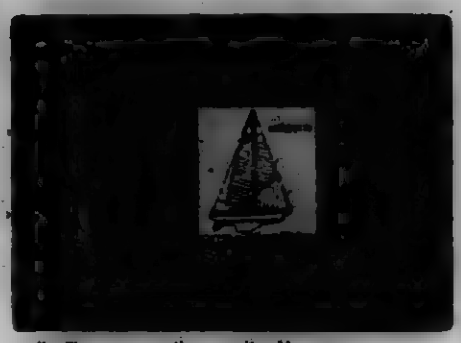
AFTER 35 YEARS AS HIS EMPLOYER, TELL HIM ABOUT DIRECT DEPOSIT AS A FRIEND.

Direct Deposit lets retiring employees send their Social Security straight to their checking or savings account. For free materials, write to: Dept. of the Treasury, Direct Deposit –D3, Annex I, PB-1100, Washington, D.C. 20226.

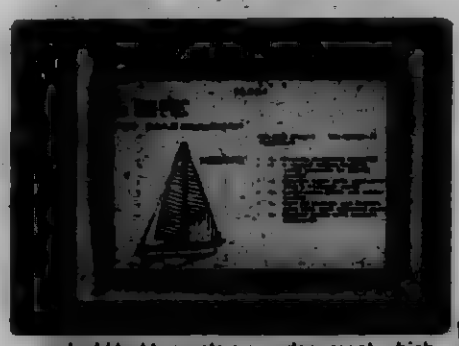
The first professional computer that looks at information the way you do.

Place any document under the scanner, push a button and in seconds...

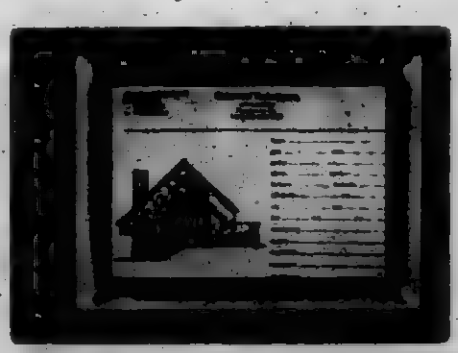


...it will appear on the monitor. You can store the whole document or isolate just part of it.

You can relocate any section...

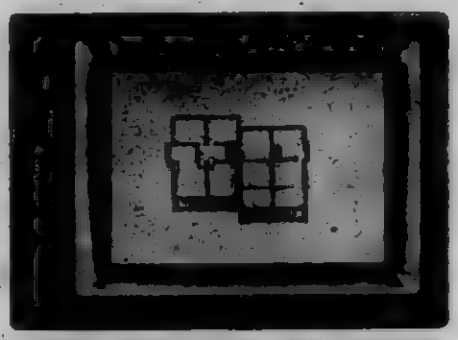


...and add text to create a new document, which can be printed or stored.

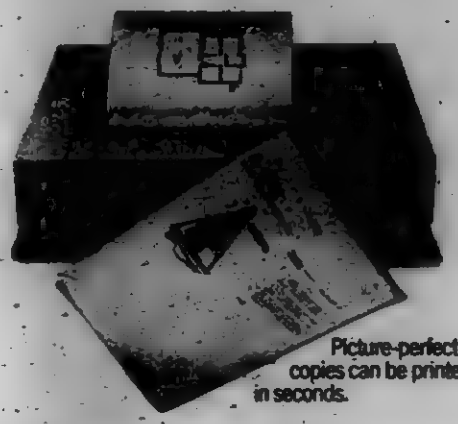


Filling out forms is a snap. Just place a form under the scanner...

...and fill in the blanks and update your database. Use the cursor (under "floor plan")...



...to bring up other image or data files associated with the original document.



Picture-perfect copies can be printed in seconds.

If you're in business, you get a lot of information exactly the way you're getting it right now.

From a piece of paper.

And a lot of time and money goes into managing that information.

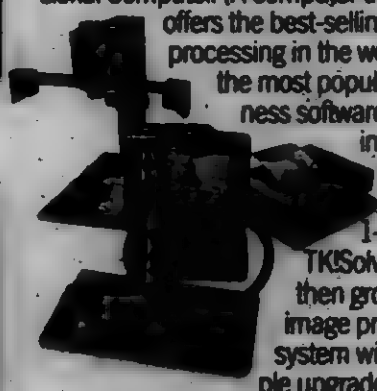
But now Wang is introducing a computer that can help you manage that information even better:

The Wang PIC™ image processing system.

With the Wang PIC, business information can be scanned, displayed, edited, filed, printed, and sent anywhere in the world. Documents can be enlarged, reduced, landscaped, and contrasted. All from one desk-top computer.

The Wang PIC can communicate with other Wang computers and even most mainframes.

And you can start with a Wang Professional Computer. (A computer that already offers the best-selling word processing in the world and the most popular business software—including Visi On,™ Lotus 1-2-3,® and TK!Solver.™) And then grow to an image processing system with a simple upgrade.



If you would like a demonstration of The Wang PIC image processing system, call 1-800-225-9264. Or write to: Wang Laboratories, Inc., Business Executive Center, One Industrial Avenue, Lowell, MA 01851.

But do it today.

Because this is one new product you don't want to overlook.

and 80186 slave card with RAM on an S-100 motherboard, one half-height, 5¼-in. floppy disk drive with 800K bytes storage, four RS-232C/RS-423 serial ports, two parallel ports, an adjustable terminal with 14-in. monochrome display and detached keyboard. Prices for the Poly 8/16 start at $4,495.

Polymorphic Systems, 460 Ward Drive, Santa Barbara, Calif. 93111.

PRINTERS/PLOTTERS/PERIPHERALS

INFORUNNER CORP.
Riteman printers

Inforunner Corp. has announced four dot matrix, bidirectional, logic-seeking printers.

The Riteman line of printers are portable and fit in standard 3-in. briefcases, according to the company.

The Riteman Plus prints 120 char./sec in 66 character modes and is compatible with the Epson America, Inc. MX-80FT, according to the vendor.

The Riteman Blue Plus prints 140 char./sec in 128 character modes and is compatible with IBM's Graphics Printer, Epson RX-80FT and Epson MX-80FT software, a spokesman said.

It reportedly prints in elite pitch mode and is equipped with quiet mode and proportional spacing.

The Riteman II is designed to print 160 char./sec in 256 programmable character modes with Epson FX-80 software compatibility. In addition, it has an 8K-byte buffer, quiet mode and proportional spacing, the spokesman said.

The Riteman 15 Printer features a 15-in. carriage and adjustable tractor feed. It is said to print 160 char./sec in 256 programmable character modes and to offer Epson FX-100 software compatibility, the vendor said.

Available now, the Riteman Plus is priced at $399. The Riteman Blue Plus is scheduled for March availability at a price of $499. The Riteman II is scheduled for April availability at $599. The Riteman 15 is scheduled for availability in March at $799, according to the vendor.

Inforunner, 1621 Stanford St., Santa Monica, Calif. 90404.

Now add NCR Service to the reasons for choosing Florida Data's OSP Line

world's fastest, most versatile matrix printers

Triple mode capability: DP, WP, Optional Graphics

Triple paper path: auto cut sheet, continuous, hand

Patented MSE (Magnetic Stored Energy) printhead

NCR is a Registered Service Mark

There was already enough reason. But now you can buy OSP with the added assurance of nationwide NCR service. You'll rarely need them, but if you ever do they'll be there in two shakes.

OSP means "Office System Printers." And it means everything you need in just one high performance machine: data processing at 600 cps, word processing at 100-150 cps, with graphics and down line load capability. It's a whole new way to go.

Call (305) 259-4700 or mail coupon for details

Florida Data Corporation

BOARD-LEVEL DEVICES

INTEGRATED SOLUTIONS, INC.
CPU, memory card

Integrated Solutions, Inc., has introduced a VME bus-compatible, Motorola, Inc. 68000/680101-based CPU and memory card. The CPU reportedly allows up to 16M bytes of physical memory to run with no wait states at 12 MHz.

The CPU also features two programmable serial ports, one with modem control. The memory management unit is said to support an 8M-byte logical process and up to 16M bytes of physical memory.

The CPU is available for $2,200, and the memory card is available for $1,695, with 512K bytes of memory, according to the vendor. Discounts are reportedly available for quantity purchases.

Integrated Solutions, 1350 Dell Ave., Campbell, Calif. 95008.

AUXILIARY EQUIPMENT

DEMCO ELECTRONICS
Graphics Tool Kit

Demco Electronics has announced the Graphics Tool Kit, which is said to be a complete hardware and software package for interactive graphics generation.

A vendor spokesman said the system is compatible with all Apple Computer, Inc. Apple II and compatible microcomputers, with output to a dot matrix printer. The proprietary hardware allows users to design on a movable screen with resolution of 640 horizontal dots by 768 vertical lines.

The main software package of the Graphics Tool Kit is menu-driven, and it manipulates vector shapes, displays fonts, draws lines and plots points.

The spokesman said the system can generate graphs, charts, sheet music, floor plans, circuit diagrams, parts layouts, logic diagrams, mechanical drawings, stylized logos and lettering.

The Graphics Tool Kit costs $495.

Demco Electronics, 10516 Greenleaf Ave., Inglewood, Calif. 90304.

SOFTWARE

KEY SOLUTIONS, INC.
Databurst

Key Solutions, Inc. has introduced Databurst, an IBM Personal Computer program generator with a full screen processor.

According to the vendor, the Databurst option enables programmers to expand and test Basic programs using the interpreter, then compile them with no changes. The compiler support is loaded into memory once and becomes an extension of the operating system.

Because it is no longer hosted by Basic, the compiler support reportedly simplifies interprogram communication.

Databurst is priced at $225. The Databurst compiler option is available for $40, the vendor said.

Key Solutions, P.O. Box 2297, Santa Clara, Calif. 95055.

TOOLS from page 70

AUTODESK, INC.
Autocad enhancement

Autodesk, Inc. has enhanced its Autocad software for precision drawing applications on microcomputers. The Autocad program reportedly permits users to perform many functions of computer-aided design.

The enhanced Autocad program reportedly includes a break command to permit partial deletion of drawing elements, a freehand sketch mode and alternate arc/circle specifications.

Autocad runs on the IBM Personal Computer and Personal Computer XT; the Victor Technologies, Inc. Series 9000; the Zenith Data Systems Z100; the NEC Information Systems, Inc. APC; the Eagle Computer, Inc. Eagle Personal Computer and 1600 models; Digital Microsystems, Inc. models 100 and 100 Plus; Texas Instruments, Inc. Professional; Digital Equipment Corp. Rainbow; and Compaq Computer Corp. Compaq.

Autocad is available for $1,800 in a basic package and for $1,500 in a package that includes advanced drafting extensions, according to the vendor.

Autodesk, Suite B20, 150 Shoreline Highway, Mill Valley, Calif. 94941.

A+ SOFTWARE, INC.
Under-Control; Gantt-It

A+ Software, Inc. has announced two software programs for file management and project control for IBM Personal Computers or Personal Computer XTs operating under IBM's PC-DOS or Microsoft, Inc.'s MS-DOS operating systems.

Under-Control is a file management program that reportedly features automatic entry screen generation, sorting, report writing, record selection and totaling functions.

Gantt-It, a project control and cost allocation program, is an optional extension of Under-Control. It reportedly features task tracking and cost allocation. With Gantt-it, charts can be printed up to 999 characters wide.

Under-Control sells for $125. Gantt-It and Under-Control together cost $195.

A+ Software, 16 Academy Drive, Shenendehowa, N.Y. 12158.

CONCEPT OMEGA CORP.
Word Concept

Concept Omega Corp. has introduced Word Concept, a multiuser word processing program that runs under Microsoft, Inc.'s MS-DOS and Xenix, Unix and Scientific Management Corp.'s Thoroughbred operating systems.

Word Concept features menu-driven input, on-line help screens, full screen editing and function key control, the vendor said.

The program is written in Microsoft's Business Basic, supports three IBM Personal Computers and interfaces with any program using Business Basic, according to the vendor.

Word Concept costs $495.

Concept Omega, P.O. Box 6701, Bridgewater, N.J. 08807.

LEADING EDGE PRODUCTS, INC.
Mail List Manager

Leading Edge Products, Inc. has announced the addition of an integrated Mail List Manager to its Word Processing software.

The package adds advanced personalized document capability to the Word Processing package, as well as the ability to select a group of records.

The Word Processing package was designed for use with the Leading Edge Personal Computer, the IBM Personal Computer or Personal Computer XT and other compatibles.

Available this spring, Word Processing with Integrated Mail List Manager is priced at $495, according to the vendor.

Leading Edge Products, 55 Providence Highway, Norwood, Mass. 02062.

SOFTWARE DIGEST, INC.
The Ratings Book

Software Digest, Inc. has published the first edition of *The Ratings Book*, a series of publications comparing and rating various microcomputer programs, with each issue focusing on a single category of software.

This initial offering is an evaluation of 30 word processing programs written for

Continued on page 76

THE TRUTH ABOUT SOFTWARE

If you are an IBM PC user, or are about to become one, be careful!

Many programs promoted as "user-friendly" are anything but friendly. Their instructions are hard to follow and hard to remember—and they may require hours and hours to master.

That's too bad, because there are a few really good programs which can make your life a lot easier and improve your productivity.

Why then are so many of the troublesome programs sold every day to new users?

Because of the lack of reliable, comparative information. Dealers, experts, long-time users and reviewers have good intentions, but their advice is usually based on experience with a limited number of programs. They may recommend the best program they know, but not necessarily the best one available.

THERE'S A BETTER WAY.

If you could, you would test all the competing programs for yourself. You would take the time to compare each and every one in many different ways. And when you were finished you would really know the score.

But you'd have to spend thousands of dollars and months of your time to do that.

Or you can simply get THE RATINGS BOOK. And all the answers will be at your fingertips.

THE TRUTH ABOUT SOFTWARE.

the IBM Personal Computer.

In addition to numerical ratings based on multiple testing, the book also contains 30 comparative ratings charts, summaries of the test results for each program and 180 screen pictures.

The Ratings Book: IBM PC Word Processing Programs costs $14.95.

Software Digest, One Wynnewood Road, Wynnewood, Pa. 19096.

NBI, INC.
Three software packages for Onyx 2000

NBI, Inc. has announced three business software programs for its Onyx 2000 Personal Computing Work Station.

The programs — Microsoft, Inc.'s Multiplan electronic spreadsheet and Gwbasic programming language and Ashton-Tate's Dbase II data base management system — are being offered as a clustered package that enables operators to share a program library, according to a spokesman.

The Onyx 2000 workstation features a standard 128K bytes of user memory, a 14-in. screen for text and graphics display and Microsoft MS-DOS compatibility.

Prices for the software vary, depending on the configuration of the system and the combination of software packages. The base price of the Onyx 2000 is $2,995.

NBI, P.O. Box 9001, Boulder, Colo. 80301.

TRILLIAN COMPUTER CORP.
Shell for Lotus 1-2-3

Trillian Computer Corp. has introduced a program said to permit its Visuall software to run in conjunction with Lotus Development Corp.'s Lotus 1-2-3 spreadsheet program.

The interface program, called a shell, reportedly permits Lotus 1-2-3 users to use Visuall, which displays a window-menu of commands to guide new users and allow them to operate their applications software at the task rather than command level.

Trillian's Lotus 1-2-3 shell is available for $49.95. A shell for Micropro International Corp.'s Wordstar program is also available for $49.95. Visuall costs $99.95.

Trillian Computer, P.O. Box 451, Los Gatos, Calif. 95031

TEXAS INSTRUMENTS, INC.
Multimate

Texas Instruments, Inc. has announced its own version of Software Systems' Multimate word processor software designed for the TI Professional computer.

According to the vendor, the package includes features such as Merge Function, a Spell/Checker Corrector with an 80,000-word dictionary and the ability to perform keystroke procedures and conversion capabilities for file integration.

Available April 1, Multimate has a suggested retail price of $495.

TI, P.O. Box 402430, Dallas, Texas 75240.

DATA MANAGEMENT ASSOCIATES, INC.
Magic MPS

Data Management Associates, Inc. has introduced a programming language called Magic MPS which it claims improves programmer productivity by up to 10 times.

Magic MPS maintains traditional language philosophies to create application programs without the need of a run-time package, a spokesman said.

Magic MPS/80, for all Digital Research, Inc. CP/M systems, is priced at $795. Magic MPS/86, for CP/M 86 and Microsoft, Inc. MS-DOS systems, is priced at $995.

Data Management Associates, P.O. Box 4340, Wilmington, Del. 19807.

LOGICAL SYSTEMS, INC.
Assembler source code

Logical Systems, Inc. has introduced assembler source code for the firm's LS-DOS/TRSDOS 6.2X operating system.

The publication is titled "The Source" and is published in three bound volumes: "The System," "The Libraries" and "The Utilities," the vendor said.

Each volume is available for $99, or $249 for the complete set, with delivery set for June.

Logical Systems, 8970 N. 55th St., Milwaukee, Wis. 53223.

See TOOLS page 76

RATINGS YOU CAN RELY ON.

The National Software Testing Center was established by Software Digest to do all the work for you, using a unique new evaluation system.

Concentrating on one category of software at a time, the best-selling and the newest programs are put through an extensive series of realistic tests.

Each program is tested exactly the same way. Not just once, but *ten times*—by ten different testers with varied levels of experience.

The scores of these testers are averaged, and the final ratings are determined mathematically.

This method cuts through inflated claims, spots programs that can cause you grief, and steers you straight to the software that works best.

CONVENIENT. QUICK. COMPREHENSIVE.

The results are presented graphically in THE RATINGS BOOK—with a minimum of words—so you can instantly see how competing programs stack up against each other in eight important ways:

- Ease of Start-up
- Ease of Learning
- Ease of Use
- Error Handling
- Performance
- Versatility
- Overall Evaluation
- Value for Money

Each volume is dedicated to a single category of software and contains a wealth of information—including comparative specification charts and screen shots showing how competing programs display the same data—to help you select software that will best meet *your* needs.

BOTTOM-LINE ANSWERS. READY NOW.

The first volume covers IBM PC word processing programs. The second covers IBM PC database management programs. Volumes for other categories of IBM PC and Apple Software will be issued soon.

Volumes 1 and 2 are now available at bookstores. Or you can order directly by phone or mail. The cost is only $14.95 per volume—far less than you would spend on one disappointing program.

THE RATINGS BOOK will give you the power to avoid software frustration. And the objective, comparative information you need to make personal and business computing a pleasure.

Because all software is not created equal.

TOOLS from page 75

EYRING RESEARCH INSTITUTE, INC.
Pdos Pascal

Eyring Research Institute, Inc. has introduced a multiple-pass Pascal compiler that generates assembler text for Motorola, Inc.'s MC68000 microprocessor.

Pdos Pascal is designed as a superset of the International Standards Organization standard to allow for systems programming with Pdos, a vendor spokesman said.

Since native code is generated with Pdos Pascal, faster program execution is possible for real-time applications, according to the spokesman.

Pdos Pascal is said to enhance the multitasking facilities of Pdos by allowing for subtasks within each Pascal program.

Pdos Pascal can be ported to any 68000-based microcomputer and is available on the Motorola VME/10 and the Sage Computer Technology, Inc. Sage 2 and Sage 4 microcomputers, according to the spokesman for the vendor.

The Pdos Pascal program is priced at $550, the vendor said.

CORVUS from page 65

work of microcomputers and offer improvements of up to 40% in throughput." The built-in network disk server circuitry can save users nearly $1,000, Corvus stated.

Omnidrive systems will be offered with 5.5M-, 11.1M-, 16.6M- and 45.1M-byte formatted storage capacity, with suggested prices of $1,995, $2,495, $3,195 and $4,995, respectively. (These prices exclude the Constellation II net-work software, which sells at $395 for Apple Computer, Inc. micros and $495 for other models.) The systems will be available this month for personal computers from Apple, Corvus, Digital Equipment Corp., IBM, Texas Instruments, Inc. and Zenith Data Systems Corp.

Corvus is located at 2100 Corvus Drive, San Jose, Calif. 95124.

bases [and] micros and hopefully stimulate the imagination of the vendors," he said.

The ECN is based on a Zenith Data Systems Corp. Z100 microcomputer. Users can access the system with any microcomputer with a modem and appropriate communications software, Butler said. He expressed hopes the ECN will eventually link the membership for teleconferencing. An organizational newsletter is also being considered, he said.

Further information on MMA membership is available from the Micro Manager's Association, located at 80 Boylston St., Boston, Mass. 02116.

NETS from page 65

ductivity improvements, they also should create a group of more computer-literate employees, ultimately requiring less support than would be the case with even a small centralized system.

But if instead of a micro on a person's desk there is only a terminal into a "central" multiuser micro system, then only the level of centralization has been reduced — not centralization itself.

The system may not be as remote as the organization's mainframe, but it requires many of the same support elements: maintenance, back-up, programming support and a host of related services. Yet the multiuser micro is likely to be in an organizational environment without any of the support provided by a central mainframe facility. At the same time, there is little incentive for users to learn any more about the workings of the multiuser micro than they do about the central mainframe system.

Thus, from an organizational perspective, the multiuser micro may end up having all the disadvantages of the central mainframe system with none of the advantages.

The initial cost of a local-area network may indeed be somewhat higher than a multiuser system supporting the same number of users. The other considerations discussed, however, may prove more important than entry costs.

RAMIS II MAKES YOUR INFORMATION CENTER A GREAT PLACE FOR PEOPLE.

RAMIS II's complete solution is the most effective way to multiply the productivity and satisfaction of your end users and your Information Center staff. Today, RAMIS II means success at hundreds of Information Centers around the world.

POWER AND SIMPLICITY FOR END USERS

RAMIS II provides everything users need for maximum productivity. Its powerful report writer, relational database and language, full-color business graphics, SAS® interface, and many other capabilities meet the most advanced decision support needs. And, with our new RAMLink, IT series, and RAMIS II/PC software, end users have the ideal solution for mainframes and personal computers.

RAMIS II English comprehension extends the power of your Information Center to a multitude of new computer users. Through advanced knowledge-based technology, even people who've never been on speaking terms with a computer can ask questions, obtain answers, and create reports in only a few minutes using everyday English.

EFFICIENCY AND RELIABILITY FOR SUPPORT STAFF

Our complete solution lets your existing staff support many more users by dramatically reducing the number of products you need. And RAMIS II makes your support job easier with built-in computer-based training plus facilities to monitor and control usage.

RAMIS II delivers the performance and reliability needed to tackle even the largest decision support tasks with confidence. In fact, because RAMIS II is also a complete application development system, single-user systems can evolve smoothly into full-fledged applications.

SAS® is a registered trademark of SAS Institute, Inc.

COMPUTER INDUSTRY

Metamorphosis marks NCR's centennial

By Peter Bartelik
CW Staff

Marking its centennial this year, NCR Corp. is, in a sense, the grandfather of the information processing industry, and until recently, many people did regard it as a very senior citizen — old and tired, slow and plodding. But in 1983, NCR broke out of its cocoon, building on changes implemented over the past decade to release a slew of new products and pursue new endeavors.

Now NCR proudly proclaims it is "Celebrating the Future." That future is to be based on a relatively new management team, new products and, perhaps most important, new ideas.

For 90 years, NCR was the National Cash Register company, completely dominating U.S. and international markets with its electromechanical cash registers, found in just about every corner store in the country, and accounting machines. But it lost its hold on that market with the proliferation of electronic competitors.

In 1973, William S. Anderson was tapped from the company's Far East operations and focused the company's goals on the information processing business it had begun in the late 1950s. In 1976, Anderson lured Charles E. Exley Jr. away from a successful 22-year career at Burroughs Corp. to become president of NCR and Anderson's heir apparent. Last year, Exley was named chief executive officer in anticipation of Anderson's coming retirement this year, and the passing of the purple coincides with a renewed vigor at the company.

NCR
Celebrating the Future

The company never had many problems with turning a profit, but it did have problems keeping up with the revenue growth in the information industry, growing in the low single digits and bottoming out at 3% in 1982, while other players grew at a rate averaging about 14%. Coming out of the recession last year, NCR boosted revenues by 6%; this year, spurred by new products and the economic recovery, NCR is expected to post revenue growth of 15% or better.

"Good growth this year will not demonstrate that we have learned how to be a very high-growth company, because it is coming off two severe years of recession in our industry," Exley said during a recent interview. "The key to my way of thinking is that we have to be constantly exploring new opportunities and new applications of the products that we specialize in, and we have to be prepared to offer, to apply the things we know how to build to new markets regularly. That is something that in our history we have not done. We have brought new technology to the same markets, but we have not addressed new markets. So the way we're going to do that is we are going to be successful in addressing new market opportunities."

The company has targeted a staggering number of opportunities it hopes to ex-

AT&T lacks DP strategy, Adapso told

CW AT ADAPSO

By Robert Batt
CW West Coast Bureau

DALLAS — The lack of a clear-cut strategy will make it very tough for AT&T to compete against IBM in the computer services industry, the Association of Data Processing Service Organizations, Inc. (Adapso) was told here recently.

Speaking at Adapso's 60th Management Conference, Esther Dyson, president of Edventure Holdings, Inc., a New York-based consulting firm, said AT&T will have a hard time competing in an unfamiliar marketing environment.

"AT&T does not have a clear strategy in sectors such as local-area networks, and it is going to be a lot tougher for it to enter the market as a new company and give the users the perception that it has a single unified approach."

Dyson told Adapso members that IBM can get away without a clear strategy in some areas of its business because it has operated in this market for a long time. But for AT&T to do so will be much harder.

AT&T, Dyson said, is very much in a "trial and error" mode, and users should not expect too many drastic moves from the company in the near future.

Commenting on AT&T's Unix operating system, Dyson said the company relinquished market control of Unix by creating it with open systems compatibility.

"Unix no longer belongs to AT&T except legally and financially. In reality, it belongs to the industry, and AT&T will need to find some other means of reaping value-added rewards," Dyson said.

IBM, she claimed, would not have an-

CDC buys access to wafer technology

By Peter Bartelik
CW Staff

MINNEAPOLIS — Trilogy Ltd., which in recent weeks has announced problems and changes in the development of its wafer-scale semiconductor technology, has granted access to that technology to Control Data Corp. in exchange for $2 million and future royalties.

The agreement was announced last week in a joint statement issued by CDC President Robert M. Price and Trilogy Chairman Gene M. Amdahl. Unlike previous corporate licensees, CDC did not purchase an equity position in the company.

CDC is the third major U.S. computer vendor to invest in the Trilogy project. Digital Equipment Corp. and Sperry Corp. separately invested a total of $68 million for equity positions in Trilogy of 9% and 15%, respectively, and for license to use the technology. The Bull conglomerate of France, formerly CII-Honeywell Bull, also invested a smaller sum.

Trilogy's wafer-scale product purportedly will pack the capacity of 100 integrated circuits onto a 2¼-in. wafer. However, Trilogy early this year announced it experienced problems with the final metalization process of the wafer, which caused the device to short out [CW, Jan. 23]. Earlier this month, Trilogy announced it had solved that problem, but had decided to simplify the design process to make it more adaptable to other vendors' products [CW, March 12].

The IBM-compatible, high-range mainframe that Trilogy plans to develop based on the wafer-scale technology was also redesigned as a dyadic, or dual-processor, configuration because the semiconductor

M&D, ABC agree on settlement of G/L Plus issue

By John Gallant
CW Staff

NATICK, Mass. — McCormack & Dodge Corp. (M&D) and ABC Management Systems, Inc. have ended a long-standing legal dispute involving international sales of M&D's G/L Plus general ledger package.

In an agreement reached March 22, ABC Management Systems granted M&D unrestricted worldwide rights for past and future sales of the ABC Management report writer system as a subsystem within the G/L Plus package. The agreement, which was announced in a brief statement issued by the firms, also resolves all legal claims against M&D by the Bellingham, Wash.-based ABC Management.

The agreement effectively dissolves an injunction imposed last year [CW, Dec. 5] by a Superior Court judge in Whatcom County, Wash., that blocked M&D from selling the G/L Plus package outside the U.S. with the ABC Management report writer. The injunction was based on the court's finding that M&D had violated a domestic marketing agreement with ABC Management by selling an enhanced version of its report writer under the name of Financial Analysis System (Fast) to international clients as a subsystem of G/L Plus.

As a result of the joint settlement, M&D is also relieved of $2.5 million in damages awarded to ABC Management on the basis of that suit. Spokesmen from both companies declined to comment on details of the settlement, such as the specifics of the marketing agreement for the report writer software, except to say that M&D is now "free to sell the ABC product anywhere it chooses."

The settlement also casts a shadow over the recently announced agreement between M&D and Software International, Inc. (SI), which gave M&D international

NCR making good on commitment to new product lines

In 1982, NCR Corp. shareholders were told every major product line would be replaced by new generation products within 36 months, and the plan seems to be ahead of schedule.

At the low end of its information processing line, the company has brought out "professional class" personal computer products and will introduce an IBM-compatible micro later this year, according to William F. Buster, executive vice-president of the development and production group.

The Tower, a 16-bit, Unix-based multiuser system, was introduced last year, and this year the I-Tower, using RM/Cobol, was introduced to replace the I-9020. Also last year, the company introduced the 9300 with twice the power of the I-9020; several new versions of the high-end 8600 series were added. Similar developments have taken place in the retail and financial divisions.

About the only product unchanged to date is the 8500, and Buster said pointedly, "You can look at the calendar and see when we will carry that out."

Mark Bell, a researcher with Framingham, Mass.-based International Data Corp., said the Tower appears to have done relatively well in the marketplace. The products ranging from the 8200 to the 9200 had become outdated, but NCR is bringing out new products to use a major resource in software written for that outdated family, Bell said.

Wafers prepared for plasma etching at NCR's Colorado Springs facility.

Charles E. Exley Jr., NCR chief executive officer, expressed his commitment to developing mainframe technology, and Buster noted the company is committed to providing customers with the ability to migrate to all levels of processing power. But Bell and Jonathan Fram, an analyst with Paine Webber, Mitchell Hutchins, Inc., pointed out that NCR traditionally has focused on transaction processing that does not require the vast power needed for scientific processing.

"NCR traditionally has produced what were called special-purpose processors," Fram said. "Special purpose has now become the norm. They have the most realistic view of the mainframe market of any of the Bunch." Bell said NCR will provide high-range products for its customers to migrate to, but will focus on middle-range products for revenue growth.

NCR has also quietly built up its merchant semiconductor presence. Of its total semiconductor production, from three facilities, 70% is sold externally, NCR said. The firm recently signed an OEM agreement to provide Honeywell, Inc. with the NCR/32 and is working with Ford Motor Co. for special-purpose chips to be used in automobiles. Fram said the firm will announce two new mainframes, and at least one will use NCR chips.

NCR, while not at the level of Intel Corp. or Motorola, Inc., will have "important leverage" with available 32-bit chips when demand saps the supplies of the major semiconductor manufacturers, Bell said. "They are developing their own technology, and they are beginning to understand the marketplace better," he added.

NCR from page 77

plot, some based on traditional strengths, but some completely departing from tradition.

In 1979, NCR acquired Comten, Inc., now named NCR Comten, a developer of IBM-compatible front-end processors and other communications equipment; in 1980, it acquired Applied Digital Data Systems, Inc., a supplier of VDTs; in 1981, the Office Systems Division was established to address office automation, and a microelectronics development and marketing organization was also added; and last year, NCR Telecommunications Services, Inc. was established to sell excess capacity on NCR's own switching network.

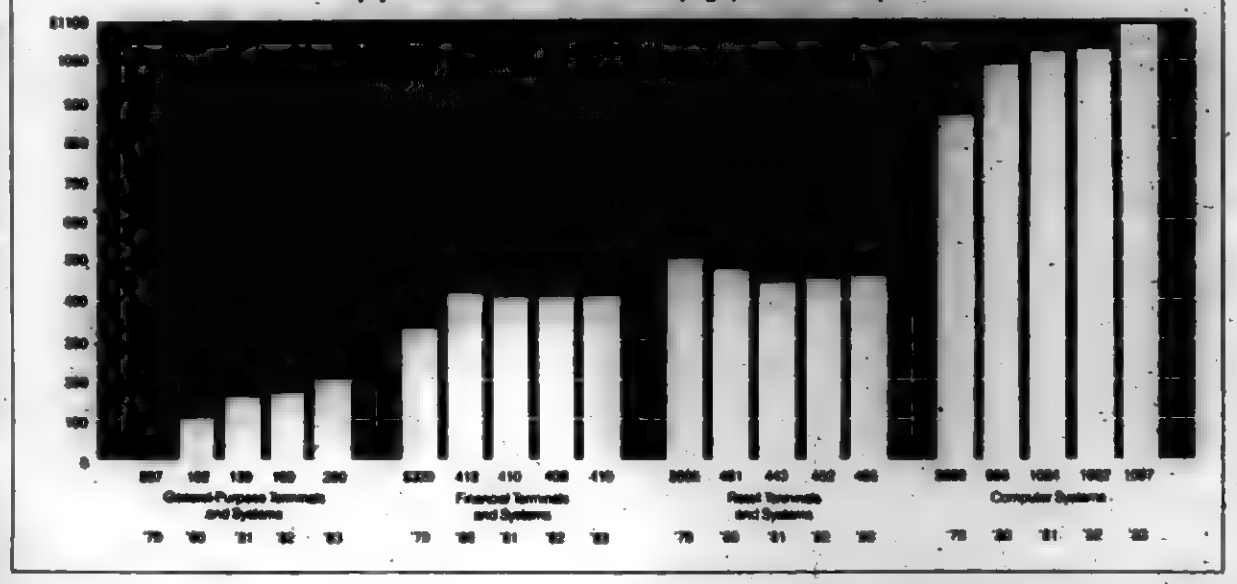
Joint ventures

The company has also established several joint ventures to develop electronics funds transfer systems from banks to point of sale and is working on similar technology for consumer self-service terminals.

Jonathan Fram, an analyst with Paine Webber, Mitchell Hutchins, Inc., observed, "They're after a large number of niches; but you've got to qualify that — they're after a large number of growing niches." Fram said of all the so-called Bunch companies, he is most optimistic about NCR's viability.

A corporate reorganization marked an infusion of the entrepreneurial spirit into an old company. "We are not attempting to orchestrate, at any level of detail from the top, what the product strategies are of these various elements," Exley said. "We have set forward areas of specialty, we have a generally agreed on technology strategy, and within that very broad compass, these units are the driving force of the business."

According to Donald J. Herman, executive vice-president over the integrated business units, "We run this company with what we call light supervision, and we're able to say to those units, 'It's your business, and you run them.'"



The NCR Tower 1632 and the 9300, both introduced last year and both designed for general applications, highlight the new way of doing things at NCR. The Tower, initially released to the OEM market, was packaged mostly from a variety of existing products from other vendors. NCR does not intend "to reinvent the wheel," according to William F. Buster, executive vice-president for the development and production units, and will purchase components and peripherals from other vendors when it seems prudent. The 9300's proprietary 32-bit very large-scale integration chip set is seen by the company as a jump forward in technology and was recently sold on an OEM basis to Honeywell, Inc. and will probably be marketed to other vendors over the coming year.

Exley

With the growth in the product line has come growth in the sales organization: NCR last year announced it would hire 500 new people for its marketing force, and executives said recently the last of the new hires are completing training.

NCR executives bitterly resent, privately at least, the adverse publicity generated by the fraud lawsuit brought against the company by The Glovertorium, Inc. and similar cases filed by NCR customers alleging misrepresentation of product capabilities. The Glovertorium won a $2.3 million court judgment on claims NCR sold it a System 8200 minicomputer and software package that allegedly never functioned at better than 20% of its warranted capability.

Manuel Garcia, who oversees all marketing operations, pointed out recently that all the lawsuits date back more than five years, "when I think people expected more than technology could give them. I think that affected every [vendor]," and involved a small percentage of customers.

But the company has taken steps to ensure that no misunderstandings occur. Sales personnel are told to make sure the customer understands what he is buying, sales managers are expected to question the salesman on what was sold, and customers receive letters from headquarters detailing the terms of the understanding, according to Garcia, so "if he received anything different from [the sales person told him], he has the opportunity to say he understood differently."

Garcia said the company places a premium on customer satisfaction, because NCR needs goodwill to survive in the information industry. "We don't have any place else to go," he said. "That [industry] is all we're in, and we don't intend to get into anything else."

The changes undertaken over the past few years seem to have gained great favor with lower level executives in production, support and training divisions around the area. One executive who was formerly employed at Wang Laboratories, Inc. recalled that when a headhunter contacted him about joining NCR, he immediately dismissed the idea of joining a declining mainframe vendor. After being convinced to meet with a senior executive, he said he got caught up in the plans under development and signed on.

COMPUTER INDUSTRY

NCR's reorganization encourages entrepreneurship

DAYTON, Ohio — NCR Corp. last year was reorganized to establish semiautonomous units. This, according to NCR executives, has spurred an entrepreneurial spirit within the century-old organization and will be the driving force for the company's future.

When Charles E. Exley Jr., who came to NCR after a 22-year career at Burroughs Corp., was appointed chief executive officer, the board of directors also created the office of the chief executive, with three executive vice-presidents appointed to oversee the reorganized entities.

Herman

William F. Buster, who spent 16 years with Burroughs before joining NCR in 1971, heads the Development and Production Units, composed of divisions for Data Entry Systems, General-Purpose Systems, Financial Systems, Retail Systems and Microelectronics.

Manuel Garcia, another former Burroughs man who jumped ship just before Exley, is head of the marketing units, including an Independent Marketing Organization to develop contracts with OEM firms.

Garcia

Donald J. Herman, founder of the organization that eventually became NCR Comten, Inc., was tapped as head of the Integrated Business Units, which include Comten, Applied Digital Data Systems, Inc., Office Systems, TSI, Inc., a Micrographics Division and, presumably, any future acquisitions.

Herman recalled that William S. Anderson, the outgoing chairman, and Exley visited him in Florida. Exley "wanted a marketer, he wanted a technologist, and he wanted a businessman. He asked me to join as the businessman."

Several NCR employees told *Computerworld* that the three act as a committee, with any one of them able to make a quick decision when needed.

Buster

NCR executives readily agree the present organization produces some duplication — for example, three divisions market terminals — and divisions even compete against each other in some respects.

Exley explained the strategy: "The integrated units and the development and production units are relatively self-contained units in the sense that those divisions don't depend on anybody else for the success of what they have to offer. So the driving force from a product program standpoint is in each of those major divisions."

While NCR's own Microelectronics Division supplies its proprietary NCR/32 32-bit very large-scale integration chip set for the 9300 50-lb "mainframe" introduced last year, Exley said the other divisions will not be directed to buy NCR microelectronics if they believe other vendors have better products.

Jonathan Pram, an industry analyst with Paine Webber, Mitchell Hutchins, Inc., said the organization "is a bit of a mess," but "the company [is] realizing the degree of uncertainty in the industry."

The lack of rigidity in the organization allows the company to react to the dynamic changes in the information processing industry, he added.

NCR president airs his opinions on mainframe market dynamics

NCR

Charles E. Exley Jr., NCR Corp. president and chief executive officer, was recently interviewed by Peter Bartolik, Computerworld senior editor of Computer Industry. Excerpted below are his views of the mainframe market dynamics that have produced greater power at lower costs.

Q You have demonstrated that hardware costs for large processors are coming down, and you intend to bring them down further. Yes we do.

Q How will you generate future revenues from that area if you make the equipment so inexpensive? Is it going to be in services, software or just selling more machines?

Well, services and software, of course, are an important part of our revenue base, and software revenues are growing far more strongly than hardware revenues, but I believe these dramatic continuing price reductions will be offset by the increase in Mips [millions of instructions per second] that we ship.

Q So as you deliver more power, that will spur a demand for even more power?

That's right. That's what I believe. I also think that the mainframe market, which has been a relatively quiet market now for some years, will benefit and become much more lively a market by further substantial cost reductions.

A problem in the mainframe market is that really there isn't anything very new on the market; even the latest releases are just a circuit-enhanced version of the same old thing. So it's not surprising that there's not a lot of action in that particular market at the present time. But I think that there will continue to be very sizable opportunities in the mainframe area; it will not be as dynamic an area as small computers, because the economics for certain kinds of jobs are overwhelmingly in favor of the smaller machines.

But there are several kinds of functions that only a large mainframe can perform. For example, the two basic things are the maintenance of a big file, which for some reason somebody decided they need to maintain at a central point; and the second thing is network control — as more and more of these terminal subsystems and small computers get interconnected, the whole process of network control becomes a very important area. And it seems to be an accepted fact today in the marketplace that that's done by a host computer, a big one. So we think the mainframe market is going to continue to be a good market for as far ahead as we can see into the future, but it does need a technology breakthrough of the kind that we have not had, really, since the first integrated-circuit machines.

Now it's our hope if we succeed, as we aim to, in bringing out the first very large-scale [integration] technology machine, that we will have made that kind of step improvement in cost/performance. And, of course, there are other considerations, such as continuous service, such as the fact that there is something inherently wrong in the process of many years standing of upgrading to a higher level of performance by rolling out the old machine and rolling in the new one. There ought to be a better way of adding Mips than that, and we're going to see if we can't come up with [that] product.

Q You mean just keep the box, but switch. . . .

Just keep adding slices of power. That is everyone's ideal. Can we find a way to do that? If we could do that, I think we'd have a real breakthrough product.

Voters want industrial policy to stress cooperation, pollsters say

By John Gallant
CW Washington Bureau

WASHINGTON, D.C. — Election year industrial policies now being planned by the two major political parties may be rejected by voters if the policies are perceived as government intervention rather than business-government cooperation, according to two public opinion researchers.

"Americans deeply believe, at least ideologically, in free enterprise, and they are instinctively wary of the government's role in the economy," William Schneider, polling consultant to the *National Journal*, told a recent conference on future policies for basic and high-technology industries.

Kevin Phillips, president of American Political Research Corp., agreed with Schneider on the public's skepticism about the government's ability to manage the economy efficiently. But, he said, the public is frustrated about the seeming difficulty U.S. firms are having in maintaining international competitiveness. As a result, he said, "the American people are extremely protectionist."

Political geography

Phillips further suggested that public acceptance of industrial policy prescriptions will increase if the economy worsens as the year progresses. He also said the issue turns on "political geography." Government actions to bolster basic industries and promote high tech will play better in the industrial Northeast and Midwest, as well as in the textile producing areas off the South.

In general, he said, most voters favor actions to enhance research and development, increase international trade, promote management-labor cooperation and support technical education.

But, Phillips said, the public will support business-government-labor cooperation only if it is not mandated. Or, as he put it, "Cooperation yes; coercion no."

Schneider, addressing that same point, told the conference, sponsored by The Government Research Corp. and several computer and electronics industries associations, "the American public does favor . . . a partnership between government and business . . . to solve specific social problems on an ad hoc basis."

But, he said, "elevating government involvement in a marketplace as a system . . . is clearly going too far."

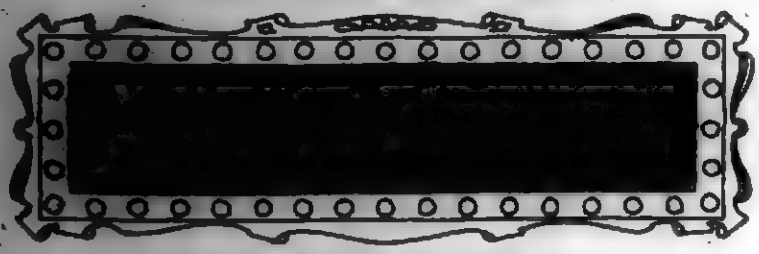
Government planning strikes Americans as a very bad idea, according to Schneider. "They like the chaos. They like the ad hoc nature of government intervention as we now have it. Don't turn it into a system."

The Democrats and the Republicans will be able to sell voters on specific remedies for specific problems, he concluded, so long as the parties can persuade the public that the measures do not portend increased politicization of the economy.

Discussing various academic theories that hold the government should or can effectively develop industrial policies for allocating resources among competing U.S. business sectors, Schneider said, "I don't think the public is going to buy it."

THE HIGH-TECH KICKOFF FOR '84

Norm DeNardi Presents



Thursday, April 19, 1984 • Hours: 12:00 to 6:00 PM
4290 El Camino Real, Palo Alto, CA

Be a part of the industry and meet today's leaders and tomorrow's innovators at the California Computer Show one-day exhibition.

A unique showcase of high technology products specifically designed to attract OEMs, sophisticated end users, dealers, and distributors.

Featuring the latest hardware and software trends, the California Computer Show highlights:

- Computers
- Engineering workstations
- Electrostatic Printers
- Graphics Systems
- Networks
- Disk Systems
- UNIX and other Software Development Tools
- Leading Peripheral Manufacturers

The California Computer Show merges the technical disciplines: corporate issues; technical considerations; industry trends, and promises for the future.

JOIN TODAY'S LEADERS AND TOMORROW'S INNOVATORS AT THE CALIFORNIA COMPUTER SHOW.

Asian Computerworld reaches the fastest growing computer market in the world.

Introducing *Asian Computerworld.*

Asian Computerworld is *Computerworld's* sister publication covering the Southeast Asian marketplace. The editorial (written in English) keeps company executives, computer users, potential users and people in the computer industry up-to-date.

Southeast Asia is considered the fastest growing computer market in the world with a total value of $1.8 billion and annual growth rates for small business systems and micros over 50%. The average annual growth rate is approximately 30%.

Asian Computerworld is published in Singapore and printed twice a month on Thursdays. The total circulation is 8,000. And the geographical distribution is as follows; Hong Kong, Singapore, Philippines, Malaysia, Indonesia and Thailand.

CW International Marketing Services makes it easy for you to advertise in countries all around the computer world. For more information on *Asian Computerworld,* just fill out and return the coupon below.

Adapso to try cooperation to solve dispute with CPAs

CW AT ADAPSO

By Robert Batt
CW West Coast Bureau

DALLAS — The Association of Data Processing Service Organizations, Inc. (Adapso) is negotiating with some of its rivals from the Big Eight accounting firms in an attempt to end a long-standing dispute.

Adapso said it is now trying the tack of cooperation rather than confrontation after failing in a recent attempt [CW, Dec. 5] to persuade the Securities and Exchange Commission (SEC) to rule on the propriety of certified public accounting (CPA) firms selling DP services to companies that they also audit.

In an interview at Adapso's 60th Management Conference here recently, Douglas Jerger, chairman of Adapso's CPA Relations Committee, said the organization has held a series of meetings with representatives from Arthur Andersen & Co., Coopers & Lybrand and Peat, Marwick, Mitchell & Co. to resolve the controversy over DP services. "Talks about talks" are going on with some of the other firms, Jerger added.

Providing DP services comprises the bulk of revenues for many of Adapso's 575 members, and in the past, some have threatened court action against individual Big Eight firms.

For several years, Adapso has carried on a crusade against the CPA firms, charging that an independent auditor cannot be truly independent, as is required by law, if the data processing systems used to prepare a client's financial statements are developed by that same auditing company.

Jerger characterized the change of direction as a victory of sorts for Adapso. "It was always the intention of the CPA Relations Committee to establish a dialogue with the accounting firms. We now have that dialogue, and we hope the relationship will blossom and that we can coexist in a way that is beneficial to all of us," he said.

Jerger said there are benefits to cooperation between the two sides that were not perceived 18 months ago, and this has slowed the pace of possible litigation.

"This is not a simple, clear-cut issue. It is one that is difficult to handle in a way that is fair and straightforward, and as we talk, the positions of the respective parties are changing as they come to appreciate the other guy's point of view," he added.

Jerger, however, denied that Adapso has totally abandoned its attempts to outlaw CPA firms from the DP services arena. Rather, he said, such action was on hold, and Adapso is retaining the option to challenge the recent SEC ruling in the courts.

At the same time, he continued, Adapso is setting up a research project to survey companies and interview financial and management information systems executives in an attempt to gather data about the participation of CPA firms in DP services.

The object of the project is to discover the impact of "management advisory services" within the major auditing firms, he said. "We want to base our decisions on real information and bring this episode to its conclusion," he added.

Co-founder leaves Vector Graphic

THOUSAND OAKS, Calif. — Vector Graphic, Inc. announced recently that Lore Harp, co-founder of the company, has resigned as president and chief executive officer and as a director of the company.

Bernard Horn, 46, formerly sales and marketing vice-president of the Xerox Corp. Printing Systems Division, has been appointed to the position of president and chief executive officer, according to a company spokesman.

Vector Graphic enjoyed early success in the microcomputer market, but has seen its financial situation deteriorate as the IBM Personal Computer soared to the top of the marketplace.

Jean Delcage, chairman of the board of the company, said in a statement at the time of the announcement, "We realize the difficulties of being a strong, long-term contender in the microcomputer industry, but we are extremely pleased to have made some major steps in the past four months."

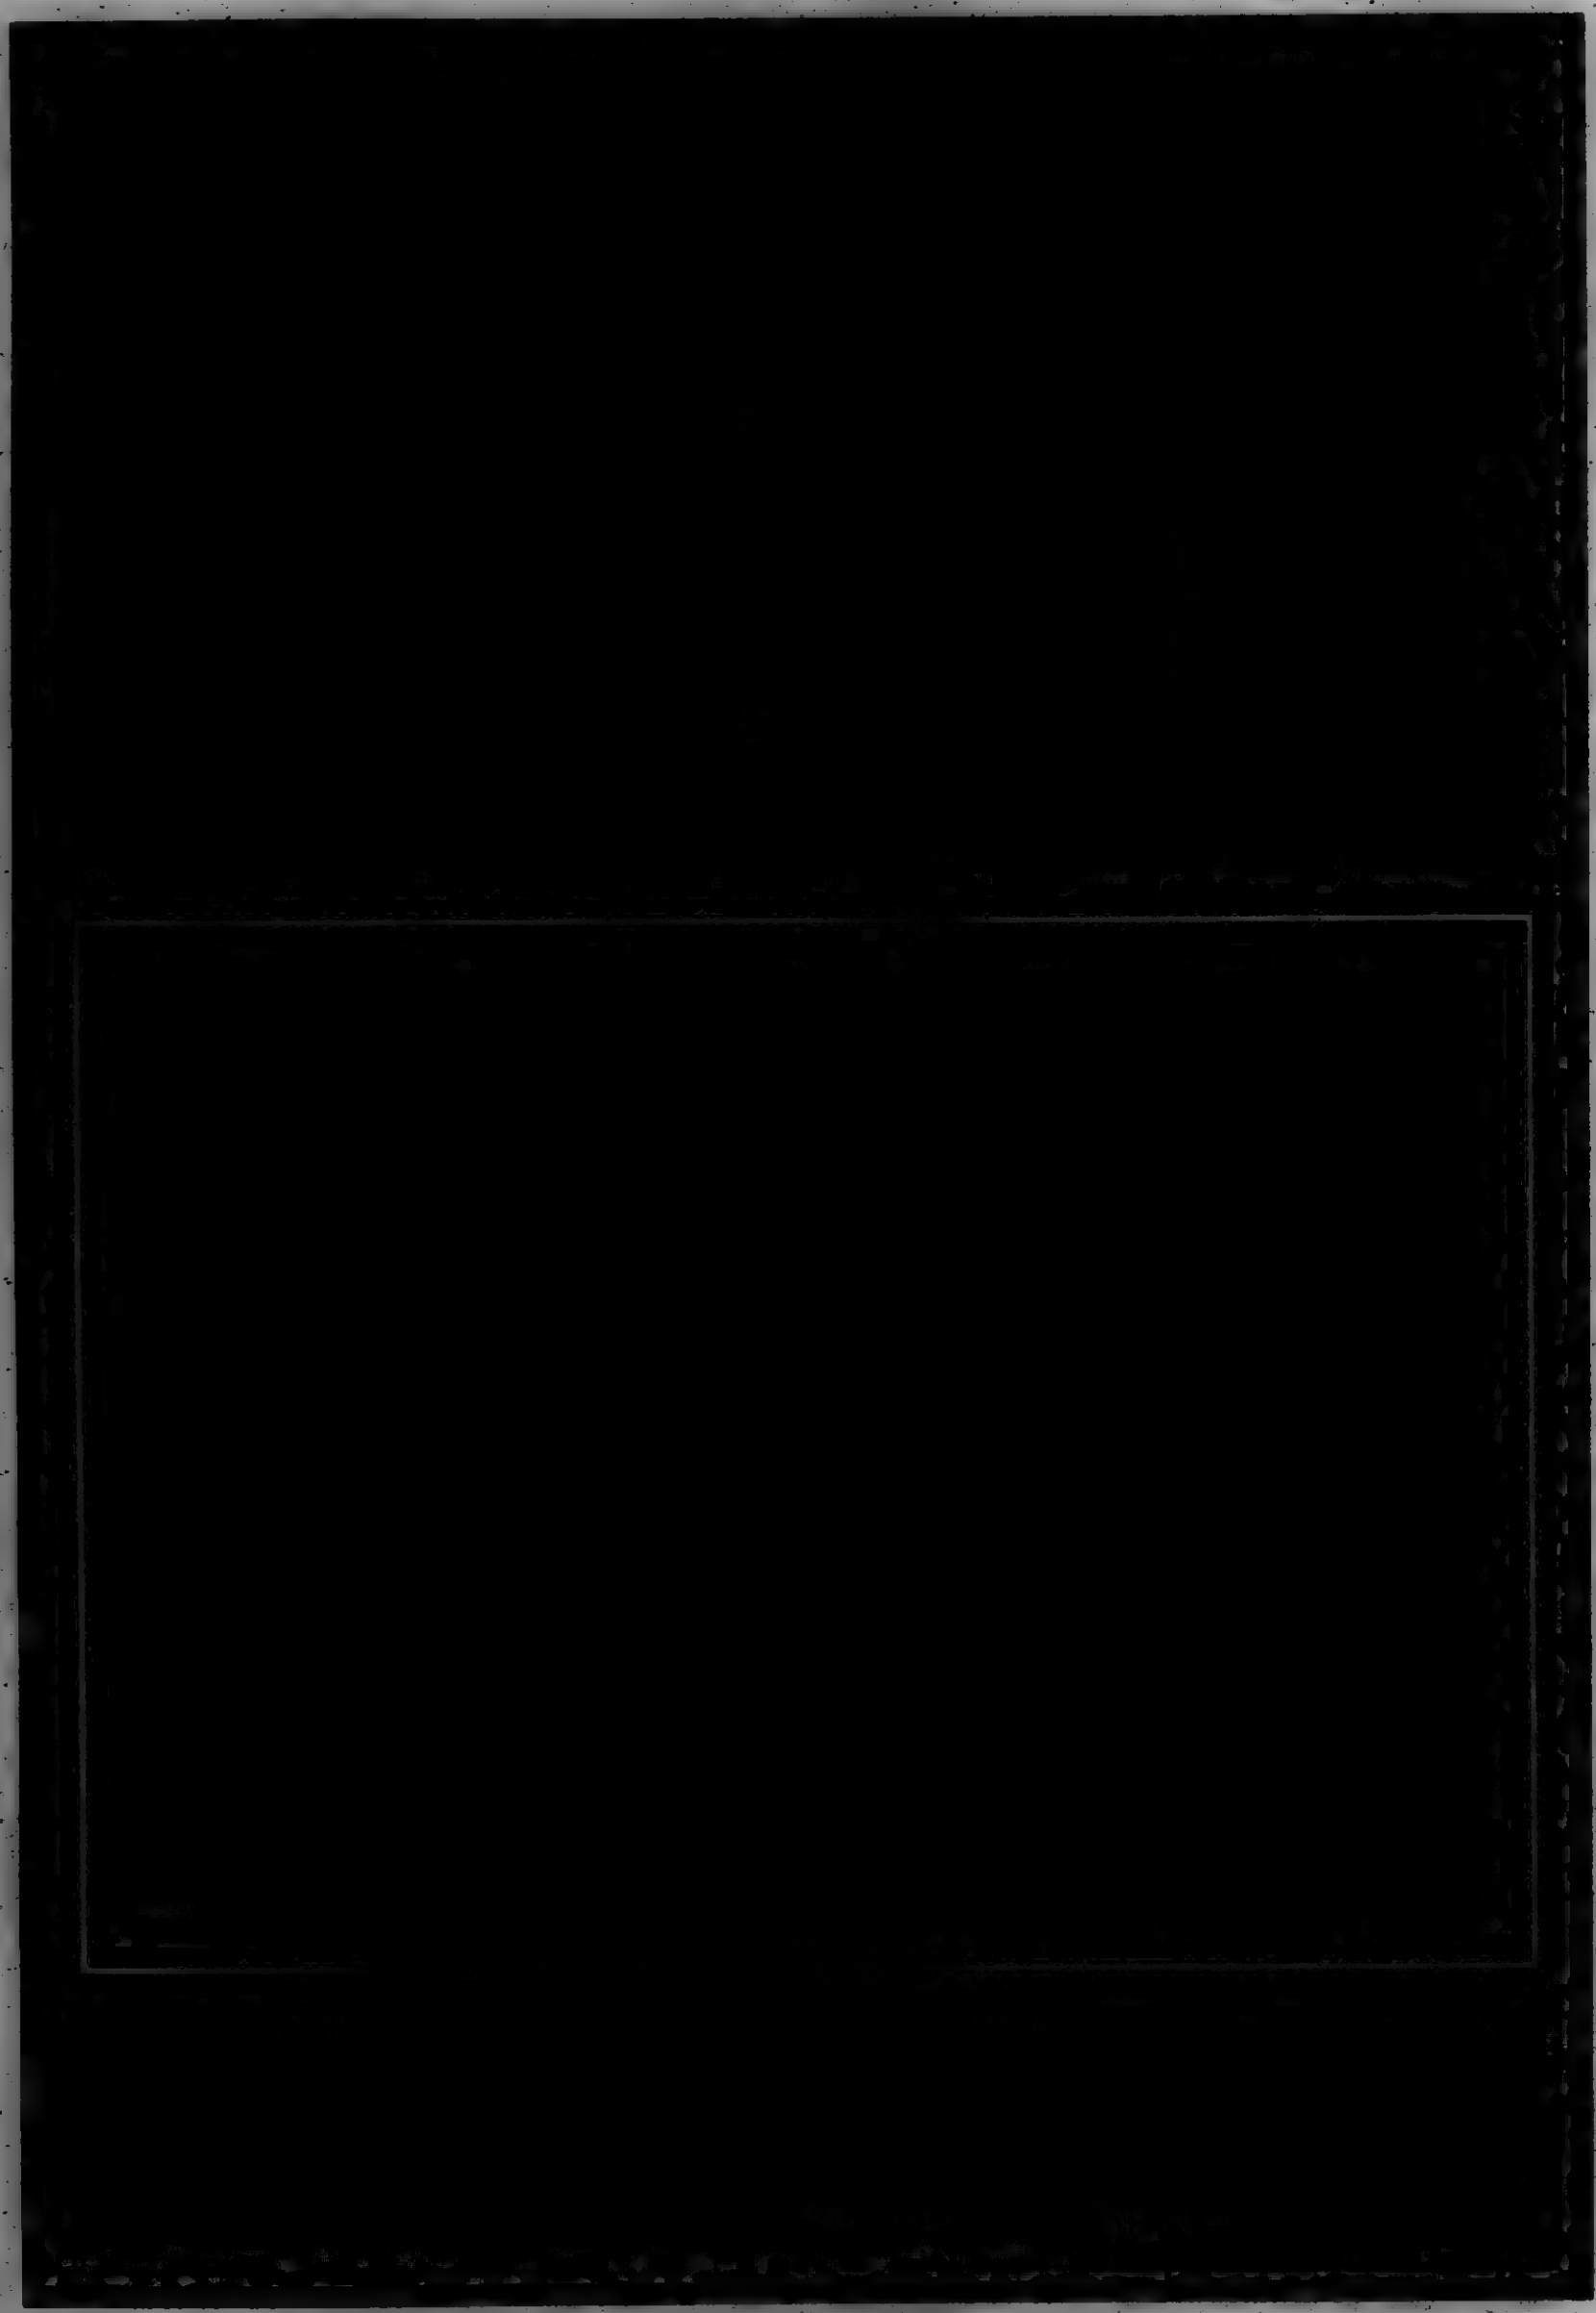
Vector Graphic recently announced a new desktop computer that claims to be two to 10 times faster than IBM's Personal Computer and in recent months obtained financing totaling $4.7 million.

Delays limit Rolm revenue growth

SANTA CLARA, Calif. — Rolm Corp. recently announced it expects revenues for the third quarter will be only slightly above the second quarter, due to delays in installations.

M. Kenneth Oshman, president, said the "delays are due to some construction slippages at customer sites; difficulties in obtaining central office facilities and some product shipment delays."

The company posted revenues of $166 million during the second quarter, and stock analysts had predicted third-quarter revenues ranging from $175 million to $180 million.



Stuff it to JES

Give your CICS, DISPRINT and IMS reports to JES
The Dynamic Report System provides a bridge between on-line systems and the JES report queues. Instead of burdening CICS and IMS with printing, move it to JES and gain performance along with centralized report distribution. Let JES account for, archive and distribute reports to 327X printers, local printers, PCs, plotters, microfilm devices and 5210s.

And Let JES Distribute Your 328X Reports
VPS, the VTAM/TCAM Printer Support subsystem places 3270/328X printers, PCs, plotters, 5210s, and word processors directly under JES. These non-dedicated devices become JES NJE print stations. VPS expands JES's local and remote hardcopy alternatives as it reduces real network costs and complexity. Ask our 400 users and their 20,000 printers.

New from Interactive Systems/3M:

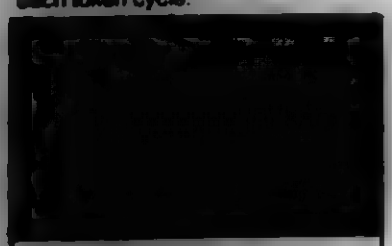
The first high-speed broadband local-area network that guards against data crashes.

If you've been thinking of investing in a contention network, consider this: How do you guard against data crashes during times of heavy system use?

Answer: You don't, because contention schemes simply don't provide any kind of data insurance.

Fortunately, there is a new type of network that does protect against data loss. It's called 3M Videodata® LAN/1. And it's the first intelligent broadband local-area network that's designed to get data through on time, no matter how much traffic is on the cable.

Videodata® LAN/1: The efficiency of token-passing plus the proven flexibility and expandability of broadband.
Token-passing networks eliminate contention troubles and data crashes by passing an electronic "token" from terminal to terminal. When a terminal has to transmit, it grabs the token and sends data packets to the receiving device. Receipt is acknowledged and the token is automatically released to continue its rounds. Because the system assigns a network entry address to each user, everyone has an opportunity to send data during each token cycle.



Because Videodata LAN/1 is a broadband system, dedicated channels can be used for full-motion video applications such as CAD/CAM and teleconferencing. These video signals are kept entirely separate from digital traffic on the network's token-passing channels.

So far, so good. But most token-passing networks are baseband systems, meaning that terminals must share a common channel as they would in a typical contention network. This can limit speed and capacity in some applications.

LAN/1 overcomes this possible limitation by combining token-passing with a proven *broadband* technology that allows many channels to be put on a single cable. The payoff: higher channel speeds, ranging up to 2.5 MB/s over a maximum seven-mile radius, with terminal data rates of up to 19.2 KB/s. Plus a capacity of up to 10,000 devices to allow plenty of room for future expansion.

In the Videodata LAN/1 network, messages can be sent from any terminal to any other without going through the host processor. Network Interface Units (NIUs) connect digital devices to mechanical taps (shown as small circles) on the main coaxial cable. A Network Monitoring Unit, or NMU, keeps a statistical record of network performance.

Self-monitoring, with a printed record of network performance.
LAN/1 gives statistical proof of its own performance in printed form, thanks to a microcomputer-based Network Monitoring Unit (NMU). This unit, which also helps in routine maintenance and troubleshooting, may be used for remote monitoring as well.

Separate channels for voice, video, and graphics. Plus the ability to work in point-to-point applications.
Because LAN/1 is a broadband network, channels can be set aside for real-time voice, video, and high-speed graphics. This can be done without compromising digital traffic capacity.

LAN/1's broadband design also permits flexibility in network architecture, so that it can be used in high-speed point-to-point applications which can't be served efficiently with contention systems.

Other benefits include full transparency, an automatic shut-off feature to keep any one terminal from capturing the token, and compatibility with both dumb and intelligent terminals. The list of features goes on and on.

For the full story on the new Videodata LAN/1 network from Interactive Systems/3M, call 800-328-1684 toll free. (In Minnesota, 800-792-1072.) Or mail the coupon.

COMPUTER INDUSTRY

Links seen as tip of iceberg

In untapped mart for productivity tools

CW AT ADAPSO

By Robert Batt
CW West Coast Bureau

DALLAS — The micro-to-mainframe link represents just the tip of the iceberg in a largely untapped market for productivity tools, according to John Landry, senior vice-president for McCormack & Dodge Corp.

Speaking at the 60th Management Conference of the Association of Data Processing Service Organizations, Inc. recently, Landry said the current frenzy over micro-mainframe links is obscuring a sense of personal computer productivity and application software waiting to surface in the Fortune 2000 marketplace.

Landry told a conference session that a great many link vendors will emerge over the next few years, but link software distribution will be dominated by the current front-running mainframe software suppliers.

The total software company of 1985, he said, will have the following characteristics:

- Mainframe applications in areas such as financial services, human resources and manufacturing.
- Mainframe development tools.
- Micro-mainframe links.
- Personal computer productivity tools and micro applications.

Selling "total solutions" will require personal computer application software integration with front-running mainframe applications packages.

These front-end extensions, he said, will include data entry and editing facilities, functionally compatible front ends, concurrent processing and fully functional micro applications interfaced to mainframe applications.

"Links could become the loss leaders used to capture customers into a mainframe and micro proprietary software architecture," he suggested.

Also speaking at the session, Jeffrey Walker, chairman of Walker Interactive Products, Inc., a San Francisco-based software company, claimed micro-mainframe links are very immature when it comes to addressing the needs of the marketplace.

The links, he contended, contain artificial restrictions, are often based on IBM 3270 technology with its inherent limitations and do not address the total problem from the end user's point of view.

"The problem for micro-mainframe links is in trying to handle a wide variety of different software that is available to end users who often choose their packages on the basis of personal bias rather than corporate standards," he said.

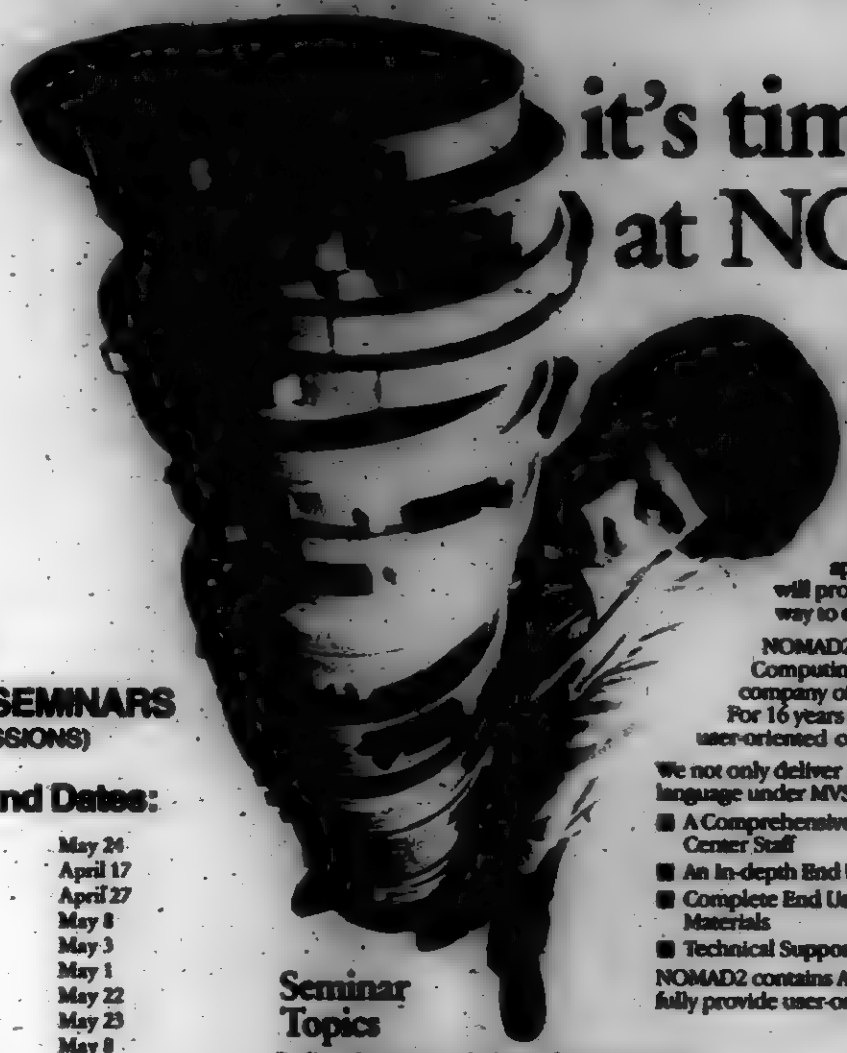
The real problem in micro-mainframe links, Walker added, is a human engineering problem rather than a technology problem.

"The software that runs on the mainframe should be able to run on micros. Personal computing is the goal because it is what the end user wants. Personal computing should therefore be available, no matter what the hardware," he argued.

Vaughan Merlyn, president of Merlyn Corp., commented on the shift in power away from the data processing department and toward end users that micro-mainframe links afford.

"Micros are growing up to become mainframes, and the distinction between the two is blurring. As a result, the decision-making power is shifting from the DP department to the end user, and many mainframe vendors are not at all equipped to deal with this change," he said.

If delivering user-oriented computing is getting you down...



it's time to look at NOMAD2!

Delivering user-oriented computing can be a tricky business. If it's your objective to satisfy the user community in your organization, it's time to speak to the experts. We'll share our experience with you at our FREE NOMAD2 Seminars.

Whether you're interested in an Information Center, Development Center, end-user computing or just quick applications development, our seminars will provide you with a closer look at the best way to deliver user-oriented computing.

NOMAD2 is a unique product created by D&B Computing Services, the information services company of The Dun & Bradstreet Corporation. For 16 years we have been delivering value added user-oriented computing services.

We not only deliver NOMAD2, the premier fourth generation language under MVS and VM, but also provide . . .

- A Comprehensive Training Program for Your Information Center Staff
- An In-depth End User Training Program
- Complete End User Documentation and Training Materials
- Technical Support for Your Information Center Staff

NOMAD2 contains ALL the components you need to successfully provide user-oriented computing services.

Exec urges financial services to meet human needs

CW at Adapso

By Robert Batz
CW West Coast Bureau

DALLAS — "The financial services landscape is littered with innovations that consumers do not want. In this business, you do not necessarily get a gold star for being out in front with a leading-edge technology."

That was the message delivered here recently by Garland Cupp, executive vice-president of the American Express Travel Related Services Co., Inc., to some 500 computer services executives attending the Association of Data Processing Service Organizations, Inc.'s (Adapso) 60th Management Conference.

In a keynote address on "The Role of Technology in the Financial Services Industry," Cupp said it is the customers, not the technologists, who will determine the future use of computer systems by financial institutions.

Cupp sees three issues as key to adapting computer-related technology to the financial services industry successfully — hardware, software and the human dimension. The last is by far the toughest, he said.

Customers will decide

"Customers will decide the technology they want. They will make the trade-offs between efficiency and privacy, cost and convenience. This makes it very difficult for vendors to lay out strategic and tactical goals," he said.

According to Cupp, two possibilities are open to the financial services high-tech supplier:

- A supermarket approach, in which the supplier appears as all things to all people.
- A boutique approach, in which the service supplier aims at specific market niches.

Making the choice, he added, is risky: "The dilemma is how to manage these enormous sets of uncertainties. You must do something, since a 'do nothing' stand will certainly fail. Timing is everything."

Cupp said it is important to be well prepared in both hardware and software, where the technology already exists to do the job that customers want.

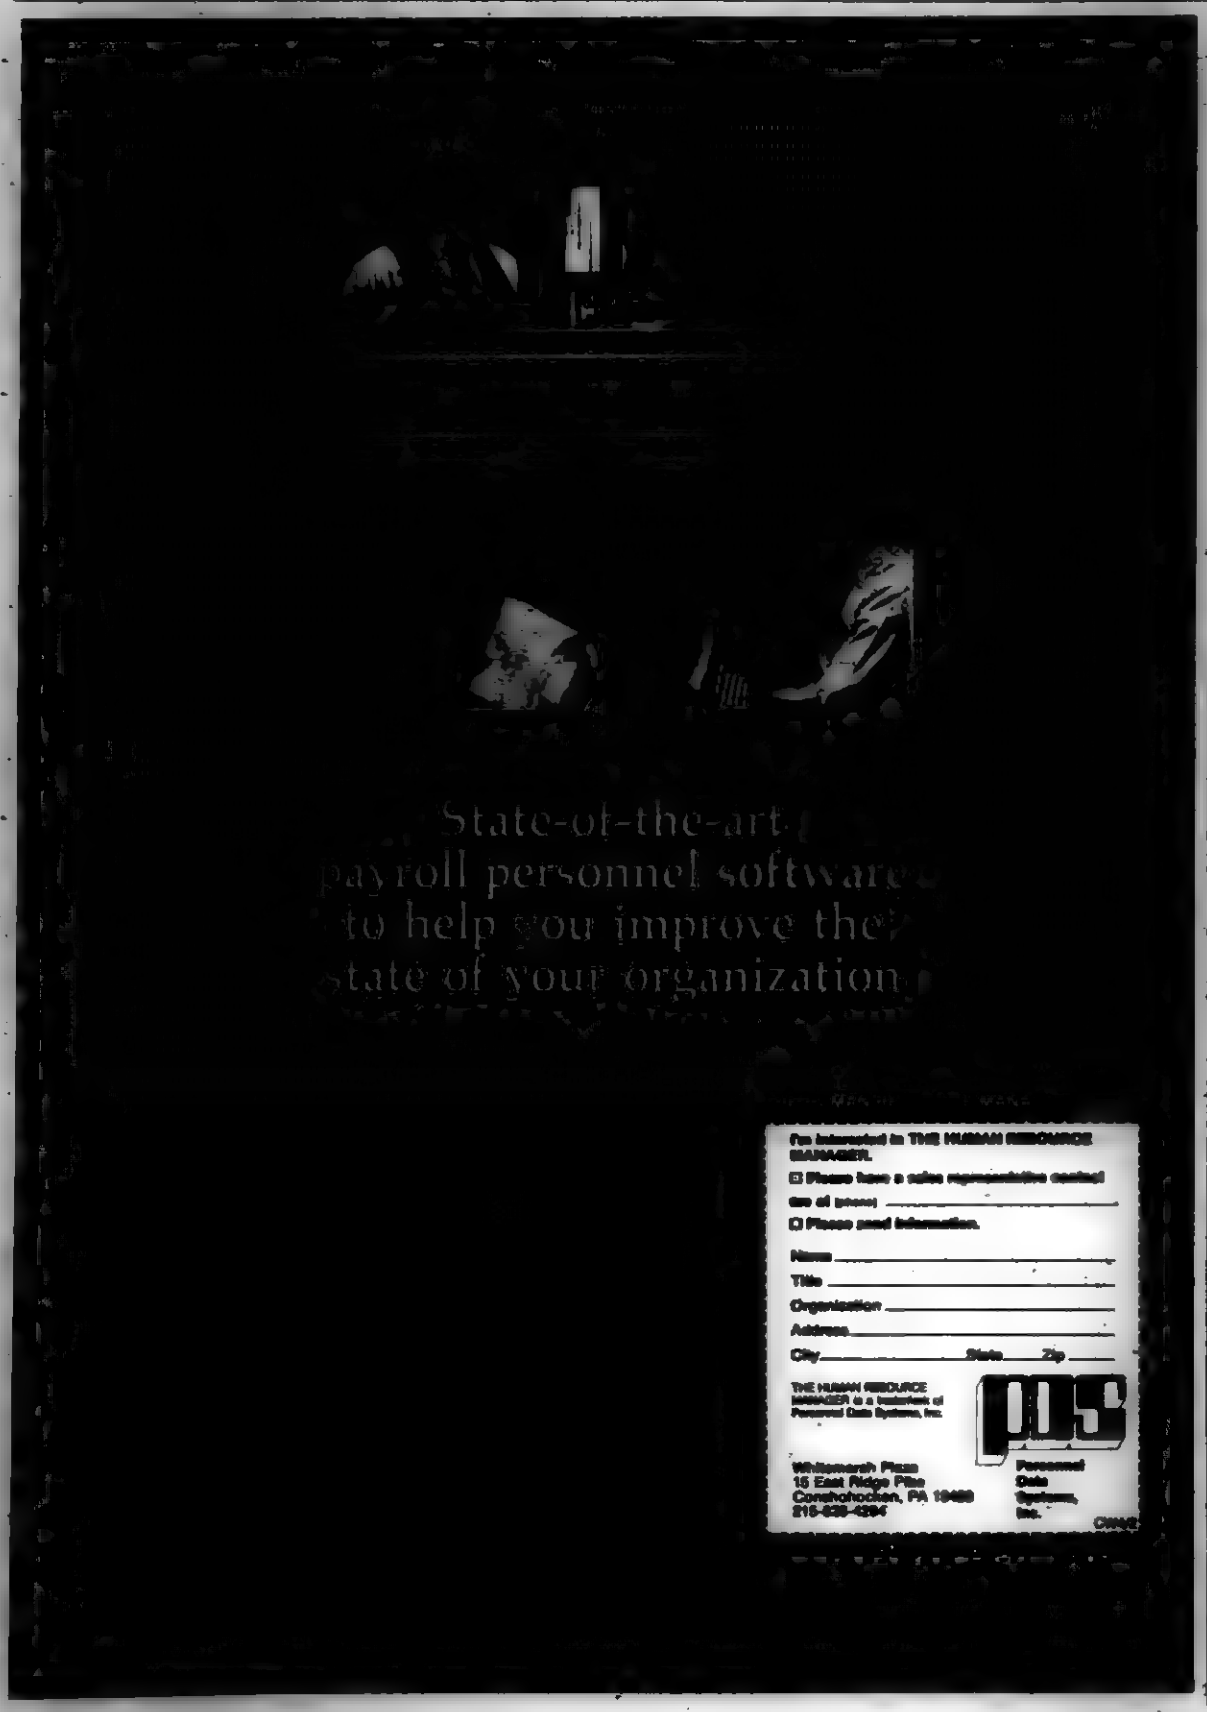
Flexible strategy

A flexible strategy is vital for a high-tech supplier to move in whatever way the human dimension element takes it, he declared. "Technology has given us unprecedented options. We are currently in a period of experimentation which reflects the confusions and dilemmas of our technological age. The key to the success of financial services companies is how well they understand the human dimension."

Cupp reminded his audience that the human dimension of applying technology to the financial sector must also take government actions into account.

The financial services industry, he complained, is operating under antiquated laws that were drawn up 50 years ago and are not meant for a high-technology world.

"These laws must be reformed if we are to remove artificial restrictions. Rules that stand in the way of innovation must be modified," he concluded.



Prelude, Lotus agree to AI licensing pact

CAMBRIDGE, Mass. — Lotus Development Corp. has announced a licensing agreement with Prelude Development Corp., a start-up artificial intelligence software firm.

Under the agreement, Prelude, which was founded by a former Lotus employee, will license AI software technology to Lotus, which plans to market products incorporating the technology within 18 to 24 months.

"This agreement permits Lotus to stay abreast of and involved with the latest developments in productivity technology without sacrificing its own short- and medium-term research focus," said Lotus President Mitchell Kapor.

Prelude President and founder Peter Gabel, who recently resigned from his position as manager of the Advanced Development Group at Lotus, added that development work will move ahead faster and further with Prelude operating as an independent entity.

Gabel is joined by another Lotus Advanced Development Group employee, Paul Weiss, now vice-president of research and development at Prelude.

The start-up reportedly will develop a family of productivity products based on intelligent data bases to be introduced in the spring of 1985.

COMPUTER INDUSTRY

Accountant: Software R&D costs should be capitalized

Speaking to attendees of Adapso's 60th Management Conference

DALLAS — Software development cost accounting should be changed to allow developers to capitalize those costs and show them as assets, a senior partner in a Big Eight accounting firm told the Association of Data Processing Service Organizations, Inc. (Adapso) recently.

Speaking at Adapso's 60th Management Conference, Francis J. O'Brien of Arthur Young and Co. said present accounting practices for software development "will make the going increasingly rough for the software industry."

Under a 1974 ruling by the Financial Accounting Standards Board (Fasb), software companies are forced to treat costs as current research and development expenses rather than capitalizing them and showing them as assets on balance sheets, O'Brien said.

"As a result, [software companies] will encounter more and more difficulty in borrowing the funds they need for future products because they cannot put their assets on their balance sheet," he said.

O'Brien said the building of software development involves using a known technology to achieve a known end, while traditionally defined R&D involves many uncertainties.

Some software companies, according to O'Brien, have circumvented the problem by acquiring software development from others.

These moves may "be unduly expensive and thus ill-advised in that the only reason they are made is to allow the purchaser to show the product as an asset and avoid the current charge to earnings," according to O'Brien.

O'Brien urged the Fasb to solve the problem by approving a recently submitted recommendation from a joint task force of the American Institute of Certified Public Accountants and Adapso.

National Semi registers third-quarter profit of $15.4 million

SANTA CLARA, Calif. — National Semiconductor Corp. recently announced a third-quarter profit of $15.4 million, compared to a loss of $12.6 million during the corresponding period one year ago, as sales climbed $121.1 million over the same period.

For the first three quarters of fiscal year 1983, National Semiconductor posted sales revenues of $1.2 billion compared to $350.6 million last year, producing a profit of $39.5 million, or 47 cents per share, compared to a net loss of $31.9 million in the first three quarters of fiscal year 1982.

Charles E. Sporck, National Semi president and chief executive officer, said the improvement of more than $54.8 million in pretax profits compared to the third quarter a year ago and the $99.2 million improvement on a year-to-date basis were due primarily to sharply improved operating performances in the components segment.

Pretax charge

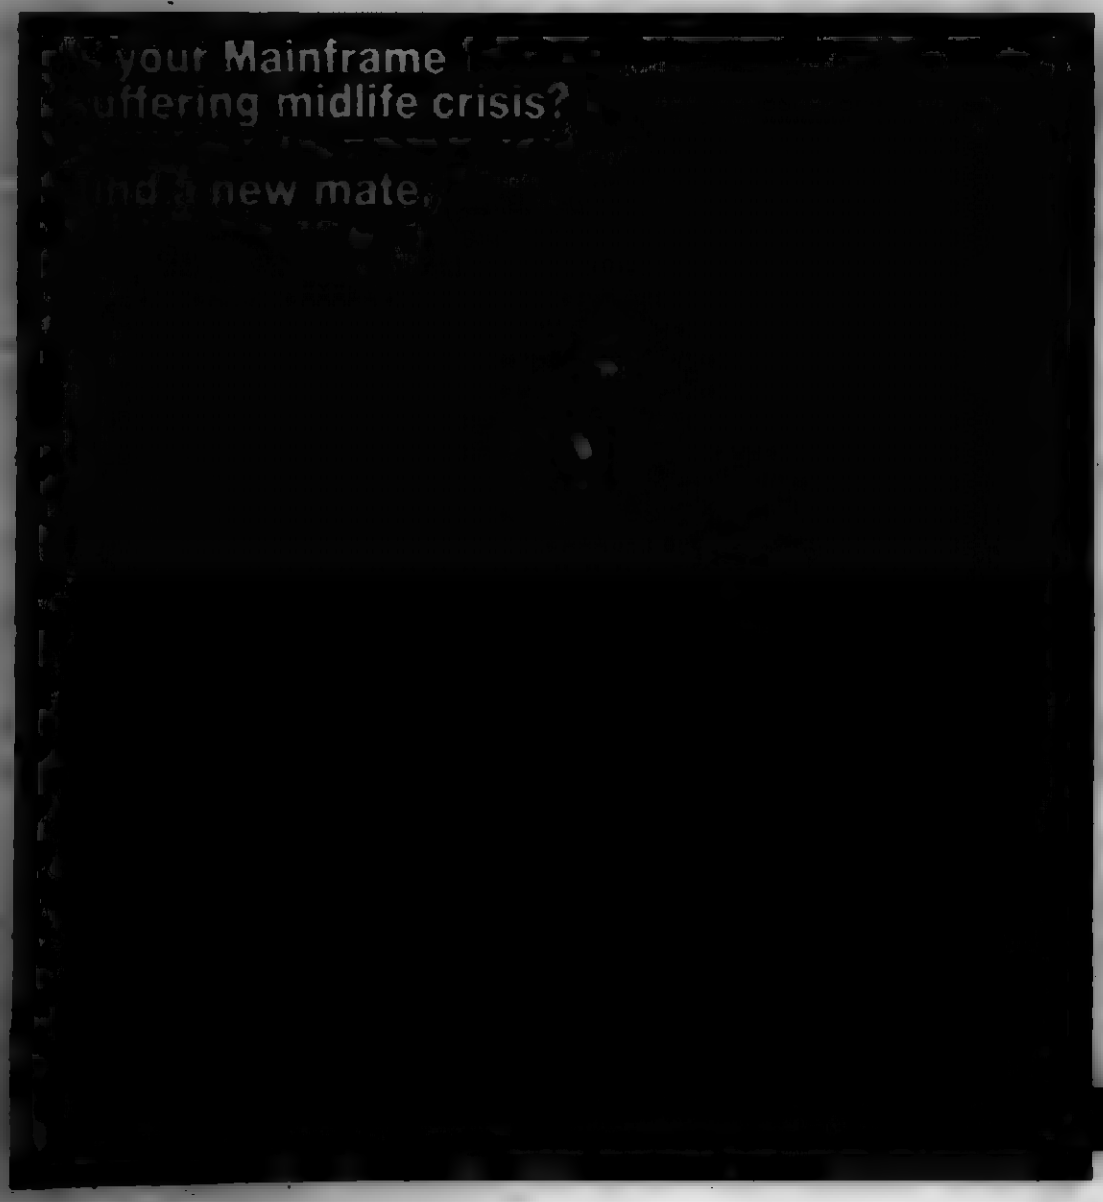
Also, results for the third quarter of fiscal 1983 included a $9 million pretax charge related to the closing of the medium systems computer manufacturing facility in San Diego, the vendor said.

"Overall, we've established a quarterly record for order rates," Sporck maintained, adding that the key to this achievement was the Semiconductor Division's 68% increase in order rates from the same period a year ago.

Effective at the start of the quarter, National changed its depreciation method for newly acquired machinery and equipment from the double-declining balance method to the 150% declining balance method. However, the change did not have a material impact on third-quarter or year-to-date earnings or earnings per share, according to a spokesman for the company.

Just after the close of the quarter, National Semi and the federal government reached agreement to dispose of liabilities arising from a grand jury probe into National's testing and certification of military microcircuits supplied between 1978 and mid-1981.

The company agreed to pay the government $1.76 million. According to Sporck, provision was made in fiscal year 1982 for this matter. As a result, the settlement did not have a material effect on the company's financial results for the quarter.



Now Attachmate-3270 adds multiple Mainframe windows to your IBM Personal Computer.

Attachmate's coax interface board can bring out the best in your existing mainframe.

When connected to your mainframe, your IBM Personal Computer can be as many as four 3278 terminals. You can work up to seven different programs and display each in a separate window.

Not one Not two But more windows

Looks just like a new IBM-3270 PC, doesn't it?

What's more:

- *Attachmate-3270 provides more mainframe security—only you have the key.*
- *You can coax connect to all existing 3270 control units and use in-place Bisync and SNA networks.*
- *You can share those high speed 3270 printers to save money, time, workspace.*
- *You can transfer files and share data with your mainframe and other PC's as well as access 3270 printer data to print, process, send or save.*
- *And, as a bonus, Attachmate's single-slot board can expand your memory by 256K bytes.*

What's less:

- *The price. Attachmate-3270 gives your mainframe and PC all of this new life—compatibility, flexibility, function and immediate delivery for less than $1,000. For more facts:*

Attachmate Corporation, (206) 644-4010, 3241-118th S.E., Bellevue, WA 98005. Dept. CW6

NEW CICS Abend-AID PRODUCT ANNOUNCEMENT

Abend-AID/CICS is a powerful software tool that transfers the burden of debugging CICS transaction abends from the programmer to the computer.

Abend-AID/CICS analyzes transaction abends, determines the cause and tells the programmer—What Happened, Why it Happened and Where it Happened. It also provides immediately On-Line the necessary supporting data in a concise, easy-to-use format.

Saves Programmer Time

- ☐ Complete, easy to understand diagnostics. Pinpoints the cause of the abend. Presents all the data needed to solve the abend. Immediate access On-Line through CICS, TSO/SPF or CMS. The region does not have to be active to view Abend-AID/CICS output.

Reduces Production Downtime

- ☐ Since Abend-AID/CICS is only invoked at the time of the abend it can be used both in test and production. Minimum overhead allows Abend-AID/CICS to work for all regions. Works instantly for all programs old and new. No recompiling. No programmer action required.

Greater Management Control

- ☐ An Abend Activity report can be viewed at any time to give you an up-to-the-minute picture of region abend activity. Report provides transaction code, terminal, abend code, program name and date/time information for all abends.

Greater Flexibility

- ☐ Exception tables enable you to choose desired output—or suppress output based on transaction code, terminal, abend code or any combination. Customized diagnostic modules can be created for user exits and specialized abend codes.

FREE 30 Day Product Evaluation

For additional Product Information or to arrange for your FREE 30 Day Product Evaluation call today.

Computervision held liable in PE patent suit

Has attached qualification to its financial statements pending suit's outcome

BEDFORD, Mass. — Computervision Corp. has attached a "qualification" to its 1981, 1982 and 1983 financial statements pending the outcome of a $40 million patent infringement suit brought by Perkin-Elmer Corp.

"The qualification doesn't really pertain to the case or to the amount, and as soon as the case is settled or adjudicated in some manner, that qualification will be removed," said Computervision spokesman F. James Carr.

PE brought the suit against Computervision before a San Francisco federal court in 1977. U.S. District Judge William H. Orrick is expected to rule soon on PE's request for $40 million in damages and interest. Orrick recently concluded a hearing on damages after the 9th U.S. Circuit Court of Appeals reversed a jury verdict that was in Computervision's favor.

Liable for damages

That reversal left Computervision liable for damages relating to its former Cobilt Division's infringement on PE's patents for the Micralign projection mask aligner, a product designed to align masks with wafers and the design patterns embedded on them.

Computervision, which is appealing the circuit court decision, and its auditors, Price Waterhouse & Co., issued the qualification March 23, 1984, and emphasized that the litigation has no impact on its current operations.

For the year ending December 31, 1983, Computervision reported $35.3 million in earnings on revenues of $400 million.

At the same time, Computervision complained that it was surprised that PE asked for $40 million in damages and said that the companies had discussed a much lower settlement. "We were thinking more in a range like 10% of that," Carr said.

PE unaware of negotiations

A PE spokesman responded that company officials were "aware of no such negotiations."

Computervision sold its Cobilt Division to Applied Materials, Inc. in 1981.

Until enjoined by the court, Cobilt produced a CA 3000 semiconductor projection alignment system designed to compete with the Micralign.

Eagle expects revenues loss

LOS GATOS, Calif. — Eagle Computer, Inc. said recently it expects losses ranging from $7 million to $9 million for the quarter ended March 31, partly due to a recent settlement whereby the company agreed to drop a microcomputer Basic I/O System (Bios) alleged to be an infringement on an IBM copyright.

Eagle said it expects sharply reduced revenues for the quarter will result from delays in converting to a new Bios and from write-downs to be taken on certain assets.

In accordance with the terms of the IBM settlement, Eagle ceased shipping micros with the contested Bios on March 6 and began shipments of the new Bios on March 23.

The suit was filed and settled the same day in February when IBM charged Eagle had copied substantial portions of IBM's Bios that is used in the IBM Personal Computer.

Eagle said it experienced an unexpected drop in orders as a result of the conversion. The company also said it was forced to delay announcement of a new microcomputer product that had been expected to contribute to third-quarter revenues.

Software AG airs profits rise

RESTON, Va. — Software AG Systems, Inc. recently reported third-quarter profits of $1.6 million, or 27 cents per share, compared with a loss of $253,000, or four cents per share, in the third quarter of 1983.

Revenue for the third quarter ended Feb. 29 was $10.5 million, compared with $7.6 million in the corresponding period a year earlier.

The third-quarter loss in 1983 reflected a $810,000 deficit resulting from a $1.5 million settlement of litigation with Mini-Technology, Inc.

For the nine-month period just ended, the company reported revenue of $29 million and profits of $4 million, or 66 cents per share, compared with revenue of $21.1 million and profits of $266,000, or four cents per share, during the comparable period in fiscal year 1983.

Nearly Nine Million Computer-Involved People Around the World Rely on Our Publications For the News They Need.

We're CW Communications/Inc.; the world's largest publisher of computer-related newspapers and magazines. And wherever you go in the computer world, you'll find computer-involved professionals reading—and relying on—our publications. With highly trained and experienced editorial staffs all over the world, our publications give readers the best and most up-to-date information available in this rapidly changing industry.

Around the world:

We publish, co-publish or provide editorial services to the leading computer publications in the world, including publications in all of the following countries:

Scandinavia—Denmark, Sweden, Norway, Finland
Western Europe—West Germany, United Kingdom, France, Italy, Spain, Greece, the Netherlands.
The Mid-East—Kuwait, Saudi Arabia.
Asia/Africa—People's Republic of China, Korea, Japan, Singapore, Southeast Asia, South Africa, India.
The Southern Pacific—Australia.
Central and South America—Mexico, Brazil, Argentina, Chile.

In the United States:

In the world's largest computer market, we publish a whole series of publications that cover different aspects of the industry. Our largest publication, with more than half-a-million readers every week, is *Computerworld*, a weekly newspaper aimed primarily at larger computer users. Its companion publications include *Computerworld Office Automation*, *Computerworld on Communications* and a series of *Buyer's Guides* covering all major segments of the industry.

In addition, we publish *MICRO MARKETWORLD* for dealers, distributors, retailers and others involved in the microcomputer marketplace. For microcomputer users, we publish *Infoworld*, *Microcomputing*, *PC World*, *MacWorld*, *jr*, *80 Micro*, *InCider*, *Run*, and *Hot CoCo*.

No one in the world publishes more computer information for more people in more countries than we do. And we'd be happy to give you more information on any of our publications. Just send a telex to our U.S. offices, attention CW International Marketing Services, (telex #95-1153) or write us at the address below.

Victor OKs European offer to buy its micro business

SCOTTS VALLEY, Calif. — Victor Technologies, Inc.'s board of directors has approved an offer from its European distributor, Applied Computer Techniques PLC (ACT), to purchase Victor's microcomputer business [CW, March 26].

Although the financially troubled micro maker's debt is estimated at $100 million, it said the purchase price "will amount to substantially less" than its $75 million in unsecured debt. Efforts to reach representatives of ACT and Victor's creditor committee for comment were unsuccessful. The terms of the agreement were not disclosed.

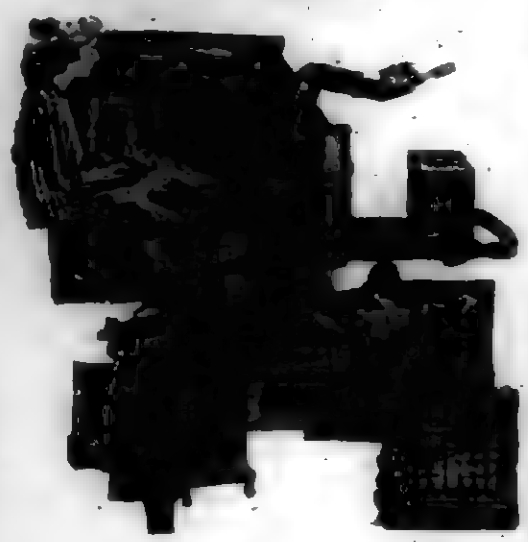
Under the proposal offered by the Birmingham, England-based distributor, Victor said it will retain distribution rights for North America and South America for Victor microcomputer products to be made by ACT.

Victor's recent filing for protection from its creditors under Chapter 11 of the Federal Bankruptcy Act made it the third micro maker in a six-month period to do so. Acceptance of ACT's bid is "subject to a definitive agreement and the approval of a bankruptcy court," a spokeswoman for Victor said.

IS THERE A FUTURE IN YOUR FACTORY?

Industrial Renewal

A new era of industrial renewal is sweeping across the manufacturing landscape. Manufacturing pursuits are back on the front burner. Companies are gearing up to regain lost markets and become competitive on a new global scale.



The Manufacturing Information Network

Manufacturing is rapidly becoming an information intensive business. Allocation of resources — what's needed, how, much, by whom, when and where — will be a crucial element in the success — or failure — of the manufacturing effort. New and automated production systems will be keyed into the manufacturing information network. And at the heart of this new working environment is the computer. Computer integrated manufacturing will usher in a new industrial revolution. Product reliability and quality are dramatically enhanced. Scrap and rework are minimized. And the improvements in overall productivity yield a maximum return on your investment.

Linkage and Systems Integration

The new dawn of manufacturing will not be realized by installing a few robots or numerically controlled machine tools. Even the latest systems approach to manufacturing will be rendered ineffective if the machines on the factory floor are not up to the job. The key to the future is linkage...linkage of the information vital to the manufacturing process with the computer driven production equipment designed to do the job. Not just one job. But the jobs that will be determined by today's and tomorrow's markets. After all, that's what flexible manufacturing is all about.

Beyond the Dream.... The Future is Now

You've heard what's happening in manufacturing: materials requirements planning; just-in-time inventory systems; FMS; Robotics; Automatic Guided Vehicle Systems; AS/RS; CAD/CAM and more.

BUT WHERE DO YOU GO TO FIND OUT MORE ABOUT THE FACTORY OF THE FUTURE?

IT'S ALL HERE...

Revenues up at Ashton-Tate

CULVER CITY, Calif. — Ashton-Tate, Inc., the microcomputer software and book publisher located here, recently announced that annual profits and revenues both were up more than 200% over restated figures for fiscal year 1982.

For the year ended Jan. 31, Ashton-Tate reported revenues of $39.8 million, up 297% from the $10 million experienced in 1982.

Profits for 1983 were $6.2 million, or 78 cents per share, for the publisher, up 266% from the $1.7 million, or 23 cents per share, experienced in 1982.

Figures for 1982 and the first six calendar months of 1983 were restated to reflect divestiture of two divisions and the acquisition of product rights.

In the fourth quarter of fiscal year 1983, the company had revenues of $13.5 million and profits of $1.7 million, or 20 cents per share.

Commenting on the success of Ashton-Tate, David Cole, president and chief executive officer, said the microcomputer data base software vendor expects "record sales and earnings for this year, largely through the introduction of new, but related, products."

Cancer Institute seeks vendors

BETHESDA, Md. — The National Cancer Institute (NCI) is seeking computer utility vendors to provide information on cancer treatment to community-based physicians with office or personal computer systems through its PDQ data base systems.

Currently available only through National Library of Medicine Medlars centers, PDQ provides health professionals nationwide with information about the prognosis and accepted treatment options for specific cancers and treatment protocols.

Additional information can be obtained through NCI PDQ, Room 11A49, Building 31, National Institutes of Health, Bethesda, Md. 20205.

MODELS AND BUILDS

Computer Task Group, Inc. has reported revenues of $64.1 million and earnings of $1.4 million for the year ended December 1983. Earnings per share for 1983 were 75 cents, compared with 62 cents from 1982.

■

Televideo Systems, Inc. has reported an increase in sales of 11% for the first fiscal quarter of 1984. Sales totaled $43.2 million, up from $38.9 million last year. Net income gained 17% to $5.7 million from $4.9 million for the period.

■

Microstar Systems Corp. reported a net loss of $3.6 million for the fourth quarter, compared with net income in the corresponding period a year earlier of $619,000, or 8 cents per share. Sales rose to $6.1 million from $5.8 million in 1982. For 1983, a net loss of $3.7 million was reported, compared with 1982 net income of $1.5 million. Sales were $20.1 million, up from $19.2 million in 1982.

■

Computer Synergy, Inc. has filed a registration statement with the Securities and Exchange Commission covering the public offering of 645,000 shares of common stock. The company will issue and offer for public sale 575,000 shares, and 70,000 shares will be sold by existing shareholders. The public offering will take place in mid-April.

■

LTX Corp. announced results for the second quarter ending Jan. 31. Sales were $19.3 million, compared with $12.8 million for the corresponding period a year earlier. Net income was $1.2 million, or 16 cents per share. Sales for the first six months ended Jan. 31 were $34.4 million, an increase of 50% over sales of $22.9 million in the prior year; six-month earnings were $2.1 million, or 28 cents per share, compared with $930,000, or 14 cents per share, for the earlier period.

■

Amistar Corp. has filed a registration statement with the Securities and Exchange Commission for public offering of 1.3 million shares of common stock. The offering is to be made in April by an underwriting group managed by L.F. Rothschild, Unterberg, Towbin.

■

Science Management Corp. announced sales for 1983 of $68.9 million and a net loss of $1.1 million, or 49 cents per share. In the fourth quarter, sales increased to $21.9 million with a net loss of $519,000, or 20 cents per share.

■

Wyle Laboratories reported sales increased 61% for the fourth quarter to $84.7 million from $52.7 million in 1982. Net income for the quarter was $2.5 million, or 34 cents per share, compared with a net loss of $300,000 in 1982's fourth quarter. Sales for fiscal year 1983 were $293.6 million, up 41% from 1982. Preliminary net income for the year was $7.1 million, or $1.05 per share, compared with 1982's net loss of $3.1 million.

The Northern Telecom system: A benchmark in batch processing that keeps getting better.

Northern Telecom batch processing systems have proven themselves, in more than a decade of use in a variety of applications, to be among the most reliable, practical, cost-effective systems ever developed. They deliver more throughput per dollar than any competitive system.

Now, as solid evidence of our commitment to batch processing, we're improving these already-successful systems for even more productivity. For instance, we're introducing a new high-speed band printer with changeable type. Operating now with IBM's SNA, we've also added new, low-cost distributed data processing capabilities for more system versatility, and to provide for future growth toward the integrated office.

We're back

M&D from page 77

marketing rights to SI's The System report writer software [CW, Feb. 20]. Software International's report writer is similar to the Fast system, and the joint marketing arrangement was clearly intended to allow M&D to circumvent the injunction against international sales of G/L Plus with a Fast-like subsystem.

In an interview with Computerworld, ABC Management President Vernon W. Ruskin said he was "pleased the two firms could reach an amicable settlement of the dispute."

M&D Chairman James M. McCormack said in prepared remarks that the agreement is "in the best interests of our international customers, agents, employees and prospects" and that it "places no restrictions on [M&D's] ability to market and support G/L Plus domestically or internationally."

The statements were in sharp contrast to remarks made earlier by McCormack, who said M&D pursued the SI deal when it "became clear after extensive negotiations that there was no interest from ABC Management in a reasonable settlement" of the dispute. At the time, Ruskin countered by saying that M&D was not "negotiating seriously" in the matter.

WAFER from page 77

design changes made the originally planned uniprocessor too slow. The mainframe's first shipments were rescheduled for mid-1986.

A CDC spokesman declined to reveal if the Trilogy changes had any impact on CDC's decision to license the semiconductor technology.

The spokesman also declined any comment on when CDC hopes to use Trilogy's technology in CDC products.

In prepared statements, CDC's Price said that "Trilogy's pace-setting development of wafer-scale integration clearly has the promise of providing even higher standards of performance and reliability to [CDC's] top-end processors.

"In addition, the manufacturing cost projections for systems using this technology gives us confidence that [CDC] will continue to be the cost-performance leader in high-end scientific processors well into the '90s," he said.

Trilogy's Amdahl said CDC's purchase of rights to the wafer-scale technology "provides continuing evidence of its applicability across a wide range of applications beyond [Trilogy's] use in our present large-scale IBM-compatible developments."

AT&T from page 77

nounced a port for Unix if it genuinely believed that the operating system still belonged to its rival, AT&T.

On a related topic, Dyson claimed the data communications market will remain confused for some time because of the unpredictable behavior of the recently divested Bell operating companies.

"These [former Bell operating companies] promise a lot, but they don't necessarily deliver. From the point of view of Adapso members, to have someone flailing around in the marketplace can be more dangerous than a well-mannered competitor that knows what it is doing," she said.

Dyson said the important question for computer services companies is whether the former Bell operating companies will buy software or hire away people.

"Initially, they will buy your software, but the [former Bell operating companies] do not have the people they require to compete effectively, and in the long run, they will try to lure your people away."

Also speaking at the session, Jack Bucter, executive director of planning for AT&T Technologies, agreed that the firm has yet to adopt a clear-cut strategy in data communications. He added that the market is still emerging and, so, AT&T is at no great competitive disadvantage. He outlined four distribution channels through which AT&T Technologies intends to bring solutions to its customers: internal and end-user sales forces, independent software vendors, value-added resellers and retail distributors.

The AT&T executive stressed that no one vendor can develop solutions to meet all the problems of its business customers.

Your processing may be remote. but Northern Telecom service is on the spot.

With service and maintenance professionals located at 157 cities nationwide, we're able to provide prompt response to your call for service. How fast? Two hours in major metropolitan areas; four hours in most other areas of the country. And our multi-year maintenance agreements guarantee continuing, low-cost operation of your Northern Telecom system.

If your system lease expires within the next six months, *now* is the time to find out more about batch processing from Northern Telecom.

Time-proven performance with long-term savings.

Northern Telecom's aggressive pricing is more proof of our commitment to batch. Our discount structure offers long-term savings on multi-year leases. And at renewal time, you can save even more with discounts up to 30%.

Call our toll-free number: 800-331-3113. Or write Northern Telecom, Mail Station T-240, P.O. Box 1222, Minneapolis, Minnesota 55440. We'll show you how we can tailor a batch system to your specific needs. And save you money, too.

high-speed, integrated-circuit fabrication facility for processing circuits with submicron minimum feature sizes.

■

Unidex Corp. of America has announced its entry into satellite television and communications and has appointed Guy C. Davis to head the company's new Satellite Technology Group for the U.S. and Canada.

■

Stratus Computer, Inc. announced it has received a contract from **Lockheed Electronics Co.** for a network of fault-tolerant computers. Lockheed was recently selected to modernize and automate the Republic of China's air traffic control system. The Lockheed system will include a distributed network of a dozen Stratus/32 Continuous Processing Systems.

■

John A. Venator has been named executive director of the Data Processing Management Association.

■

Visa International has authorized France's **Carte Bleue** to issue a Visa card containing a computer chip in the card's top blue band. The board's approval will permit Carte Bleue to use Visa cards as part of a 10,000-card pilot test of the memory card — often referred to as the "smart card."

■

Microelectronics Business International (MBI) has completed funding to establish **Advanced Semiconductor Engineering** of Taiwan. The financing to fund the $18 million project was arranged through Citibank of Taiwan. MBI also negotiated the purchase of an existing 100,000-sq ft manufacturing facility in the Nantze Export Processing Zone.

MERGERS AND ACQUISITIONS

SFE Technologies, San Fernando, Calif., has announced that it has acquired **Orchard Electronics, Inc.**, which is headquartered in Concord, N.C. According to SFE, Orchard was acquired for cash and will be operated as a wholly owned subsidiary of SFE.

■

Teradyne, Inc., Boston, announced recently its acquisition of the Burlington Division of **Scientific Atlanta, Inc.**, Burlington, Mass. The division now becomes part of Teradyne's component test group, which is under the direction of Vice-President James Prestridge.

■

Infoworks Corp., Nashville, announced it has become a subsidiary of **Innovision, Union Planters Corp.**, Memphis. Terms of the merger were not available.

■

Information General Corp., Woodland Hills, Calif., and **Cyma Corp.** announced that both companies have terminated talks concerning possible acquisition. According to Informatics' President Bruce T. Coleman, the companies could not reach agreement on terms of the proposed acquisition.

■

Spectravideo, Inc., New York, has reached an agreement with **Bondwell Holding Ltd.**, Hong Kong, subject to satisfactory arrangements with its creditors, for Bondwell to acquire the controlling interest in Spectravideo. A condition of the agreement, it was announced, is the restructuring of approximately $2.6 million of Spectravideo debt.

■

Kaufman Data Communications, Inc., Mountain View, Calif., is the new name for **Kaufman Research Manufacturing., Inc.**, which has been acquired by **Orange Nassau Electronics, Inc.**, Tempe, Ariz. Terms of the acquisition were not available.

■

Ultimate Computer Services, Denville, N.J., and **ADL Enterprises** announced a merger of the two firms. The combined company will be known as Ultimate Computer Services. Terms of the merger were not available.

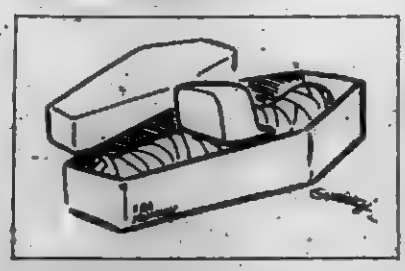
AT&T joins Cbema group

WASHINGTON, D.C. — The executive committee of the Computer and Business Equipment Manufacturers Association (Cbema) recently approved a membership application submitted by AT&T.

"AT&T is the first major telecommunications provider to join Cbema," said Vico Henriques, Cbema president. "Their membership reflects the merging of interests between the major components of the industry and will allow the industry to speak with a more unified voice on domestic and international issues."

Cbema is an association composed of 40 companies that manufacture and sell computer and business equipment hardware, software, telecommunications, services and supplies.

Henriques said he expects AT&T representatives to the association to offer new insights and perspectives on Cbema's major issues.



Announcing

The one-stop, international advertising service for micro marketers.

You'll reach microcomputer buyers all over the world with *Computerworld*'s International Marketing Services (CWIMS). Because we have the microcomputer market *covered* with an international network of publications. And what a market!

As the need for computerization in government, industry and educational systems all over the world becomes more acute, countries look to the cost-effective, adaptable microcomputer to bring them into the computer age. This means a very lucrative market for the U.S. micro marketer, since international product demand exceeds product supply.

Now, with the help of *Computerworld*'s International Marketing Services, you can advertise in 15 magazines devoted exclusively to supplying information to microcomputer users in: Australia *(MicroWorld, PC World)*, Brazil *(MicroMundo)*, Denmark *(Micro Verden)*, Finland *(Mikro)*, France *(Golden, PC World)*, Japan *(PersoCom World)*, Norway *(Mikro Data)*, Sweden *(MickoDatorn, Min Hemdator)*, Spain *(Micro Sistemas)*, The Netherlands *(Micro/Info)*, West Germany *(Micro-Computerwelt, PC Welt)*. And, your advertising message can reach buyers of microcomputer products and services around the world through special micro sections in any of our 40 publications in 25 countries.

Act now—and take advantage of this international demand for microcomputer products. Whether you want to test the market—or locate a distributor or representative—our publications will put you in touch with the right people around the microcomputer world.

For more information on getting international micro coverage, call Diana La Muraglia, General Manager, International Marketing Services, toll-free, at 800-343-6474. In Massachusetts, call 617-879-0700 or return the coupon below.

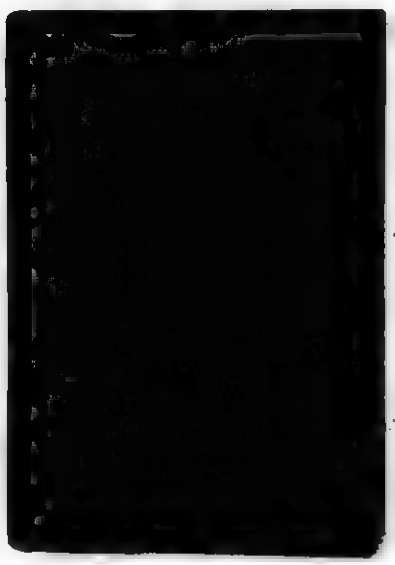
IF YOU MISS CW ON COMMUNICATIONS IN THE NEXT THREE MONTHS, LOOK AT THE ISSUES YOU'LL BE MISSING.

JUNE.

Bypass. Bypassing the local loops provided by the Bell Operating Companies has become rampant with the availability of alternative technologies. See what this means to both big, regional operating conglomerates and smaller, non-Bell Operating Companies—all in the June issue.
Closes May 4.



JULY.

AT&T update.
Who are the winners and who are the losers after more than six months of deregulation?
Closes June 1.

AUGUST.

This issue will look at various teleconferencing technologies—including full motion video, freeze frame, electronic blackboards and computer conferencing. The cost-effectiveness of teleconferencing technology will be examined, plus information on private and public facilities—all in the August issue.
Closes June 29.

On Communications is ideal both for the advertiser and the reader. Because each one offers focused, in-depth information on areas of interest within communications.

Readers always want to catch up on what's hot and what's not in their particular specialty. And find out what the vendors have to offer.

As an advertiser, you won't want to miss the opportunity to tell them.

Maybe that's why our On Communications is becoming more popular every day.

Because everyone wins.

For more information, or to reserve your space in any of our upcoming issues, simply call the sales office nearest you. Or fill out and return the coupon to Ed Marecki, National Sales Director, Computerworld, 375 Cochituate Road, Box 880, Framingham, MA 01701.

POSITION ANNOUNCEMENTS

COMPUTER POSITIONS

COFL, part of the State University of New York and located in the beautiful Finger Lakes region, is currently planning an expansion of its computer curriculum, services, and facilities (presently exploring building a new technology center). COFL (enrollment FT: 1975, PT: 1977) operates a PRIME 750 and 2655 computer network to support many academic programs.

DIRECTOR ACADEMIC COMPUTER CENTER

Director will develop and administer all academic computer services required to support a community college's instructional program. Responsibilities include supervising technical and support staff, evaluating hardware/software, preparing/administering budget, and assisting faculty in effective use of computers in instruction.

Minimum of Bachelors degree (Masters degree preferred) in Computer Science or related field, and three years experience in programming, systems analysis, and computer systems administration (mini and micro). Experience in teaching and computer-assisted instruction desired.

Twelve-month, renewable contract, $24,000 - $30,000 annual salary, good fringe benefits. Additional compensation for part-time teaching.

FACULTY POSITION IN COMPUTER SCIENCE

Faculty member will teach courses in the Associate in Science in Computer Science degree program, including assembler, data structures, and related microcomputer courses. Responsibilities include advisement of Computer Science students and liaison with four-year transfer institutions.

Masters degree in Computer Science preferred, Masters degree in related area with appropriate Computer Science background acceptable. Teaching experience necessary.

Continuing appointment position. Assistant Professor rank, $20,000 range. Additional compensation for evening and summer school instruction.

FACULTY POSITION IN DATA PROCESSING

Faculty member will teach courses in the Associate in Applied Science in Data Processing degree program, including introductory courses, programming courses, and systems analysis and design. Responsibilities include student advisement, and curriculum revision to insure continued successful student placement.

Masters degree preferred, Bachelors degree required. Significant teaching experience and experience in business data processing environment required.

Continuing appointment position. Assistant Professor rank, $20,000 range. Additional compensation for evening and summer school instruction.

Send letter of application, resume, and three letters of reference by April 27, 1984 to: Personnel Office, Community College of the Finger Lakes, Canandaigua, New York 14424. EEO/AA.

Sohio

Discover Sohio in Dallas, Texas

Opportunities exist in our Geophysical Systems Development staff for individuals with experience in seismic systems development to develop state of the art seismic processing systems in a DEC VAX 11/780 - CRAY IS/X-MP environment.

The successful candidates will work within a structured analysis and design project team environment to provide seismic systems development support for the Geophysical Research and Development staff at Sohio's Technology Data Center in Dallas.

CRAY Software Optimizing Analyst

BS (MS preferred) in computer science, math, physics or geophysics with at least 2 years' code optimization experience on CRAY IS/X-MP systems is required. Experience with DEC systems (VAX-11/750, VAX-11/780) and FORTRAN '77 is preferred. Previous experience with seismic software development and geophysical signal processing is desirable.

Individuals should have interpersonal skills to effectively interact with Sohio's Geophysical R&D staff. Project management skills helpful.

It's time to consider joining the Sohio adventure where the compensation package, including benefits, is outstanding. The opportunity for visability is unequaled and — to top it off — Sohio has one of the best relocation programs in the industry. To find out more, send your resume, complete with salary history to: Dan Allman, SOHIO PETROLEUM COMPANY, Dept. D078, 5420 LBJ Freeway, Suite 800, Two Lincoln Centre, Dallas, Texas 75240.

Equal Opportunity Employer M/F/H/V. Principals Only Please!

THE LEADER IN ARRAY PROCESSING TECHNOLOGY...

FLOATING POINT SYSTEMS, INC. offers opportunities in the leading edge of professional achievement. As the world leader in the design and manufacture of array processors, we are setting the pace for high-speed algorithm execution with the parallel architecture of our products. We are seeking applicants for immediate openings as:

- **CAE System Administrator**
  Administer an APOLLO operating system devoted to CAE design. Some systems software and tools development also involved. Requires BSCS or equivalent, and operating systems experience.
- **Applications Software Engineers**
  Will design and implement scientific and engineering applications software. Requires BSCS in Math or equivalent, and familiarity with assembly language coding and microcomputer architectures; a background in numerical analysis and/or signal processing is desirable.
- **Senior Diagnostic Designer**
  Will coordinate and provide technical leadership for new product diagnostics development. Requires BSCS/BSEE or equivalent, and previous diagnostics design and development from conception to manufacturing integration.
- **Diagnostic Designers**
  Will design, code, and document software diagnostics for new product development. Requires BSCS/BSEE or equivalent; experience in hardware testing and/or Motorola 68000 or 6809 is desirable.
- **Senior Software Development Engineers**
  Will develop and enhance system communications between array processors and host operating systems. Requires BSCS or equivalent; operating systems internals and I/O device driver experience preferred.
- **Computer Scientists**
  Will perform PDS support. Requires BSCS or equivalent, and experience in PDS development. VAX, APOLLO, or IBM experience preferred.

  Will perform operating system support. Requires BSCS or equivalent. APOLLO, VAX/VMS, IBM/CMS, or IBM/MVS experience preferred.

  Will design and develop software for new product development. Requires BSCS or equivalent. PASCAL or MODULA-2; compiler construction or graphics experience preferred.

Besides an excellent compensation and benefits package, your opportunity to work within a creative company is further enhanced by our location in metropolitan Portland, Oregon. The clean, green beauty of the Pacific Northwest surrounds us and the Cascade Mountains and the Pacific Ocean are nearby. Outdoor activities are year-round, the climate is always invigorating no matter what the season, and the cultural events are plentiful in the Rose City.

Software Engineers

We are Structural Dynamics Research Corporation, SDRC, an international engineering consulting and computer software firm.

Openings exist for dynamic individuals to assume roles of technical leadership in the design and implementation of User Interface Development Systems and User Interface Management Systems. The successful candidates will design and implement these software systems on in-house DEC and IBM mini and mainframe computers using the C programming language.

This development process requires significant skills in computer science disciplines relating to software tools and operating system design and interfacing. Openings exist for:

- Software tools designer. Design and implement a screen manager and text editor concentrating on Human Engineering and Graphics.
- Operating Systems Specialist. Design and implement machine independent operating system interfaces concentrating on concurrency issues and device independence.

These positions are best filled by people with these qualifications:

- Experience in operating systems, real time programming, compiler development, or forms interfaces
- Experience in the development of large interactive applications
- Experience in or interest in computer graphics
- Familiarity with relational database concepts
- Graduate work in Computer Science or equivalent experience

SDRC offers a stimulating and challenging career opportunity, professional growth and excellent company paid employee benefits.

INTRODUCING CARI

The System That Matches Job Candidates To Openings Via GE Teleprocessing Network.

The New Idea That Puts You In The Right Place, At The Right Time, For The Right Job.

CARI Does It Fast—Here's How
CARI is a cooperative effort with General Electric Information Services. Utilizing their teleprocessing network, CARI puts your qualifications in front of America's top corporations.

CARI enters your Candidate Profile into the CARI System. Then, it is available to employers nationally. Employers with openings for key positions enter their specific job requirements into the CARI System. When the job calls for the qualifications you possess, you get the call—***directly from the employer.***

Trust CARI To Keep It Confidential
CARI automatically screens your present employer and parent company from seeing your name and profile. Potential employers call you directly. There's no middleman involved.

What's More—It's Free
CARI performs this valuable service to you, for absolutely nothing. CARI's corporate clients assume the entire cost.

Get In The Right Place Today
Complete and return the coupon. We'll send you a CARI Candidate Profile Summary. That's all it takes. CARI will tell you regularly how many companies have seen your profile. You can also update the qualifications at any time.

Start moving to the best job you can find.

Call Toll Free 1-800-221-5635

CARI is a data base and telecommunications service—NOT an employment agency.

MAKE THE CARI CONNECTION TO JOBS LIKE THESE.

TECHNICAL SPECIALISTS
Data base, data communications, telecommunications, minis, micros, systems software and application software technical skills required. Degree in Computer Science or Engineering and good interpersonal skills necessary.

ANSI/TYMLSX SOFTWARE SPECIALISTS
Will develop, design and implement micro computer software. Bachelor's degree in Computer Science and/or Accounting (15-20 hours in each) and high SAT's/ACT's required.

PROJECT MANAGERS
Provide project management support and consultation in the inception, development, design and implementation of major projects and management systems. Qualifications include 5 years experience in systems analysis, good communication and business and technical problem solving skills. Bachelor's degree required. Master's preferred.

SENIOR PROGRAMMER/SENIOR PROGRAMMER ANALYSTS
Provide support for the development of major new CICS applications. Candidates must have 3 years experience in COBOL and CICS programming in a large IBM mainframe environment.

SYSTEMS ANALYSTS
Work with multiple users in an on-line environment. Responsibilities include installation, new release and testing of INQUIRE systems on 3081 and 3033 hardware. Three years experience with COBOL, PL1, and TSO/INQUIRE, CICS/INQUIRE and 2 years user friendly language experience essential.

SENIOR TECHNICAL ANALYSTS
Support user telecommunication projects and interface personal computers with word processors. Responsibilities include hardware and software selection, development of PC communication architecture, training, debugging and vendor interfaces. Candidates will have a technical degree and minimum 4-6 years related experience.

SENIOR SYSTEMS ANALYSTS
Assume an expanding role in a corporate MIS operation. Candidates will have 5-8 years related systems experience to include 3 years COBOL, IDMS and 2 years with user friendly languages.

TECHNICAL SPECIALIST
Initiate and support a variety of program products in an MVS/JES3 environment. Heavy involvement with top secret security package. Strong BAL programming and design skills, previous installation and support experience required. B.S. in Computer Science or equivalent experience.

PROGRAMMER/ANALYST
Must have 2-4 years experience COBOL, SPF, TSO, HIPO, OS/JCL. Will write programs specifications and code programs.

TECHNICAL PROGRAMMER
Support Network Control, activate and monitor on-line performance, circuit and equipment operation and supervise operators on a large network. Prefer 2 years experience operating a large network, knowledge of VTAM, CICS, 3705's, NCCE, NPDA and problem diagnostic/resolution. TSO and JCL a plus.

SENIOR SYSTEMS PROGRAMMING TELEPROCESSING SYSTEMS
Working with IBM 3081 hardware and an MVS system with an SNA network, positions provide systems programming support for telecommunications software and test processing products. Bachelor's degree in Computer Science or equivalent, and 2 years software experience utilizing CICS or VTAM in an IBM environment required.

SOFTWARE RECOVERY COORDINATOR
Prepare, test and maintain documentation and procedures to assure recoverability of critical software resources. Provide technical leadership for IPC Disaster Recovery Coordinators, and disaster recovery exercises. Requires working knowledge of MVS and program products, and good communication skills. Expertise in BAL, JCL, PROCS and system libraries required. Disaster recovery experience a plus.

MANAGER HARDWARE/SOFTWARE
Requires good knowledge of hardware/software involving real time control and data communication systems. Should have assembly language, C and operating systems interface. Hardware familiarity with both 8 and 16 bit processors.

PROGRAMMER/ANALYST
Position requires minimum of 3 years DEC VAX hardware, FMS software experience. On-line systems exposure. COBOL experience required, along with several years programming and systems analysis.

DATA PROCESSING MANAGER
Experience with System 34 required. Large mainframe exposure helpful. Applications include financial and manufacturing (MAPICS); some programming experience on System 34 necessary. Prior supervisory experience required.

SR. PROGRAMMER ANALYST
Must have at least 3 years of BAL experience using IBM hardware in an OS environment. Heavy user contact.

SR. SYSTEMS ANALYST
Must have 3 years experience programming; COBOL, and/or SAS. ReadyCode, FOCUS, microcomputer familiarity a plus. Will support corporate users with programming and analysis on one-time planning and research oriented projects. Will be DP liaison of users in projects from microcomputer to 4th generation language applications.

SYSTEMS PROGRAMMER
At least 3 years experience using COBOL, TSO, OS/VS JCL and IBM utilities. CICS and/or data base and VSAM a plus. Will provide programming support and batch programming assignments within a Big Ticket Merchandising System and a Promotional Reporting System, with some on-line exposure. At least 2 years experience using VSAM.

PROGRAMMER ANALYST
At least 2 years experience COBOL, SPF, TSO, HIPO, OS/JCL. Will write programs specifications and code programs.

SYSTEMS PROGRAMMER
At least 2 years programming; COBOL, JCL, Utilities and independent "research" analyst for your own efforts. TSO, SPF required; Operations a plus. Will support and develop programs in Batch Credit. Possibly minimal travel.

SR. SYSTEMS PROGRAMMER
Experience with documentation and procedures in Software areas, proficient in BAL and a working knowledge of MVS and related Software functions. Must be able to deal with all levels of management on a technical basis. Responsible for all systems software aspects of disaster recover-at all IPC's.

SYSTEMS PROGRAMMER
Experience working on IBM PC Apple, micro hardware and communications, along with mainframe programming are a plus. Will serve as consultant in MicroComputer Center assisting users with problems as well as assist in hardware and software evaluation and give seminars to the user community on micro products.

SR. SYSTEMS PROGRAMMER
Responsible for all software preparation, maintenance and testing of Disaster Recovery procedures and documentation. Requires BS in Computer Science or equivalent, strong BAL, working knowledge of MVS and related software functions. Strong communication skills and extensive experience with software documentation and procedures essential.

MVS SYSTEMS SOFTWARE PROGRAMMER
Will be responsible for and must have experience in installation and maintenance of MVS JES3 and related program products. Strong BAL, MVS SMP, and I/OSYSGEN experience required.

SR. PROGRAMMER ANALYST
Troubleshooter and programmer for production and enhancements with multiple user interface and large IMS data base. Four years experience using COBOL, TSO, OS/VS, JCL and IBM Utilities. IMS and CICS a plus. Initiative and problem solving skills a must. Bachelor's in Computer Science or equivalent preferred.

OPERATING SYSTEMS
Coordinate installation and modification of JES2 software on large scale IBMs in an MVS/SP shop moving towards MVS/XA. Minimum 6 years senior MVS Systems programming experience, with 3 years involving JES2 internal code and IBM/MVS software experience essential. Some applications require knowledge of time sharing/decision support systems and integration of VAX technologies.

SR. SYSTEMS ANALYST – FINANCIAL SYSTEMS
Research, design, develop and support modifications in large system Sales Audit area. Two years each of programming, development and research experience with heavy user interface skills required. IMS or CICS knowledge preferred. TSO, SPF, COBOL, BAL, JCL programming skills required.

SR. PROGRAMMER ANALYST
Must have at least 3 years COBOL-COMMAND level CICS experience using IBM hardware in an OS environment. Heavy user contact.

PROJECT LEADER – HUMAN RESOURCES SYSTEMS
Lead, plan and organize the technical team in the design, development and installation of a large HR system. Your experience must include large system/IMS data base design, JCL, DL/1 and hands-on IBM IMS Utilities. CICS and previous experience in benefits, payroll and personnel applications a plus.

ASSOCIATE TECHNICAL SPECIALIST
At least 4 years IMS Application Programming and Technical Programming expertise in IMS and CICS and 2 years System Software Programming experience. Familiar with IBM software maintenance procedures and the reorganization of data bases including the creation of REORG-PROCS. ASSEMBLER & IBM DBRC Product helpful.

PROJECT LEADER
Direct and document team of programmer/analysts in development of MIS Financial/Credit systems based on user requirements. Requires programmer/analysts with 3-7 years experience using COBOL, BAL, JCL and IBM Utilities, plus 2 years as project leader. Operations experience and knowledge of TPF, TSO, TOP-Secret, Panvalet, PAC II or PC70 desired.

SR. SYSTEMS ANALYSTS
Direct and develop "Top Secret" security data base and train personnel in its use. Requires knowledge of data security software, and minimum 3 years experience in systems analysis, design, programming, testing and debugging, plus TSO and SPF experience. Good communication and interpersonal skills necessary.

Data Processing

This Progressive Midwestern Bank Has... A Growing Number of Data Processing Opportunities

We are a $5 billion bank, located on a leading Midwestern city. Our large scale IBM environment includes an extensive on-line network, and we're aggressively moving towards integrated systems. Outstanding career opportunities currently exist in the following areas:

DATA RESOURCES MANAGER

In this key position you will have the opportunity to manage both the Data Base Administration and Data Administration activities utilizing IBM's IMS DBMS. Supervising a staff of 10, you will also direct our migration to data base and provide leadership for data base projects. Strong communication skills and a proven track record, with at least 4 years managing a data resource department is required. Banking or financial experience considered important.

SYSTEMS ARCHITECT

You will be responsible for establishing long-term information systems architectural goals and workable plans to meet the established objectives. You must be able to interact with development teams and provide design guidance. IMS DBMS design knowledge is desirable. A high level global view of financial systems is also important. Experience evaluating vendor application software is a plus.

INFORMATION SYSTEMS STRATEGIC PLANNER

In this high visibility position, you will develop a strategic information systems plan based on our corporate business plan. The self-motivated, results-oriented individual we seek must have financial industry experience with at least 2 years in information systems planning. Excellent communication and organizational skills are essential.

These positions offer personal, professional, and financial growth opportunities. We offer relocation assistance, excellent benefits, and a salary commensurate with experience. If you would like to be a part of our growing team of computer professionals, you should forward your resume including salary history in confidence to:

CW-B 4194, Computerworld, Box 880, Framingham, MA 01701

An Equal Opportunity Employer

Senior Programmer/Analyst

Small data processing shop is looking for top notch, career minded individual. Join a progressive, rapidly growing Louisville, Kentucky based firm.

Duties include the analysis, design, programming and testing of new and existing financial and management information systems.

Qualified candidates will have a minimum of five (5) years Cobol experience some of which will be on a mini computer using data base structures in on-line applications. HP3000 experience is a definite plus. Send resume and salary requirements to:

Chad Wilson
NTS Development Company
10172 Linn Station Road
Louisville, KY 40223

PROJECT MANAGER DISTRIBUTION SYSTEMS

Entre' Computer Centers, Inc., America's fastest growing franchisor of retail computer centers, is seeking a seasoned Data Processing professional with proven project management skills to lead the implementation of our sophisticated on-line distribution systems.

Your qualifications must include top notch organizational, leadership and interpersonal skills; an in-depth understanding of customer service, order processing, and inventory control systems; and a strong systems analysis and design background. An understanding of accounting concepts and systems and prior exposure to TANDEM computers would be definite pluses.

This position offers outstanding professional compensation and an exceptional growth opportunity in a fast-paced, dynamic environment. Our corporate headquarters are conveniently located in Northern Virginia with easy access to the Nation's Capital.

To pursue this opportunity further, call or send your resume with salary history to:

Mr. Neil J. Comstock
Director, Information Services

ENTRE

1951 Kidwell Drive
Vienna, Va. 22180
(703) 556-0660

Sorry, no entry level positions are available at this time.

It's Your Move.

TRW Information Services Division offers growth-oriented career opportunities and a chance to make the move you've always wanted to make. Imagine Southern California . . . long sunlit beaches with cliff-top views . . . plus mountain resorts . . . the wide open splendor of wind swept deserts . . . all just a breeze away from TRW ISD, nestled in the heart of beautiful Orange County. Now is the time to make the move to a land where dreams are lived to the fullest, with a company that values and rewards the talent you bring. Consider these opportunities with the leader in computer based information services.

Senior Programmer Analysts

Requires five years of large scale IBM programming experience in either ALC/BAL or COBOL. Must be able to work in a new development environment taking a project from the design stage through implementation. Structured design and programming methodologies desirable.

You will work in a modern environment with the latest in state-of-the-art hardware and software: IBM 30XX's, MVS/XA, TSO/SPF, CICS and the largest IMS data base in the U.S.!

We offer competitive salaries, outstanding benefits and a complete relocation package. Send your resume today . . . and come express yourself. Tomorrow is taking shape at a company called TRW.

Sohio

Geophysical Software Professionals

Discover Sohio in Dallas, Texas

Opportunities exist in our Geophysical Systems Development staff for individuals with experience in seismic systems development to develop state of the art seismic processing systems in a DEC VAX 11/780 - CRAY IS/X-MP environment.

The successful candidates will work within a structured analysis and design project team environment to provide seismic systems development support for the Geophysical Research and Development staff at Sohio's Technology Data Center in Dallas.

Geophysical Systems Analyst

Requires expertise in using structured analysis and design techniques to analyze, design, specify and test state of the art seismic systems for Sohio's aggressive exploration programs.

Minimum 3 years' experience in seismic software development including time series analysis or geophysical signal processing is required.

Individuals should have above average skills in interpersonal relations, written and oral communication. Project management skills are also desirable.

Geophysical Data Base Analyst

Requires expertise in using structured analysis and design techniques to analyze, design, specify and test geophysical data base management systems for use with state of the art seismic interpretation systems.

BS or MS degree in computer science, math or related field is required. Minimum 3 years' training and experience in the analysis, design, specification and testing of software systems under a structured environment is required.

Individuals should have above average skills in interpersonal relations, written and oral communications. Project management skills are desirable.

All positions require familiarity with FORTRAN 77. Experience with DEC (VAX-11/750 & VAX 11/780) and CRAY IS/X-MP systems is desirable. DEC assembler, DEC systems internals, data base management systems, graphics software and hardware experience is preferred.

It's time to consider joining the Sohio adventure where the compensation package, including benefits, is outstanding. The opportunity for visability is unequaled, and to top it off, Sohio has one of the best relocation programs in the industry. To find out more, send your resume, complete with salary history, to Dan Allman, SOHIO PETROLEUM COMPANY, Dept. D072, 5420 LBJ Freeway, Suite 800, Two Lincoln Centre, Dallas, Texas 75240.

Senior Data Base Analyst

If you'd like to work in an achievement-oriented environment where the spirit of innovation is thriving...

Make it happen with Harris

Harris, Florida's largest industrial employer, is a Fortune 200 corporation, with sales of $1.8 billion. And the Semiconductor Sector alone, accounts for $200 million in annual sales. In fact, we are one of the twelve largest suppliers of integrated circuits in the United States.

At Harris, we've always believed that the best way to develop cutting-edge, innovative products is to encourage, recognize and reward individual achievement. And we'll continue to do just that, by providing an environment which fosters both vitality and unlimited growth potential.

To support the growth of the entire Semiconductor Sector, we're seeking a Senior Data Base Analyst. In this key position, you'll design physical data bases to implement the logical design in support of informations systems development and operations plans. Responsibilities will also include: insuring the integrity, availability, and efficient performance of division data bases; assisting in capacity planning; and providing training for users of data base software.

To qualify for this outstanding opportunity, you should be proficient in physical data base design, IDMS compilers and utilities, IDMS operation and internals, IDMS data dictionary capabilities and operation, TSO/SPF, OS/MVS JCL, COBOL and BAL programming languages. In addition, you should have a working knowledge of Cullinet development and productivity tools, as well as personal computer data base software and OS/MVS operating system concepts.

A BS and 4 years' IDMS data base experience is required. A Masters degree is preferred.

Harris Semiconductor offers an excellent compensation/benefits package, a formal merit review program and the opportunity to work in beautiful Melbourne, Florida. Located on Florida's high-tech Space Coast, Melbourne offers you and your family a delightful year-round climate, affordable housing and a variety of recreation.

For immediate consideration, please call Dick Langlar COLLECT at 305-724-7413, between the hours of 8 am - 5 pm, EST. Or send your resume to his attention at Harris Semiconductor, Dept.CW14, P.O. Box 883, Melbourne, Florida 32901.

We are an equal opportunity employer M/F/H/V.

Lecturerships in Computing and Information Technology.

As a result of continued developments in Computer Science and Information Technology generally, we are seeking to attract young people of exceptional promise for a small number of new appointments. The successful candidates will be required to undertake research and to contribute to the Centre's Teaching Programme.

Ideal candidates would have a higher degree preferably in Computer Science and special experience in either:

(a) Database and Information Systems
(b) Computer Architecture or
(c) Intelligent Knowledge-based Systems

Initial salary will be within and up to the maximum of the range £7,190 to £14,125 per annum. Appointments will commence as soon as possible and will be made for a fixed-term of three years initially with the possibility of renewal or subsequent transfer to a continuing appointment.

Application forms and further particulars may be obtained from the staff officer (Quoting ref:384/244), University of Aston in Birmingham, Gosta Green, Birmingham B4 7ET England (Tel: 21 359 3611 ext. 4984).

Closing date for the receipt of applications is April 27, 1984.

Growth Opportunities
For Data Processing Professionals

Holiday Inns, Inc. is shaping the future of the hospitality industry. Due to our continued success, we have on-going and immediate needs for dynamic professionals in the following areas:

ACP/TPF

Senior ACP Programmer—Must have minimum 5 years of system and programming development experience with large scale teleprocessing systems oriented toward the solution of business problems, of which no less than 3 years should be in an ACP environment.

SYSTEMS DEVELOPMENT

Programmer Analysts—3-5 years experience including systems analysis; proficiency in COBOL and either Data Base or CICS applications. TI-990 experience desired.

Senior Programmer Analyst—Minimum of 5 years experience including systems analysis, system design, COBOL, CICS and Data Base applications; and project leadership. Previous experience in a payroll/personnel environment a definite plus.

Both positions require knowledge of IBM mainframes, OS JCL and TSO/SPF.

The Memphis area affords a moderate cost-of-living, mild but seasonal climate and a vast array of cultural and recreational activities. Our worldwide headquarters provides a working environment conducive to personal and professional growth and achievement.

We offer excellent compensation, competitive employee benefit packages and an educational assistance plan. If qualified and interested, send your resume in strict confidence to: HOLIDAY INNS, INC. - Recruiting and Selection/JC, 3796 Lamar Avenue, Memphis, TN 38195.

Holiday Inn

CLEVELAND
THE NORTH COAST OF AMERICA

Cleveland is the nation's best kept secret. Anyone who has lived here knows it is a city with much to offer. Four beautiful seasons, parks and bountiful recreation facilities, plus cultural activities including the symphony, ballet, opera and live theatre. Our midwestern lifestyle offers friendly neighborhoods at affordable prices.

Leaseway Transportation has been headquartered in Cleveland since it was founded, over 80 years ago. With revenues of over $1.3 billion, Leaseway stands out as a major employer with outstanding career opportunities, especially for systems professionals.

Our new data center is equipped with an IBM 3083BX/4341 complex running under OS/MVS and a dual processor Sperry 1100/72 system. Distributed systems include Prime, HP and Four-Phase. Extensive use is made of database architecture in systems design with development work performed on-line and supported by a fourth generation language.

If you are degreed and have broad business and systems project experience, Leaseway wants to hear from you. IBM and transportation industry knowledge are preferred. Expansion of our corporate capabilities has created the need for:

*** SR. PROGRAMMER/ANALYSTS**
*** SR. SYSTEMS ANALYSTS**

Please send your resume and salary requirements to Debra Miller at:

Leaseway Transportation
3700 Park East Drive
Cleveland, OH 44122

COMPUTER CENTER DIRECTOR DENISON UNIVERSITY

Position open July 1, 1984 or as soon thereafter as possible. Responsible for planning and directing overall activity of the college computer center in providing instructional and administrative computer services to a liberal arts college. Ultimate responsibility for design of physical computer system, allocation of computer services and training of staff.

Denison has strong commitment to academic computing, operates a central VAX 780 computing system, shortly to be upgraded to VAX Cluster. Over 100 terminals connected to system plus distributive micro-processors dedicated to word processing. Information processing architecture includes distributed processing and networking of all information facilities over next few years.

Seek person with supervisory experience in networking, microcomputers, data processing, including data based management and applications design.

Reports to Provost. Letter of application, resume, transcripts and list of references by April 23, 1984 to Dr. Louis F. Bodenheimer, Provost, Denison University, Granville, OH 43023.

Denison is an Equal Opportunity/Affirmative Action Employer.

CAD/CAM engineer

FMC Corporation's Central Engineering Laboratories is a multidiscipline research center chartered to provide technical services and identify new product opportunities for the construction, defense, food, material handling and petroleum business of FMC.

We are seeking a Mechanical Engineer familiar with CAD/CAM systems who wants to become part of our corporate CAD/CAM support group. This position will be responsible for installing and maintaining CAD/CAM software and providing user training and guidance on the application of software. Additional responsibilities will include providing support with problem resolution by fault isolation and correction; determining, specifying and implementing enhancements and extensions.

This position requires a BSME or equivalent and 2-3 years FORTRAN programming experience. An understanding of engineering applications for CAD and CAM, knowledge of VAX/VMS systems, and the ability to work with large FORTRAN programs is also required.

We offer an excellent salary and benefit package as well as challenging project assignments. For confidential consideration, submit resume or call: Ms. V. Payne, (408) 289-3433, FMC Corporation, Central Engineering Laboratories, 1185 Coleman Avenue, Santa Clara, CA 95052. We are an equal opportunity employer m/f.

ASSISTANT IN ENGINEERING

The University of Florida, College of Engineering, invites applications for the position of Assistant in Engineering. The primary responsibilities are managing and instructional facilities for CAD/CAM, primarily for teaching CADAM and related program packages to users of this facility. The facility is based on an IBM 4341, Model 12 computer system running the VM operating system; primary applications programs supported are CADAM, CATIA and CAEDS. The operating systems software is separately maintained; the duties of the incumbent of this position are to oversee user training and to aid users with application program problems.

Candidates must have a Master's degree in a relevant engineering field, or a Bachelor's degree in a relevant engineering field plus equivalent experience. Also the candidate must have recent experience with the particular hardware and software systems outlined above, as well as teaching experience using this system. The University of Florida is an equal opportunity, affirmative action employer.

Applications or resumes should be directed to Dr. M.J. Chanton, Chairman, Search Committee, College of Engineering, University of Florida, Gainesville, FL 32611.

Application deadline is May 15, 1984.

Verbatim

Programmer/ Analyst

Verbatim leads the world market for magnetic storage media products. One reason is our people. We hire the best, and we give them every opportunity to advance, with semi-annual reviews.

We have an opportunity in our MIS team for an experienced Programmer/Analyst to maintain and support our Payroll and Personnel Systems in our HP3000 environment. If you have 3 years directly related experience, you will handle paycheck generation, tax updates, W-2 forms and other year-end reports, and automatic deposit processing. Extensive knowledge of COBOL, system utilities, programming methods and payroll procedures required. Strong written and oral communication skills essential.

Verbatim benefits are among the best, including profit sharing, stock purchase plan, and paid sabbatical leave. Please send your resume to Professional Employment, Dept. RH-CW, Verbatim Corporation, 335 Soquel Way, Sunnyvale, CA 94086. An equal opportunity employer.

DATA PROCESSING

New Jersey

TIRED OF A ROUTINE ENVIRONMENT?
WE'VE GOT THE ANSWER TO YOUR PROBLEM!

Toys "R" Us is experiencing tremendous growth which is creating a constant need for new applications and services within our data processing department. Our current domestic operations are expanding rapidly and our new Kids "R" Us Division has aggressive growth plans. In addition, we are moving into the international market-place with plans to begin operations in Canada, Great Britain and Singapore within the next two years.

Virtually nothing will be routine in our D/P Department for the foreseeable future. We are constantly being challenged with new and stimulating projects and we are in the process of dramatically increasing the professional D/P staff at our headquarters. We presently need a number of individuals in each of the following areas:

Project Leaders Applications Software

Experienced in mainframe applications. Must be able to lead development and implementation of on-line computer software. Management experience and demonstrable, significant development experience is necessary.

COBOL Programmer/Analysts

Experienced in a wide range of application software. Applicants must have a good working knowledge of COBOL and data base management systems.

P.O.S. Field Coordinators

Experienced in low voltage wiring, test equipment and communication devices. Will entail approximately 30% travel.

If you have had problems with boredom, you won't find it boring here. If you are looking for a company that will challenge your skills regularly-this is your kind of opportunity. You'll find our salaries competitive and our benefits package outstanding. Send your resume, salary history and requirements in confidence to:

Computer Science faculty opening

to begin in September 1984. While preference will be given to holders of a Computer Science degree, the minimum requirement is a Master's degree in a related field. The position requires a broad general background in the computer field, with extensive experience in more than one of the following: COBOL, FORTRAN, statistical applications (SPSS), Pascal or assembly language. Also desirable are teaching experience and a special area of competence in computer architecture, operating systems, theory of programming languages, data communications, theoretical computing, or data structures. Salary dependent on qualifications. Closing date is April 15, 1984, or until the position is filled. Apply with resume to: Dr. Lois Y. Bryant, Computer Science Department, State University College, Geneseo, New York 14454 (716) 245-5231. AA/EOE.

WEST COAST CORRESPONDENT

Computerworld has an opening in our busy West Coast bureau for an experienced correspondent.

As one of three writers based in our Menlo Park office, you will be responsible for producing usable copy as required each week. You will report to the West Coast Bureau Chief who will assign you to cover stories that take place or originate on the West Coast. You will support the news gathering activities of existing bureau personnel, particularly in the coverage of stories of interest to computer industry vendors and top data processing executives.

You'll cover press conferences, new product announcements, major meetings and other newsworthy events as directed by the West Coast Bureau Chief or the Managing Editor. You will be expected to meet deadlines established by the West Coast Bureau Chief.

In addition, you'll conduct telephone and personal interviews with industry figures and DP executives on a wide range of technical or business topics of interest to our readership. Some travel is required.

To qualify, you should possess a strong journalistic instinct, be able to write quickly and accurately for weekly deadlines and, most important, have demonstrated professional news reporting and writing skills. Familiarity with computer technology, companies, trends and products is a definite plus.

Computerworld is the number one trade publication in the U.S., and we're growing bigger every year. We offer pleasant working conditions in modern offices, a comprehensive medical/dental/vision plan, profit sharing and an attractive compensation plan.

To apply, send your resume, samples and salary history to:

Jeffrey Stecker
West Coast Bureau Chief
Computerworld
1020 Menlo Rd.
Menlo Park, CA 94025

No phone calls, please.

Martin Marietta Aerospace

Software Systems Analyst

Martin Marietta Aerospace, NASA's prime contractor for the Space Shuttle External Fuel Tank, has an immediate opening at their Michoud Assembly Facility in suburban East New Orleans for a Software Systems Analyst.

You must be experienced in systems design to provide transaction of database security with contemporary knowledge of software security. A BAMS is required as well as 5-8 years of experience.

Candidates interested in learning more about these opportunities at Martin Marietta should forward resumes including salary history to: Martin Marietta Aerospace, Attn: Denver Glaeser, Dept. CW-42, P.O. Box 29304, New Orleans, LA 70189. We are an equal opportunity employer, m/f/h.

"A COMPUTER LEASING COMPANY'S FINANCIAL STABILITY IS VITAL."

We said that in 1973, when Randolph became a subsidiary of The First National Bank of Boston . . . and we say it again, because it is still true and even more important today.

As an important part of The First National Bank of Boston, one of the nation's oldest and leading financial institutions, Randolph has a built-in financial stability that continues to be unique in the third-party computer leasing industry.

LEASING COMPUTERS IS OUR ONLY BUSINESS.

Randolph specializes in leases for IBM 3081, 303X and 4300 computer systems and peripherals . . . firm evidence that we plan to perpetuate our computer leasing activity.

Our people have an average of 18 years experience in the DP industry . . . from 360's to 3081's. They know all about alternative financing to be sure, but they also know their way around a DP department and the hardware in it.

WE SPECIALIZE IN SOLVING PROBLEMS.

Machine installed on a rental basis? Long wait for delivery? Stuck with a lease on your old machine? Own a 3081 but need cash? Whatever your problem, we can tailor a lease that will fit your exact needs and let you start saving money right away.

SAVE $80,000 EVERY MONTH FOR THE NEXT 5 YEARS.

You can lease the same 3081 that IBM rents for more than $180,000 per month from Randolph for less than $100,000 per month. If you're renting an older machine, we can save you even more—and you'll get about 4 times the throughput in the bargain.

WHEN IS THE BEST TIME TO TALK TO RANDOLPH?

The sooner the better. But it's never too late, even if you already have a machine installed.

Our 19 years in computer leasing gives added assurance that Randolph will continue as the leader in the computer leasing industry . . . continue to live up to the terms and conditions of our agreements . . . provide upgrades . . . fulfill all of our commitments.

LET RANDOLPH HELP YOU GET THE SYSTEM YOU NEED NOW, *NOW.*

We've already done it for many of the Fortune 500 companies . . . and we can do it for you. Call Joseph S. Kelly, Jr., Executive Vice President, **800-243-5367**

When you lease equipment, make sure it comes with a good name behind it.

With the rapidly changing and improving technology of your industry, it's not always easy to keep your company's system up to date. And it's important to make sure you get the best advice, the best service, and the best financing available.

At Greyhound Computer Corporation, we've been leasing, servicing, refurbishing, maintaining and providing financing for computer and other equipment for over 20 years. And we have the resources and the knowledge to help you customize your equipment-leasing requirements. We can also assist you with the financing.

Whether you want to lease or purchase your equipment, look for the name with the kind of strength you need behind it: Greyhound.

ORDER FORM

COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 416 and 451) should be clearly typewritten. Ads may be given over the phone to our ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $130.00 (One unit minimum and no fractional units allowed.) There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

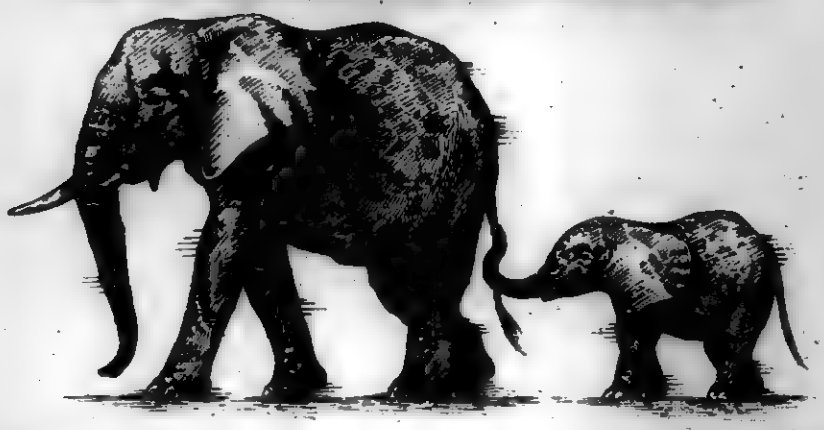
WHEN IT COMES TO LINKING PC's TO MAINFRAMES, ONE COMPANY IS A MILLENNIUM AHEAD.



You don't have to look hard to see why McCormack & Dodge has linked more PC's to more mainframes than any other business software vendor.

It's a classic case of a superior product leading to superior sales.

To begin with, our link does more than just link. It works like you do. Selectively. Analytically. And in real time—so that company decision-makers always have the freshest, latest data available. Current and accurate up to the second you display it on your PC screen.

If you've tried out other PC links, you'll notice the M&D difference the moment you start downloading information from the mainframe to your desk. For example, you'll see that you can access all applications, no matter who designed them—not just those designed by McCormack & Dodge. And you'll discover the ease of working with a system that lets you pinpoint and selectively summon exactly the portion of data you need.

Once you've called the data down to your PC, the Lotus 1-2-3 software in our link lets you crunch numbers backwards, forwards, up and down—anywhere your mind wants to take them. You can instantly construct detailed spreadsheets. You create brilliant color graphs.

And the moment you finish massaging the data to your liking, our link lets you shoot it back to the mainframe (assuming you have the proper security clearance). You do it yourself on the spot—in real time. Without keyboard operators or programmers. So the entire company has the benefit of the latest information immediately. Not days later.

The M&D PC link is one of several products in our highly acclaimed Millennium family of borderless business software. When you compare the entire Millennium concept to anything else claiming "total integration," you'll see that M&D isn't just out-linking the competition. We're out-thinking them.

WHEN YOU THINK ABOUT TOMORROW, MILLENNIUM MAKES SENSE TODAY.

DEC introduces its first relational DBMS

By John Gallant
CW Staff

NEW YORK — Digital Equipment Corp. turned over the first cards in its relational data base management system hand when it held a press conference here last week to introduce two packages for its VAX line of processors.

The company also unveiled the VAX-11/785, a mid-life kicker for its high-end VAX-11 supermini series, and launched its first attempt at breaking into the videotex market, with a $25,000 software package called VAX VTX (stories on page 6).

The VAX RDB/VMS and VAX RDB/ELN packages are the first to be announced in DEC's planned line of relational DBMS products, a spokeswoman said. They run on the entire line of VAX processors, ranging from the high-end VAX-11/785 down to the Microvax I.

VAX RDB/VMS reportedly runs on all VMS-based computers and is an integrated component of DEC's VAX information architecture. The VAX RDB/ELN package was developed for small and mid-size VAX processors in the dedicated or distributed DEC VAX/ELN execution environment; it is targeted at dedicated applications requiring time-critical data manipulation and analysis.

IBM moves to mitigate compatibility snags

By John Dix
CW Staff

IBM last week announced a barrage of products aimed at mitigating the problem of incompatibility among its low-end computer systems, then rounded out the announcements with the introduction of a low-end System/36.

While industry watchers heralded as important various aspects of the multifaceted announcement (stories on page 8), almost all agreed that the most significant were the products targeted at integrating IBM's low-end systems — particularly the Personal Computer — with larger systems.

In announcing the integration products, IBM was "coming through on a promise of a couple of years ago to tie together its low-end products," said Harry Edelson, a vice-president with First Boston, Inc., a New York investment firm. "This adds utility to all of its low-end products."

Gordon Casey, vice-president of the Drexel, Burnham and Lambert Group, another New York-based investment house, said the basic thrust of the announcement was to "continue to fill in the gaps for existing customers with [IBM] 5520s, Displaywriters and [Personal Computers]."

IRS having budget problems as tax day draws near

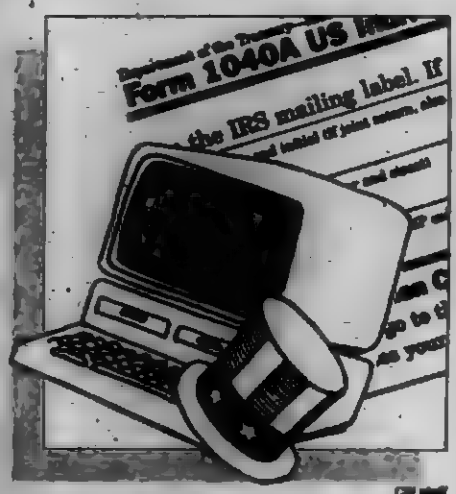
By Bryan Wilkins
CW Washington Bureau

WASHINGTON, D.C. — The U.S. Congress wants to give the Internal Revenue Service what it's asking for in the form of computers to beef up its revenue collection, but the Reagan budget planners are seeking to take it away.

Originally, the IRS sought $129 million in automated data processing modernization for the fiscal year starting in October. The Office of Management and Budget, the executive agency responsible for the budget revisions, cut that figure to $60 million, prompting howls of concern.

In a letter last January to Secretary of the Treasury Donald Regan, IRS Commissioner Roscoe Egger bemoaned the projected cuts in the IRS budget. "At a minimum," Egger told Regan, "the cuts will cripple the progress already made."

Egger said the IRS, in the midst of a five-year system replacement schedule, could not carry out its functions without a minimum of $104 million for DP upgrades. But OMB was not convinced. It restored



some funds, but only $14 million, so the IRS now has a budget of $64 million for DP modernization.

Rep. Doug Barnard Jr. (D-Ga.), chairman of the House of Representatives Subcommittee on Commerce, Consumer and Monetary Affairs, which oversees the IRS, charged recently that the budget cutbacks called for by OMB will result in lost tax revenues. Barnard said $3 billion that should be collected by the IRS will not be collected because of the cutbacks in the IRS computer modernization program. Instead of collecting about $36.8 billion in revenue in fiscal 1985, according to Barnard, the IRS will collect only $33.8 billion.

"We can only deduce that, in fact, the IRS will be crippled in its tax collection functions," commented Dean Scott, a staff official of the subcommittee. "Computer matching will be set back, and the fact that [the IRS] will be collecting 200 million new information documents as a result of new legal requirements probably means they will need greater operator resources."

Congress has been ready to appropriate money toward the modernization of the IRS' returns processing, in view of the massive projections of uncollected revenues from the so-called underground econ-

AT&T trying to cut backlog

Reassigns 1,000 employees

By John Blau
CW Staff

NEW YORK — AT&T Communications reassigned 1,000 employees last week in an effort to tackle the backlog beast that has been plaguing its order-processing procedures and causing installation delays for its Wats, 800, private-line and other special services.

By the middle of last month, 16,000 to 17,000 special service orders (including private-line orders) were backlogged, a company spokesman said. This equates with a month's worth of work — meaning that if the company stopped taking orders and focused on the backlog alone, it would take a month to catch up.

Similarly, 30,000 orders for Wats and 800 service — representing two weeks' worth of work — have been pushed to the back burner.

The spokesman predicted that the Wats/800 backlog would be dried up within the next couple of months, but would not venture a guess when orders for special services would be filled. The backlogs vary because Wats/800 services involve only one network point of contact, whereas point-to-point and multipoint private lines must be engineered through to other locations, typically requiring the coordination of at least two telephone operating companies.

In a formal response to an inquiry from the Federal Communications Commission, AT&T corporate vice-president Dan Culkin recently wrote that the company would address the service delay problems by bolstering its "provisioning process." This process begins when an order is taken and includes the time it takes to engineer the requested service and install the actual line.

The 1,000 reassigned personnel are being employed at the front end of this process, the spokesman said. To back them up, Culkin told the FCC that AT&T's computer system (comprising roughly 40 systems) would be made available on an extended basis.

Last week, the AT&T computer system became operational 16 hours a day, five days a week and six hours on Saturday, the spokesman said.

User horror stories

Meanwhile, user horror stories continue to mount.

Allen Dyer of CWT Specialty Stores in Providence, R.I., said that when he tried to place an order for a 2,400 bit/sec Dataphone Digital Service (DDS) line, he was given the runaround between New York and Boston, only to learn that his records presumably had been destroyed.

But Dyer sees light at the end of the tunnel. After going through seven account representatives in January, CWT Specialties was assigned a representative who did a lot of leg work to rectify the problem, and the quoted installation date for its 2,400 bit/sec DDS circuit was reduced from 83 days to 62 days.

Another user, Doug Jackson of Linclay Corp., a real estate developer, was told his four-point DDS circuit would be installed in 57 working days. Eighty days later, there was still no sign of an installation crew.

Dyer, Jackson and others experiencing lengthy installation delay problems will be happy to hear there is a toll-free number customers can call to complain. To verify that number — 1-800-222-0400 — for publication, *Computerworld* gave it a try.

It was never answered.

AT&T asks FCC for looser rein; cites drop in business as reason

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — Contending that it has lost nearly four million customers to competitors in the last three years, AT&T last week asked for less regulation of its activities by the Federal Communications Commission.

Reduced regulation will lead to lower rates, more customer choice and faster introduction of new technology, said Al Partoll, executive vice-president of AT&T Communications, Inc. He added that because of AT&T's divestiture, the company has greatly reduced assets, no longer controls local exchange facilities, lacks the monopoly market power of the former Bell system and, therefore, doesn't need to be regulated as much as its predecessor.

Specifically, AT&T Communications wants to offer new services without having to submit extensive cost information and wait for the commission to review it — a process that may take several months. The company also wants to construct new facilities without getting the commission's prior approval and to earn a return on its investment that is determined by the market rather than the FCC.

AT&T's request came as part of its reply to an FCC notice of inquiry of last October regarding long-term regulation of AT&T's domestic interstate phone service.

AT&T Communications estimated that its "direct expenditures alone resulting from regulation may reach $250 million per year." Partoll pointed out that it took the FCC 103 days to approve AT&T's proposals for optional calling plans; because of that delay, he said, the company's competitors were able to get to the market first with plans of their own.

The International Communications Association (ICA), a users group representing several of the nation's largest companies, also submitted comments to the FCC's notice of inquiry. In essence, the ICA claimed the FCC should continue regulating AT&T as long as the company has significant market power.

This regulation, the ICA added, should not come at considerable expense to AT&T, as such expenses will be passed on to users.

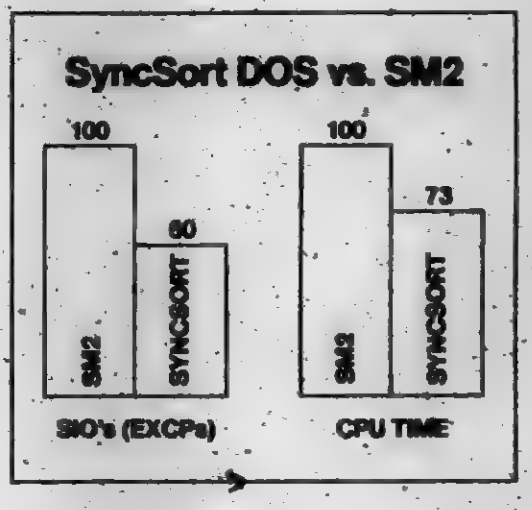
IN-LAWS

Smile, IBM. New SyncSort DOS is the perfect mate for your 4300 series!

Call (201) 568-9700.

Meet our new DOS/VS(E) release.



High performance computer without high performance sort program like bride without groom—expectation without fulfillment.

—Old Chinese Proverb.

* * * *

You say you just got this brand-new 4300 ? It's got big blue eyes, great price-performance curves and nifty disk drives? Now you're thinking about marrying it to IBM's 5746-SM2 sort program?

Well, don't do it pardner! The groom is definitely too old for the bride. Like IBM's other DOS sorts, SM2 is a hangover from an older generation of sorting technology.

There's only one sort around that's really fit for the hand of a glamorous new 4300 computer. And that's the latest release of SyncSort DOS. It's perfect for DOS/VS(E) and its new Fixed Block Architecture and VSAM type of data. Here's what SyncSort DOS can bring to the marriage:

1. BETTER PERFORMANCE. The first release of SyncSort DOS—back in 1978—incorporated many of the breakthroughs we made in OS sorting. Since then, in numerous releases, we've steadily cut the amount of resources that go into sorting. The new release carries on that old family tradition. Compared to SM2, SyncSort uses up to 50% less CPU Time and up to 70% fewer SIOs.

2. BETTER PROGRAMMER PRODUCTIVITY. SyncSort DOS has a host of features to cut the amount of programming time that goes into applications. You can often reduce the amount of time required for simple reports from five programmer days to one programmer day simply by using these features. They can:

- select relevant records;
- perform summaries on designated numeric fields;
- reformat records on output;
- insert character strings;
- convert numeric data to printable characters (including editing);
- produce reports divided into logical pages with headings, pagination and dating—and much more.

3. BETTER CUSTOMER SERVICE. We have the smartest Tech Service people in the business and the best and fastest service. About 85% of all requests for service are resolved within 24 hours. Try us and find out for yourself.

So if you'd like to match that phenomenal new computer with the perfect mate, give us a call. We'll send over one of our matchmakers to give you a personal demonstration.

Once you've seen SyncSort DOS in action, we don't think it'll be long before you call us with a familiar request: "Play it again, VSAM!"

Customs chief blasts House version of Export Act

By Patricia Keefe
CW Staff

BOSTON — The Bonker Bill, the House of Representatives' proposed version of the Export Administration Act, is best characterized as the "1929 Relief Act of 1963," charged the U.S. Commissioner of Customs, who recently asserted "it would be a disaster if it ever became law."

Commissioner William von Raab made those remarks here before the Symposium on the Transfer of Technology in the International Marketplace, which was sponsored here recently by the Federal Bar Association.

The Bonker bill, named for Rep. Don Bonker (D-Wash.), would "virtually strip customs of its authority to inspect export shipments except under very special circumstances," von Raab charged.

"I have spoken out against the bill many times and have stated my alarm and distress at the prospect of such legislation," he said, adding that "those of us who see the dangers inherent in the theft of our critical technology are pulling for the Senate bill [to renew the Export Administration Act, which expired last September]." A House-Senate conference two weeks ago began hammering out the differences between the two bills.

Customs favors the Senate bill because it would allow customs to continue with Operation Exodus, a program that has resulted in hundreds of arrests and convictions for illegal technology exports. "Those of us who are pledged to protecting America's technological superiority see Exodus as a practical solution," von Raab said. "We believe in keeping our guard up. We believe that Exodus is a wise precaution in a dangerous world."

Operation Exodus is especially important today, he said, because the latest technology tends to be developed in the civilian sector, where it is not protected by national security laws. As a result, this technology is much more accessible to the Soviets and their American recruits, he said.

Further, many of the latest products are both easy to smuggle and very valuable, according to von Raab. With an estimated 300 weapons systems on Soviet drawing boards requiring U.S. technological know-how, "we can expect [the Soviets] to come shopping."

Suggesting that the overall intent of the Bonker bill is to speed trade without restriction, von Raab asked that it be done in such a way that it does not limit the authority of the government or customs to stop the theft of technology goods and secrets. "We are serious about helping manufacturers avoid unnecessary delays in exporting their high-technology products," he said.

Von Raab claimed that while industry is not happy about any delays caused by customs' inspection program, "they are just as anxious as we are to keep the Soviet Union from getting their hands on American technology."

Stressing that this is the only aim of Operation Exodus, von Raab said that "if in the process we cause some inconvenience, it seems to me a small price to pay." He claimed that only 2% of export shipments suffer any delay and that the people most affected by the delays, the manufacturers, seem to agree that the delays are necessary.

IRS from page 1

ency as well as unreported income contributing to the federal budget deficit.

In recent years, Congress has passed laws, such as the Tax Equity and Fiscal Responsibility Act, which require employers and financial institutions to file information on individuals that was not required before. The IRS will process this additional information for the first time this spring as individual tax returns start flowing into the 10 IRS service centers scattered across the country. The information from employers and financial institutions was due at the agency Feb. 28.

Since 1978, computerized matching of the information filed by individuals and employers has been carried out by the IRS. However, there has been little matching of information filed on 1099s, which carry interest and dividend information with individual tax returns. This year, however, a large percentage of 1099 information filed on magnetic tapes or disks will face a computer match.

The major problem that has faced the IRS has been inaccurate information filed by either the employer or the individual, mainly the taxpayer's identification number. Correcting this information takes time, according to the IRS. Fourteen months elapse from the time the data is first filed to the time a case of underreported or incorrect tax return information is uncovered. It then takes 12 months more before the regional center completes action on a case.

The General Accounting Office, the investigative arm of Congress, wrote a report on the state of computer technology at the IRS and concluded that substantial additional resources will be needed for the IRS to process the increased work load.

The projected budget cuts slated by OMB have prompted congressional concern that the IRS will not be able to crack down on tax cheats or use the new information returns. However, an OMB spokesman said the IRS will receive a budget increase in fiscal 1985. An IRS spokesman confirmed this, noting the increase for fiscal 1985 was $205 million.

IRS field agents showing up for audits with portables

By Paul Gillin
CW Staff

WORCESTER, Mass. — Internal Revenue Service field agents here are hopeful that replacing calculators with portable computers will hasten the slow, arduous auditing process.

"An audit can take as long as four hours," said John D. Johnson, director of the IRS' Boston district, which includes New England and part of New York. "The use of portable computers will cut that time considerably."

The Worcester field office is serving as a test site for a possible nationwide implementation of portable computers. If the experiment is successful, portable computers will become standard equipment for 12,000 IRS field agents next year.

Field test

A dozen field agents in the Worcester office and four agents in Worcester's suboffice in Springfield, Mass., will take part in the test.

Agents will load taxpayer records from the Boston district's central files, stored on a Zilog, Inc. 8000 minicomputer in Andover, Mass., into the portables. Agents will then walk into a taxpayer's office, place the portable on a desk and use spreadsheet and financial analysis programs to review 1982 and 1983 tax bills.

"A lot of our work is done with spreadsheets," Johnson said. "Sometimes an agent would forget a number or a formula. Rather than recompile the figures, he may not correct the mistake. This system will make agents more efficient."

The Boston district will decide by April 15 the type of portable computer to be used.

"We have looked at more than 100 portable computers," Johnson said. "We require one that is truly portable. One of the field agents weighs only 90 pounds, and she has to be able to carry the equipment."

Johnson listed ease of use as a second requirement. "One vendor took almost half an hour to set up his equipment," he recalled. "We are not interested in that type of microcomputer."

The machine must be powerful enough to run software packages such as Lotus Development Corp.'s 1-2-3. "We require at least 256K [bytes of random-access memory]," Johnson said.

Once the portables are delivered, "we will leave the agents alone and let them develop applications for six months," Johnson said. One trained technician will be in the Worcester office to connect wires, answer questions and solve problems.

Gain expected

The IRS is expecting a significant productivity gain from the portables. A similar program by the inspector general's office of the U.S. Department of Transportation in 1983 yielded a 20% to 25% productivity gain, Johnson said.

In addition to using microcomputers in the field, the Boston district is using them to advance employees' computer literacy.

Six months ago, the Boston district instituted a voluntary course in which employees receive self-study manuals and Texas Instruments, Inc.'s 994/A micros. "Rather than pay $800 for a Basic course, we spend $8 for a manual," said Robert Pontbriant, the Boston district's data service chief.

Response to the course has been overwhelming, according to Johnson. Approximately 500 employees have completed the course; each receives a certificate at an award ceremony and can receive college credit for taking the course.

To pass the course, an employee must write a program that improves IRS productivity. A number of programs are used in IRS offices throughout the country. "One of the employees wrote a 1,000-line program for calculating a special tax class," Johnson said.

"Agents had requested that program for years. With the volume of work the data processing department had, the program was never completed. Word of the program spread to other offices, which now use the program," he said.

Indictments charge illegal DP shipments to Soviets

By Edward Warner
CW Staff

BOSTON — A 22-count indictment handed up by a federal grand jury in Boston last week charged several U.S. and foreign firms and businessmen with shipping millions of dollars of sophisticated computer equipment to the Soviet Union in violation of trade restrictions.

Only two U.S. citizens are among the 11 companies and individuals indicted. They are Albert C. Beeson Jr., vice-president and contract administrator of MLPI Business Systems, Inc. of Phoenix and R. Paul Boucher, president and owner of Young Sales and Service, Inc. of Nashua, N.H. Both firms were also indicted.

The indictment alleges that the two firms took part in a conspiracy in which computers and related equipment were shipped to the Soviet Union and East Germany via Canada and Switzerland during 1981 and 1982.

Among the equipment listed as having been shipped are seven Digital Equipment Corp. PDP-11/34 and PDP-11/44 minicomputers and a group of nine DEC PDP-11/04 and PDP-11/34 machines.

Also said to have been shipped by the indicted are four Hewlett-Packard Co. 9825T desktop computers, which the company said are primarily used in manufacturing; six Digi-Data Corp. tape transport systems; six DEC computer interfaces; a Data General Corp. CPU board; and other equipment.

MLPI denial

In a prepared statement, MLPI Business Systems called the indictment "publicity and politically motivated." The firm said that it had cooperated fully with the federal investigators and that none of its officers "was guilty of any wrongdoing, whatsoever."

The statement also claimed the firm had no financial involvement in the alleged exports and that an export agreement existed solely between DEC and MLPI-Canada, its Canadian subsidiary, which was also indicted.

The indictment claims that two men, Detter Enderlein and Fred Schiavo, acting through two Swiss firms, Semitec AG and Elsaut AG (each half-owned by Schiavo and both indicted), ordered the U.S.-made computers and equipment from two Canadian firms, MLPI-Canada and Eurodata, Inc., which was also indicted. Enderlein and Schiavo also are alleged to have arranged transportation of the equipment from West Germany and Switzerland, where it had been sent by the Canadian firms, to East Germany and the USSR.

Eurodata's president and owner, Leslie Klein, was arrested at Miami International Airport April 2, shortly after the indictment was turned over to federal prosecutors.

The computers and equipment sent to the Soviets, the indictment states, are on the Commerce Department's Commodity Control List of products that cannot be shipped to the USSR and Soviet bloc nations. Items from that list cannot be shipped outside the U.S. without a valid export license, unless the products are destined for use in Canada. They cannot be shipped out of Canada without a U.S. re-export license, which the Canadian firms are charged with failing to obtain.

The indictment also claims that several of the conspirators filed false statements claiming the equipment being exported was only for Canadian use and that Boucher filed a false Shipper's Export Declaration with the U.S. Customs Service.

Also named in the indictment are MPLI-Canada executives Ray McLellan and Olivier DuPaul. McLellan, the firm's order administration manager, and DuPaul, branch manager of one of the firm's offices, are alleged to have ordered five computer systems from DEC in 1981 that were later re-exported from Canada to Schiavo and Enderlein. They are also alleged to have misrepresented the destination of the nine PDP-11/04 and PDP-11/34 computers, knowing that the computers were destined for the Soviets.

An HP spokesman said his firm sold four HP 9825T computers to Young Sales and Service in late 1981 and early 1982 after the firm met HP's requirements to prove that it was an OEM vendor. Young was to write software for the computers, the spokesman said, but when HP learned that no software was being written by the company, it ceased doing business with Young when its contract expired in June 1982.

When Young later placed another order with HP, this time for eight 9825Ts, the order was turned down, the HP spokesman added. A spokesman for DEC, meanwhile, said his firm requires OEMs to undergo "a very intricate process" to prove their authenticity. He declined to comment further.

The case is being prosecuted in Massachusetts, where most of the equipment is said to have originated, primarily from DEC and HP. Neither of the case's two federal prosecutors could be contacted despite repeated attempts.

FREE SEMINARS

VM DATA AND OPERATIONS MANAGEMENT

If you have a VM Information Center, you can't afford to miss the free seminars sponsored by VM Software Inc.

VMSI is the leader in systems software products for VM. We are committed to building quality system products to meet your growing needs without modifications to CP or CMS. Our products have been installed by 43 of the Fortune 50, as well as in 23 different countries.

At this free seminar, learn how these products can make your data center run more efficiently:

- **VMACCOUNT:** System accounting, reporting, and capacity management system for the VM environment.
- **VMARCHIVE:** Archival storage and retrieval system for online and offline storage of CMS files.
- **VMBACKUP:** Backup and restore system for CMS and non CMS minidisks using full or incremental dumps.
- **VMSCHEDULE:** Complete scheduling and monitoring system for end users.
- **VMSECURE:** Directory management, disk space management, and resource access control for VM systems.
- **VMTAPE:** Comprehensive tape drive and tape volume management for VM.

As an added incentive to attend, VMSI offers a discount on products you purchase within sixty days of the seminar. We will reduce the license fee by $1000 for an individual product, or $2000 for the full integrated product line.

Don't miss this chance to improve your VM data center while saving your company money. Register today for the seminar in your area by completing and returning the coupon below.

DEC high-end VAX adds 30% to 50% more power

By Tom Henkel
CW Staff

NEW YORK — In an apparent response to the tidal wave of recently announced superminicomputers from its competitors, Digital Equipment Corp. last week splashed back with a high-end addition to its VAX-11 line. The VAX-11/785 unit offers 30% to 50% more performance than the older Model 780 and carries a 15% higher price tag.

The performance of the high-end VAX-11 — unwrapped last week at the same press conference at which DEC unwrapped its own relational data base management system for the VAX line (story on page 1) — was attributed by DEC to faster Schottky CPU circuits, the quadrupling of cache memory capacity to 32K bytes and the addition of an optional floating-point accelerator.

The machine sports a 133-nsec processor cycle time, which is one-third faster than the Model 780's 200-nsec processor cycle time. The improved performance, DEC said, means the 785 can perform better than the 780 in computer-aided design and manufacturing and educational, technical and commercial time-sharing applications.

Instruction microcode

Instruction microcode for the VAX-11/785 is stored in random-access memory; in the 780, it was located in read-only memory. This change, DEC said, makes it easier to make microcode updates while also increasing CPU performance.

Furthermore, the console memory capability of the 785 is 48K bytes; the 780's maximum is 16K bytes. This increase on the 785 improves console performance for system monitoring and error reporting and also makes maintenance easier, DEC claimed.

By utilizing specialized synchronization circuitry, the VAX-11/785 can use the same Synchronous Backplane Interconnect interfaces, controllers and peripheral equipment of smaller VAX series processors. In addition, according to Bruce A. Ryan, manager of the VAX product marketing group, users of the 780 processor can field-upgrade to the 785 for $91,200. A field-upgrade kit, including the optional floating-point accelerator, costs $95,000.

Runs both VMS, Ultrix-32

Ryan also noted that the 785 can run both the VMS and Ultrix-32 operating systems (Ultrix-32 is DEC's version of Unix).

The optional floating-point accelerator, the FP785, is said to enhance by an average of 47% the processor's performance in compute-intensive applications. The floating-point processor uses the same technology and internal timing as the VAX-11/785 and costs $14,000.

With first customer shipments slated for September, a base configuration of a VAX-11/785 processor with 2M bytes of main memory, cabinetry and a VMS operating system license costs $195,000.

A preconfigured system designed to use DEC's All-in-1 office automation software costs $322,735. That configuration includes 6M bytes of main memory, a 456M-byte disk drive, magnetic tape drive, four Decmate II small business systems with word processing software, licenses for VMS, the All-In-1 office menu, VAX Decmail and the DECDX/VMS communications package (which facilitates communications with the Decmate II).

A fully configured system that operates in DEC's Vaxcluster multiprocessing environment costs $399,000. That configuration includes 8M bytes of memory, a console, VMS, 1.2G bytes of fixed disk storage, DEC Unibus cabinetry and a magnetic tape drive.

DEC is headquartered in Maynard, Mass. 01754.

DIGITAL EQUIPMENT CORP.

System Characteristics	VAX-11/730	VAX-11/750	VAX-11/780	VAX-11/785
Relative Performance[1]	20	40	62	86
Mips[2]	.36	.72	1.06	1.4
Memory Size in Bytes (Minimum-Maximum)	1M-5M	512K-8M	512K-32M	2M-32M
Purchase Price[3] (Memory Size)	$21,500 (1M)	$47,000 (1M)	$145,000 (2M)	$195,000 (2M)
Lease Price (Lease Term)	None	None	None	None
Machine Cycle Time (Nsec)	810	320	200	133
Channels (Minimum-Maximum)	1	1-5	1-8	1-8
Cache (Buffer) Size	None	4K	8K	32K
Bus Architecture	Yes	Yes	Yes	Yes
Price per 1M Byte Of Main Memory	$4,900	$4,900	$4,500[4]	$4,500[4]

1. CW estimates based on vendor-supplied information. Relative performance ratings are based on an IBM 370/158-3 equaling 45. These numbers are designed to put the processor into perspective with other systems; they do not constitute a buyer's guide. All systems are not alike; they use different operating systems, instruction sets and architectures and, therefore, cannot be directly compared. In addition, actual relative performance may vary with the application, peripherals and software.
2. Vendor claims.
3. For a basic configuration consisting of 2M bytes of main memory, power supply, cabinetry and a VMS operating system license.
4. Memory upgrades are available in a minimum 2M-byte configuration for $9,000.

CW Chart

Newest VAX garners more punches than praise

By Tom Henkel
CW Staff

Digital Equipment Corp. last week received more jabs than praise for its newly announced VAX-11/785 superminicomputer.

Comments at DEC's product announcement last week in New York and on the floor of Dexpo East 84, a conference for DEC users in Boston, ranged from "too little, too late" to "a nonannouncement."

The new processor was a letdown for many who expected DEC to unveil the long-awaited Venus, a high-end successor to the VAX-11/780, which DEC still promises to announce sometime this year. Instead, DEC appeared satisifed to share the dimmer corner of the the limelight with AT&T's line of VAX-class processors, announced two weeks ago [CW, April 2], and IBM's new low-end System/36, announced last week (story on page 8).

Despite any disappointment it may have engendered, the announcement of the VAX-11/785 did give capacity-starved users of the VAX-11/780 an upgrade option. DEC claims the 785 offers 30% to 50% more performance than the 780. Previously, to get that kind of performance enhancement, DEC users basically had to switch to another vendor's system, such as IBM's 4300 line.

And many VAX users have been switching to the 4300 over the past few months, according to Sonny Monoesson, president of American Computer Group, Inc., a Boston firm that deals in used DEC hardware. Monoesson said he knows DEC is losing high-end VAX users to IBM because that is how he makes a living — buying up used VAX processors. Monoesson claims the market for used VAXs has been brisk.

But other industry watchers contend that the VAX line is selling well. In fact, one analyst said DEC is beating IBM in the mid-range processor market.

If DEC is indeed satisfied with sales of the 780, why would it jeopardize that market by offering a new processor that will not be available until at least September? According to Stephen A. Levine, the president of TEC Computer Systems, Inc., a Newton, Mass., DEC distributor, DEC had to announce the 785 to appease its current installed base of 780 users.

But is the 785 really a good deal for existing users? In material presented to the press and industry analysts at New York's Windows on the World restaurant last week, DEC stated that the 785 costs about 15% more than the 780. That 15% appears to apply only to fully configured systems. The purchase price for a base configuration is $195,000, about 35% greater than the $145,000 purchase price for a similarly configured 780, noted Dave Moschella, an industry watcher with International Data Corp. in Framingham, Mass.

For current users of VAX-11/780s, there is a charge of better than $90,000 to field-upgrade to the 785. While that is certainly less costly, not to mention less disruptive, than migrating to IBM's 4300 line, Moschella noted it still appears to represent the same price curve that has always been offered on the VAX line.

Not anxious for early orders?

DEC does appear anxious to chalk up early orders for the VAX-11/785. The spokesman admitted DEC is offering a discount on 780-to-785 upgrade kits to users willing to purchase 780 processors by the end of June. The spokesman said he was not sure how much a discount is being offered, but industry sources say the upgrade kit is being discounted about $40,000.

In remarks at the New York announcement, however, DEC President Kenneth Olsen stated, "We're not going to give the company away by lowering our prices too quickly." That remark prompted some industry watchers to speculate that DEC announced the 785 purely to get more mileage out of the current VAX line-up before the Venus announcement. But other analysts, like IDC's Moschella, think Venus may offer so much more performance than the 780 that some users will not be able to justify buying it.

In any case, the VAX-11/785 will not be available until at least September, and, a DEC spokesman said, the 780-to-785 upgrade kits will not be available for an indefinite time after that. That has industry watchers puzzled. If DEC is set to announce the high-end Venus by the end of the year, they ask, why announce a slightly more powerful version of the 780 that probably will not be available for volume shipments until about the same time as the Venus announcement?

Videotex software fits VAX-11

NEW YORK — Digital Equipment Corp. last week unwrapped videotex software for the VAX-11 series of superminicomputers running under its VMS operating system.

Dubbed VAX VTX, the package reportedly can be incorporated with DEC's All-In-1 office menu system and supports the company's VT100 and VT200 CRT terminals, VT100-compatible terminals and the entire line of DEC microcomputers.

VAX VTX is comprised of three components, a spokesman said, including terminal control/concentrator software and data base access and update software.

The spokesman said VAX VTX is also compatible with DEC's Decnet communications software. It can be used as part of the All-In-1 office information system and can be called from the All-In-1 menu.

VAX VTX is expected to be available in June and will license for $25,000, according to the spokesman. DEC is headquartered in Maynard, Mass. 01754.

NEWS

RDB gets mixed greeting

John Gallant
and Paul Gillin
CW Staff

Digital Equipment Corp.'s first foray into the relational data base management system (DBMS) arena signals a renewed emphasis on software in general and the information center in particular. However, broad market acceptance of the new products is less than certain.

That was the reaction of industry watchers contacted by *Computerworld* following DEC's introduction last week of the VAX RDB/VMS and VAX RDB/ELN software for the VAX-11 series processors.

The announcement signals DEC's commitment to the information center, according to Shaku Atre, president of Atre International Consultants in Rye, N.Y. "DEC now has a large VAX, Unix, a local-area network and personal computers," Atre said. "But it has needed something to sit on the VAX that is easy to retrieve from. DEC is trying to make it attractive to buy a complete system."

But Atre also noted that DEC "has not shown a great deal of enthusiasm about its software products" in the past. "DEC may have to convince people that it is serious about this."

Missing details

Skepticism centered on DEC's failure to provide many technical details about the RDB software. "A lot remains to be seen," said Dr. George Schussel, president of Digital Consulting Associates, Inc. in Wakefield, Mass. "If this software is more complex and comprehensive than other systems on the market, then it will be embraced by DP managers. If not, it may be more of an information center tool."

"The announcement touched briefly on some of the system's capabilities, but there was no real discussion of the user interfaces," said Gary Morgenthaler, president of Relational Technology, Inc., which markets the Ingres relational DBMS. "It's not clear what additional software users will need to make the system functional."

According to Dan Nolan, president of Heuristic Developments, Inc., DEC users will adopt a "wait-and-see" attitude toward the new products. "DEC will push these products heavily, but I think most customers will sit back and watch," he said. "People are reluctant to accept new disciplines."

Announced as supporting distributed data bases, the DBMS could be a piece in DEC's plans to give its mainframe users a place to migrate, according to Ann Morley, senior software consultant at International Data Corp. in Framingham, Mass. "They have to convince Decsystem-10 and 20 users to migrate to VAX clusters rather than to the IBM 30 series," she said.

However, Ronald G. Ross, editor of the "Data Base Newsletter," doubted that distributed data bases are feasible yet. "Every vendor making relational noise is claiming to support distributed data processing," Ross said, "but I'm not sure they'll follow up on that with a truly distributed data base. I'm not convinced either that a lot of people are willing to go the distributed data base route."

Industry analysts also split on the impact of DEC's announcement on established relational DBMS contenders, such as Oracle Corp.'s Oracle, Relational Technology's Ingres and Cincom Systems, Inc.'s Ultra. "It's clear that many current DEC user companies will prefer DEC's own system over others, and that will hurt," Schussel said.

"I hope the others will tighten up their acts as a result of this," Nolan said.

"But I'm afraid they'll attack DEC at the print-shop level. They will minimize whatever capabilities the DEC systems have, but they should be moving toward more R&D," Nolan added.

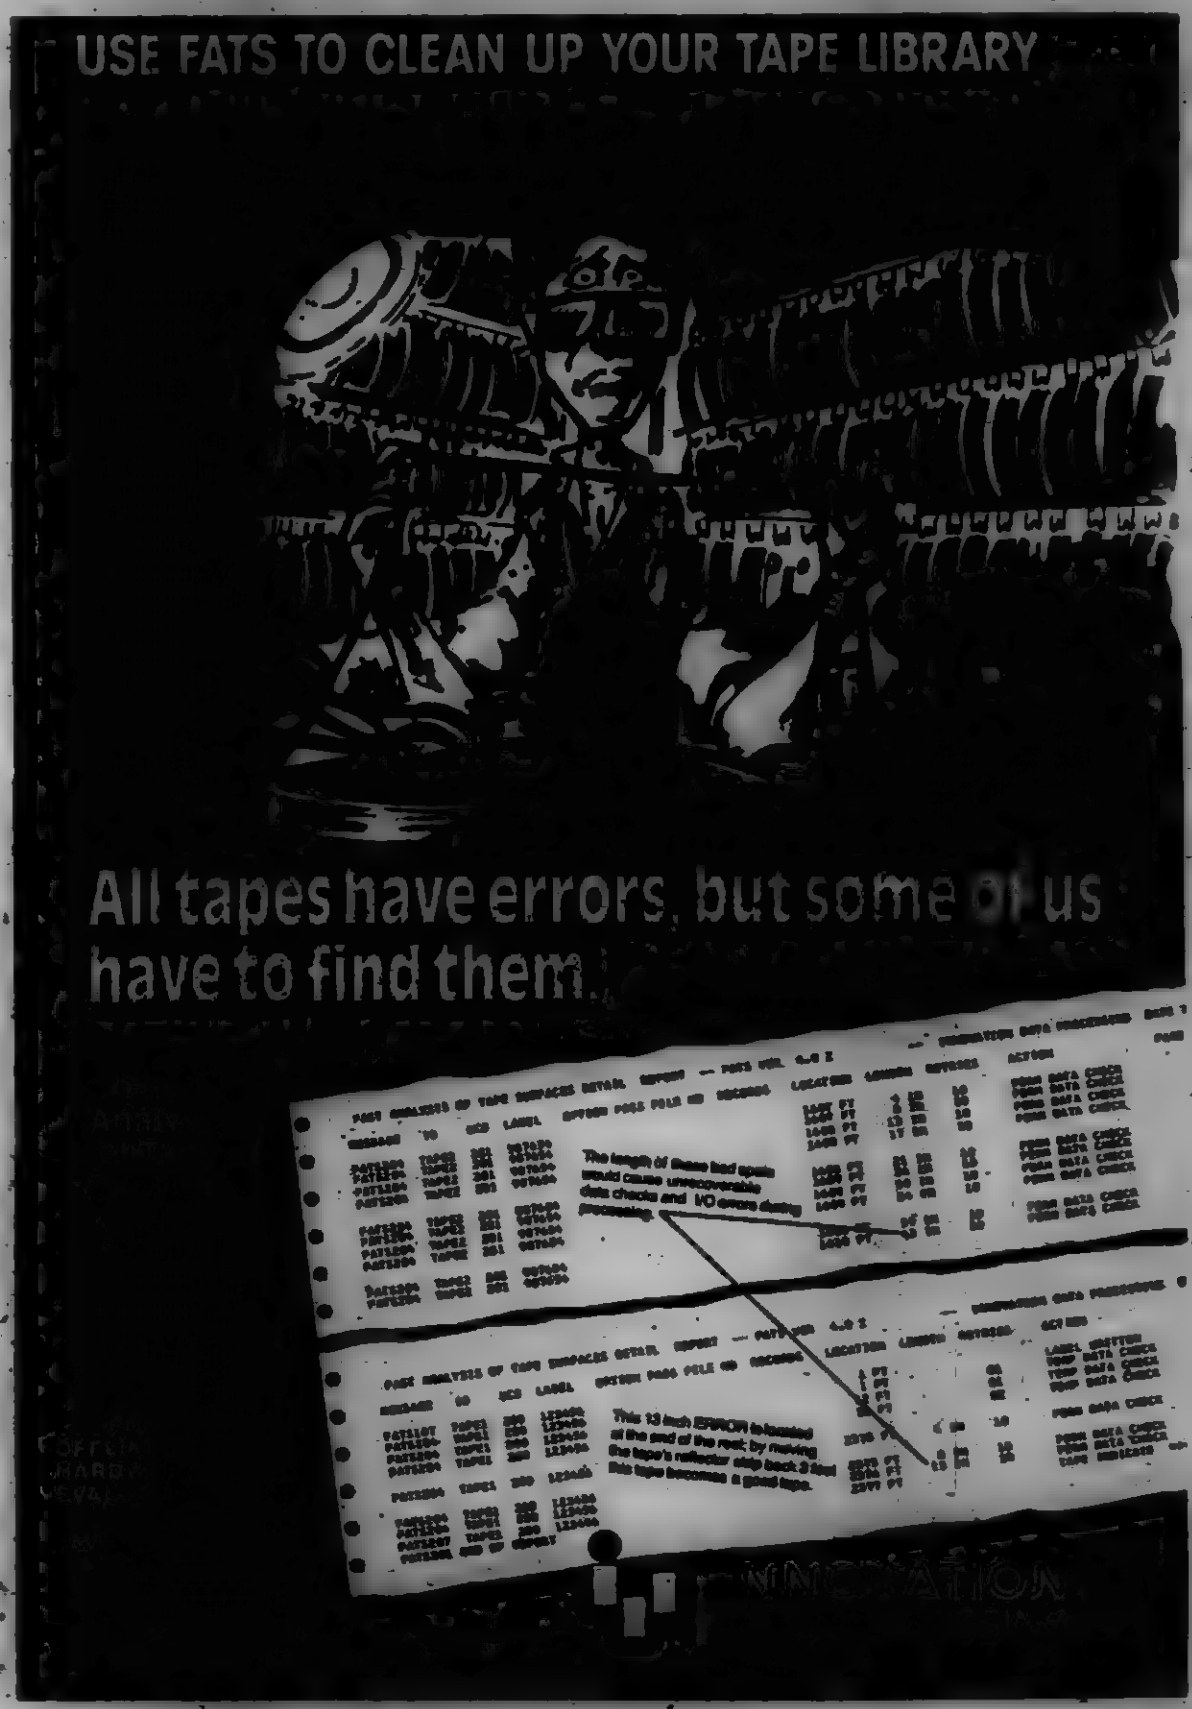
DEC from page 1

The two DBMS use the Digital Standard Relational Interface as a common application interface, allowing application programs written for either system to access data managed by the other, the spokeswoman noted. They also enable users to retrieve and update information transparently from remote systems using Decnet communications links. With the Decnet facilities, application programs can run on one system, while data can reside on any other VAX system in the network.

Both VAX RDB/VMS and VAX RDB/ELN are said to offer an interactive query language to aid data manipulation and debugging of application program logic. The packages also feature a data definition language for definition and central storage of data descriptions, data validation functions to ensure conformity to predefined parameters, transaction recovery features and contention arbitration to handle simultaneous attempts to access the same data.

In addition, VAX RDB/VMS reportedly adds security features to those provided by the VMS operating system, and it provides what the spokeswoman described as long-term journaling to preserve data integrity in the event of application or system malfunction.

Development license fees are $9,000 for VAX RDB/VMS and $7,500 for VAX RDB/ELN. VAX RDB/ELN will be available in June, VAX RDB/VMS in August from DEC, headquartered in Maynard, Mass. 01754.



IBM issues products to tie its micros, larger systems

By Mike Bucalyn
CW Staff

NEW YORK — IBM last week issued a barrage of new products, most aimed at linking its Personal Computers with larger IBM machines.

The introductions "just about turn the [Personal Computer] into a new system," claimed Philip Estridge, president of IBM's Entry Systems Division. "They take the [Personal Computer] into the mainstream of IBM's office strategy."

Among the new offerings unveiled at a press conference here:

■ The Professional Office System/Personal Computer Connection (Profs/PC²). Profs/PC² extends selected Profs functions to the IBM Personal Computer, Personal Computer XT, 3270 Personal Computer, Personal Computer XT/370 and Portable Personal Computer. It allows users to transfer Profs incoming mail and other business information to Personal Computers for stand-alone processing; the results can be sent from the micros back to Profs for processing or distribution to other Profs users, IBM said. Available in June, the program will cost $200.

■ Transfer facility programs that connect the System/36 or the System/38 with the Personal Computer, Personal Computer XT or Portable Personal Computer. The programs allow the micros to both download and upload files to and from the larger machines, said H. Mitchell Watson Jr., president of IBM's System Products division.

Two transfer facilities will be available next month, one for the System/36 and the other for the System/38. Each costs $960.

■ The Displaywrite series of text processing software programs for the Personal Computer, Personal Computer XT, Portable Personal Computer and 3270-PC. Similar to the Textpack 4 program, which runs on the IBM Displaywriter, Displaywrite 2 includes a spelling checker with about 100,000 words; it costs $299. Displaycomm BSC is a Binary Synchronous Communications program enabling Personal Computers, Personal Computer XTs and Portable Personal Computers to send Displaywrite 2 documents to other suitably equipped Personal Computers, Displaywriters and host computers; it carries a $375 price tag. Both programs are available this month.

■ IBM 8100 information system support for the Displaywrite 2 program running on a Personal Computer or Personal Computer XT. Attached to an 8100 local or remote loop and operating under Displaywrite 2, Personal Computer workstations can exchange documents with the larger system, according to the company. The support is available under the 8100 DPCX/DOSF Release 4 and DPPX/SP Release 2.

■ An attachment kit that connects the Displaywriter and the Personal Computer, Portable Personal Computer, Personal Computer XT or PCjr. The attachment allows transfer of documents and files between a Displaywriter and a single Personal Computer. The setup also permits a Displaywriter to connect with the IBM Personal Computer Cluster, using a Personal Computer as an interface. The kit is expected to be offered in August at a cost of $495.

■ IBM 5218 letter-quality printer support for up to four Personal Computers or Personal Computer XTs. A printer attachment package (with cable and printer-driver program) will cost $220; the printer-sharing device will cost $625. Both will be available next month.

■ An enhanced version of the 5520/Personal Computer Attachment Program, which provides support for the Personal Computer, Personal Computer XT, 3270-PC, XT/370 and Portable Personal Computer. The Version 3 program will cost $384, and an attachment kit (with program, adapter and cable) will cost $1,113. The program is expected to be available in the third quarter.

■ The PC/Videotex program, which permits a Personal Computer, Personal Computer XT or PCjr to be used as a videotex terminal. Cost for Personal Computer and Personal Computer XT versions is $250. It is scheduled to be sold in October.

■ The PCwriter, a text processing program supported by the Personal Computer, Personal Computer XT and Portable Personal Computer. PCwriter is scheduled to be offered this month at a cost of $190.

IBM's Information Systems Group is based at 900 King St., Rye Brook, N.Y. 10573.

IBM last week released this graphic interpretation of how its microcomputers, workstations and peripherals can be integrated into larger system configurations. The graph highlights both the diversity of connections and the ubiquity of the IBM Personal Computer.

The dotted lines show document-transfer capabilities that IBM intends to establish, but has not yet released as products.

"DWS" indicates IBM's Displaywriter word processing system; "PC" stands for the Personal Computer; the 6670 is IBM's information distribution system; and the S9000 is a laboratory-oriented microcomputer.

The 5253, 3101, 3104, 3170 series, 3180, 3270 series, 3640, 3080 and 8775 are display stations; the 4250 is a printer; the 3290 is a plasma-panel display station; the Scanmaster is an image processor; the 5291 and 5292 are color display stations; and the 5080 is a raster display terminal.

Latest System/36 handles 86 terminals, fits under desk

NEW YORK — IBM last week introduced a low-end model of its System/36 small business system that handles up to 86 terminals and fits under a desk.

The new System/36 Model 5362 provides "the same system throughput as a full System/36" at a 38% lower entry price, said H. Mitchell Watson Jr., president of IBM's System Products Division, at a press conference held here last week to announce the system. The system is for both new and experienced customers who do not need all the storage capacity or devices available with a standard System/36 Model 5360.

The Model 5362 runs all System/36 programs without recompiling and uses most System/36 printers and displays, according to IBM. It plugs into a standard grounded 110V wall socket and handles up to 22 local workstations and 64 remote units.

The system, scheduled to begin shipping next month, comes with 128K bytes of random-access memory (RAM), expandable to 512K bytes; up to 120M bytes of disk storage; and a 1.2M-byte diskette drive. It can accept up to four communications lines and operate in networks using Systems Network Architecture/Synchronous Data Link Control, Binary Synchronous Communications or X.25 packet-switched protocols.

The biggest difference between the 5360 and the 5362 is the amount of storage available, IBM said. The top-of-the-line version of the 5360 features 1M byte of RAM and 800M bytes of disk storage. The top-of-the-line 5362 offers 512K bytes of RAM and 120M bytes of storage.

Four models of the 5362 are available: the A01, with 30M bytes of disk storage and a starting price of $13,000; the A02, with 60M bytes of storage and an $18,000 price tag; the A03, with 90M bytes of storage for $24,000; and the A04, with 120M bytes of storage and a $28,000 price.

A basic configuration, with 128K bytes of RAM , 30M bytes of disk storage, display terminal, printer and System/36 System Support Program operating system, will cost $23,510.

Maintenance charges for the new system are substantially less than for the 5360, IBM said. The monthly fee for the starting 5362 unit is $60; the starting 5360 costs $96 a month.

IBM Credit Corp. will offer term lease and installment payment financing, with term leases starting at $253 a month for a five-year lease of the lowest priced 5362.

In conjunction with last week's announcement of the System/36 Model 5362, IBM also lowered one-time charges for selected features available in the System/36 System Support Program.

More information is available from IBM's Information Systems Group, 900 King St., Rye Brook, N.Y. 10573.

IBM from page 1

Reiterating that sentiment, George Colony, president of Forrester Research, Inc. in Cambridge, Mass., said that he believes the most significant part of the announcement is the new capability to exchange files and documents between Personal Computers and other systems.

"The real trick for IBM," Colony explained, "is to keep the [Personal Computer] as an 'open' machine for third-party software developers and pull it under data processing to link it to higher level systems. I think it is doing this successfully."

Additionally, Colony believes the announcements give the 5520 a "new lease on life." While the days of the 5520 as a shared-logic word processing system may be limited, Colony sees the 5520 being adopted as a Personal Computer controller.

If that does not keep the 5520 from going under, it might eventually fall prey to the Personal Computer, a fate that, according to Drexel's Casey, also awaits the Displaywriter now that Displaywriter software is available for the IBM micro.

Turning to the "Baby 36," IBM's newly announced low-end System/36, analysts were universally impressed by the unit's low price and compatibility with applications software developed for other processors in that product family.

Skip Bushee, executive vice-president of Infocorp, a research organization in Cupertino, Calif., said the major advantage of the new system is its $24,000 price tag and its compatibility with System/32, System/34 and high-end System/36 applications. "You used to have to spend $50,000 for a system that could play all those applications," Bushee noted.

Shareholder wins proxy fight, vows to oust MAI chief

By David Myers
CW New York Bureau

NEW YORK — Insurgent stockholder Asher B. Edelman has won his bitter proxy fight with Management Assistance, Inc. (MAI), nailing down four seats on MAI's 10-member board of directors and vowing to oust Raymond P. Kurshan, chairman and president of the minicomputer maker and computer services firm.

By a vote of 3.9 million shares to 1.9 million, Edelman's slate of directors — Raymond French, Clark Mandigo, Charles P. Stevenson and himself — was elected at the MAI annual meeting on March 14, it was disclosed last week. Edelman, whose combine now holds 12.8% of MAI's stock, told *Computerworld* last week that the group's goals are to sell the $376 million company and force Kurshan out of office.

"We want to do everything possible to make this company work for its shareholders. Neither [Kurshan] nor his work fits that description. Raymond Kurshan is a total autocrat and without talent," Edelman said.

Not confident of ouster

However, Edelman said he is not confident of being able to oust Kurshan. "Confidence implies hubris, and that is not my motive," Edelman said.

Reached at MAI offices here, Kurshan said he has no intention of stepping down. The 13-year company president and his management team captured "a fair share of the independent shareholder vote" once the Edelman group's votes were subtracted, according to Kurshan.

"I don't know how that could have happened," Edelman said, pointing out that his group holds slightly more than 900,000 shares. "If you take those out, the vote was 3:2 instead of 4:2."

Nevertheless, Kurshan insisted he did not consider the lost proxy battle "a personal repudiation of my efforts."

Kurshan's management team had waged a fierce and at times mudslinging campaign against Edelman, raising questions about Edelman's experience in the computer industry and detailing his legal brushes with the Securities and Exchange Commission.

By contrast, Edelman's campaign was low-key. In proxy materials, he asked shareholders' votes to bring about "a change in management's direction" and "emphasize [MAI's] maintenance and service business," perhaps even dropping manufacture of the Basic Four line of minicomputers. Edelman also criticized management salaries.

Edelman, French, Mandigo and Stevenson will be invited to serve on MAI committees "so they can form better judgments about the company," Kurshan said. "They have lacked an understanding of this company. Their comments and criticisms have been inappropriate."

Talking with prospective buyers

Both Kurshan and Edelman said they are in discussion with several prospective buyers or merger partners.

Edelman said he is talking with computer industry firms and added that MAI could either be sold "lock, stock and barrel" or be divided into manufacturing and service halves to be sold to two separate buyers.

Kurshan insisted he had concluded "several months before Mr. Edelman came upon the scene" that MAI needed to find a "suitable merger partner" in order to halt two straight years of losses. MAI lost $3.4 million in 1983. However, Kurshan said his discussions with likely purchasers have not gone beyond the stage of exchanging information. "We are not negotiating with anyone," he said.

The proxy election will wind up costing MAI over $5 million, Kurshan said, resulting in an anticipated loss for the company's second quarter ended March 31, according to Kurshan. Without the proxy battle expenses, second-quarter income would have surpassed last year's, he added.

Court upholds tariff delay

WASHINGTON, D.C. — Bell Atlantic's effort to force early implementation of new, higher tariffs has been shot down, at least for now.

Bell Atlantic, one of the seven regional Bell operating companies created when the Bell system was broken up Jan. 1, asked U.S. District Court Judge Harold Greene on March 26 to bar the Federal Communications Commission from delaying the tariffs any longer. They had been scheduled to become effective April 3, a date about to be changed to June 13 [CW, April 2]. Bell Atlantic also requested an immediate court hearing.

Greene denied the latter request and put off a final decision until he has reviewed comments from interested parties. As a result, final action will be delayed several days. Meanwhile, the new tariffs have been deferred until June 13.

Do you have some questions about VSAM file handling in COBOL?
Then here's the book for you...

VSAM for the COBOL Programmer

If you have to work with VSAM files and you're unsure of what you need to know about them, then you should get a copy of *VSAM for the COBOL Programmer*. Just as its title implies, this practical, how-to guide will teach you all the basics of handling VSAM files in COBOL.

The first chapter is an introduction to VSAM. It talks about VSAM's advantages ...and drawbacks...and introduces you to the common terms you'll need to know before you can continue.

Chapters 2 and 3 are the meat of the book because they cover VSAM key-sequenced files. Key-sequenced files are equivalent to ISAM files on a non-VSAM system, and they make up about 95% of all VSAM files.

Chapter 2, then, explains the COBOL elements you need to know for key-sequenced files. And it gives in-depth coverage to handling the errors that can occur when an I/O statement is executed for a VSAM file. In addition, it tells you how to code the OS JCL you need for COBOL programs that use VSAM files ...and why the JCL is so much simpler than it is for ISAM files.

Chapter 3 covers IDCAMS, the Access-Methods-Services program. This is the utility program you must use to set up disk space for a VSAM file before you can even create the file in a COBOL program. In addition to learning how to set up file space, you'll learn how to use IDCAMS to: copy, print, and rename VSAM files; load a VSAM file from a non-VSAM file; and list and maintain a VSAM catalog.

Once you've mastered the material in chapters 2 and 3, you can quickly go through chapters 4 and 5. They cover the COBOL, JCL, and IDCAMS considerations for entry-sequenced and relative-record VSAM files. These are equivalent to sequential and relative files on non-VSAM systems.

Throughout chapters 2-5, the learning is geared toward the OS user. But chapter 6 is devoted to the DOS user. It presents all the variations you need to know about if you're working on a DOS system. So here, you'll learn how the COBOL code, the JCL, and the IDCAMS statements differ from OS. And I think you'll be surprised at how few differences there are.

In short, then, by the end of the book you'll have a thorough grasp of what you need to know to write COBOL programs for VSAM files.

2 reasons why this book is effective

1. The author of this book, Doug Lowe, selected the content based on an analysis of what a COBOL programmer needs to know about VSAM. That means this book contains everything of use to the average COBOL programmer and very little that isn't. It also means you can learn significant VSAM skills...and find the answers to your VSAM questions...in a minimum of time.

(By the way, this book does not cover dynamic access or alternate indexing. Alternate indexing will be covered in *CICS for the COBOL Programmer: Part 2*, due out at the end of the year.)

2. Perhaps the most important feature of this book is that it contains plenty of examples, so you always see just what the author is talking about. Examples like:

- COBOL listings for file-creation, update, and print programs
- summaries of the codes that can occur in the FILE STATUS field after an I/O statement has been executed ...along with recommendations on what action to take when an I/O error occurs
- DOS and OS JCL for running VSAM COBOL programs
- IDCAMS statements for creating, printing, copying, and renaming VSAM files
- JCL for using the ISAM interface program supplied by IBM

There are over 50 illustrations in all, designed to help you learn about VSAM ...and to serve as models when you're coding VSAM jobs on your own.

So why wait?

If you're not sure of all the answers when it comes to VSAM file handling in COBOL, get a copy of *VSAM for the COBOL Programmer* right away. I think you'll be surprised at how much knowledge you can get for $15.

Our unlimited guarantee

You must be satisfied. If you ever feel our books aren't effective, you can return them for a full refund...no matter how many you buy, no matter how long you've had them.

To order, call 1-800-221-5528 / In California, call 1-800-221-5527 (9 to 4 Pacific Std. Time)

OR Mail the coupon below

Interested in other aspects of COBOL training?

Then take a look at a two-part course called *Structured ANS COBOL*. Part 1, designed for the complete beginner, teaches a professional subset of COBOL that gets the student writing programs for sequential files right away. Part 2 covers advanced subjects like table handling using SET and SEARCH, subprogram linkage, the COPY library, indexed file handling, and the sort/merge feature. Both books present practical methods for developing *structured* programs, so they can be used independently as well as in a set.

Benefits of micros come slowly, managers warned

Fortune 1,000 conference-goers urged to practice skills at home

By Paul Hawaniewicz
CW Staff

DALLAS — Senior managers' hopes of quickly reaping the benefits of microcomputers have to be tempered, Thomas Samson, partner at Arthur Young and Co., warned here last week at the Fortune 1,000 Personal Computer Market Forum sponsored by Future Computing, Inc.

"Time is the most precious item that a senior manager has," according to Samson, whose firm trains senior managers in the use of personal computers. "He wants instant gratification when he sits down and uses a microcomputer."

But he doesn't receive it. Samson estimates that it takes at least 20 hours before a senior manager becomes proficient working with a software program.

"It's like flying," Samson noted. "A pilot takes 30 hours of ground instruction before he steps into the cockpit. It takes 60 to 100 hours before one becomes really productive with a software package."

This period can be shortened if the manager brings the microcomputer home. "The best time for users to learn is at home for a few hours at night or during the weekend," Samson said. "I urge companies to invest in portables and encourage employees to take them home." Senior managers are turning to microcomputers to facilitate the analysis of corporate data. Before the advent of personal computers, these managers were frustrated at the data processing department's attempts to build corporate information pipelines, according to Samson, who said that "few of these pipelines were successful."

> *'I urge companies to invest in portables and encourage employees to take them home.'* — Thomas Samson, partner at Arthur Young and Co.

Managers look to microcomputers as the new messiahs for providing these information pipelines. "Vendors and data processing managers claimed that hooking mainframes and microcomputers for data analysis is an easy process," Samson stated.

However, senior managers become frustrated at the steps needed to find and load useful data. "Data is stored in a manner a technician can understand, but the manager cannot easily use," Samson said. "There are only a handful of ways that data can be manipulated. It takes time to complete the process — time that senior managers do not have."

Samson is not impressed with manufacturers' recent claims of products designed for ease of use. "[Apple Computer, Inc.'s] Macintosh will help first-time users become acquainted with the machine," Samson explained. "But time is spent mastering the functionality of a specific program. The Macintosh will not solve that problem."

Micro-mainframe links not yet seen satisfying users

By Paul Hawaniewicz
CW Staff

DALLAS — Companies supplying microcomputer-to-mainframe communication links are responsible for providing the security features needed to ensure data integrity.

So claimed James Black, director of advanced concepts at University Computing Corp., who spoke here last week at the Fortune 1,000 Personal Computer Market Forum sponsored by Future Computing, Inc.

Current links do not limit access of data to authorized personnel or ensure that data updated on a microcomputer is transferred back to the mainframe, according to Black.

Inadequate security features were one of many micro-to-mainframe link shortcomings that analysts here noted. "Companies are announcing but not delivering products," Black stated. "We have hardware [and] software, and now we have vaporware that disappears when you try to find it."

In addition, manufacturers are announcing links with very limited capability, according to Don New, president of Phase Information Machines Corp. "Most of the current links access only the vendor's mainframe package," New said. "The product is designed to protect the company's market share and not to help the end user."

Besides limited capabilities, the links are difficult to manipulate, one user claimed. "Vendors claim that hooking microcomputers to mainframes is easy," said Thomas Samson, partner at Arthur Young and Co. He claimed that data as currently stored is understood by the technician, but is not easily used by the manager.

One vendor advocated the emergence of easy-to-use links. "The link should be mundane and work as easily as a telephone," said David Clark, director of consulting at Execucom Systems Corp.

But providing an easy-to-use link is not all that is required. "The problem is not user-friendliness but user-effectiveness," Black said. "The product can be very friendly, but if it doesn't help productivity, it will not be used."

Productivity can be increased if the link works with any microcomputer or mainframe program. "One link should provide a gateway to all data," Black said. "It shouldn't matter if users work with Lotus [Development Corp.'s] 1-2-3 or any other program."

Differing data formats hinder the development of that type of link. "There just aren't any standards for data formats," New said.

Since mainframes and micros grew in different eras, format differences are significant. "Mainframe applications were designed more than a decade ago," New said. "We have to retrofit mainframe data so that the microcomputer can use it."

Retrofitting these applications will take time. "We should attack the problem by building on what is already there," Clark said. "We should design simple links, be satisfied with quick, small wins and use that experience to build more complete links."

AT&T to request waiver for subdivision

WASHINGTON, D.C. — AT&T plans to ask the Federal Communications Commission soon for a waiver of the Second Computer Inquiry decision that would allow a newly created subdivision to market transmission service and terminal equipment on a bundled basis to the federal government, a spokeswoman said last week.

The new entity, set up within AT&T Technologies, Inc., would install and maintain whatever it sold.

The idea was vigorously opposed by the company's competitors, who insist that if the waiver is granted, it will enable AT&T to underprice other bidders by offering the transmission services at below-cost rates. That would force users of AT&T's regulated services to make up the difference, explained John Morgan, general manager of government systems for the Bell Atlantic telephone companies.

A major reason for adopting Computer Decision II, he added, was to prevent such cross-subsidies.

VAX SPREADSHEET WITH GRAPHICS

GRAPHIC OUTLOOK combines an electronic spreadsheet with full business graphics. GRAPHIC OUTLOOK interfaces to your DISSPLA®, SAS®, DI/3000®, or IMSL® graphics software. Or you can license it complete with its own graphic software. Our 30 day demonstration tape includes the full spreadsheet with graphics.

— Horizontal and vertical bar charts, pie diagrams, line and scatter plots.
— Drives most popular graphics terminals and plotters.
— A 3-dimensional spreadsheet capability lets you link spreadsheets together.
— Reads and writes ASCII interface files.
— Journaling, sorting, cell labels, user-defined functions, cell edit.
— Special project scheduling functions.
— Extensive on-line help, and tutorials.
— With SPAWN command, communicates interactively with user-written programs that update worksheet values.
— Over 60 built-in mathematical, scientific, financial, statistical, and worksheet manipulation functions.
— Low resolution graphics provides bar charts and line drawings on VT100-type terminals.

Turn micros into marketing tools, bankers urged

Premium placed on the delivery of customer services

CW AT EFTA

By James Connolly
CW Staff

ORLANDO, Fla. — Personal computers are tools that bankers can use not only in back rooms for accounting purposes, but in the lobbies to provide direct services to customers, the Electronic Funds Transfer Association Convention (Efta) was told here last week.

"What the customer wants is a responsive bank. The front-line staff can't just be order takers," said Wayne Nystrom, president of Infoware Corp. of Nashville. "Customers want answers. McDonalds [Corp.] has a higher level of customer service on a national basis than do banks."

Nystrom and consultant Wayne Johnson, director of the accounting firm of Deloitte, Haskins & Sells of Atlanta, said that personal computers mean increased productivity and profitability for banks, organizations that traditionally have been slow to accept new technologies.

Three-quarters of U.S. banks are now using microcomputers in addition to mainframes, minicomputers or service bureaus for their data processing needs, Nystrom said. The micro can be a fun training aid, as well as a "valuable starting point for the delivery of services," he added.

Applications cited

Among the applications that Nystrom cited were customized individual retirement account projections, financial planning for upscale customers and cash management for businesses.

He singled out banks in Milwaukee and Louisville, Ky., where bankers have thrown out service manuals in favor of personal computers that show customers what they offer and that help officers steer customers away from passbooks.

"They are small uses, perhaps, but they are very important signals to what the future holds for microcomputers," Nystrom said. He expects further uses for personal computers to include more home banking, including transfer of securities.

Telling attendees that they would find their own applications as they began using computers, Nystrom advised, "You've got to get your hands on a personal computer and play with it."

He recommended starting with pilot installations.

The advantages to personal computers include immediate implementation, high rewards for a low-risk investment and a broad range of uses and benefits, he said.

Johnson said the use of computers as marketing tools should include computer-based learning for employees, electronic consulting such as funds management and expert systems and artificial intelligence as decision-making aids.

Software now at beta test sites can help microcomputers operate as expert systems in tasks such as credit evaluation and employee evaluation, Johnson said.

At the artificial intelligence level, computers feature robotics as automatic teller machines, can replace loan officers in reviewing credit applications, can provide funds settlement and can provide delinquency follow-up.

But, he warned the bankers, "You've got to be on your guard that you don't spend so much time looking at the keyboard that you lose contact with the task at hand.

"Some people get so hung up on the computer that they lose the ability to operate independently."

Nystrom

What do top computer professionals usually say when we tell them about our unique, completely portable software?

"Show me!"

And actually we are not surprised. After all it took us 5 years to figure out how to do it. And now that we've gotten over that hurdle our biggest problem has been convincing people that Tominy's* completely-portable application development system really works.

Tominy allows you to develop completely portable application programs which can be used without modification on micros as well as mainframes and everything in between. That means no more costly and unproductive time spent in developing special systems to fit individual computers. With Tominy one size fits all.

We have such confidence in the system that we offer it with a 90 day no questions asked money back guarantee.

Because it is not possible to tell you here everything our portable application development system does, we have ready to send you a kit that not only offers detailed information on how the system operates but also shows how it is presently being used to increase productivity and reduce costs in over 1000 installations nationwide, including 25 of the Fortune 500 companies. It's yours free for the asking if you send in the coupon or call (513) 984-6605.

We are sure that after reading it Tominy will make a believer out of you too.

Tominy
Once is finally enough.

*Tominy's completely portable application development system is presently available for IBM's PC, System/34, System/36, Series/1, 43XX, 3000, 370xxx, DEC VAX/VMS systems, UNIX and XENIX operating systems

☐ I'd like to be convinced. Send me your information kit.
☐ Have a representative call.

Limits must be set on access to EFT, attendees told

CW at EFTA

By James Connolly
CW Staff

ORLANDO, Fla. — The computer does not know right from wrong, so limits must be set on who uses computerized funds transfers and how they use them, warned speakers at the Electronic Funds Transfer Association Convention (Efta) here last week.

The keys to funds transfer security are identification, ensuring that the proper person is accessing the network; and transaction limits, keeping potential losses to a minimum if there is a successful fraud, warned bank security consultant George H. Warfel Sr. of Warfel Associates of Menlo Park, Calif.

Sharing the podium with Warfel was Howard G. Johnson Sr., partner at Price Waterhouse & Co. of New York, who added that senior bank officials seldom understand or want to understand "hackers." He said bank managers erroneously picture hackers as home computer users equally interested in stealing CATV signals and accessing bank computers.

Johnson cited a survey of bank and retail officials, who listed security as the No. 9 concern when building point-of-sale networks. They ranked marketing and consumer acceptance first and second.

Johnson and Warfel noted that software can prevent many of the security problems associated with funds transfers and that physical security controls are relatively easy to conceptualize and execute. Noting the changes in the banking industry in recent years, as banks moved away from being 10 a.m.-to-3 p.m. businesses with transactions controlled by customers' signatures, Warfel emphasized that the use of personal identification numbers and passwords have left bank computers ignorant of who is using the system.

Technological developments and deregulation have extended the "window" in which a bank once operated, which means the bank often may be transferring more money than it has in assets, Warfel said.

Risk involvement

He said that not all EFT activity involves significant risk. Risk is determined by a combination of dollar amount, frequency of occurrence, randomness in time and dollar value and the question of whether funds are being issued to a person.

Using those factors, he concluded that telephone bill paying is a low-risk transaction in that it usually occurs at the same time each month and that the amounts involved are usually predictable.

Other low-risk transactions include preauthorized payments and automated teller machines and direct deposits, he said. At the other end of the scale are wire transfers and foreign exchanges, which are highly risky. Warfel said those transactions are random in time and value, involve large sums of money and seldom involve personal contact.

To combat fraud in the high-risk transactions, Warfel urged that banks and networks adhere to caps in their transfers, not allowing transfers after a fixed percentage of assets has been paid out until replacement funds are received. He also recommended that networks use uniform procedures to identify recipients of wired funds and criticized government regulators who, he said, do not understand the banking business and the technologies it uses.

Control over retail EFT nets seen slipping away from U.S. banks

By James Connolly
CW Staff

ORLANDO, Fla. — Retailers have the chance to steal control from banks over such consumer-oriented electronic funds services as point-of-sale (POS) terminals and bill paying, according to the president of Electronic Banking, Inc. of Atlanta.

Speaking at the Electronic Funds Transfer Association Convention here last week, Allen H. Lipis said that gasoline retailers and supermarkets will want their own — not bank-owned — POS terminals and that major nonbanking corporations are likely to control electronic funds transfer (EFT) networks as consumer-oriented services mature.

"EFT services won't mature until the late 1980s, if not the 1990s, and banking won't be the dominant force," he said. Lipis noted that only 4% of the more than 500 conventioneers were senior bank managers. "Why doesn't EFT have the attention of senior bank management? Maybe

Test new technology to cure AT&T breakup ills, users told

CW AT EFTA

By [illegible]
CW Staff

ORLANDO, Fla. — The AT&T divestiture means skyrocketing rates and poorer service for the operators of bank and retail electronic funds transfer networks. These users can best cope with divestiture by experimenting with new technologies, taking active roles in telephone rate-setting proceedings and getting the most out of their own systems.

So said telecommunications consultant Alfred Natali of East Hanover, N.J., who spoke at last week's Electronic Funds Transfer Association Convention (Efta) here.

Natali told the network managers attending the conference that telephone costs will continue to rise as users deal with both AT&T and the seven divested Bell operating companies.

He noted that some rates have already more than tripled while other new charges, such as a $35 per month charge for carrying data rather than voice communications, have been added.

EFT networks dealing with AT&T and the divested operating companies may encounter extensive service delays, Natali added. Those delays may include waits of up to 100 days for installation of a private line, a key to the operation of a funds transfer network.

While the consultant offered suggestions for coping with divestiture, he warned that even those steps don't assure lower telephone bills. "Experiment with new technologies," he said, acknowledging that those technologies are capital-intensive.

Even with new technologies or with the use of alternative carriers, such as MCI Communications Corp. and GTE Sprint, the networks still must pay for private lines at the network terminals.

Those private lines, according to Natali, have been targeted for rate increases while residential service and private branch exchanges have benefitted.

Another kink in the new technologies is the lack of uniformity.

"You don't know in advance where the points are going to fail when designing a network, so you have to use a uniform medium. And — guess what — the only ones who have that are the telephone companies," Natali said.

Convention attendees commented that they, too, have noticed difficulties since the January divestiture. "The basic change we have seen is in the service. It has gone downhill," said Richard J. Troidl, administrative vice-president for computer services at Empire of America in Tonawanda, N.Y.

CONTROL from page 12

they have found that the profitability is not what they hoped," he observed.

Lipis predicted that private business also will take control of the automated clearinghouses traditionally dominated by the Federal Reserve Bank and that a key to operating such ventures will be the ability to settle accounts on a same-day basis.

Lipis noted that the growth of EFT services has usually involved a 15-year maturing process.

He cited the slow growth of telephone bill paying which, according to Lipis, is still five years from maturity, and the growth of automated teller machines (ATM), which reportedly have put only a 3% dent in check writing.

The nationwide, shared ATM networks that banks operate offer little long-term success, he contended, because they are expensive to operate and are difficult for the handful of potential customers to find while traveling.

The greater profit is to be found in automated bill paying, he maintained, adding that consumers write the majority of checks for that purpose.

At present, electronic bill paying's "only real market" is the microcomputer hobbyist, he said. He noted that the future for consumer-oriented electronic bill paying lies in a complex switching system, in which bill-paying home terminals are linked to creditors' systems.

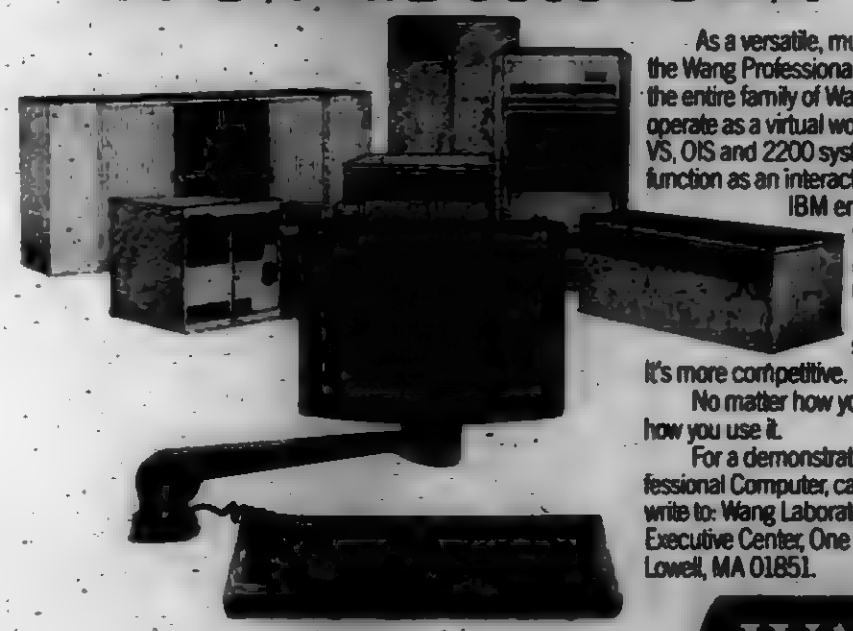
However, one area in which banks may find a market is in networking corporate bill paying, where companies such as Sears, Roebuck & Co. are already making inroads, he said.

Speaking with Lipis, author Martin Mayer of New York observed that the quality of Sears' 10-month-old corporate trade payments system may scare the Federal Reserve Bank.

Mayer blamed the Federal Reserve Bank for mishandling automated clearinghouses, which has set back U.S. EFT operations, particularly in areas such as direct payroll deposit. He noted that only 5% to 7% of U.S. payrolls are directly deposited, compared with 70% to 100% in some European countries.

But Mayer believes the banking industry is still strong enough to recapture the business it has lost to its competitors, particularly in the area of wholesale transactions rather than consumer-oriented EFTs.

just happens to be the world's most universal workstation.



As a versatile, multi-purpose workstation, the Wang Professional Computer can tie into the entire family of Wang products. It can operate as a virtual workstation on the Wang VS, OIS and 2200 systems. And it can even function as an interactive workstation in the IBM environment, either through remote communications or through local attachment.

The Wang Professional Computer. It's more competitive. It's more compatible.

No matter how you look at it. No matter how you use it.

March storms test data center disaster recovery plans

DP managers cope with tornados, power spikes, electrical outages

By John Gallant
CW Staff

WASHINGTON, N.C. — Despite a killer tornado that raged across the countryside only five miles away, the data center at the National Spinning Co., Inc. here suffered only a momentary loss of power. But that was enough.

As one of Joseph Rose's staff members walked the 30 feet from his office to the computer room late in the evening of March 28, the lights flashed five times in rapid succession, and the data center's IBM Series/1 processor and two IBM Model 4963 disk drives went down — for good. For Rose, director of computer services for the $130 million yarn manufacturing company, it was the beginning of a DP nightmare and the first test of his disaster recovery plan.

He was not alone. While operations continued uninterrupted at most data centers contacted by *Computerworld*, other DP managers faced the uncertainties and the fears of equipment damage and data loss brought on by the winds and snow that ravaged East Coast states as March exited.

Though Rose was one of the few forced to implement disaster recovery plans, for National Spinning, having such a plan was critical. When National Spinning's processor and disk drives failed to come up automatically and manual restart attempts proved futile, Rose called on nearby IBM customer engineers for assistance.

After working most of the night, IBM personnel reluctantly conceded that both of the system's 64M-byte self-contained disks had, for unknown reasons, been destroyed. Inventory and manufacturing data vital to the company's 24-hour-a-day packing and shipping operations had been lost.

As replacement controller cards and disks were flown in from an IBM center in Greensboro, N.C., Rose set in motion a contingency plan to keep the packing lines running during the night. Inventory and shipping data were recorded manually, while packing slips and labels that would otherwise have been torn from the printers tied to the Series/1 were written up by hand.

Nearly a full day later, IBM service personnel had repaired the damaged equipment. Rose and his staff began initializing the disks and reloading data from backup diskettes created — fortunately — only two hours before the system failed. Information captured manually was then entered to bring the data files up to date after 36 grueling hours of downtime. Incredibly, no shipments were delayed.

"It was quite a learning experience," Rose said. "There were some minor flaws in our plan that cost us a few hours. Some small files, such as dates and report requests, weren't backed up properly and were lost irretrievably.

"Our manual contingency system worked fine, but there were little, nitty-gritty things that fell through the cracks because we hadn't practiced implementing the disaster plan."

In Needham Heights, Mass., MIS Director Lou Chiesa was in the midst of closing the financial books and preparing a payroll for the Ludlow Corp. early the afternoon of March 29, when the lights went out. The IBM 4341 mainframe in Ludlow's cold and darkened data center would be useless for the next two days, a situation that threatened to delay paychecks for some 3,000 workers.

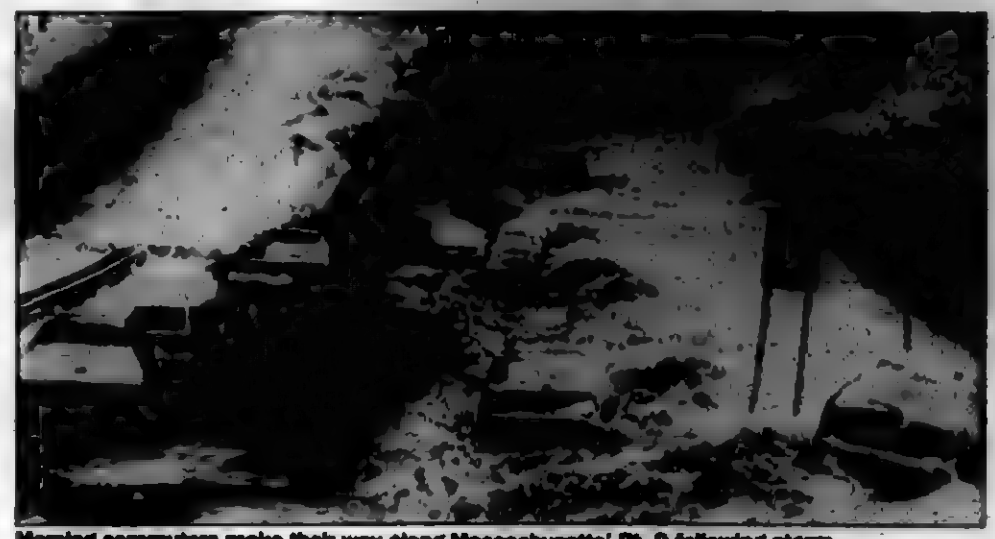
"It was a critical period for us," Chiesa said. "We had to assess how long the power outage would last. On Friday, [Boston Edison Co.] told us the power would be on Saturday. On Saturday, they told us it wouldn't be on until Sunday. We finally decided Saturday morning that we couldn't count on luck, and we put our emergency plan into action."

Chiesa is also MIS director for Ludlow's sister company, Grinnell Fire Protection Systems Co. in Providence, R.I. At 9 a.m. Saturday, he and his DP staff armed themselves with flashlights and retrieved backup payroll, operating system and applications program tapes from Ludlow's data center and transported them to Grinnell, nearly an hour away.

After 12 hours of preparation, Chiesa had implemented Ludlow's payroll system on Grinnell's IBM 3031 mainframe. When the first paychecks rolled off the system during a mock processing run, Chiesa's staff members applauded.

A short time later, power was restored to Needham Heights, allowing Ludlow to complete its financial closing and payroll processing at its own data center on schedule.

"It proved to be an excellent exercise," Chiesa said. "Both of the mainframes operate with DOS/VSE under VM, which makes the data transportable. It costs me an extra $10,000 a year to maintain VM, but in this instance it was worth it. It's also fortunate that I could commandeer the Grinnell system so easily.



Morning commuters make their way along Massachusetts' Rt. 9 following storm.

Faced with power spikes

About the time the lights went out in Needham Heights, Frank Smith was in a meeting with company officials to determine the best way to keep DP operations running smoothly in the face of repeated power spikes. Smith, senior vice-president of information systems for Shawmut Bank of Boston, was concerned about the electrical surges that had already interrupted processing on Shawmut's two IBM 3033 mainframes several times.

"In the midst of this meeting to determine whether to go on backup power," Smith said, "we hit another spike. We had already had five or six spikes, so this time we just stayed down. We went to our backup diesel generators and stayed on them all night until we were certain the power had smoothed out. We went back on regular electrical service at about 7 a.m. Friday."

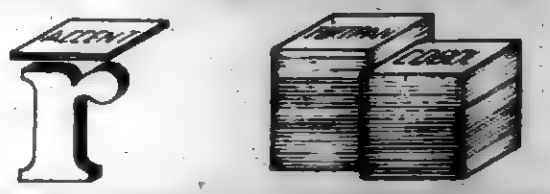
Smith said there was never any danger to equipment or data as a result of the power spikes. He estimated Shawmut lost only about 40 minutes of processing time during the transfer to and from backup power.

"I certainly wouldn't say it was a disaster. We simply wanted the assurance of a reliable power source. We ran normally all through the night."

Despite the flooding that washed across Manhattan's financial district at the height of the storm, New York data processing departments seemed largely spared any damage. Lower Manhattan's tight real estate market provided a measure of protection.

"We . . . have data centers in separate locations. That wasn't intended to provide us with backup, but that's how it works," Norbert Gottenberg, manager of information services at Lehman Brothers Kuhn Loeb, said.

ACCENT R CUTS CODE 80%!



More power for your DEC-10/20, VAX*

CUT CODE
ACCENT R can cut your code up to 80%. ACCENT R's 4th generation language incorporates a unique concept that models the various data processing components. These models result in 80% less code than required by FORTRAN or COBOL. Better yet, since ACCENT R is a compiler, you don't sacrifice efficiency.

SAVE TIME
Less code means less programming and debugging time. But that's not the only way ACCENT R can save you time. ACCENT R's powerful non-procedural language provides a complete range of commands so end users can easily add, change and delete data items. End users can even generate custom reports by simply answering a few questions.

CUT COSTS
Naturally if you save time, you save money. Programmers produce more applications in less time. End users generate their own reports and put less demand on the data processing professionals. And both programmers and end users are happier. Satisfied employees means less turnover. And, more timely information leads to more profitable decisions in today's fast paced business world.

SAVE YOUR SANITY
If you are one of the many people now using a DEC 10 or 20, but see a VAX in your future, rest easy. ACCENT R is migratable software. DEC 10/20 today, VAX tomorrow. A syntactically identical version makes migration easy, special pre-release pricing makes it affordable. Contact NIS for details.

*VAX is a trademark of DEC

Microprocessors: the heart of the micro revolution

PRODUCT SPOTLIGHT

By Peter Bartelt
CW Staff

The lines of distinction among various types of processing hardware have narrowed in recent years as microelectronics technology has packed increasingly greater power into increasingly smaller boxes. This year and next, the differences between categories of processors seem likely to become even more obscure as very large-scale integration leads the microcomputer into the realm of the superminicomputer.

Literally at the heart of this ongoing revolution is the microprocessor, the tiny piece of silicon upon which engineers can now imprint as much circuitry as once filled room-size computers in the early days of data processing.

Starting with the 1972 introduction of Intel Corp.'s 4-bit 4004 and 8-bit 8008 chips, the microprocessor/microcomputer industry has evolved into a multibillion-dollar business. The total value of microcomputer systems sold to home and business is expected to capture more than 50% of the total information processing systems market by 1988, according to recent predictions by Infocorp, a California market research firm.

Microprocessor technology was introduced to the DP environment through the vehicle of the minicomputer, with mini vendors carving out a niche in the traditional mainframe market by offering smaller packages and lower prices. In mid-1977, Digital Equipment Corp. announced the PDP-8, based on a single chip. This year, DEC is expected to unveil what it has termed the "VAX-on-a-chip," which DEC President Kenneth Olsen told *Computerworld* late last year will have just about all the capability of a VAX-11/780 supermini.

While many hardware vendors have introduced their own microprocessors, it was merchant semiconductor vendors that fueled the 8-bit micro market. In the mid-1970s, Intel Corp.'s 8080 and 8085 chips and Zilog, Inc.'s Z80 and Z80A were sold to a variety of start-up micro companies. MOS Technology introduced its 6502 and spurred the continuing success stories of Apple Computer, Inc. and Commodore Business Machines, Inc. (Commodore later acquired MOS Technology).

Then, in 1981, IBM selected for its Personal Computer the Intel 8088 chip, which can internally process 16 bits of data, but transfers that data 8 bits at a time. The overwhelming success of the Personal Computer created unprecedented demand by other vendors seeking to make their new machines compatible with the burgeoning array of software being written for the IBM microcomputer.

Microprocessors

Model/ Manufacturer	Technology	Data bus (bits)	Internal Architecture (bits)
Z80/Zilog	NMOS	8	8
6502/MOS Technology	NMOS	8	8
68000/Intel	NMOS	8	8
8085/Intel	NMOS	8	8
8088/Intel	NMOS	8	16
8086/Intel	NMOS	16	16
Z8000/Zilog	NMOS	16	16
80186/Intel	NMOS II	16	16
80286/Intel	NMOS II	16	16

iAPX/32/Intel	HMOS	32	32
80386/Intel	HMOS II	32	32

CW CHART

Intel became the provider of choice for hardware vendors seeking a true 16-bit chip — the 8086 — that both processes and transfers 16 bits of data at one time. Now Intel is trying to keep up with demand for the 80186 16-bit chip, which combines on one chip the 8086 design with peripheral and support functions. The company has also released the more powerful 80286 16-bit chip for multiuser applications; the 32-bit 80386 chip expected this year is reported to feature demand-paged virtual memory and on-line memory support of up to 4G bytes.

The other players

Besides Intel, there are currently three other leading players in the chip game: Motorola, Inc.; Zilog, Inc.; and National Semiconductor Corp.

Motorola introduced its 68000 family, providing 32-bit internal processing with 16-bit data transfer capabilities, in 1979. Apple selected the 68010 16/32 for Lisa, its highly touted but low-selling system. In January, however, Apple introduced the Macintosh with the same chip, and that product seems poised to ensure Motorola's position as chief challenger to the Intel products.

Motorola also has announced the MC68020 with 32-bit transfer and processing capability.

Although Zilog was a chief player in the 8-bit arena, its 16-bit Z8000 chip "just missed it," according to William F. Zachman, vice-president of International Data Corp., the Framingham, Mass.-based market research firm. Exxon, which acquired Zilog, "showed an incredible ability to turn gold into lead," Zachman added.

Zilog, however, has announced a 32-bit chip, the Z80,000, which it said will be available early next year with virtual memory implemented in hardware.

The other major player in the chip game, National Semiconductor Corp., is in the running in the 32-bit market, but "is unlikely to overtake the rest of the world," Zachman said. National Semi has a family of 16/32-bit chips and has also announced the NS32032 with 32-bit transfer and processing capability.

While Intel, Motorola, Zilog and National Semi are the best-known names in the chip game, other players seem poised to enter the action.

AT&T, for example, has a 32-bit microprocessor, the WE 32000 — formerly Bellmac 32000 — and recently announced a successor, the WE 32010. Although it is only used on AT&T Technologies' products at this time, it is something that has to be counted in, Zachman said.

See CHIPS page 16

Software developers look to users

While microprocessor vendors and microcomputer vendors debate the relative merits of particular chips, the software developer is more concerned about how many end users will be using a particular machine.

Software developers need an incentive to devote resources to a particular microprocessor, according to Camino Wilson, president of Lifetree Software, Inc. in Monterey, Calif., and author of the Volkswriter word processing package. The incentive can take the form of direct compensation from a microcomputer vendor or an ironclad market share of users who need application packages.

"We'll gamble," Wilson said, "on the [Apple Computer, Inc.] Macintosh; that's a reasonable gamble." In addition to the market potential of the Macintosh, Apple was very forthcoming in providing information on the hardware to developers, he said.

Writing software for more than one microprocessor "is pretty awful" because different versions of source code are needed for each model and there are few "mature compilers" available to ease the work load, Wilson said. When there is an existing market, he added, there are more tools available to the developer.

Developers who work in higher languages, such as Pascal and C, he said, find the task of working on more than one microprocessor easier than those who work in assembly language.

Chip vendors gird for 32-bit battle

By Peter Bartelt
CW Staff

While the 16-bit microprocessor market has barely had time to gel, semiconductor vendors are already aggressively positioning themselves to gain the dominant spot in the 32-bit microprocessor arena.

At Motorola, Inc., where the 16/32-bit 68000 seems destined to ride Apple Computer, Inc.'s Macintosh to success, the emphasis is now on upward mobility. Motorola has created a processor that, it maintained, can accommodate changing needs for on-board peripheral and support functions. "With the 68000 family, we took the tack that all code should be upward-compatible," James Farrell, manager of technical communications, said.

Motorola believes its principal 32-bit rival, Intel Corp., has made a strategic error by trying to design into new 16-bit chips some level of compatibility with the earlier 8080 and 8085 microprocessors.

At Zilog, Inc., where the highly successful Z80 was followed by a less successful Z8000, the emphasis is on on-board memory management, with virtual memory capabilities built into the chip. The company is also stressing ease of use; the chip can be adapted for fast or slow applications to meet particular needs, Peter Ashkin, advanced systems marketing director, claimed.

Ashkin believes the 8088 phenomenon — in which IBM's entry into personal computing created a dominating standard — is unlikely to recur in the 32-bit arena. Zilog expects that 90% of all applications packages for 32-bit microprocessors will be written in high-level language which, Ashkin pointed out, "makes [the applications packages] transportable" to competing microprocessors.

The introduction of 32-bit machines will revolutionize the market in 1985 as the entry of the Intel 8080 and Z80 did in 1975, Ashkin predicted. "We're not offering an incremental increase in performance; we're offering an order of magnitude increase in performance," he said, pointing out that 32-bit machines will be able to program for environments of up to 4G bytes of memory.

With each semiconductor vendor cramming more and more functions onto the microprocessor chip, the capacity for even greater integration still appears to be unreached.

Paul Penfield, a professor in MIT's electrical engineering and computer science department and head of MIT's microsystems program, said the limit to the density of microprocessor chips is about 100 million transistors. "We are now in the neighborhood of 100,000 transistors, a few hundred thousand in the most advanced chips."

Motorola's Farrell said some theories have been formulated about stacking or piling circuits on top of each other on a particular chip. "We're already seeing capacitors being put on edgewise," he noted.

Farrell sees a practical limit of four million to five million transistors for a single piece of silicon. "We're optimistic we can do that," he added.

Business schools to benefit from $25 million IBM grant

ARMONK, N.Y. — IBM has launched a $25 million grant program to coax business schools into beefing up instruction in information systems management.

Twelve graduate schools of business administration, to be selected next year, will be awarded five-year grants of $1 million each and will also receive about $1 million worth of IBM data processing machinery, Big Blue said in announcing the program last week.

"Our aim is to encourage business and management schools to develop more graduates who clearly understand the role information systems will play in coming years.

"We hope the schools will achieve that goal by improving the quality of instruction and expanding course offerings and research in [the information systems] field," John R. Opel, IBM chairman, said in a prepared statement.

IBM pointed out that the grant program is similar to a 1982 series of grants given to engineering schools to improve education in manufacturing engineering.

Judge reinstates charges

Against trio in IBM-Hitachi case

By Jeffry Beeler
CW West Coast Bureau

SAN FRANCISCO — Criminal charges have been reinstated against three defendants who allegedly participated in a conspiracy to steal proprietary IBM systems technology and transport it to Tokyo-based Hitachi Ltd.

Federal Judge Robert Aguilar abused his discretion in 1982 when he dismissed conspiracy charges against the trio, the Ninth U.S. Circuit Court of Appeals here concluded in a recent ruling.

The federal appellate court cited Aguilar's abuse as the reason behind its decision to reopen the case against Tabassom Ayazi, Raymond Cadet and Barry Saffaie.

All three were arrested and indicted in mid-1982 for allegedly trying to pass selected volumes of IBM's Adirondack Hardware Design Workbooks to Hitachi, one of Big Blue's chief Japanese competitors in the large-scale mainframe arena.

Bolstered Hitachi efforts

The confidential workbooks, which describe the architecture and other technical details of IBM's latest generation of CPUs, might have greatly bolstered Hitachi's efforts to compete in the mainframe field, according to federal prosecutors. But the desired workbooks never found their way into the Japanese vendor's hands.

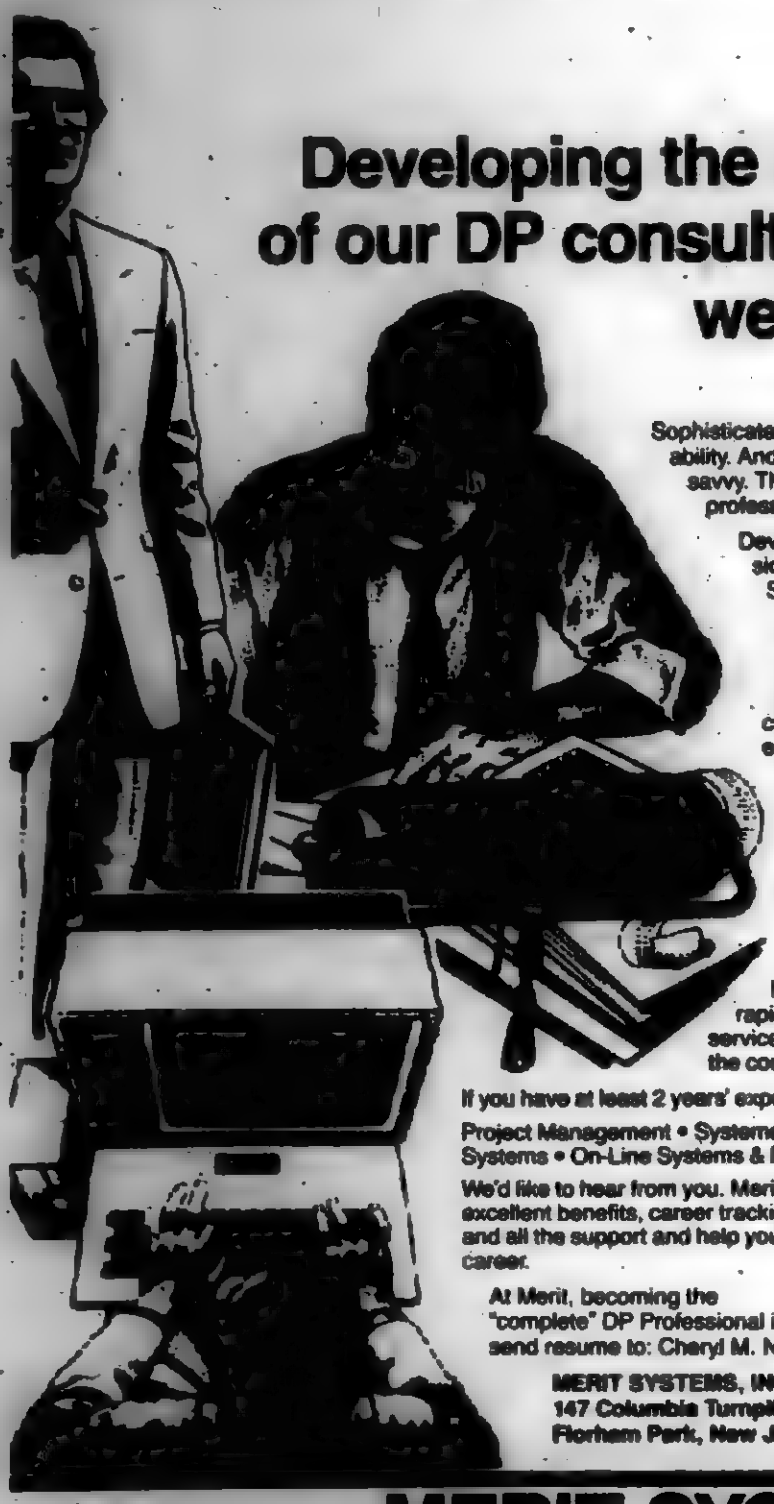
Instead, they were intercepted by federal law enforcement agents who allegedly bought the materials from the defendants while posing as electronics black marketers.

Seizure of the documents helped bring to light an alleged conspiracy that eventually resulted in indictments against Hitachi, Mitsubishi Electric Corp. and more than 20 of their employees or purported agents. Among the "sting" victims were Ayazi, an Iranian college student; Cadet, a former IBM engineer; and Saffaie, who previously worked for Hitachi's National Advanced Systems Corp. subsidiary in the U.S.

Most of the defendants, including Hitachi, pleaded guilty to the charges and received the maximum sentence under American law.

The indictments also prompted IBM to file a civil lawsuit against Hitachi, which settled the dispute out of court after agreeing to terms highly favorable to its American rival.

But the portion of the case dealing with Ayazi, Cadet and Saffaie was soon dismissed when the U.S. attorney's office here refused to furnish the defendants with case documents that purportedly might have aided them in their defense. The dismissal itself, however, was then overturned by the local U.S. appellate court, which faulted Aguilar for exceeding his judicial authority. As part of its ruling, the appeals court also endorsed the idea of requiring the prosecution to surrender its case documents to Aguilar and allow the federal judge to review their contents.



Developing the full potential of our DP consultants is what we're all about.

Sophisticated technical expertise. Acute analytical ability. And a keenly developed sense of business savvy. They're the traits coveted most in the DP profession. And in DP professionals as well.

Developing those three "prized" career dimensions to the fullest is what makes the Merit Systems' approach to consulting so unique.

Ours is a team approach to systems consulting...one that draws on your broad range of talents. At Merit, we're just as interested in the "bottom line" as our clients, and that means helping you develop expertise in business, management and other areas that complement your technical talent. As a Merit DP professional, you'll enjoy total consulting responsibility.

And that's the way Merit believes DP consulting should be.

We believe that our competitive edge is the direct result of career achievement. And our clients seem to agree. Perhaps, that's why Merit has grown so rapidly in the last few years and why we service such a wide variety of clients across the country.

If you have at least 2 years' experience in

Project Management • Systems Design & Development • DataBase Systems • On-Line Systems & Programming

We'd like to hear from you. Merit can offer you a very attractive salary, excellent benefits, career tracking and continuing education programs, and all the support and help you'll need to grow in every facet of your career.

At Merit, becoming the "complete" DP Professional is up to you. Call or send resume to: Cheryl M. New, (201) 377-3107

MERIT SYSTEMS, INC.

CHIPS from page 15

Intel, Motorola, Zilog, National Semi and AT&T probably will occupy just about all the competition that the market can bear, Zachman said.

There are others to watch, however. NCR Corp. produced its own 32-bit microprocessor and support chips, the NCR/32s, and has packaged them in the NCR 9300, a 50-lb machine said to have twice the power of the I-9020. The company has also signed an agreement for Honeywell, Inc. to use the chips.

Hewlett-Packard Co. has developed its own 32-bit chip, which it uses in its HP 9000 workstation. Also expected is the DEC VAX-on-a-chip.

IF YOU WANT THE BEST APPLICATIONS DEVELOPMENT TOOL, TALK TO THE PEOPLE WHO DEVELOP THE BEST APPLICATIONS.

Of all the applications development tools ever designed, only one has the proven success of our new Millennium SDT.

Because Millennium SDT was designed by McCormack & Dodge, a company with over a decade of proven success developing applications. Business applications used in over thirty countries. By the world's biggest and most demanding corporate clients.

M & D design teams have developed everything from accounts payable to payroll/personnel software. Recently, they've won industry acclaim for developing the only family of systems on the market with a genuinely borderless environment. The Millennium series.

What made the Millennium series possible was our discovery of Millennium SDT, a remarkable tool based on a remarkable truth: eighty percent of the functions in all applications are, in fact, generic. Which means that 80% are reusable.

This discovery allowed us to vastly simplify and accelerate our entire systems development process. Tasks that once took months suddenly took days. And we were able to bring a breakthrough product line to the marketplace well ahead of our competition.

If Millennium SDT revolutionised our systems development process, think of what it can do for yours. You'll make more efficient use of your data processing resources than you ever thought possible.

And just to give you an idea of how fast our applications development tool works, we've included your first application in this ad. All you do is find the dotted lines, fill in the requested information, mail the completed form, and wait for the postman to bring a packet of important information. And, if you're in a real hurry, call 1-800-343-0325.

Soon your backlog will begin to disappear. You'll be a Millennium ahead.

START WITH THIS APPLICATION.

WASHINGTON UPDATE
Jake Kirchner and Bryan Wilkins

IBM shooting suspect declared fit for trial

WASHINGTON, D.C. — Edward Thomas Mann, 39, a former IBM employee who drove his car into an IBM building and then opened fire with a machine gun, killing three people and wounding nine, is mentally competent to stand trial, a Maryland county circuit court judge has ruled.

The shooting incident took place in May 1982 at an IBM facility in a nearby Maryland suburb. Since that time, Mann has been undergoing psychiatric evaluation.

Initially, medical authorities determined Mann was not mentally competent to face charges, but since being placed on medication last October after assaulting his own doctors, he has subdued his delusions that IBM is involved in a conspiracy to take over the world, his psychiatrists said. Court-appointed psychiatrists previously determined the existence of the delusions.

A Maryland state psychiatrist told Montgomery County Circuit Court Judge William Miller that he is unsure whether Mann has actually improved as a result of the treatment or is bluffing in order to take his case to court. Miller set the trial for Sept. 24.

Smart card tech touted to House committee

WASHINGTON, D.C. — Smart card technology can provide a high level of security in on-line financial transactions, according to testimony recently presented to a House of Representatives subcommittee considering credit card and computer fraud legislation. The subcommittee is considering the Counterfeit Access Device and Computer Fraud and Abuse Act of 1984, legislation that would penalize persons using credit cards or computers for fraudulent purposes.

If smart cards were utilized, computer terminals and communications networks linking individuals with financial institutions would not have to rely on security systems; an embedded integrated circuit can reliably establish the authenticity of the card and the identity of its bearer, according to Stephen Weinstein, American Express Co.'s vice-president for technology strategy.

Weinstein, who is chairman of the American National Standards Institute working group on integrated-circuit cards, told the House Judiciary Subcommittee on Crime late last month that data from the transaction can be entered directly into the chip in the card, eliminating the need for a printer at the terminal. "Withdrawal of the card would 'depersonalize' the terminal, leaving no trace of the user's private codes and information and thus discouraging attempts at fraud by other users or by personnel maintaining the terminal," he said.

CAB posts plan to bar CRS bias by carriers

WASHINGTON, D.C. — The Civil Aeronautics Board (CAB) has issued a set of proposed regulations to ban bias in the computer reservations systems (CRS) that airlines provide travel agents.

The rules would mandate that schedules displayed on the CRS terminals give no preference to the flights of the carriers that provide the system and would regulate pricing of CRS services and other aspects of the relationships between travel agents, CRS providers and airlines that do not offer their own CRS services.

Most agents use the CRS services of American and United Airlines. Carriers without their own systems can, for a fee, have their schedules carried on existing systems. The CAB and the Justice Department concluded, after independent investigations, that there is merit to long-standing complaints that CRS providers have sometimes biased their systems in favor of their own schedules and in some cases made it prohibitively expensive for other airlines to obtain access to the systems.

The CAB asked for comments on its proposed rules and on a related proceeding to develop rules for specifying the way in which connecting flights are selected and arranged for display on CRS terminals. Comments on the two proposals are due April 26. Copies of the rules and more information can be obtained from either Robert D. Young or Samuel E. Whitehorn, Civil Aeronautics Board, 1825 Connecticut Ave. N.W., Washington, D.C. 20428.

Guide published for Cobol-80 users

LITCHFIELD, Conn. — Jerome Garfunkel Associates, Inc. has published a guide to the Cobol-80 programming language.

Among the listings in "The Cobol-80 Guide" are changed features from Cobol-74, all new reserved words and the obsolete language elements with explanations.

The guide also contains a skeleton format of Cobol-80, according to a spokesman for the publisher. One section of the guide discusses the future of Cobol and includes a list of features that eventually may be added to the language.

The guide costs $18.40.

"The Cobol-80 Guide" may be obtained from Jerome Garfunkel Associates, Inc., which is located at Cobble Court, Litchfield, Conn. 06759.

Manual out on Dbase II

ESTILL SPRINGS, Tenn. — Associated Technology Co. has published "Dbase II Coding Guide," a 46-page reference manual designed to help software departments in the formulation of microcomputer data base standards.

The guide provides a set of company standards and examples. The manual ensures top-down program construction, testable programs and easy maintenance, according to the vendor.

The guide sells for $22 from Associated Technology, which can be reached through Box 448, Estill Springs, Tenn. 37330.

ATTENTION COPICS USERS

A truly on-line, integrated Receiving, Quality and Material Control System replaces the COPICS Field Developed Receiving Module.

In addition to updating your MRP, Purchasing and Inventory Control data bases, this powerful system, RQMCS, features:

- Automatic Back Out
- Flexibility
- Only One Data Base
- Total Audit Trail
- Quality Control
- On-Line Updating
- Posting Options
- No Conversion

RQMCS users are enthusiastic about the system's processing speed and the immediate control it has provided for their entire receiving operation. For more information call:

Mass. governor to introduce strong computer crime bill

By John Gallant
CW Staff

BOSTON — Massachusetts Gov. Michael Dukakis is expected this week to present to the state legislature a computer crime bill that officials of the Bay State's high-technology companies are hailing as one of the nation's most comprehensive.

Drafted by Lt. Gov. John F. Kerry, the legislation is based on recommendations drawn from more than 600 users, computer security experts, educators and criminal justice and legal authorities. If it is passed, the state's hackers and computer criminals will face severe penalties and a restitution program that may include community service.

According to Jonathan Winer, counsel to Lt. Gov. Kerry, the bill creates two categories of computer fraud. It defines first-degree computer fraud as the accessing of any computer system to obtain goods and services illegally or to execute a scheme to defraud. Altering, destroying or preventing access to a computer system also falls within the realm of first-degree computer fraud, which would be punishable by a fine of up to $20,000 and a maximum five years in prison.

Second-degree fraud, targeted toward hackers, is defined simply as accessing a computer system or data base without authority and is punishable by fines of up to $5,000 in a one-year period.

The bill also includes civil provisions that would empower judges to impose injunctions on offenders before criminal proceedings are initiated. Those provisions would also make convicted violators liable for triple damages in subsequent civil suits brought by victims.

The bill's restitution plan would force offenders to reimburse victims, either financially or through a work program outlined by a judge.

According to Winer, the state legislature addressed the issue of computer crime last year by amending the state's larceny statute to include theft of electronic data — an effort that many legal and data processing experts felt was insufficient. "The legislature was ready to pass something more comprehensive last year, but there was no consensus in the high-tech industry.... I'm convinced that consensus exists this time," Winer noted, adding, "But this is a short legislative session filled with some very important issues. I can't guarantee passage this year."

Winer said the bill includes a unique definition of what constitutes a computer. As outlined, a computer is "any manufactured device which performs logical, arithmetic and memory functions."

"We really wrestled with the language so that users and judges would feel comfortable with it. We didn't limit the definition to only electronic devices because we wanted to include whatever technologies emerge in the future," Winer said.

Favorable response

The legislation received a highly favorable response recently when it was unveiled before the governor's Anti-Crime Council, a coalition of state district attorneys, judges, police and corrections authorities. At that meeting, attorneys and security officials from Massachusetts' high-tech firms gave their backing to the bill, which was described as the most far-reaching state legislation to date.

The bill "attacks computer crime on several different fronts, and it provides the victim with both criminal and civil relief. It addresses a concern that all manufacturers share, namely, that we don't want to see our products misused and abused," said Richard Guilmette, manager of corporate security and safety for Natick, Mass.-based Prime Computer, Inc.

Guilmette's views were echoed by Harvey Burstein, corporate director safety/security-staff attorney for Data General Corp. of Westboro, Mass. "This bill is much tougher and broader than laws in other states. Also, I think it provides a good model for federal efforts, most of which seem to be hanging in the lurch right now," Burstein said.

Government DP expo set for June

WASHINGTON, D.C. — Government Computer Expo '84, dedicated to end-user computing and microcomputers and their applications in government, will be held here June 26-29.

In addition to exhibits, the expo will feature a technical program of tutorials, briefings and workshops.

Session topics include "The Unix Operating System," "Technological Innovations," "Microcomputer Software Acquisition Management" and "Networks and Microcomputers."

Registration fees for the full conference are $385 (government) and $460 (industry). Further information is available from Government Computer Expo '84, 1620 Elton Road, Silver Spring, Md. 20903.

Words Alone Don't Describe The Lasergrafix 1200 Printer.

The QMS Lasergrafix 1200 is a breakthrough in electronic page printing. But words alone just don't describe it. Because QMS designed the Lasergrafix 1200 to do so much more than words. With a built in intelligent controller that takes simple print commands through your normal data stream. Built-in applications firmware eliminates the need for additional software—and frees your computer's resources for other work.

The difference is graphic—for all your business, scientific and individual printing needs. Create forms that have multiple typefaces and letters up to ten inches high—all on the same line. CAD/CAM. Bit mapped and vector graphics. Pie charts. Bar charts. Even barcodes. At a crisp resolution of 90,000 dots per square inch. With a printing speed of 12 pages per minute.

And, of course, letter quality word processing.

The Lasergrafix 1200 interfaces with just about any computer system. With versatility that lets you take business graphics to the limits of your imagination. Ask for a demonstration. You'll discover that the whisper-quiet performance of the Lasergrafix 1200 speaks softer than words.

And says a whole lot more.

Only Lee Data's Universal Terminal System can satisfy all of your information processing needs... 3270, Async and personal computing.

Finally, there's a single, universal way to satisfy the individual information processing needs of all your people. From sales manager to accountant. From research to production. The Lee Data Universal Terminal System can do it all.

And our system is modular by design to provide you any or all of these cost-effective, problem-solving advantages:

3270-compatibility plus more

Combine complete 3270 system-compatibility with an innovative Lee Data design and you have a System that delivers greater convenience and flexibility.

Our System not only offers standard 3274-compatible local and remote control units, but now also provides combination local/remote controllers with a unique dual-host access capability.

In addition, you can choose from a full line of terminal capabilities, beginning with our cost-effective 3178-compatible display on up to our popular All-In-One Display which offers, in a single unit, four selectable screen sizes—including 132-column—a great advantage in program development, spread sheet applications and many others where flexibility is required.

3270-plus-Async: another cost-effective advantage

If your application needs currently find you switching between 3270 and VT100-style terminals to get the job done, Lee Data has a better way.

As part of our System, you can enjoy the further advantage of a 3270/Async capability that allows dynamic selection of 3270 and VT100 operating modes from a single Lee Data display. A simple command entered at the keyboard provides you access to applications running on an IBM CPU, non-IBM systems (such as DEC, H-P or Prime), as well as timesharing services. Another Lee Data solution to simplifying your company's terminal network.

And now integrated personal computing too

That's right! Now our System also includes a sophisticated personal computing package that can easily be integrated into an existing Lee Data 3270 system.

With our approach, you get continued interactive access to host-based files, plus all the advantages of professional business computing from the same Lee Data workstation.

Advanced features include a host file transfer capability, a single-board design, four standard system expansion slots and, of course, complete IBM-compatibility.

All these additional capabilities plus the same user-friendly Lee Data displays.

Plus these added benefits...

To any Lee Data System, add our unique Coax Eliminator products and realize additional savings of up to 85% in cabling costs alone.

Combine this with all the outstanding features already mentioned and you'll find a System offering everything you need for efficient, cost-effective operation.

Discover the advantages of our Universal Terminal System for yourself. For more information, call our system specialists toll free:

INTERNATIONAL REPORT
CW International News Network

AUSTRALIA

SYDNEY — An on-line credit management system developed for in-house use by Grace Bros. Pty. Ltd. here will be marketed by IBM Japan Ltd. With the help of IBM's Software Development and Support Center established in Sydney last year, Grace plans to seek additional markets for its software products in Europe and the U.S.

■

CROWS NEST — Australia is rumored to be the launchpad for the entry of ICL Co. into the market for Pick & Associates, Inc.'s Pick operating system. ICL reportedly plans the mid-year release of a Pick-based supermicrocomputer that, later in the year, will also be used to consolidate ICL's Unix thrust.

■

MELBOURNE — Following its recent deal to provide electronic funds transfer switching equipment to the State Bank of Victoria, Quadstar Corp. has lined up two more Australian customers and has laid plans to establish a subsidiary here. The two customers reportedly are a West Australian bank and a Victorian retailer.

BRAZIL

SAO PAULO — About 15,000 people were said to be on hand for Brazil's second annual Micro-Festival here two weeks ago. The event was comprised of both exhibits and sessions where market trends were discussed. The number of exhibitors reportedly increased 50% over last year.

CHINA

BEIJING — In 1983, both computer revenues and profits in China leaped 63% over the previous year, according to a recently released report. Sales of large and medium-scale systems increased by 64%, while microcomputer revenues jumped 130%, and the peripherals market increased a whopping 250%, the study said.

FRANCE

PARIS — France's Bull and Japan's Nippon Electric Co. Ltd. (NEC) will swap technology for a minimum of 10 years and integrate their respective product lines under the terms of a recently completed long-term agreement. At the same time, NEC penned a similar research and development agreement with the U.S.' Honeywell, Inc. The agreements call for the three companies to work together to integrate NEC's large-scale S1000 system and Honeywell's Gcos operating system software with Honeywell and Bull peripherals and communications systems. The system that results from these efforts is expected to be available in late 1985 or early 1986.

JAPAN

KANAGAWA — Marantz Japan, Inc. has alleged that vendors of Unix and Unix-related equipment have stolen the Unix trademark from Marantz. The maker of audio equipment said it registered "Unix" as the brand name for its radio cassette recorder in 1962. AT&T International Japan is expected to hand down the public opinion on this claim on April 5.

■

TOKYO — IBM Japan Ltd. posted 1983 revenues of $260 million and showed a growth rate of 36%. A spokesman for the company attributed IBM's good year to the success of the IBM 5500 Personal Computer and the IBM 3080 series. IBM Japan employed about 14,180 people as of year-end 1983.

NETHERLANDS

AMSTERDAM — Following IBM's European price cuts on its Personal Computer product line, many other vendors are following suit. Both Digital Equipment Corp. and Hewlett-Packard Co. have announced price cuts by as much as 25% on their small systems, according to sources.

■

AMSTERDAM — Philips Information Systems, Inc. has made moves to strengthen its position in the communications marketplace by announcing an office automation and communications software package. Philips also intends to integrate its Data Systems and Telecommunications divisions into one corporate entity and bring to market one strategic product: an IBM Personal Computer-compatible microcomputer. The system is rumored to be based on the Corona Data Systems Corp. microcomputer and will be manufactured by Philips' Canadian subsidiary, Micom.

WEST GERMANY

MUNICH — In an attempt to break IBM's market stronghold here, 12 major European vendors of information technology hammered out an agreement to introduce common standards for open data communications based on proposals from the International Standards Organization and the Consultative Committee on International Telephone & Telegraph. The manufacturers — AEG-Telefunken, Inc., Nixdorf Computer AG and Siemens AG from Germany; Bull, Generale D'Electricite and Thomson-Brandt from France; International Computer Ltd., ICL Co. and Plessey, Ltd. from the UK; Italy's Olivetti and Stet; and Philips Information Systems, Inc. of the Netherlands — declared their intention to put together a catalog of compatible telecommunications products by 1985.

■

FRANKFURT — A study group composed of DP managers and organizational specialists concluded that DP managers might be in trouble due to the influx of microcomputers in large companies. "DP managers who cannot get rid of their time-intensive

System glitch brings Chicago exchange trading to grinding halt

CHICAGO — Trading on 20 futures markets of the Chicago Mercantile Exchange was halted for 2¼ hours last month because of a computer malfunction which drastically slowed the system's response time.

The glitch was caused by a combined hardware and software failure, according to Douglas Skinner, manager of data processing operations for the exchange. Skinner declined to elaborate on the malfunction's cause. The exchange's data processing department has nine IBM Series/1 computers, which run software developed in-house.

The malfunction, which occurred at about 9:20 a.m. (CST) on March 16, reportedly brought delays of up to 20 seconds in the computers' posting of changing prices on the exchange's display board. Response time, usually only two seconds, is critical in trading, where points on a contract fluctuate in seconds and are worth as much as $25 each, according to Chicago Mercantile Exchange spokeswoman Pat Campbell.

Halted trading

The exchange halted trading from 9:35 a.m. to 12:05 p.m. (CST), by which time Skinner said the problem had been isolated and repaired. It was the first time since 1979 that trading had been halted on the exchange, Campbell said.

Volume on the Chicago Mercantile Exchange for March 16 totaled 151,466 contracts traded. On the previous Friday, 215,069 contracts changed hands.

Since trading continued at other U.S. mercantile exchanges, Chicago traders were unable to cope with rises and falls in futures contract prices during the trading halt. Campbell said traders suffered losses when they were unable to unload contracts which were dropping in price, but added that no accurate estimate could be made of the amount of traders' income lost since "every single contract is measured differently."

Al Kopin, president of Glass, Ginsburg, Ltd., a firm trading on the Chicago Mercantile Exchange, said no assessment had been made of his firm's losses, if any, and that it was unlikely such an assessment would be made. "It's always frustrating to have the market close down," he added.

High-speed telecommunications enters Olympic arena

By Jean Baker
Staff Writer

LOS ANGELES — What is becoming the 24th event in the Summer Olympics to be held here is the entry of modern, high-speed telecommunications technology in the Games.

Less than two years ago, the Los Angeles Olympic Organizing Committee (Laooc) was a handful of employees with nothing more sophisticated than electric typewriters. Today it is a planning organization made up of hundreds of employees utilizing $50 million worth of computers and other high-technology equipment.

AT&T Technologies, Inc., EMS, Motorola, Inc., Pacific Bell, Swiss Timing Ltd., Xerox Corp. and MCI Communications Corp. are the major technology suppliers in data processing and communications at this summer's Games. The technology will aid in recording and reporting the results of the Games' events for the approximately 50,000 Olympic family members, who include athletes, coaches, organizing staff and members of the media.

Some of the technological innovations in store for the Olympics include:

■ An AT&T-provided Electronic Messaging System (EMS) that will connect the Olympic Villages and sports venues from Santa Barbara to Fairbanks Ranch in San Diego County. In addition to the Laooc, others who will have access to the system include athletes, coaches and trainers; the press; the International Olympic Committee; and the individual national Olympic Committees.

The EMS will connect 60 Olympic sites within a 4,500-square-mile area. It includes 14 AT&T 3B20S supermini-computers; more than 160 Infotron Systems Corp. Model 782 network concentrators; 1,700 Teletype Corp. Model 5410 asynchronous terminals, which operate at full or half duplex at speeds up to 19.2K bit/sec; plus 300 printers.

■ MCI International is working with AT&T to allow telexes to be sent directly from EMS terminals through local computers and abroad. These will include foreign news stories composed on the EMS. MCI will also provide regular telex machines and printers at the press center for those who do not want to send their stories on the EMS.

■ Pacific Bell reportedly has moved up the installation of its fiber-optic digital light-wave system in Southern California, adding thousands of phone and data communications lines for the Olympics. The system will link all elements of the communications network, including radio paging and international telex services.

■ IBM is providing 300 Personal Computers, 190 Displaywriters — the computers used for ticketing, transportation and accommodations — and a voice messaging system (IBM's Audio Distribution System) accessible to people who speak 10 different languages (English, French, Spanish, German, Mandarin, Russian, Korean, Portuguese, Japanese and Arabic).

Again, the system will be accessible not only to the Laooc, but to everyone who is accredited to the Olympic Games.

■ Xerox will supply hundreds of copiers both for administrative needs and for immediate printout for the press at sports venues during the competition. The company is also supplying telecopiers and the printers for printing results.

■ Motorola is supplying 1,500 pagers with digital display capabilities of up to 160 characters and 1,500 pagers that signal with a beep when the wearer receives a call.

The company is also supplying more than 2,000 portable radios to support construction, medical services, sports, transportation and security operations before and during the Games. Some 300 mobile car radios are also being provided.

■ Swiss Timing created as the combined efforts of Omega and Longines in 1972, is providing the equipment to measure athletic performance and timing periods.

Mobile lab to monitor athletes' training efforts

COLORADO SPRINGS — A mobile laboratory with $60,000 worth of computer-based medical instrumentation on board will be utilized for the first time by the Los Angeles Olympic Organizing Committee for testing athletes on training effectiveness.

Moving away from previous testing procedures, which involved the use of stand-alone analyzers and manual processing of data, the automated testing devices on the mobile lab include a Gould, Inc. 9000IV pulmonary exercise lab and IM1000 computer monitor with supporting software, used for the observation and analysis of vital cardiopulmonary signs.

Gould, Inc. and the Gould Foundation have donated equipment and monetary support for the U.S. Olympic Committee Sports Medicine Mobile Laboratory.

Micro network to host Coca-Cola's Olympics guests

By Lynn Haber
CW Staff

LOS ANGELES — To help accommodate more than 4,000 company guests with everything from hotel and transportation arrangements to dining and entertainment at this summer's Olympic Games, a major U.S. soft drink company will utilize a microcomputer network. Coca-Cola USA, the domestic soft drink division of the Coca-Cola Co. and the official Olympic soft drink supplier, will run what it has dubbed the Olympic System — three IBM Personal Computers and PC/Focus, a fourth-generation application generator and data base management system from Information Builders, Inc. — to ensure that all accommodations, tickets to Olympic and special events and ground transportation are ready for Coke guests the minute they check in at their hotels.

"Virtually every aspect of this hospitality effort will be supported by microcomputers," according to Bill Conner, Coca-Cola USA's Olympic System manager. "We'll use microcomputers to confirm hotel and ticket reservations, pin down transportation and send individual departments within our company their bills when the Olympics are over."

Expecting to host up to 1,000 guests daily at the summer games, Coca-Cola has booked more than 600 rooms at three major hotels. Five modes of transportation covering 20 different locations have to be scheduled per day. In addition, tickets have to be allocated and distributed for 28 Olympic events, with guests selecting the events of their choice from 350 different meets.

Added to this, dinners, parties and tours to local attractions must also be arranged.

To meet this challenge, Coca-Cola USA last fall formed a three-person Olympic systems team headed by an MIS manager, a systems analyst and a meeting services administrator. After discussing hardware options, the team narrowed down its options to three approaches: to use Coke's mainframe in Atlanta, to buy computer time from a California-based computer service company or to put a computer on-site.

"All three situations would have worked for us. We had problems with every one of them, but we simply weighed our choices against the problems we felt we could deal with most effectively," Conner said. "The ideal situation was to have a computer on-site, and that way it would be completely under our control.

"After evaluating the situation in terms of performance and dollars, we decided that we could design our system around the micros and simply add micros as the systems demand went up."

The evaluation of various software packages led the committee to select Information Builders' PC/Focus because of its versatility, Conner said, and also because many people at the company had previous experience with the mainframe version of the product. But, he added, "data base handling was the main reason why we chose it."

The Olympic System consists of five data bases that will be linked together through PC/Focus' Join facilities when necessary. The data bases cover orders, venues, accommodations and names and addresses. In addition, a transportation data base is being developed for each hotel to produce schedules of Olympic events, departure times, estimated arrival times and travel times.

To maintain, update and query the data around the clock, an IBM Personal Computer will be located at the concierge desk in the Sheraton Grande Hotel, the Coca-Cola USA Olympic headquarters. A second Personal Computer will be located at the ticket exchange window, also located at the hotel, and a third will be located at the hotel's executive offices. A fourth Personal Computer will be available as a backup. Each of the three active Personal Computers will be configured with a 10M-byte hard disk and 768K bytes of random-access memory.

Behind the scenes, an inventory reconciliation will be run nightly based on the data collected on the venue data base. Though no decision has yet been made, the Personal Computers may be physically linked with coaxial cables in a local-area network or they may function as three stand-alone systems.

The Personal Computers will be manned 24 hours a day. Data entry procedures have been designed with Information Builders' Fidel, a Focus screen-oriented data entry language, to produce menu-driven procedures with built-in interactive prompts. To make the system nearly fail-safe, there will be password protection for all critical programs. All programs will be transferred nightly onto floppy diskettes, and purges will be executed to keep the data bases clean and ready for the following day's activities.

In the event that all the Personal Computers are damaged by some accident or disaster, the system can run on a remote Coca-Cola mainframe computer that supports Focus through the PC/Focus Dial communications facility.

Seated in front of one of the four IBM Personal Computers that will be used by Coca-Cola USA at this summer's Olympic Games are some members of Coke's DP staff.

Coke's 'Robot' will greet the company's guests when they arrive for the Olympics.

In the words of our users.

Court makes state agency sell computerized list at cost

By Edward Wasserman
Staff

JACKSON, Miss. — A state court in Mississippi has told the state's Department of Public Safety to sell at cost — about $400 — a magnetic tape copy of its computerized mailing list of Mississippi's 1.8 million drivers. The state had wanted to charge the Mississippi Republican Party $25,000 for the list.

The Mississippi Republican Party had offered $500 for the list, which it wants for direct-mail campaigning. When the state turned down its offer, it brought suit.

Mississippi Assistant Attorney General Steve Kirchmayr said the state had previously been charging a rate for the driver's license list close to that charged by private mailing list firms. "Now," he said, "we've got the mailing list companies cursing us for putting them out of business."

Mississippi drivers have been complaining that the state provides the list at all, he said. This is probably because "people don't want to receive any mail, period."

Under the 1983 Mississippi Open Records Act, the list must be made available to anyone who wants to buy it. It includes each driver's name, home address, race, sex and date of birth.

Kirchmayr said the Open Records Act requires the state to provide the information on any of its public record lists for "the actual cost of reproduction."

The state, however, had been pricing the driver's license list based on the wording of an earlier act, which said that it could charge "a proper fee commensurate with the service rendered." That fee, he said, would have been $250, plus five cents per name.

"Our dilemma was which statute controls," he said.

'Bargain basement'

Kirchmayr called the at-cost offering of the list "a basement bargain" and said in the wake of the court ruling, several firms had already inquired about buying their own copies of the driver's license list.

He added that the court decision represents a sizable loss of revenue for the state's treasury, which received the revenue from previous sales of the list made at the going rate. Kirchmayr estimated that copying the list will cost no more than $400, possibly less.

Kirchmayr said that ruling will likely be appealed to the state supreme court, but that no appeal has yet been filed, nor has a copy of the list been produced for the state Republican Party. The list will be run on the party's computers to provide names and addresses for direct-mail campaigns, Mike Allred, general counsel of the Mississippi Republican Party, explained.

The party is particularly interested in cross-referencing the names of the state's drivers with those on the party's list of Mississippi registered voters.

By cross-referencing, the party will be able to single out those individuals who have not registered to vote and appeal to them by mail to do so, Allred said.

Allred does not see the party's purchase of the list as an invasion of privacy issue, because the state's Open Records Act specifies that such lists are public property.

The party, he said, has told the state it does not want the copy of the list it receives to contain any driver's license or Social Security numbers, which would allow cross-referencing with wider data bases.

"The only things we wanted were those things that were open," Allred said.

CAD/CAM guide out

ARLINGTON, Texas — The Office of Continuing Education at the University of Texas here has published a guide for managers who want to use visual aids during presentations about computer-aided design and manufacturing (CAD/CAM).

The 400-page *CAD/CAM Presentation Resource Guide* is a guide containing 8-in. by 11-in. overhead foils, which include topics on CAD/CAM graphics, group technology, computer-aided process planning and manufacturing management systems.

Priced at $125, the guide is available from the Office of Continuing Education, University of Texas at Arlington, Arlington, Texas 76019.

Data base growth covered in supplement

SANTA MONICA, Calif. — The number of on-line data bases worldwide broke the 2,000 mark recently, according to the winter 1984 supplement to the "Directory of Online Databases."

The supplement on data bases noted that 136 data bases came into use in the past three months, bringing the total to 2,014.

The growth in data bases, according to Carlos A. Cuadra, president of Cuadra Associates, Inc., the firm that publishes "Directory of Online Databases," is a result of the spread of personal computers and "the changing economics of electronic distribution," which permit data bases to be started without major financial investments.

The listed data bases are reportedly available from one or more of 300 on-line services worldwide.

The "Directory of Online Databases" is published quarterly.

A one-year subscription to "Directory of Online Databases" is $75, and a two-year subscription is $140.

More information on the directory is available from Cuadra Associates, which is located at Suite 305, 2001 Wilshire Blvd., Santa Monica, Calif. 90403.

IBM and DEC Merger Announced

Term-Tronics Creates With the Power to Join

In the beginning the Computer Universe was a lonely place. There was IBM and only IBM. Then others entered the field, major competitors such as DEC. Today, each of these Computer Age Titans commands an impressive following.

But because no one has a monopoly on desirability, there arose a knowledgeable user population which sought the best of both worlds. To serve this astute and growing audience, Term-Tronics was born.

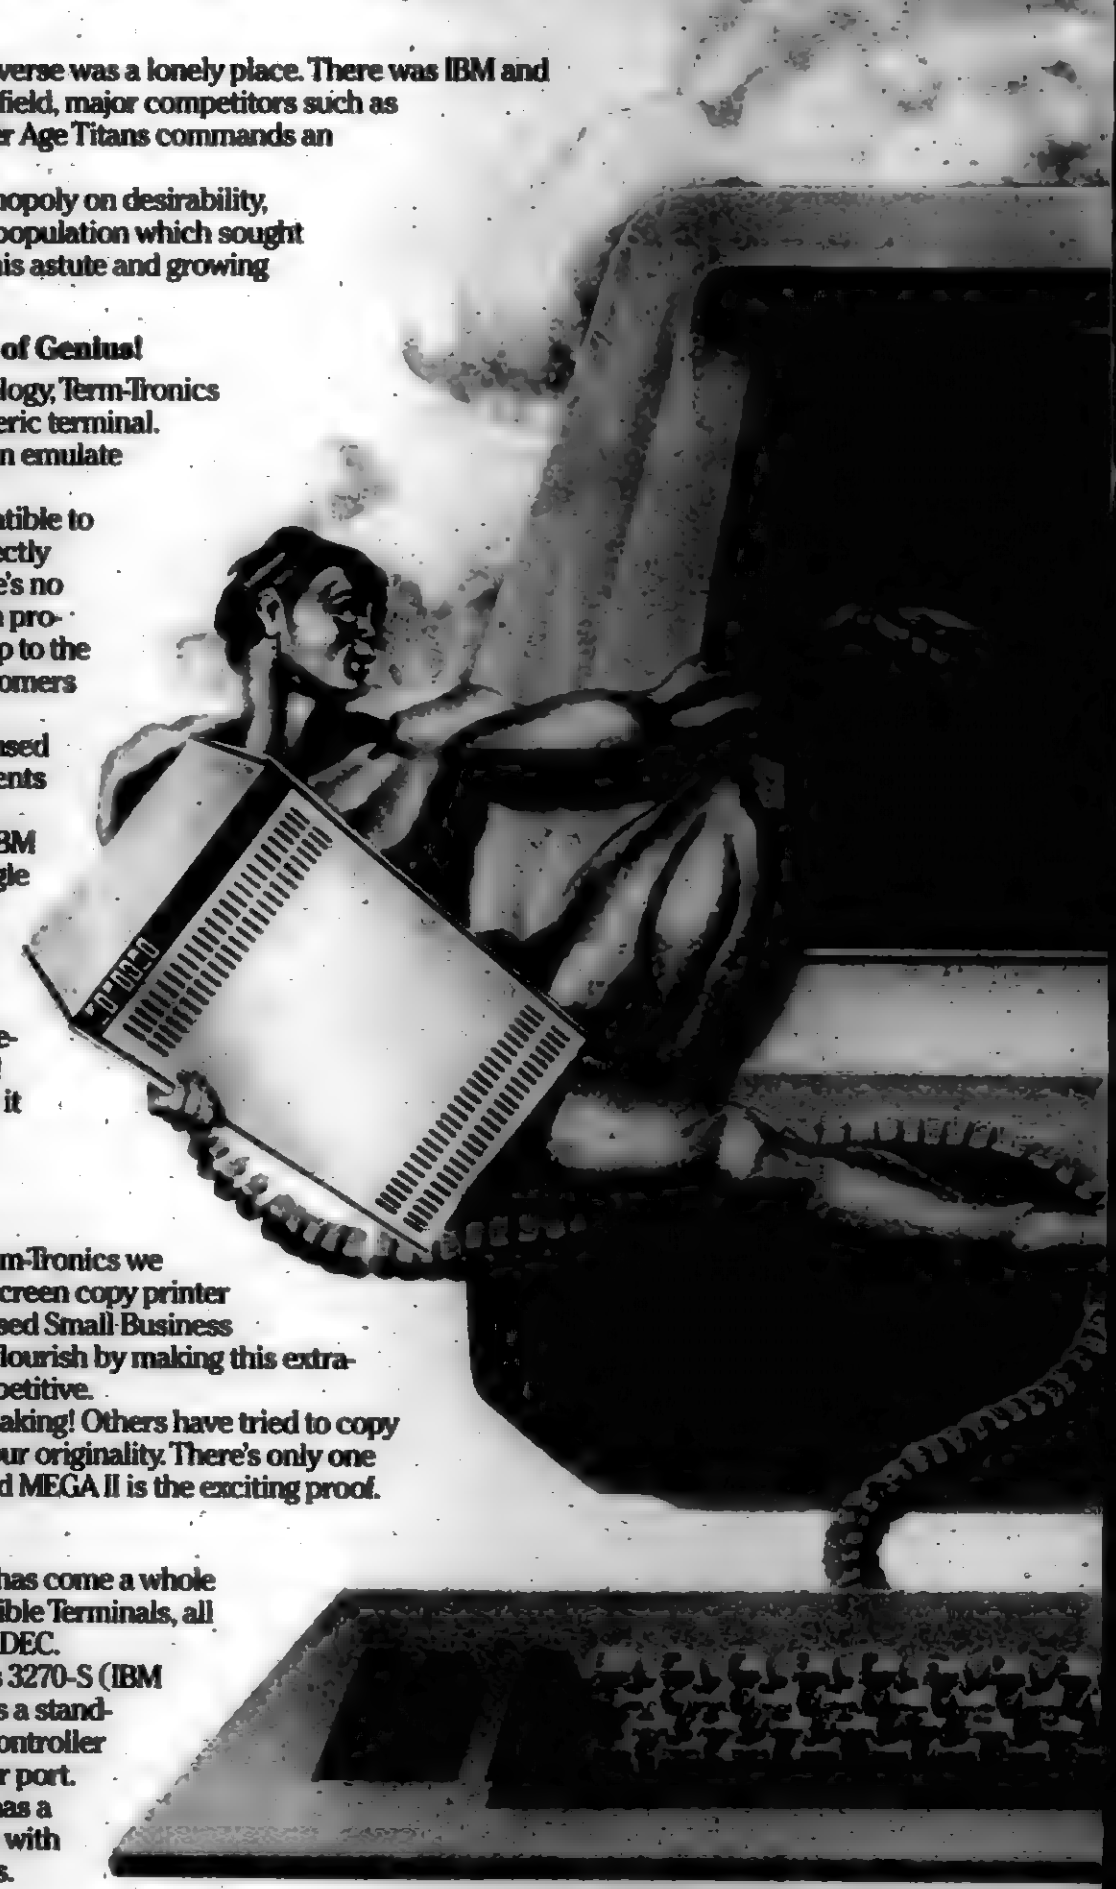
Multi-Host Capability — a Stroke of Genius!

Utilizing breakthrough technology, Term-Tronics created MEGA II, the first truly generic terminal. With a single keystroke, the unit can emulate IBM or DEC.

MEGA II is coaxial plug-compatible to IBM 3278* and 3178* and plugs directly into IBM's 3274* controller. So there's no longer a need to be concerned with protocol incompatibilities. That adds up to the kind of peace of mind that has customers walking on clouds.

What's more, MEGA II can be used in either local or remote environments with SNA or BSC communications.

Incredibly, MEGA II emulates IBM 3278 Models 2 through 5 with a single keystroke. The multi-host MEGA II is DEC VT-100* compatible. It also can emulate other asynchronous terminals simply by loading new emulations into the terminal via telephone, and all in 10 minutes or less! Another heavenly advantage is that it requires no additional equipment.



Putting the Finishing Touches on the Masterpiece

But we didn't stop there. At Term-Tronics we went on to add support for a local screen copy printer and an RS232C port for a CP/M® based Small-Business Computer. Then we finished with a flourish by making this extraordinary unit remarkably cost competitive.

The results have been earth-shaking! Others have tried to copy our achievements but they lacked our originality. There's only one Master of Data Communications and MEGA II is the exciting proof.

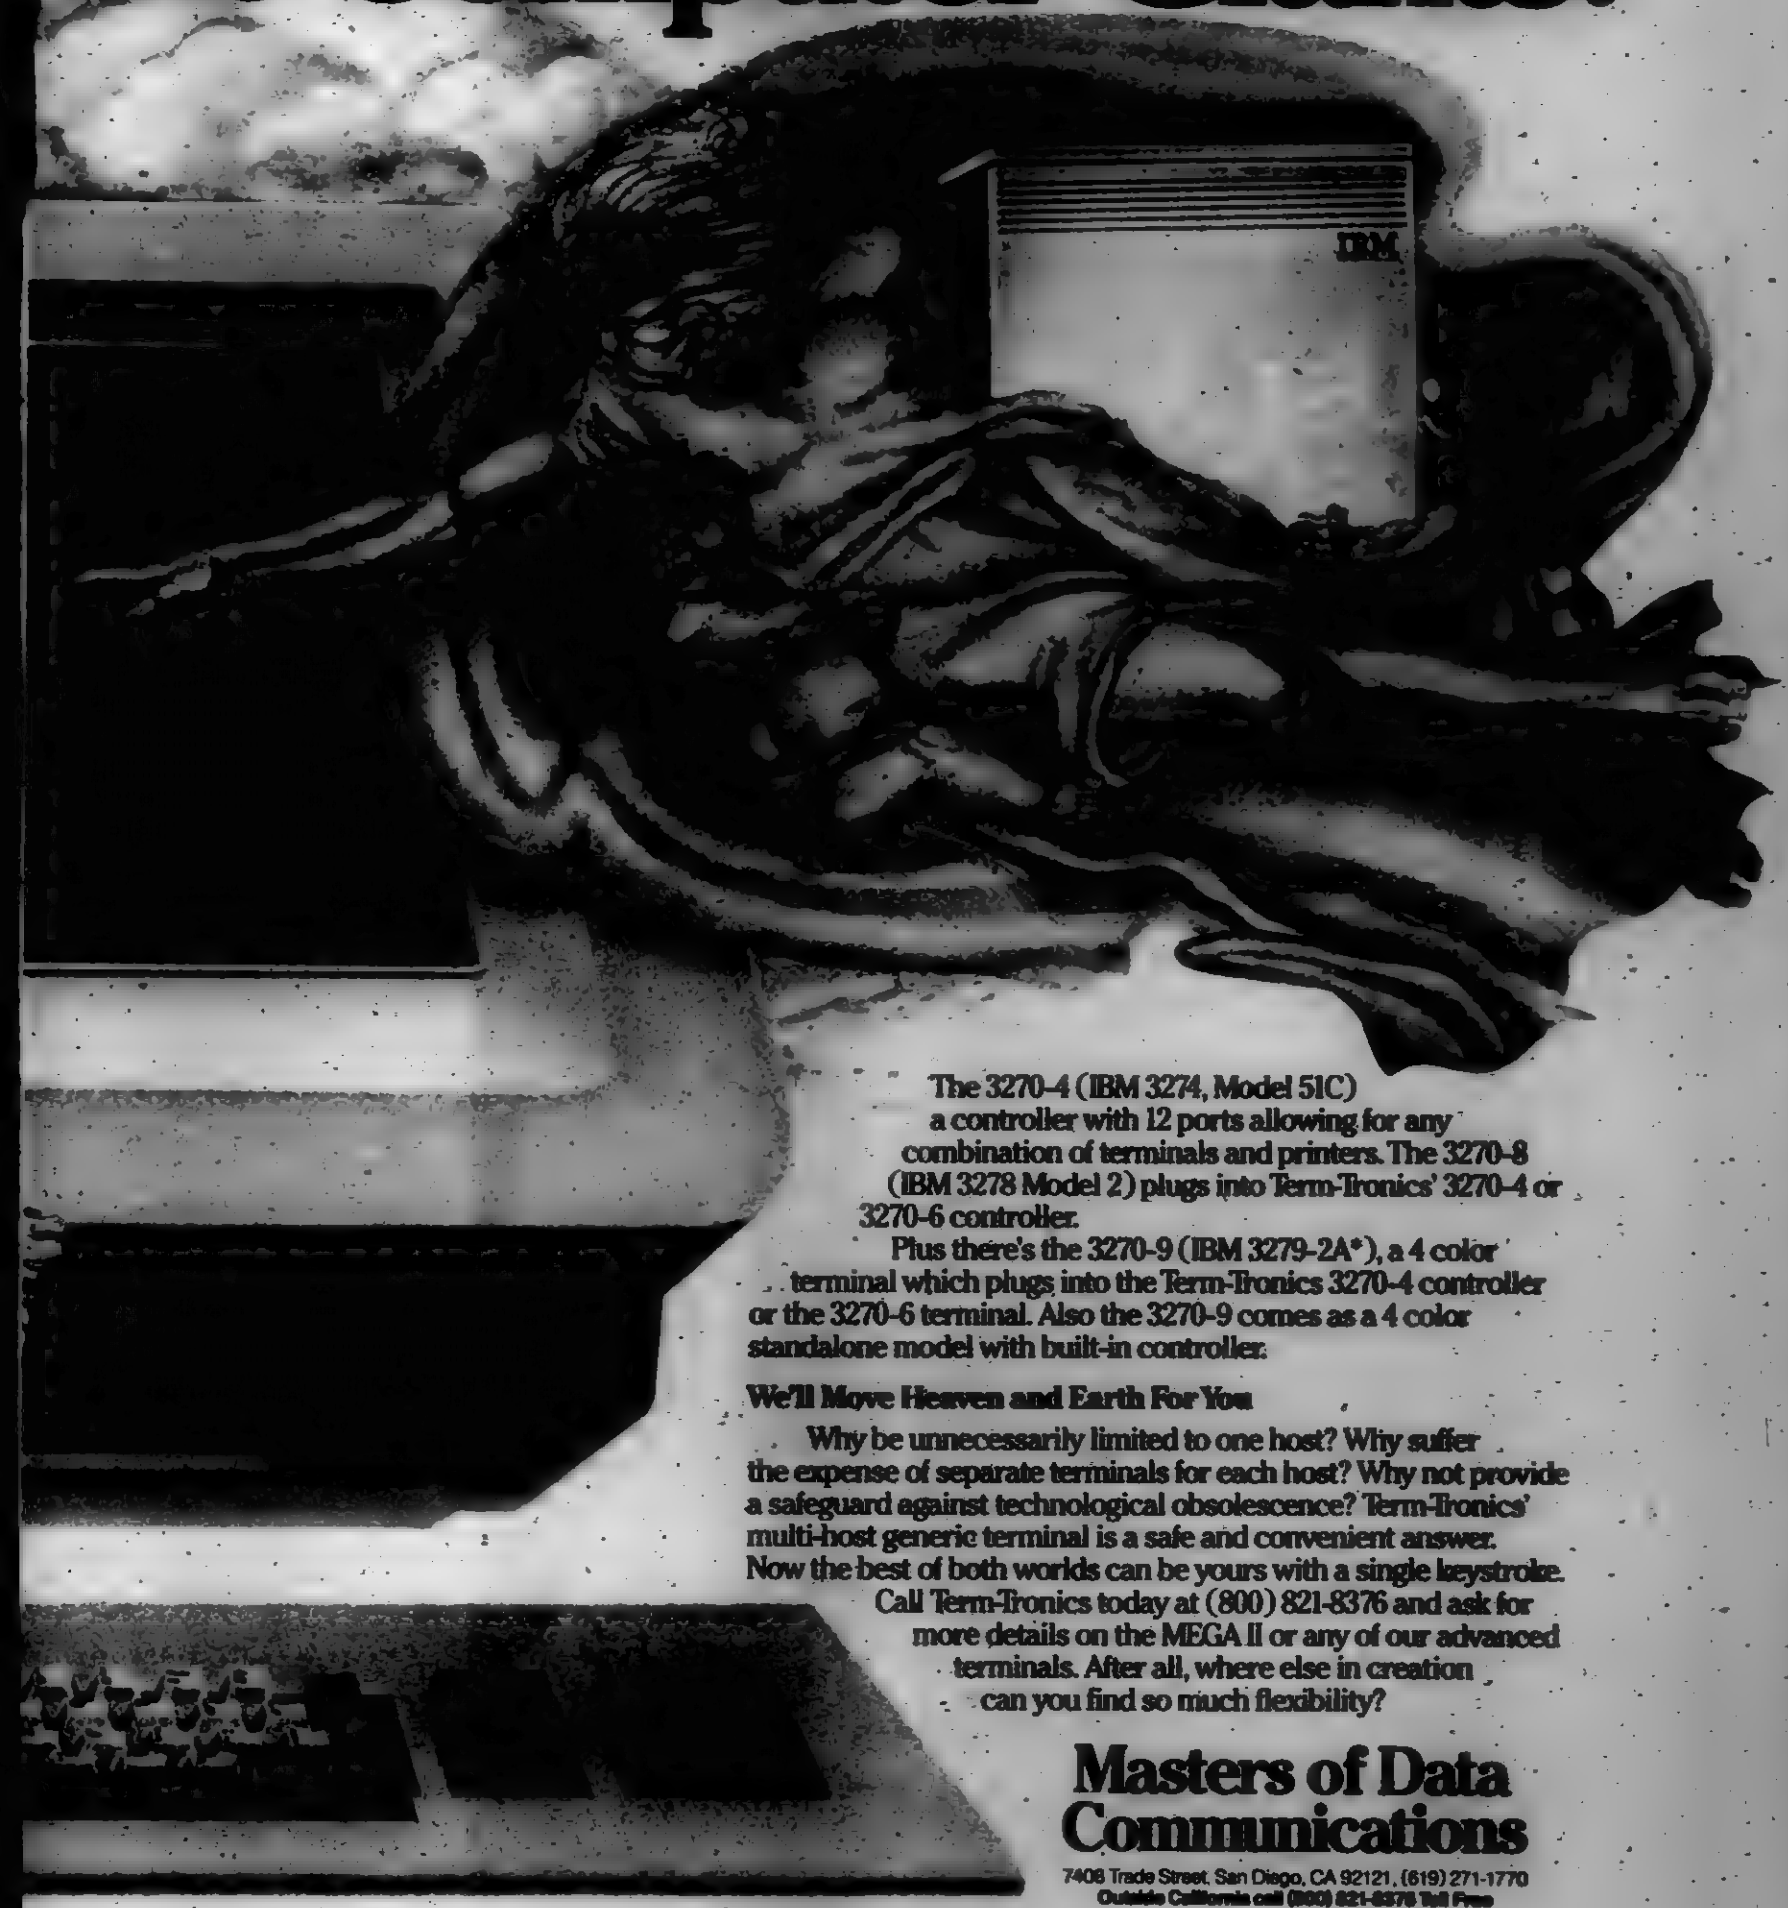
The Golden Age of Terminals

From the same creative minds has come a whole series of remote BSC mode Compatible Terminals, all of which can be upgraded to talk to DEC.

These include the Term-Tronics 3270-S (IBM 3275* or 3276* compatible) which is a stand-alone terminal featuring a built-in controller and a separately addressable printer port. The 3270-6 (IBM 3276) which also has a built-in controller and can interface with 3 additional terminals and 4 printers.

Term-Tronics

a Multi-Host Terminal the Computer Giants.



The 3270-4 (IBM 3274, Model 51C) a controller with 12 ports allowing for any combination of terminals and printers. The 3270-8 (IBM 3278 Model 2) plugs into Term-Tronics' 3270-4 or 3270-6 controller.

Plus there's the 3270-9 (IBM 3279-2A*), a 4 color terminal which plugs into the Term-Tronics 3270-4 controller or the 3270-6 terminal. Also the 3270-9 comes as a 4 color standalone model with built-in controller.

We'll Move Heaven and Earth For You

Why be unnecessarily limited to one host? Why suffer the expense of separate terminals for each host? Why not provide a safeguard against technological obsolescence? Term-Tronics' multi-host generic terminal is a safe and convenient answer. Now the best of both worlds can be yours with a single keystroke.

Call Term-Tronics today at (800) 821-8376 and ask for more details on the MEGA II or any of our advanced terminals. After all, where else in creation can you find so much flexibility?

Meet to look at 'micro wars'

SAN FRANCISCO — The future of the microcomputer industry will be the focus of a conference here May 7-8, sponsored by International Data Corp. (IDC). The conference, titled "Micro Wars: Shape Up or Shake Out," will examine survival strategies for the coming market shakeout and offer predictions of who will be the winners.

Apple Computer, Inc. cofounder Steve Wozniak will deliver the keynote speech and reportedly will discuss the scope of the micro industry in the coming years.

Other speakers will be John Rehfeld, vice-president and general manager of Toshiba America, Inc.'s Information Systems Division, and Aaron Goldberg, research manager of IDC.

Registration for the conference is $695 for the first person from each organization and $595 for each additional person. More information is available from IDC through Box 955, 5 Speen St., Framingham, Mass. 01701.

Software conference seeks new committee members

STATEN ISLAND, N.Y. — The program committee of the Conference on Software Maintenance, to be held Nov. 11-13 in Washington, D.C., is seeking members to propose themes for sessions and other duties.

The Conference on Software Maintenance reportedly will bring together managers, software developers and researchers to discuss solutions to software maintenance problems. It is being sponsored by the Association for Women in Computing, the Data Processing Management Association (DPMA), the DPMA Special Interest Group on Software Engineering and the National Bureau of Standards.

Program committee members will help organize or conduct sessions or activities and, when possible, attend program committee meetings in Washington, D.C.

Those interested in applying for membership on the program committee should write to Nicholas Zvegintzov, 141 St. Marks Place, Staten Island, N.Y. 10301.

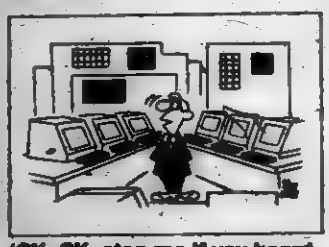
Rep. Zschau to keynote Avois meet

ARLINGTON, Va. — Rep. Ed Zschau, whose district includes much of California's Silicon Valley, will be the keynote speaker at the Voice Input/Output Systems Applications Conference '84, to be held Sept. 11-13 at the Marriott Crystal Gateway Hotel here.

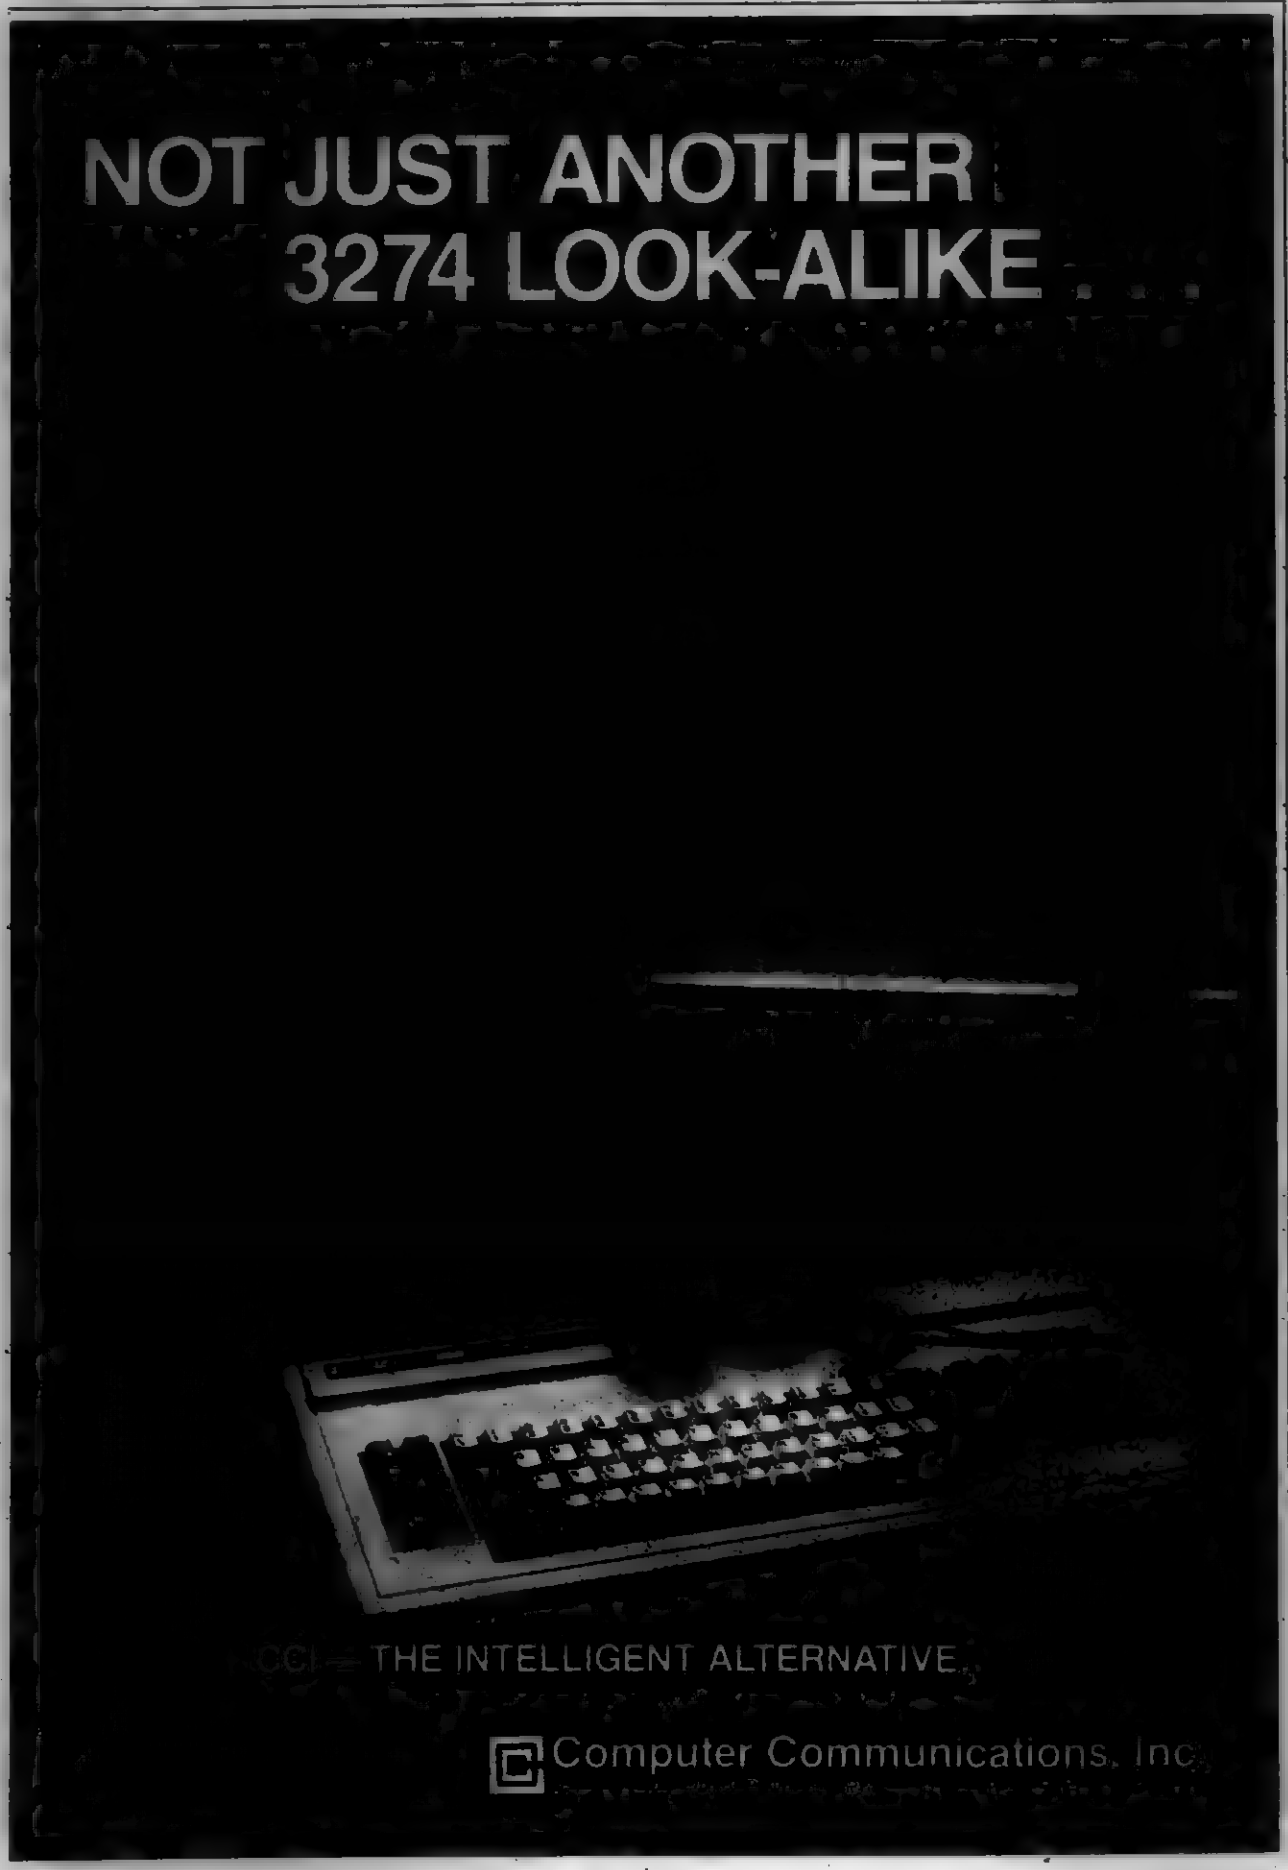
Zschau, chairman of the Republican Task Force on High Technology Initiatives, is a member of the House Committee on Foreign Affairs. He was founder and president of System Industries, Inc., an electronics firm, and has been chairman of the American Electronics Association.

According to the conference sponsor, the American Voice Input/Output Society (Avois), conference topics will include voice interaction with computers in medicine, aid to the disabled, office systems, design, process control and telecommunications.

Registration for the conference is $200 prior to Aug. 19 and $250 after that date. Additional information on the conference can be gained through Avois, P.O. Box 60940, Palo Alto, Calif. 94306.



'OK, OK, stop me if you heard this one!'



Are candid assessments of sales reps appropriate?

TURNAROUND TIME
Larry Long

Q For almost two years, I have been the initial contact person for all hardware vendors that want to sell us their products. By policy, all vendors are routed to me. We are a small company of 300 employees, but I still see six or seven vendors each month.

My job is to assess the compatibility of their products with existing hardware and our standards. Also, I feel some obligation to assess their knowledge of their products and their willingness to work with us toward a solution.

I'm disappointed in some of the sales representatives, especially those selling word processing equipment. They are quick to tell you what others don't have, but can't answer basic questions about the features of their own equipment.

Some ask, "How many do you want?" before assessing our most basic needs. Personally, I don't feel we should do business with these people.

When I inform one of our managers that someone will be calling on them, I usually give them my candid assessment of the sales rep's capability and interest. I do this because at least half of our managers have already been sold a bill of goods and bought hardware without regard to application. Do you feel my extra comments are appropriate?

A Since your company's management has such a bad track record for acquisition decisions, your comments are appropriate and probably appreciated, as long as they can be substantiated with fact and logical rationale.

However, it is not your place to pass judgment on a vendor because of vendor bias or a personality clash. If you continue to provide this bonus information, you should clear it with your boss.

Q I graduated with a computer science degree six months ago and took a job as a programmer. I just received my first performance review; my supervisor told me that I was doing excellent work and learning fast.

While everything seems to be going well on the surface, I may spend several days in front of the tube without coming up for air. I feel isolated and would prefer to do work that involves more personal interaction. I would like to stay in a computer-related career field, but not in programming. Can you suggest other positions that would give me more opportunities to work with people?

A Being a programmer does not necessarily imply the working life of a hermit. Quite the contrary — a programmer's isolation is more often than not self-imposed.

The most effective programmers have frequent interactions with members of their project or maintenance teams. Peer review and user input are integral to successful software development.

By not encouraging interaction with more senior programmers, it's apparent that your supervisor is not giving you proper direction. During the first year of employment, a programmer needs and deserves more guidance. Express your concerns to your supervisor.

Your decision to give up on programming is premature. Given the proper environment, programming offers opportunities for personal interaction and career challenge. I would recommend that you give yourself an opportunity to mature as a programmer (a minimum of two years). Then, armed with a valuable programming background, you can transfer to systems analysis, data base administration or any of a half dozen other computer career fields.

Q I have a degree in physics and am currently working in an online, data base environment as a programmer/analyst. I would like to get a bachelor's degree in computer science, but for family reasons this is not possible.

Is it possible to cover up this deficiency by taking some examinations in the field that are recognized in the employment market? Also, are there any recognized correspondence courses I can take to enhance my career prospects?

A There are no examinations that you can take that will significantly impact your employability. The Certificate in Data Processing and Certificate in Computer Programming, which require examinations, are among the most widely held and best known certifications, but they seldom affect hiring decisions.

I am not aware of any accredited degrees in computer science that can be earned by correspondence. Some trade schools offer correspondence courses but, in my opinion, you would be better off if you take full advantage of on-the-job training and internal education opportunities. Having a computer science or MIS degree provides an easier entree into the computer fields, but these degrees are not prerequisites for career advancement.

Long, president of Long and Associates, is a consultant, lecturer and author in the field of information services. If you have a question you'd like him to address, send it to Larry Long, Editorial Department, Computerworld, P.O. Box 880, Framingham, Mass. 01701.

Electronic Spread Sheet for VM/CMS & MVS/TSO
- Not Just Another CALC -

Powerful - Spreadsheet size is limited only by available virtual storage: ESS easily handles spreadsheets with thousands of rows and/or columns.

Proven - Already in use at over 100 installations.

Compatible - ESS accepts the same commands as VisiCorp's VisiCalc® program for microcomputers. A person familiar with VisiCalc® can be using ESS productively in minutes. In addition, ESS can load and save files in VisiCalc® format.

High Performance - Assembler language code and sophisticated storage management techniques give you fast response, even with very large spreadsheets.

Easy to Install - Just load the ESS program. No additional program products or languages are required.

Cost Effective - ESS gives all your users access to personal computing capabilities for just $220 per month. Compare that to the cost of buying hundreds of microcomputers.

Questions? - For more information about ESS, or to arrange a 30-day free trial, call or write TRAX.

Move over, Michener; store sells only high-tech books

By Jolley Greater
CW West Coast Bureau

SUNNYVALE, Calif. — Just as some electronics stores sell only hardware and others deal strictly in software, so Computer Literacy specializes in another valuable commodity: books.

But Computer Literacy is no ordinary bookstore. No tell-all memoirs by fading Hollywood movie queens crowd its display windows. No slick exercise manuals bearing the glossy likeness of Jane Fonda in leg warmers smile down from its shelves. Not even the best-selling tomes of James Michener or James Clavell beckon from the countertops.

As might be expected of a bookstore that sits smack in the middle of the world's densest concentration of high-tech vendors, Computer Literacy carries a highly selective inventory. Each of the estimated 15,000 volumes that form the establishment's current collection focuses on just one subject — computers.

Granted, works like *The Fundamentals of Digital Switching* or *High Output Management* probably lack the wide popular following of Harlequin romances or Mickey Spillane whodunits. Granted, the leaden-titled likes of *Designing Testable Logic Circuits* are probably a far cry from the average reader's idea of a good book to curl up with by the fireplace on a stormy night.

But for Computer Literacy's target audience — MIS professionals and electronics design engineers — such high-tech fare holds a powerful appeal and serves a vital purpose, according to store owner Dan Doernberg. In the fast-paced computer and microelectronics field, the need to keep abreast of the latest technological advances is constant and intense.

"We're not in a leisurely business," Doernberg said. "Companies are constantly telling us that they need additional information to help them develop new products because they're competing with five recent start-ups."

At a time when public interest in personal computing and other electronics matters is running at an all-time high, Computer Literacy is hardly the only bookstore to stock extensive collections of technological literature. But with a selection currently totaling about 5,000 titles, it boasts at least 10 times more electronics-related volumes than its general-interest competitors, Doernberg claimed.

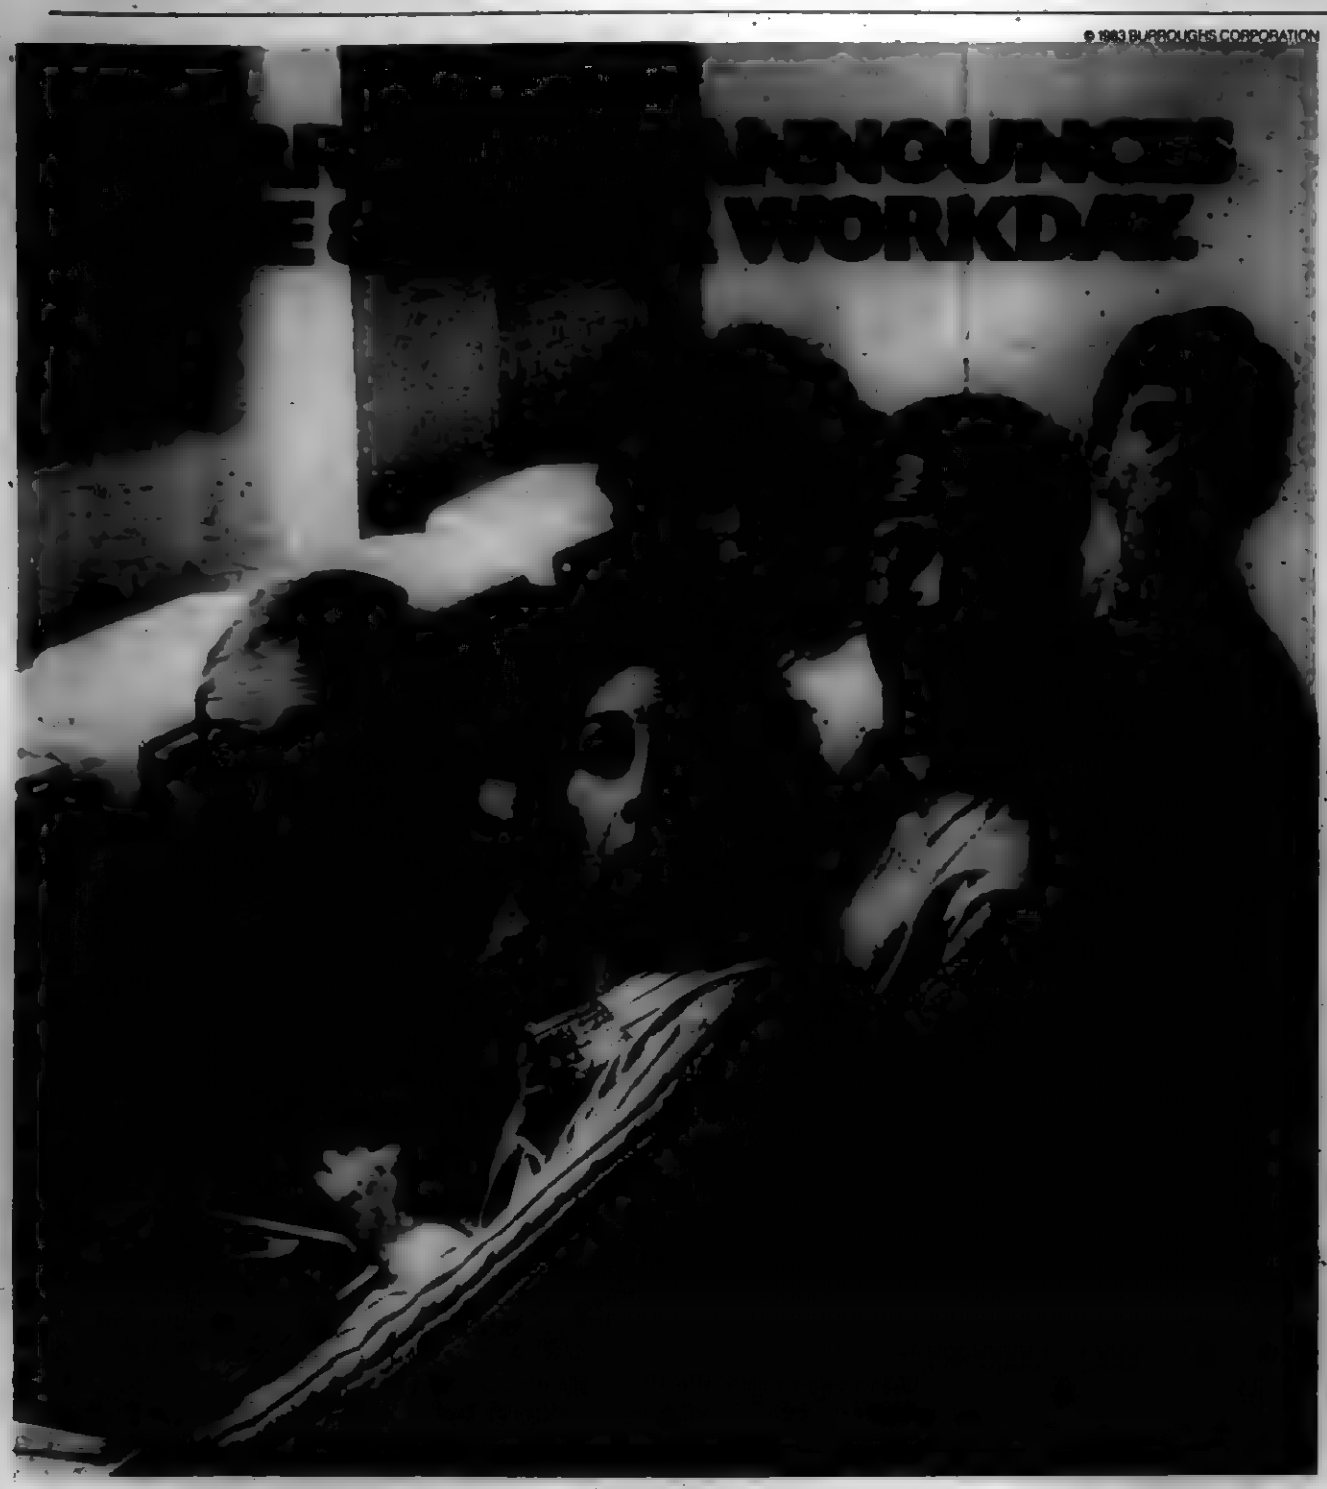
Targeting professionals

Although a handful of other bookstores may rival Doernberg's shop in the size of their computer-oriented collections, few, if any, of the competitors have any in-depth understanding of their products' contents. "Most of the stores that are going into computer books these days are aiming mainly at the consumer market," according to Computer Literacy's manager, Rachel Unkefer. "We, on the other hand, are interested only in serving the needs of technical professionals."

Doernberg agreed. "We're computer-book specialists," he said. "All we do is keep track of computer books. In addition, everyone in our store has a technical background. So when customers have only a general idea of what they're looking for, we can direct them to the right books."

When Computer Literacy first opened its doors for business over a year ago, it restricted its operations mainly to the surrounding Silicon Valley. Since then, however, the store's geographical market has gradually expanded, with the result that approximately 10% of its corporate sales go to customers outside California.

As the scope of the store's business has broadened, its customer base has steadily diversified to include a growing number of MIS professionals, who now account for roughly 35% to 40% of Computer Literacy's total sales.



Thanks to an ingenious productivity tool from Burroughs called the Logic and Information Network Compiler, or LINC, computer programmers can now increase their productivity as much as 10 times! (In some cases, even more.)

It's like getting an extra 72 hours of work in a day.

How is this possible?

The LINC software system automatically writes virtually all the coding programmers would have to do manually so it drastically reduces the time it takes to develop and implement even complex application systems. (It also simplifies program maintenance.)

Furthermore, LINC uses a new high-level language that defines problems in business terms, not computer terms, so important information can be easily created and managed.

And people can use LINC with very little training.

At Burroughs, productivity has always been a primary consideration, whether it's the technological innovation of our hardware or the advanced design of our software.

For more detailed information call 1-800-621-2020.

It may be the most productive phone call you'll ever make.

Burroughs

THE QUESTION ISN'T WHO'S BIGGER. IT'S WHO'S BETTER.

Trio charged with using text system to crack law firm files

By Patricia Keefe
CW Staff

NEW YORK — An unemployed broker and two clerical employees of a prominent New York law firm have been charged with using word processing equipment to break into the law firm's confidential computerized files.

The trio was charged with conspiracy to trade securities following a year-long Securities and Exchange Commission investigation into allegations of insider trading based on the "misappropriation" of confidential, nonpublic information from the law firm of Skadden Arps Slate Meagher & Flom.

Instigated by the firm, the investigation is continuing, according to Assistant U.S. Attorney Andrew Levander, who would not comment on whether further charges are expected in the case.

Charged in the case are two Skadden Arps employees, Alfred Salvatore, a proofreader, and Steven Crow, an "expert computer word processing operator"; and Aaron L. Lerman, formerly employed by Prudential-Bache Securities. Crow allegedly broke electronic internal office codes and stole information on tender offers and corporate acquisition plans and passed that data on to "others," including Lerman, in exchange for a share of the profits gained — in one instance $60,000 — from illegal insider trading, Levander said, but he declined to identify or comment on the number of the others involved.

The scheme is alleged to have taken place over a period of little over a year.

The information concerned several companies that were recently taken over or were involved in a takeover battle, including Puritan Fashions Corp., Houston Natural Gas Corp. and U.S. Industries, Inc., Levander said.

Federal officials claim a fourth person, Steven Karanzalis, a broker with Paine Webber, Inc., traded stocks and options based on the information misappropriated from Skadden Arps.

Karanzalis formerly worked with Lerman at Prudential-Bache, according to the U.S. Attorney's office here.

Although a warrant was obtained to search his home, Karanzalis has not been charged with any offense. However, he is described in court documents as a co-conspirator.

Arraigned two weeks ago, Salvatore and Crow were released on $50,000 personal recognizance bond each, but remain under court supervision.

Lerman was also released on $50,000 personal recognizance bond, posted $500 bond and is under stricter court supervision, Levander said. Attorneys for the trio declined to comment.

ACR issues bibliography

PHOENIX — Applied Computer Research Inc. (ACR), has published its 10th annual bibliography of literature on data processing performance evaluation and management.

The bibliography is contained in the special March issue of the "EDP Performance Review" newsletter. The issue contains more than 500 entries citing literature published in 1983, including periodicals, books, conference reports and government documents.

The bibliography is classified by subject with cross-references and an author index. Each entry contains complete source data.

Copies of the March issue are available to nonsubscribers for $25 each from Applied Computer Research, Inc., P.O. Box 9280, Phoenix, Ariz. 85068.

THERE'S ONLY ONE UFO.

A lot of software suppliers are trying to fit into UFO's shoes these days. They'll try to tell you that their On-line Application Development Systems are as powerful...as proven...and as accepted as UFO. They'll try to persuade you that they can offer you UFO's dramatic reduction in the time and expense of developing your CICS and IMS/DC applications. That's what they'll try to tell you. But the revealing and indisputable fact that UFO now has more than 1,500 installations ...more than all other independent suppliers combined...is your absolute proof that there's only one UFO.

No other On-line Application Development System can match UFO's speed, performance and cost savings.

UFO helps you melt away your programming and maintenance backlogs by eliminating the prime source of inefficiency in the application development process...repetitive coding. Pre-programmed and pre-tested functions like..."add, update, copy, browse, and display"—are initiated by keying in simple commands. There's no complex new language to learn, no code to write. Even access to your DL/1 database requires no special database training. With UFO, all your programmers can quickly become CICS or IMS/DC application development specialists without extensive and expensive training.

Because UFO is a non-procedural system, the time required to initiate new programs is dramatically reduced. Your programmers are guided through the development process with a free-form screen PAINTing facility, data dictionary, menu assistance and help screens. Simple fill-in-the-blanks techniques focus activity on what's to be done, not how to do it. And applications can be developed interactively with end-users, permitting changes at the prototype stage for guaranteed end-user satisfaction.

If you're concerned about reducing the time and cost of developing, maintaining and securing on-line applications...call in the best. UFO...User Files On-Line...from Oxford.

OXFORD SOFTWARE CORPORATION
174 BOULEVARD/HASBROUCK HEIGHTS, NJ 07604/201 288-4515

Strategic planning urged for implementation of CBT

By Patricia Keefe
CW Staff

CHICAGO — DP trainers who do not plan strategically for the implementation of computer-based training (CBT) will likely lose their ability to control, manage and adapt to this change in companywide instruction.

This warning was issued by Lorraine Shutman, an assistant vice-president at Security Pacific National Bank of Los Angeles at a recent conference here. Shutman, whose responsibilities include administering Security Pacific's CBT system, offered attendees a model for developing a CBT strategy for their company.

Strategy planning provides a framework for the coordination of strategic, administrative and operational plans to accomplish a prescribed aim, she explained.

Navigation course

Shutman reminded her audience that strategy planning is not a tool for overcoming obstacles one by one, but a long-term course of navigation from point A to point Z.

"Strategy planning demands that you think through the social, political, economic and technological factors that may affect your ability to accomplish your mission," Shutman said, breaking down those factors into a series of issue-based questions:

- *Social.* What must happen so that we may transition our trainees to a new delivery system for training?
- *Political.* Who owns CBT and how will it be implemented?
- *Economic.* What is in it for your organization?
- *Technological.* Is hardware and software available to do what you need done?

Plan for use

After performing needs assessment and data-gathering duties, planners need to develop a plan for use before and during CBT implementation, according to Shutman.

The plan should state the quality and texture of the business — that is, who you will interact with, who the team players and program authors are and what kind of control you will have on authors and quality.

The strategy must push the tactical plan for implementing CBT.

The strategy must also balance the overall scheme. "Is there an organizational need for a delivery vehicle for training?" Shutman asked.

Product superiority must also be addressed, such as how to produce quality training while guaranteeing mastery, productivity and cost-effectiveness.

Perhaps most important of all, Shutman said, the plan must provide the mechanics for an understandable, unified method of presentation and communication — in other words, how to get management to buy in.

In summation, Shutman offered an outline of a five-year strategy for CBT implementation:

- *Assumptions.* The four factors addressed above.
- *Mission.* The prescribed aim or dream.
- *Rationale.* What makes your mission viable.
- *Strengths.* How CBT assists your organization in meeting its goals.
- *Weaknesses and threats.* What can block your progress to your prescribed aim and what threatens the implementation of CBT at your organization, respectively.
- *Objectives.* What you hope to accomplish within the context of your strategy plan.

CBT planners told micro-mainframe link on the way

By Patricia Keefe
CW Staff

CHICAGO — If you are still agonizing over whether to implement computer-based training (CBT) on microcomputers or mainframes, you could just sit back and wait for integration to come to the rescue.

"Hold your horses and wait for micro-mainframe integration," urged Stephen Sankey, information center manager at the Bank of America, who spoke at a recent conference here. "There's a lot of [system integration] stuff about to be delivered."

Alone, each type of hardware has its drawbacks. Together, as parts of an integrated whole, the benefits of each virtually outweigh those limitations, Sankey said.

However, not all CBT planners can afford to wait for the integration of micros and mainframes to reach their firms, if it ever does.

Formerly manager of CBT at the bank, Sankey gave his audience the benefit of his own deliberations in this area, covering issues of cost, instruction, authoring and administration.

At first glance, it would seem that the firms that do not have a lot of money to spend would do well to turn to micro systems — the hardware, software and backup are relatively cheap, Sankey pointed out.

However, the cost of memory add-ons could prove expensive if the system does not provide hard disk storage.

Moreover, he added, 90% of the cost of CBT is wrapped up in authoring. How expensive the authoring is depends upon the specific needs of the user, not so much the hardware involved. Mainframes allow unlimited course size, easy sharing of data, student dialogue and system backup and recovery, as well as allowing external text to be brought in.

Micros provide ease of authoring in their own way by providing prompts, control over the machine, support of alternative media and elimination of the issue of resource competition, Sankey said.

Technical support

Turning to technical support, Sankey suggested users with limited technical backgrounds might find comfort in a mainframe-based CBT system that allows them to draw on the experience of the systems and mainframe support staff.

Support is not necessarily synonymous with user friendliness, however, and micros win that round with Sankey.

Powerful graphics, ease of use with video, fast response time and portability are some of the "friendly" issues that can raise student motivation, Sankey said.

Mainframes can provide a more powerful CBT system, which is important for users concerned with simulation (prototyping and CBT product support fields) and security issues. Powerful analysis of answers and answer trapping is also available on mainframes.

Administrative issues

Mainframes also seem to have an edge when it comes to administrative issues such as tracking, reporting, scheduling, courseware availability and actual training and support.

Micros are somewhat handicapped by the need for multiple diskettes, which affects the ability to centralize, distribute and schedule courses, according to Sankey.

The mainframe provides extensive data recording, remote distribution, high-volume printers and centralized data.

Moreover, compared with micro-based systems, mainframe-based CBT usually comes with extensive vendor support, a cadre of authors, users groups and CBT classes. Sankey found micros seriously lacking in these areas.

More N.Y. hospitals to receive pediatric protocol system

By Lynn Haber
City Staff

NEW YORK — A pediatric protocol system that serves as an educational tool, aids in resource allocation and monitors patient care will be expanded to serve additional city hospitals here.

The system was first implemented at Kings County Hospital Center in Brooklyn in 1981 and afterwards at the Metropolitan Hospital Center in Manhattan. Implementation of the system at Coney Island Hospital in Brooklyn began last month and will begin at two other as-yet-undisclosed New York municipal hospitals at the end of this year.

The pediatric protocol system was jointly designed for the Municipal Hospital System of New York by the Fund for the City of New York and the New York City Health and Hospitals Corp. to provide two types of information: population and utilization data, which helps supervisory physicians get a perspective on their resources, and data that measures compliance or adherence to a set of pediatric health care guidelines.

Medical protocols are outlines of standard practice for the diagnosis and treatment of given illnesses. "Presently, the system deals with eight common pediatric problems, some of which include upper respiratory infections, sore throat, asthma and urinary tract infection. The guidelines are linked to a structured chart that the doctors fill out," explained Bruce Posner, MIS director for the Pediatric Protocol Project at the Fund for the City of New York. "The information from the chart is coded and entered into the computer, and it is the information on the chart that the computer compares with the guidelines. Reports are then produced which outline, in either aggregate form or on a case-specific basis, adherence to the guidelines."

Supervisory physicians then use the reports to identify a particular issue that may need educational review. "Reports are useful to gauge compliance to the guidelines," Posner said, "but it is understood that in as many as 15% of the cases that the doctor sees, there may be a perfectly valid reason for departing from the guidelines. How the reports are interpreted is crucial."

The same computer system will be used by the additional hospitals to monitor pediatric care. The data processing department uses a 4M-byte Formation, Inc. F4000 processor running in an IBM VM/CMS and VS1 operating environment. Two full-time programmers, in addition to Posner, work on the project.

In its assignment to help city agencies improve productivity, the Fund for the City of New York, established in 1968 with a grant from the Ford Foundation, has additional projects under its belt. These are developed by the fund at the request of different service agencies to optimize or monitor areas that the agencies would otherwise have difficulty monitoring themselves.

For example, the fund recently finished an automated routing system for garbage collection trucks for the New York City Sanitation Department. "Until now, the sanitation department had to produce their routes manually and had no idea if those routes were optimum," Posner said. "Now, they have a computer system which enables them to test many alternative ways of routing and allows them to plug in different parameters so they can test, be more productive and know they're getting optimum routes."

Another computerized system that the fund helped create was a risk assessment system for the Department of Special Services for Children. The system generates reports that help track cases of child abuse and neglect and the allocation of resources.

On-line data base helps bank woo wealthy depositors

Detailed personal information helps attract lucrative business

ATLANTA — The marketing department at a bank here is using an on-line data base as a way of competing with other financial institutions for the highly sought-after business of well-heeled customers.

The First National Bank of Atlanta last year established a new department whose employees use a special data base containing detailed personal information about a select group of customers. "The department was set up to serve the needs of the very affluent customers of the bank," said Margaret Anne Boone, a commercial officer in the bank's marketing department.

With the data base, department employees can quickly access information about the customer — everything from a spouse's name to the name of the country club to which the individual belongs. First National hopes that by providing more personalized service, it will attract more business from those customers.

Rapid information retrieval

"When one of this select group of customers has a request for banking services, our staff can rapidly retrieve a significant amount of information on this customer from the data files," according to Thomas Hills, group vice-president. "In addition, we can search for different types of information by any field of data in the information files."

For competitive purposes, the bank wanted to develop the data base as soon as possible. But the bank's IBM 3081, 3083 and 3033 mainframes were already carrying a heavy work load, and "our programmers were telling us that it would be way down the road before our data base was completed," Boone said.

Bank officials briefly explored other alternatives to expedite the program, such as software packages and a time-sharing service. "We looked at a couple of things that really did not suit our needs," Boone said. The bank finally chose Quality Information Systems, Inc.'s Qtime data base management software.

"[Qtime] was the only thing that was presented to us that really suited our needs," according to Boone. "Their people walked in off the street, literally, and made a presentation. During that presentation, I made the determination that this was what we needed. They did not even know we were looking [for a data base management program]."

The data base resides on a pair of IBM Personal Computer XTs, with one floppy and one hard disk and 512K bytes of memory. The Personal Computer XTs are linked to each other by Orchid Technology, Inc.'s PC Net local-area network, according to Greg Barfield, the bank's DP manager.

Boone said the Qtime program proved to be easy to learn and use. That was an important consideration, she said, in a department where none of the employees — most of whom were part-time workers — had any previous computer background. "I have been able to sit down with the part-time workers, and in an hour they have had the ability to load information and work with it."

Eventually the bank would like to provide a terminal for each of the employees in the marketing department to access the data base. One approach now being examined is replacing the two Personal Computer XTs with six IBM Personal Computers tied by an Ethernet local-area network with a 70M-byte hard disk.

Dema conference/expo slated for Sept. 24-26

STAMFORD, Conn. — The Data Entry Management Association (Dema) has released its 1984 meeting schedule, which includes the Eighth Annual Dema Conference & Equipment Exposition, scheduled for Sept. 24-26 at the New Orleans Sheraton.

Also announced by Dema were three-day profesional growth seminars, slated this week, April 11-13, at the Sheraton Hotel in Seattle and April 30-May 2 at the Royal York in Toronto.

The seminars include "Essentials of Data Management," which includes Dema's Certification Program in Data Management; "Increasing Quality & Productivity in Your Data Entry Department"; and "New Directions for Information Management." The seminars each cost $485 for Dema members and $545 for non-members.

Dema is an association of information managers involved in both traditional and emerging methods of data entry, including key-to-disk, on-line and distributed processing; voice entry; portable and personal computers; and word processing. Dema can be reached through P.O. Box 16711, Stamford, Conn. 06905.

ABA establishes user groups

CHICAGO — Lawyers who use computers and applications software in their offices can now join several users groups set up by the American Bar Association's (ABA) Section of Economics of Law Practice.

The topic areas of users groups include IBM; Digital Equipment Corp.; Apple Computer, Inc.; Wang Laboratories, Inc.; the Radio Shack TRS-80; time and billing applications; substantive applications; and the CP/M operating system, the group sponsors said.

The groups were set up by the Economics Section's computer committee, which six times a year publishes "Network," a newsletter about computers and their office uses.

Only members of the ABA's Economics Section may join a users group.

Further information is available from Donna Spilis, Economics Section, American Bar Association, 1155 E. 60th St., Chicago, Ill. 60637.

Decision support meet set

NEW YORK — A two-day conference on "Decision Support Software: Personal Computer, Mainframe and Distributed Applications — A Managerial Perspective" is scheduled for May 21-22 here at the New York Hilton.

The conference will discuss end-user computing, distributed decision support, local-area networks, microcomputer policy, fourth-generation languages and artificial intelligence, according to the sponsor, Research and Planning, Inc. of Cambridge, Mass. Scheduled topics include impact of decision support systems on organizations, approaches to evaluating and selecting decision support software and communicating management information.

The conference costs $495.

Research and Planning is located at 215 First St., Cambridge, Mass. 02142.

Manufacturing system ousts firm's in-house software

QUINCY, Ill. — After replacing its in-house software with a manufacturing software package, a maker of pumps, compressors and drilling equipment reported that it had increased production by 20%, cut overtime by 18% and eliminated parts shortages.

Headquartered here, the Gardner-Denver Divisions of Cooper Industries, Inc. have manufactured pumps and drilling equipment for mining, metals, energy, compressors for industrial and special applications since 1859. The divisions employ nearly 1,200 skilled workers here and in Sedalia and La Grange, Mo.

In 1979, officials realized that their in-house software running on Burroughs Corp. mainframes didn't meet their needs. They felt the system needed too much manual support, that customer orders had to be scheduled manually and that the system's material requirements planning feature didn't integrate with the existing system.

"There was too much overtime just to meet the orders. We realized the software and hardware we were using didn't meet our business needs. We had to change," said Ken Jones, manager of MIS.

A task force with representatives of various areas in the organization was formed to research the manufacturing software field. It decided in December 1980 to purchase Management Science America, Inc.'s (MSA) Manufacturing System. Jones said one reason for choosing MSA was its implementation approach, with up-front planning and involvement of employees from all areas of the company.

The company bought an IBM 4341 with an IBM OS environment to support the software. Dennis Lipscomb, an analyst in the Sedalia plant, was named project leader for the implementation in the two plants in Quincy and the pilot project in Sedalia.

The Sedalia employees were eager to help. "Gardner-Denver was going to have a class-A system and nothing less. The employees knew that if the plant succeeded, every individual succeeded," said Sedalia plant manager Don Bradley.

Phase I of the implementation began in January 1981, with the division analyzing its business to see how the software would work most effectively. Also, management and MSA provided educational and training opportunities to employees, and Gardner-Denver formalized its operating procedures and controls.

Gardner-Denver then began a cycle-counting program for its inventory. The result was that inventory accuracy rose from 67% to 97%.

The inventory records helped to eliminate parts shortages, Bradley noted. He said that in the past, the final assembly department had required two or three days of notice to expedite parts on the shortage list. With the new system, inventory audits showed that parts shortages were no longer a problem.

"My only argument with MSA was over my shortage list. How would I know what was missing? But then I realized I didn't need one," said Bob Nagel, materials manager. The materials department now can plan its schedule up to a month in advance, giving Gardner-Denver the control it needed to implement the system.

All three plants implemented the first four modules — inventory records, manufacturing, master production scheduling and software control — by November 1982.

With the system, Gardner-Denver can create a master production schedule for employees to follow. Surprises and panic buying have been eliminated, and the purchasing department is no longer ordering parts already in the

Range of uses found for six-year-old financial system

DALLAS — Six years after installing a financial planning and modeling system for strategic planning, Dresser Industries, Inc. continues to find additional users of the program.

"In the six years that we've had the system, it has become a frequently used tool for anyone who wants to generate reports or manipulate rows and columns of numbers," said Bryant Kershaw, manager of planning systems in the Operations Research Department of Dresser, an energy products and services company here.

At first, the product was primarily used by strategic planners. As enhancements were added to the system, accountants and financial planners began using it. Kershaw estimates that 500 non-DP users around the company perform an average of some 25,000 executions on the system each month.

In 1977, Dresser evaluated a number of financial modeling and planning tools that would help eliminate the tedious work required in strategic planning. After a thorough review process, the company, which has two Amdahl Corp. 470V/8 and two IBM 3033 mainframes, chose CA-Autotab from Computer Associates in Jericho, N.Y.

"We wanted a program that would let planners think about planning," Kershaw said. "With CA-Autotab, they're able to use scenarios and options to find the best product and marketing combination. Doing that manually, especially with a three- or five-year forecast, requires a huge volume of data. The program saves a tremendous amount of time.

"It's especially good for modeling," he added, "because you can use up to 40 'what-if' situations, vary them within each model and still retain your original data." Moreover, "It's so simple that familiarity with computers or programming isn't necessary. . . . CA-Autotab is an English-language system."

In addition to working online, Kershaw noted, CA-Autotab can operate in a batch mode. "Once the model has been established with your rules and formulae, it completes your calculations."

Training for CA-Autotab does not require a great deal of time or effort. "We have trained close to 300 people in the last few years," Kershaw said. "A person becomes productive after only a half of a day of training."

Employees have readily accepted the product. "Anytime you can get a product which allows users to immediately see the benefits in time and money, then that product will go over well," Kershaw said. "I believe CA-Autotab was the first product we used that was truly user-oriented."

PUMPS from page 41

stockroom or sitting on the receiving dock.

"Upgrading our system has upgraded our ability to meet schedules. We don't have that month-end crunch, where everything cascades down to the last four or five days," Jones said.

He reported that the MSA Manufacturing System also has helped Gardner-Denver improve customer service. The company always had a reputation for prompt service, Bradley said, but employees had to work overtime to deliver 97% of its orders on time. Now, the company is provided that reliable service, but has reduced overtime by 18% in the machine shops.

"It was frustrating to have our priorities changed. We spent all our time starting jobs, instead of completing them. Now, we can plan and select jobs requiring the same machines and do those all at one time," Nagel said. "This not only has helped employee morale, but in just 6½ months, we increased our productivity level by almost 20%."

SIX REASONS WHY CINCOM'S MRPS IS THE SUPERIOR SOFTWARE SOLUTION TO YOUR MANUFACTURING CONTROL PROBLEMS.

Paper trader plants custom package to handle deals

NEW YORK — An accounting package is helping a paper trading company here handle its daily operations, while providing the capability to handle future growth.

Perry H. Koplik & Sons, Inc., a privately owned paper trading company here, serves as an agent, broker and trader in wood pulps, secondary fibers, newsprint, liner board and kraft paper. In 1981, it found itself seeking what is now a common goal: computerizing manual operating procedures with an emphasis on improving administrative efficiency.

Although traditional accounting software packages were readily available, the company discovered no one had developed software that could address the main thrust of its particular business needs. According to Edward Stein, Koplik's vice-president and chief financial officer, "Essentially, what we needed was a system that could provide the ability to continue handling an ever-increasing volume of transactions, as well as all the operational functions of the company."

The trade business is a complex one. Traders rarely, if ever, see the product they are handling; their function is to explore the market, bringing together buyers and sellers. A trader's success depends on being able to handle a wide variety of clients and to process volumes of vital data quickly. Accurate and up-to-date trading information is essential in an environment that changes constantly.

Hardware, software issues

Previous to its search for a turnkey system, Koplik & Sons ran invoices, purchase orders and statistics on an IBM 5110 running in batch mode. When it decided to automate a greater portion of the business, it had to consider both hardware and software issues. Although Koplik & Sons looked at other vendors' equipment, it chose Datapoint Corp. because of the "flexibility of its hardware and its growth opportunities," Stein said. For software, Koplik contracted in 1981 with Datamatics Management Services, Inc., which developed a custom system for the paper trader.

The hardware purchased includes 18 Datapoint 8220 data terminals; one 8600 application processor, two 3600 application processors and one 6220 application processor; a 4755 file processor; and two printers — a Model 9257 300 line/min dot matrix printer and a Model 9621 serial printer.

Martin Almquist, consulting director for Datamatics, said, "It is extremely important that the trader have a system that allows him to monitor the entire trading operation continuously, checking availability of goods, negotiating prices and terms and verifying the resulting arrangements."

The Trade Data Expediting (Tradex) system that Datamatics designed for Koplik is able to isolate the different variables of the trading operation and format a support program closely aligned with the actual way the trading business is conducted. Appropriately, it is a system centered around the "route sheet" concept. This sheet, now accessible through the CRT screen, integrates information about all the parties involved in the transaction: the customer, vendor and shipper. Previously, this information was handled manually, which resulted in a lot of paper shuffling that required a lot of time.

"The final result was not just a program, but a solution combining a fully integrated, on-line system to execute and monitor the entire trading business environment," Almquist said.

The Tradex system provides a cohesive operating routine that combines order processing, financial statements and management information reporting. It facili-

Colleges' on-line system preps students for job market

RICHMOND, Va. — A group of community colleges here is replacing an obsolete remote job entry terminal system with an interactive on-line system in order to provide students with the best possible preparation for the job market and to facilitate administrative reporting.

The installation of the on-line system is a two-phase project. The first phase, completed approximately six months ago, targets the academic population of the college system. The second phase, scheduled for completion in two years, targets the administration.

The Virginia Community College System (VCCS) is composed of 23 colleges in 33 locations. In the fall quarter of 1983, approximately 6,500 students were enrolled in a two-year data processing curriculum that awards an associate's degree in applied science. Almost 22,000 students were enrolled in some type of DP course.

For DP purposes, VCCS is divided into four regions. Each region has its own IBM 4341 mainframe that serves all the campus computer laboratories and communicates with a host 4341 located here.

Up to 12 IBM controllers communicate with or are locally attached to each regional 4341 — either 3274 controllers with up to 32 ports or 3276 controllers with a capacity of eight ports. The old system's batch terminals with printers are being phased out.

Charles Allen, VCCS' manager of operations and technical support, is coordinating the conversion from batch to on-line. In selecting an on-line system, Allen looked for performance of equipment. The academic network has approximately 600 Telex Computer Products, Inc. 178 and 278 terminals on all four systems. VCCS also purchased approximately 25 T-1800 dual-purpose printers from Printer Systems Corp. of Gaithersburg, Md.

"Having an on-line environment for instruction has exposed students to state-of-the-art methods and equipment," Allen said. "And that's essential preparation for the business world."

According to Allen, the academic network has been operationally sound since completion of installation about six months ago. The 4341, which currently has 12M bytes of memory, is scheduled to be increased to 16M bytes of memory in the near future, Allen said.

A network for administrative purposes will add another 4341 at each region, according to Allen. "We expect all campuses to be doing on-line registration when that system is in place," he said.

Computer Interruptus

Midnight. And you wish you would be left in the dark. But miles away in the DP Department, a misplaced DD override, an invalid concatenation, or some other equally obscure JCL error brought production to a standstill.

And when the system breaks down, it's you or your staff they call up. Which usually means getting up and getting down there. And after a night like that, how productive will the morning be?

What a waste. If you had the JCLCHECK™ program, you wouldn't have JCL errors, period. None. Zilch. Zero.

Because the JCLCHECK program can catch any and all JCL errors and give you complete, on-line JCL validation and concise error diagnostics. Plus complete documentation on a job stream or entire production system suitable for insertion in the run book. And it can operate under TSO, TONE, ROSCOE or CMS.

Imagine, with no more JCL errors, your programmers can finally concentrate on what you hired them for: writing programs.

So what are you waiting for? Send the coupon or call us at (408) 554-8121 for details. We'll show you how the JCLCHECK program can bring your error detection out of the dark ages, increase production, and eliminate applications backlog. And that'll put you in the spotlight.

PAPER from page 43

tates the documentation of each step of the trading operation and uses this information to generate the data by which advantageous decisions can be made.

"The Tradex system gives on-line capabilities for operational needs as well as the ability to enter and handle diversified data, Stein said. "It is a viable system that provides management with an effective operational tool that results in better returns on investments."

The Tradex system includes not only routine administrative support programs, but also accounts payable and receivable. An integral part of it is the ability to maintain key variables having the most impact on the trader's profit margin — freight and tariff prices, terms, commission structures and time frames — and to report these activities accurately.

Rather than simply concentrating on accounting, Tradex provided the ability to have an on-line accounts payable, supplier, freight and expense payable system, which was essential to Koplik & Sons.

Package keeps publishers' subscriptions circulating

WHITE PLAINS, N.Y. — If you ever wondered what happened to the latest issue of your magazine or why your subscription was canceled without notice, then you can identify with the problems of publication circulation.

"Logistical headaches in publishing tend to settle in the circulation department," observed Doris Minsker, manager of fulfillment services for Knowledge Industry Publications, Inc. based here. Because Knowledge Industry requires accurate subscription lists to *Video User*, which has 18,500 subscribers, and to eight newsletters aimed at markets ranging from book publishing to computer software, the publishing company decided to automate its manual subscription record keeping.

"Previously, we would research customer questions manually," Minsker said. "We could spend a half hour looking for a piece of paper and then send out a duplicate subscription."

The company did not have an up-to-date subscription base. An outside service bureau batch processed subscription data. "We were at least two weeks behind keypunching data," Minsker said. "We had to print mailing labels in advance, or miss mailing deadlines. We never had an accurate picture of our subscription base."

After looking at several packages, the company purchased an $18,000 data management system developed by Vista Computer, Inc. of Elmsford, N.Y. The package runs on a Data General Corp. Eclipse superminicomputer.

The Vista system automatically tracks subscribers' names and addresses, subscription payments and terms. It also issues invoices, payment reminders and renewal notices. "We use the system to flag subscribers close to renewal and mail preprogrammed messages in advance," Minsker said. "It clearly improves our renewal rate."

The system helps to "qualify" the readership by tabulating responses to audit cards and identifying those readers who haven't responded to information requests. This information is vital because a magazine cannot earn income from a subscription until it is verified. The longer a subscription is unfulfilled, the more money the company loses.

"Since we qualify readers more quickly, the package speeds cash flow," Minsker said.

When subscribers now call for information, Minsker can provide accurate answers because the system uses on-line menus and a data base.

Enhancements to the original package create mailing labels and lists used for book promotions and circulation campaigns. Another enhancement produces reports for Audit Bureau of Circulation examinations.

ICCA sets conference

HOUSTON — Interconnections '84, the national conference of the Independent Computer Consultants Association (ICCA), will feature F.G. Rodgers, vice-president of marketing for IBM, and Ken Olson, founder and chief executive officer of Digital Equipment Corp., as speakers.

The conference will be held May 16-19 at the Galleria Marriott Hotel here. The ICCA is an association of approximately 3,000 independent computer consultants which is headquartered in St. Louis.

The registration fee for members is $150 before March 31 and $175 after that date. More information is available from Walter Ulrich Consulting, Suite 450, 2626 S. Loop W., Houston, Texas 77054.

All consultants look alike.

Until you start asking a few questions.

You need some answers. And that's the "moment of truth" that separates an On-Line Software International consultant from the rest.

Our people are seasoned professionals with years of specific on-line experience. Heavyweights, not juniors. And their individual expertise in CICS, IMS, operating systems and networking is reinforced by our unique communications and data base system. A network that lets each consultant tap the vast experience of our entire organization.

If you want to know more about how we can analyze and execute your project, call us or mail the coupon today. You'll get a prompt answer. The first of many. Call toll-free 800-526-0272 or in New Jersey 201-592-0009.

Please send information on your consulting services.

OA system controls gas distributor's delivery, billing

MUSTANG, Okla. — An office automation system has helped one of the largest independent distributors of liquid propane gas in Oklahoma to gain control of its delivery and billing schedule, allowing it to pursue continuing growth.

Bernard Briscoe started Briscoe's LP Gas Service, Inc. 30 years ago. Today, the enterprise's annual revenues are approaching the $7 million mark. However, Briscoe's son-in-law and general manager, Randy Terrel, remembers that three years ago, booming growth placed management in the paradoxical position of contemplating the very survival of this family-owned enterprise.

Creating a classic case of "too much, too soon," the oil crisis in the mid-1970s proved to be something of a Pyrrhic victory to Briscoe. The sudden interest in drilling for petroleum fired an influx of roustabouts and wildcatter types to the Oklahoma City area. City zoning laws forced new trailer parks and mobile home sites to locate in outlying areas bereft of piped-in natural gas.

As a result, Briscoe's marketing base exploded, until it appeared the company might be getting in over its head. An arbitrarily chosen 21-day or 30-day delivery schedule, fuel deliveries until midnight and a manual billing process that also determined which customers were due for deliveries created havoc at Briscoe.

In addition, a Briscoe subsidiary that handled conversion of vehicles from petroleum to liquid propane was exceeding all expectations. At one time, it had a waiting list of more than 400 cars and trucks.

In the midst of that chaotic success in 1979, Briscoe and Terrel attended an industry trade show, where they heard of Dealers Management Services' Fuel Pak software, which was programmed to run on Wang Laboratories, Inc.'s 2200 MVP computer system. After the show, they began calling other Wang users in the business, as well as users of other computer systems.

The Wang systems already in place received uniformly high grades. "What really made up our minds to go with the Wang system were the reports we heard about the quality of the service," Terrel said. "We figured we could always get a computer and some software to do what we needed, but we wanted to make certain we went with a company that was willing to take us by the hand and lead us into this.

"It was important for us to get the best system we could find with the best backup and service available. In this respect, Wang got better recommendations than all the other computer companies put together."

The system, consisting of a 128K-byte Wang 2200 MVP processor, a 32M-byte fixed disk, a Model 2236 Data Entry terminal, a multiplexer, a printer controller, a 180 char./sec Model 2235 matrix printer, a 53.6M-byte Model 2280-2 fixed disk and four modems, went on-line in August 1980. Initially, Briscoe's office staff voiced some concern about the switch-over from a purely manual system to an automated office system.

"We'd never seen anything like this before, and we knew everything important to the company was on that machine. The feeling was if you pushed the wrong button, everything would be lost for good," Terrel said. "Now everyone is really comfortable with the computer."

The computer handles delivery scheduling by automatically using a degree-days figure to calculate how much fuel each customer is likely to have used the day before. Based on that consumption, delivery tickets are printed a week ahead of time for the drivers. Because the route men have become so much more efficient, the company was spared the expense (estimated at $450,000) of having to buy more trucks and hire extra drivers.

Controlling billing process

The computer system has also aided the billing process. Before the Wang 2200 MVP came on-line, customers who paid late had what amounted to a free ride. "When the Wang system came in," Terrel said, "we had it programmed to add an automatic interest rate of 1.5% per month on balances that are unpaid after 30 days. In no time at all, we found out that the money we were bringing in from the interest payments alone — money we were losing in the past — would more than pay for the cost of the computer in less than a year. It was kind of like getting the computer for free."

Moreover, Briscoe has been able to save almost $35,000 a year in salaries and benefits for site billing clerks by centralizing the billing operation in Mustang. This has also reduced billing errors by at least 75%.

The system has also simplified the process of reporting monthly sales to the state. "We used to have one clerk to figure this out by hand. That's all she would do for two weeks out of every month," Terrel said. "Now we just push a button on the 2200 MVP, and the machine prints out the complete record of all sales. We send the list to the state just the way it comes off the printer."

Mobile terminals, host mini contain fuel firm's costs

SALT LAKE CITY — Mobile terminals in service trucks and a host minicomputer are helping a gas company hold down costs and provide better information to its customers.

Mountain Fuel Supply Co., with more than 220,000 customers throughout Salt Lake County, utilizes its radio-linked network to dispatch servicemen and to provide them with up-to-date information about their accounts.

An IBM Series/1 minicomputer linked to the fuel company's IBM 3081 mainframe can send information to an average of 65 service trucks in the field. That data is received by Motorola, Inc. D-1118A terminals equipped with Motorola VP100 printers installed next to the truck's driver's seat.

"We have IBM emulation on the control unit. The minicomputer talks to the terminals and printers in the field, and they access information off the host as if they were [IBM] 3270 terminals," explained John Child, Mountain Fuel's supervisor of distributed data processing. "We are able to provide the serviceman and the customer with any information that would be provided by a 3270 terminal in the office."

The system gives work orders to the service representative assigned to each neighborhood and monitors assignments to make sure no one is overbooked.

In one day, 4,500 calls

Cold snaps and the day after the first cold night of fall are usually hectic for the Mountain Fuel crews. That first cold night is when many people discover their furnaces' pilot lights are out. One day last winter the crews handled 4,500 calls.

Child reported that Mountain Fuel was the first utility to operate with the full system, with both terminals and printers in all trucks.

Servicemen receive their day's assignments at their area service centers in the morning. Those assignments, as well as emergency calls that come up during the day, are fed into the terminals by the Series/1. With a printout of their assignments, the individual servicemen can arrange their schedules as they see fit.

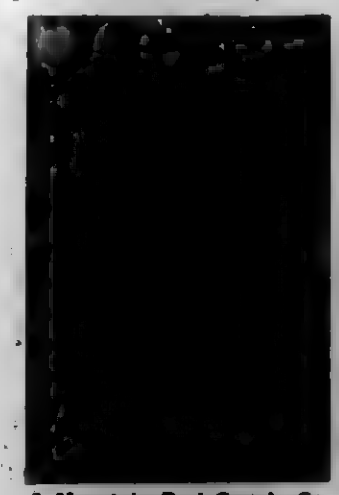
The system also tells the service representative who made the last service call to the assigned address what was done, when it was done and whether there are any other service calls, such as a disconnect or reconnect order, scheduled.

"Being able to assign servicemen automatically is only part of it. The real value is in being able to get at the customer data base. We have the ability to access information on a real-time basis, which helps the serviceman and also satisfies customers by giving them all of the information that they need from just one company employee. It stops duplication," Child said.

The terminals and the mini provide comparative billing information, with safeguards that bar servicemen from access accounts that aren't assigned to them.

"If while he is out there checking on a gas leak the customer says, 'How come

See FUEL, page 48



A Mountain Fuel Supply Co. representative checks a printout from the mobile printer in his service vehicle to check his next assignment.

A MINICOMPUTER NETWORK CAN INCREASE YOUR PRODUCTIVITY OR YOUR PHONE BILLS.

Most companies experience the same thing when they start tying remote terminals to their minicomputer.

Much higher phone bills.

But now there's an inexpensive solution to that costly problem: The new Codex 6002 Intelligent Network Processor.

This low-cost multiplexer will save you money even if you're using as few as two terminals. The 6002 boosts operating efficiency, reduces the number of needed lines and protects data from errors due to line disturbances. And it can handle any mix of up to 16 asychronous "terminals", including graphics terminals, word processors and personal computers from virtually any manufacturer.

Plus, only with the 6002 can you add asychronous equipment without worrying if your multiplexer is compatible or not. So not only will it save you money now, but also later as your network grows and grows.

The Codex 6002 Intelligent Network Processor. It's just one of our many products that enable minicomputer users to develop and efficiently manage a growing network.

To learn more about the 6002, call 1-800-821-7700, ext. 892. Or write: Codex Corporation, Dept. 707-92, 20 Cabot Boulevard, Mansfield, MA 02048.

Boscom to open in '85 with international high-tech forum

BOSTON — Boscom, the computer and communications marketplace on this city's renovated Commonwealth Pier, will officially open May 28, 1985, when it hosts the International Congress on Information and Office Management, an event that its organizers predict will bring together an estimated 5,000 professionals from more than 20 domestic and foreign professional associations.

When it becomes fully operational in mid-1985, the one-million-sq-ft Boscom facility will feature permanent showrooms and exhibition space, meeting rooms, videoconferencing facilities, hospitality centers and restaurants, according to a spokesman.

The steering committee for the International Congress on Information and Office Management held a teleconference in January to discuss seminar subjects and guest speakers.

Professional associations that make up the steering committee for the forum include the Administrative Management Society, the American Society of Association Executives, the Association of Legal Administrators, the Data Processing Management Association, the Institute of Administrative Management, the Society of Office Automation Professionals, Geyer-McAllister Publications, Inc. and the National Business Education Association.

Additional information on the office management conference can be obtained from Boscom, which is located at Commonwealth Pier, Boston, Mass. 02210.

FUEL from page 47

my bill is running twice as much as last year?' the serviceman can look up how much was used and is being used. He might find out that the bill is actually the same, or he might find that it is indeed higher. Then he can suggest what steps the person might take, such as insulating the attic," Child said.

The servicemen typically handle gas service connections and disconnections, gas leaks and emergency safety service on appliances.

As a security precaution, the servicemen logoff the system every time they leave their trucks.

The system has been operating for five years. "When we put it together five years ago, we were about the only ones doing it. I know other companies have tried it since with mixed success," Child added.

Quick payoff

"We figured it would take about four years to pay off. But it actually came in a little sooner." He noted that Mountain Fuel has an advantage over other companies in that it has to contend with no labor unions.

The Series/1, with an IBM EDX operating system and software written by Mountain Fuel's programmers, and the truck-mounted equipment cost $300,000. Child said it costs the company about $7,000 to add the terminal and printer to a truck.

Savings have come from the company's minimizing overtime costs, with the system providing better coordination of calls, and from avoiding increased staffing, as the same number of representatives are handling up to 30% more customers than five years ago.

Child said those service representatives took a "we'll see" attitude when the system was introduced. "Now they won't work without it."

He reported that the previous system required servicemen to radio their dispatchers if they needed service histories for an address and that the dispatcher then had to call up the account on a terminal.

"The system has probably done an even better job than we anticipated when we put it in," he concluded.

R&D had certain requirements that had to be met; manufacturing, accounting and marketing had others. Then microcomputers started showing up on desktops, with modems and printers here and there. Now you face the task of making it all work together. Sharing resources. Sharing information. And making more effective use of the information processing equipment you've already invested in.

NET/ONE LEAVES YOU IN CONTROL OF EQUIPMENT DECISIONS.

Net/One® is a general purpose communications system that turns equipment from different vendors into a fully functional, fast, powerful, information processing network. Because it can connect equipment from virtually any vendor, you remain free to choose equipment based on capability, rather than compatibility.

Off the shelf, Net/One supports industry-standard equipment interfaces—Async, Bisync, SDLC, through RS-232, V.35, RS-449 and IEEE-488 — as well as many high speed parallel interfaces. The list is expanding every month. But if you have special equipment that isn't in that list, Net/One is the only local area network that's fully programmable at every level so special interface protocols can be added now, or when you need them, later.

BROADBAND, BASEBAND, OR ANY COMBINATION THEREOF. YOU CALL THE SHOTS ON MEDIA, TOO.

Net/One is the only local communications system that gives you the option of broadband or baseband or a combination of both, with architecture that will allow you to add other media such as fiber optics in the near future.

YOU DON'T HAVE TO KNOW EXACTLY WHERE YOU'RE GOING TO BUY A NETWORK THAT WILL GET YOU THERE.

Everything about Net/One has been designed to respond to your needs, as they evolve, and to remain fully adaptable to evolving communications technology. System architecture is completely modular, so it can grow at the

System helps firm keep track of employment records

WILMINGTON, Del. — Invention often is born of necessity. At least that is how the Human Relations Department of Hercules, Inc. developed a cost-effective computer-assisted retrieval system to store and retrieve employment records for its home office personnel.

As part of a major campaign to increase office productivity, Hercules, a chemical manufacturer based here, decided to install communications, energy and word processing equipment in its new headquarters building, four blocks from the firm's old headquarters. As part of the move, which took place last June, management mandated that anyone moving into the new building had to leave his paper files behind.

"We had talked about adopting microfilm for our personnel file for about five years," H. Lloyd Jennings, who was manager of Personnel Information Systems, said. "The relocation to the new building furnished us with the time and place to make the change."

Jennings decided on computer-assisted retrieval. But his file size and volume did not justify the installation of a dedicated mini or even the extra programming necessary to put the microfilm file's index on the company's IBM mainframe.

The only computer equipment available to him was the company's new Wang Laboratories, Inc. VS 100 word processing system. Jennings determined that the Wang system would be suitable for the microfilm index storage; only a little programming was necessary to protect the security of the index and to extract data from the mainframe.

The programming was handled by Jenning's then-assistant, Joan Maloney, and was done in Wang's Glossary language; employee names and Social Security numbers were extracted from the payroll program in the mainframe, saving several days of data entry time. This was done over telephone lines, and the whole process took about a week, Maloney said.

This information became the basic index for personnel files. As documents were microfilmed, their roll- and frame-number addresses were added to the index.

However, because the Wang file was limited to about 120 screens, the index had to be spread out over several files. To locate a particular file, an operator punches in the first letter of the name needed, and the program locates the correct file automatically, Maloney said.

Kodak microfilmer

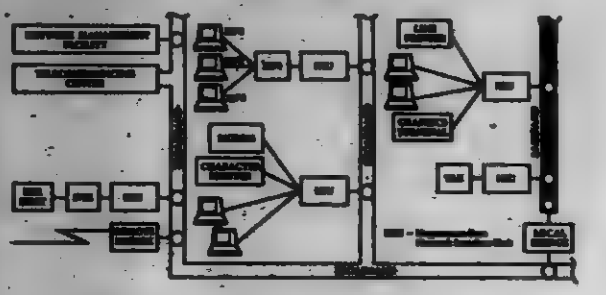
The choice of the micrographics equipment also was based on need and was narrowed down to Kodak Corp. Because the department receives only 50 to 75 documents a week for filming, a Kodak Starfile RV-3 microfilmer was selected. A more automated microfilmer would have been an expensive extravagance, according to Jennings.

An intelligent Kodak IMT-150 microimage terminal with built-in printing capabilities was installed last fall for retrieval of the document images created by the Starfile RV-3. It is automated for fast retrieval using the roll- and frame-number index stored on the word processing system and can store up to two dozen search requests. Paper copies of the images also are made in the microimage terminal for distribution to requesters.

"We complied with management's mandate by cutting our document storage space from 22 file cabinets occupying 64 square feet of floor space to 23 rolls of microfilm that fit into part of one file drawer," Jennings said. "We also get the advantages of computer-assisted retrieval at a budget price by using equipment that is already available and carefully matching new equipment to our needs."

same time and in the same direction you do. Regardless of the direction that turns out to be.

When separate divisions within a company or a campus need to share resources, one Net/One system can be bridged to others, and to remote networks. These bridges can interconnect baseband, broadband, or Net/One systems that include both. And like vendor independence and media independence, this bridging capability is available now from Ungermann-Bass.



NOW, THE IMPORTANT DIFFERENCE BETWEEN TALKING A GREAT NETWORK AND DELIVERING ONE.

We've been installing Net/One since July of 1980. Hundreds of our systems are already out there moving information for people like Control Data, Caltech, Fairchild, ITT, RCA, Boston University, U.S. Forest Service, and Ford Aerospace.

So we can do more than talk about what you need in a local area network. We can actually deliver one, now. And we can refer you to a long list of customers who are actually using one (or two or three) now.

Let's talk about how to turn the equipment you have, now—whatever it is—into the network you want, now. And the network that can take you wherever you want to go from here. Net/One.

Ungermann-Bass, Inc., 2560 Mission College Boulevard, Santa Clara, California 95050. Telephone (408) 496-0111.

AIM announces speakers for May 7 meet

ARLINGTON, Va. — The Associated Information Managers (AIM) has announced speakers to address this year's annual meeting, "Coping With Chaos: Information Management in a Rapidly Changing Environment," which will be held May 7-9 at the Hyatt Regency Crystal City here.

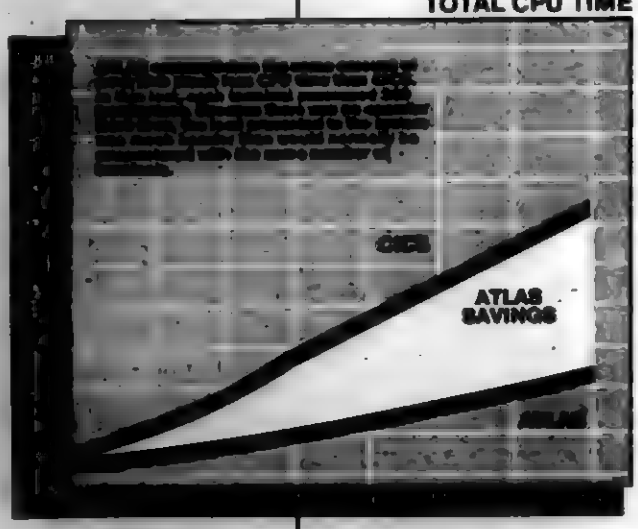
Representatives from the University of Southern California; Peat, Marwick Mitchell & Co.; Handy Associates; Blount, Inc.; King Research, Inc.; Maxima Corp.; American Equipment Lessors; Stauffer Chemical Co.; and Warner-Eddison Associates will speak.

Registration fees for the conference are $325 for members and $425 for nonmembers on or before April 2; registration fees after April 2 are $375 for members and $475 for nonmembers.

A one-day preconference program called "AIM University" will be held May 7 and will focus on implementing a business plan, managing human resources and information budgeting and evaluation. The fee for AIM University is $75 for members and $100 for nonmembers.

More information is available from Associated Information Managers, Suite 4706, 1776 E. Jefferson St., Rockville, Md. 20770.

IF YOU KNOW RAMIS II, YOU'LL UNDERSTAND WHY ATLAS™ BEATS CICS!



With the same combination of innovative technology and practical features that has made RAMIS II the leading fourth-generation language, Mathematica introduces ATLAS: a new high-performance data communications monitor.

Under test conditions, ATLAS supported eleven terminals with the same average response time as a single terminal under CICS.

CICS/VS is a registered trademark of International Business Machines Corp.

ATLAS PUTS YOU A GENERATION AHEAD

ATLAS inaugurates a whole new generation in data communications software. Because CICS and other traditional monitors were initially developed in the late 1960s and early 1970s, they incorporated functions like "pseudo-tasking" to compensate for deficiencies in the operating systems then in use. Today, those functions remain and they impose layers of overhead to burden your computer—unless you use ATLAS.

Designed for the 1980s and beyond, ATLAS is the first monitor to truly unlock the power of IBM's 4300 series computers and DOS/VSE operating system. The result is more productive application development, high reliability, and drastically reduced systems programming demands. But most of all, dramatically improved performance.

TEST ATLAS YOURSELF

In a recent test, ATLAS outperformed CICS/VS by more than 2 to 1 in both elapsed time and CPU time. And the heavier the load, the better ATLAS performed.

To find out exactly what the next generation in data communications can mean to your organization, try the ATLAS performance test on your computer. Whether you use ATLAS alone or together with RAMIS II, you will be able to support more terminals, improve response time, and get more work done in the rest of your DOS/VSE partitions.

To arrange a free trial or for more information, contact your local Mathematica office, call toll free (800) 257-5171, or return the coupon below.

Afcom meet scheduled for May 30

LAS VEGAS — "Bridging the Gap Between Computer Operations and Systems Development" will be the topic of the keynote address at the fourth annual operations conference of the Association for Computer Operations Managers (Afcom), which will be held here May 30-June 1.

The keynote address will be given by Edward Roeske, author of *The Data Factory: Data Center Operations and Systems Development.* The conference agenda includes 11 sessions addressing areas of computer operations, such as disaster recovery planning, automated tape library systems and automated documentation.

In addition, according to Afcom, the conference will feature informal discussion groups and a trade show geared to operations concerns.

Registration fees for the fourth annual operations conference, which will be held at the Sahara Hotel, are $580 for Afcom members and $645 for all others.

More information is available from Afcom, which is located at Suite 201, 11501 Brookhurst, Garden Grove, Calif. 92640.

Meet to cover logistics software

WELLESLEY, Mass. — A conference on computer software applications in transportation and logistics management for company managers, software developers and researchers will be held here May 31-June 1 at Babson College.

Conducted by Babson's Office of Sponsored Research, the conference will provide a forum for the business, high-tech and academic communities to exchange ideas on problems related to using logistical software in management decision making.

Scheduled to speak are William McKenna of Ford Motor Co., Robert Camp of Xerox Corp., Yosef Sheffi of MIT and Stella Dafermis of Brown University.

Registration, due May 24, is $250, including meals and program materials.

More information is available from the Director of Sponsored Research, Babson College, Wellesley, Mass. 01257.

What three letters represent the most powerful on-line computer in business today?

TX

The most powerful on-line

Time was, the answer to the previous page was as easy as ABC.

But that was yesterday.

Today, the world of business computing is being introduced to a system featuring over two-and-a-half times the performance and twice the price/performance of its nearest competitor.

A versatile system. Able to compile the information of the largest corporations into a single relational data base. Instantaneously updated and fully available across the entire system.

An expandable and compatible system. Allowing the simple addition of future programs and equipment, without sacrificing past investments.

And most importantly, a system that won't let you down. Because its fault-tolerant design won't let itself down. Even if a major component fails.

This system isn't from IBM.

It's from Tandem.

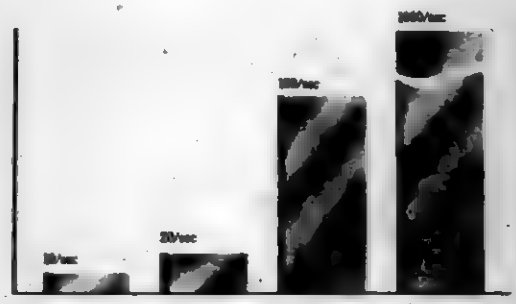
Introducing the NonStop TXP™ system.

TXP: 32-bit transaction processing.

The TXP system processes high volume loads faster and more economically than any other system. Executing over 100 transactions per second now and thousands of transactions in the near future.

It's built around multiple parallel 32-bit processors. Each addressing 16 MB of physical memory and over a gigabyte of virtual memory.

To help memory keep pace with that kind of processing, TXP pulls 64 bits on each memory access.



Our success can be summed up in a second.
Transactions per second. Numbers unsurpassed in the industry. On-line systems that fit your needs today. And tomorrow. With more processing power on the way.

The TXP system also features parallel data paths. Manipulating 32 bits of information in a single cycle, two 16-bit operations in the same cycle.

And TXP incorporates extensive pipelining, to process multiple instructions simultaneously. Each processor overlaps instructions in three levels: Fetching one, while preprocessing a second, while executing a third.

While helping TXP deliver full 32-bit power, for less.

Cache memory pays off in faster response times.

Cache memory is a high-speed data storage area between the processor and main memory. It lets the processor store more frequently used information closer. So it can get to it faster.

And our tests have shown that the TXP cache memory has a 98% "hit rate." Which means the requested data is virtually always nearby for fast access.

The result? Larger volumes of work can be processed in shorter amounts of time. Helping TXP to be even more productive.

Making cache memory pay big dividends.

A system you'll expand, not disband.

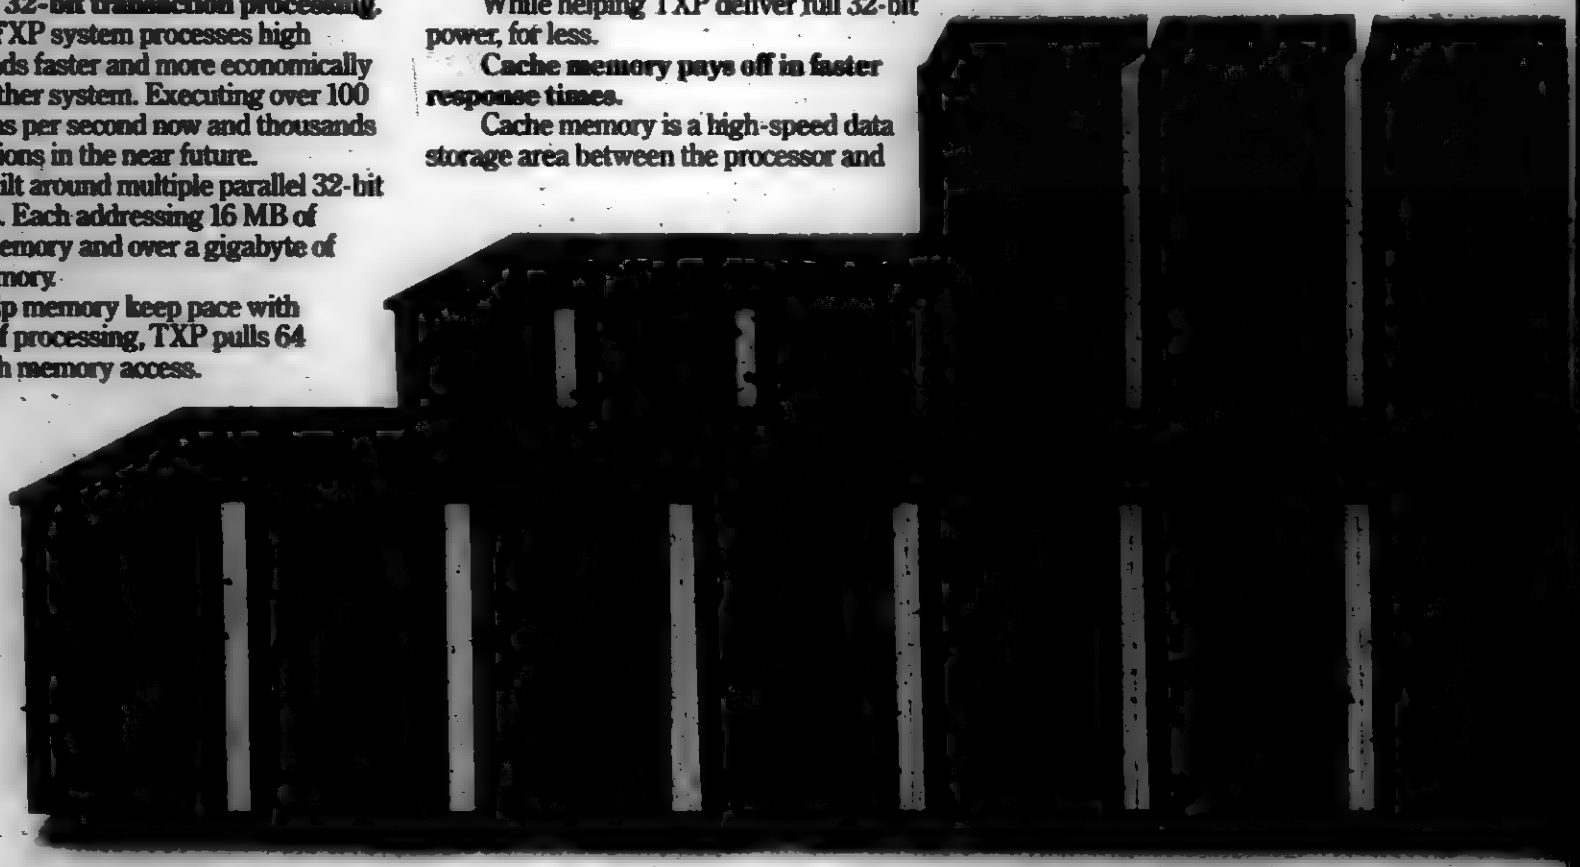
Most computer systems have very limited expandability. So if a company outgrows its computer's capacity, it usually means starting again from scratch.

Selecting and buying a larger and more expensive system.

Then reprogramming.

Then re-training.

Plus all the chaotic disruption and



XP

computer in business today.

massive loss of revenue that's unavoidable during the switch-over.

Not so with the TXP system.

It can expand from two to 16 processors. Increasing its power by a factor of eight.

That's more power than any of the largest mainframes.

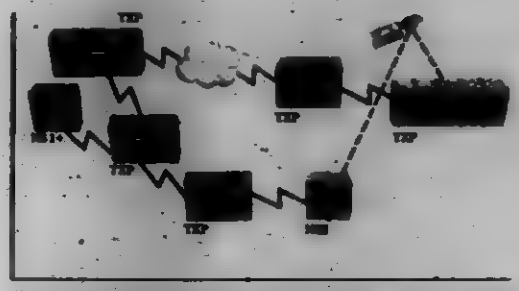
And the additional processors can be installed while TXP is running at full speed. No downtime. No reprogramming.

Still not enough power? Up to 14 TXP systems can be joined together by high-speed fiber optics. Linking the systems together as one computer with 224 processors.

But that still isn't the full potential of the TXP.

TXP systems at up to 255 sites can be joined in a worldwide network. Generating the power of over 4,000 processors.

And that gives TXP the most powerful on-line computer capacity in business.



The most powerful computer network in business today. *Users access a single unified global data base from any of thousands of terminals anywhere in the system.*

Expandability our competition wishes they could disband.

NonStop™ system compatibility from the people who started it all.

TXP can process more information and support more programs, users and devices than any other computer designed for on-line transaction processing.

Devices you most likely already have.

Even devices made by IBM.

But what if your company isn't quite ready for the TXP system's awesome power?

We suggest the Tandem NonStop II™ system. The second most powerful on-line computer in business today. The cost effective solution for medium to large corporations.

What if your company is somewhere between a Nonstop II and a TXP?

No problem. They can be combined. They can share the same data and programs. In fact, NonStop II and TXP processors can coexist in the same cabinets.

And what if your company needs even a smaller computer? We make a smaller computer. The Tandem NonStop 1+ system. Perfect for those low-volume sites where less processing power is needed.

Tandem literally wrote the book on NonStop™ transaction processing. That's because we introduced the first NonStop system.

Over eight years ago.

And for over eight straight years, despite attempts by others, we've continued to lead the industry.

Learn all about TXP, ASAP.

For complete literature, contact your local Tandem Sales Office.

Or write Tandem Computers Incorporated, 19333 Vallco Parkway, Cupertino, California 95014.

Or call us, toll-free. (800) 482-6336.

TXP is the most powerful on-line computer in business today.

Without question.

TANDEM

Anatomy of an automation

Committee picks manufacturing control system

KENSINGTON, Conn. — You are a small manufacturer of large machine tools who is still scheduling and controlling manufacturing with pencil-and-paper methods. You know you need to automate your administrative systems. In order to improve the work flow through the factory, you are going to have to shorten lead times, reduce inventories and eliminate costly last-minute shortages.

The bottom line: You know you must install an electronic production control system right now.

But with the proliferation of minicomputers, microcomputers and mainframes, where do you turn?

To the uninitiated, the babble of bits and bytes is a language of confusion. But it is all part of the problem that faced Donald T. Benson, president of Goss & DeLeeuw Machine Co. here. Like any good executive, his solution was to form a committee, but this time the committee was different.

The committee consisted of only two people: John R. Abell, special assistant to the president and assistant secretary, and Ronald E. Kerner, a Goss & DeLeeuw toolmaker whose hobby was computers. Abell, who had 36 years' experience with the company, knew administrative requirements and manufacturing procedures intimately, and Kerner, who, while pursing his degree, had studied computer design and programming for 10 years and had built his own computer, provided the electronics background.

That balance of company experience and computer knowledge was complemented by the fact that two people working together, answering directly to the president, can accomplish more than a large group that is groping for leadership. The two have since become the company's data processing department, with Kerner moving from shop to office as DP coordinator.

"We were primarily looking for a manufacturing system. We didn't want to do any accounting at the outset," Kerner said. "We wanted a packaged, on-line, real-time interactive system that could be adapted to our company without too many changes. So while hardware was important to our decision, software was the determining factor."

One other factor was important. The two-man committee specified that both software and hardware be provided by the same vendor in order to keep the in-house DP group to a minimum. The committee recommended that the company should be willing to alter its forms and procedures to utilize the software in its present form, thereby minimizing the requirements for programmers.

Kerner drew up a flowchart showing the company's needs, and four of the 12 vendors with whom he and Abell talked had systems that could meet those needs with their own applications programs.

They determined that NCR Corp.'s Interactive Manufacturing Control System II (IMCS II) most closely fit the company's requirements. The NCR representative recommended that it be run on an NCR 8410 computer, which was the smallest and least costly of the 8400 series of computers. However, as Goss & DeLeeuw's computing needs increased, the 8410 could be upgraded with more memory and speed by adding circuit boards. Changes in the computer would be transparent to the programming.

Once the computer system was installed, the first activity was to build an inventory of all parts in stock, including data on cost, selling price and numbers, with about 7,000 active parts in stockroom inventory and several thousand in general plant inventory.

"Many of our field people knew parts by their existing numbers, so we wanted to keep them the same if possible," Abell said. "It was simple to adapt our existing part numbering system to the data processing system. We just picked them up, adding zeroes where necessary to fill them out to the five digits our program requires."

Completion of the item master file had an immediate effect on the customer service department. "We need to know parts availabilities and prices to answer the questions," said Pete Steffick, customer service manager. "When we used to get a telephone inquiry, we would run to the stockroom to check on immediate parts availability, then to the front office to

See NEEDS page 56

One of seven computer terminals on the system operated by Goss & DeLeeuw is located in the parts stockroom. The stockroom cycle counts active inventory. The most recent physical count was 99.4% accurate with the inventory report.

BECOME A VSAM EXPERT.

SysEd's new 5-day VSAM course will make you a VSAM expert. You'll not only learn how VSAM works, but *how to make it work well*, and what to do if things go wrong. Even if you're already using VSAM, you'll gain a better understanding of its capabilities and flexibility . . . like how to select among the options VSAM offers for configuring data sets, both batch and on-line.

Our hands-on case study instruction begins the very first day. You'll write and test three real-life programs and use Access Method Services on our own 4341/II computer. There are eight 3270 terminals dedicated to the class. You'll receive individual attention from our experienced teachers, and you'll want to bring your actual programming and debugging problems to class.

SysEd's VSAM course contains the most up-to-the-minute information available anywhere, including the latest features and capabilities of VSAM, and is in line with state-of-the-art hardware.

SysEd courses are held weekly and on weekends at our training centers in New York City, Chicago, San Francisco and Dallas. On-site courses at your own computer installation are also available. *Classes are limited.* For early enrollment or more information call Dave Shapiro (212) 889-3386.

FAILURE TO READ THIS AD COULD BE HAZARDOUS TO YOUR WEALTH.

You already know the frustrations inherent to your job. It's time you heard about the rewards.

Your expertise has put you in a position to take advantage of an opportunity that not too many people have in their lifetime.

To be your own boss. To call your own shots. To control your own future.

And that's what we're offering you at The Software Place.

Perhaps the finest retail source of business and personal software now expanding in selected markets across the nation, The Software Place is part of a segment that analysts project will more than double in sales each year to $2.9 billion by 1988.

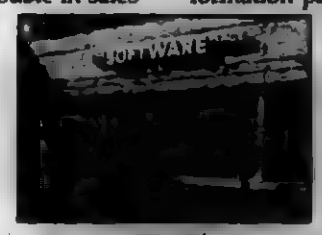
And you can be a part of it as an owner/manager of your own store.

Franchise opportunities are now available to qualified individuals with $50,000 liquid capital and the ability to obtain $110,000 additional financing.

In return, you'll receive one of the most comprehensive franchise programs in the industry. A program that analyzes your market area to determine the most advantageous site for your Software Place store and then goes on to take you through store opening and beyond. Including ongoing technical support that continues throughout the life of the store.

Give us a call. If you meet the requisites outlined in this ad, we'll send you our complete information package, including our videotaped presentation.

We think you'll find that it contains a wealth of information.



THE SOFTWARE PLACE™

8701 North MoPac Blvd, Suite 165 Austin, Texas 78759 512 343-0414

ADDS Viewpoint/Color from your point of view.

EVEN BOSSES NEED A LITTLE COLOR.

Right out of the box, the new ADDS Viewpoint/Color brings extra clarity and comprehension to any business application. Bosses like that.

They also will like the ergonomically designed detachable keyboard with its separate key cluster for numeric entry and cursor control. And the display screen which tilts from a minus 5° to a plus 15° and swivels a full 360° for comfortable viewing.

But should only a boss deserve color?

The full-featured ADDS Viewpoint/Color costs less than many monochrome terminals so there's no reason not to let color improve your communications company-wide. That makes nine good reasons to buy ADDS Viewpoint/Color terminals. Red, blue, green, yellow, cyan, magenta, white, black and price.

IT ALL ADDS UP.

ADDS

A Subsidiary of NCR Corporation
100 Marcus Blvd., Hauppauge, New York 11788

NEEDS from page 54

check prices. This all happened while the customer waited on the phone. One thing about it — all of that running around kept us in good physical shape."

Now that the inventory is available through a computer terminal on his desk, Steffick can be keying in parts numbers while he is talking to the customer. When the request is entered, the screen shows parts availabilities and prices, and Steffick can answer the customer's questions immediately.

"It saves a lot of time and effort and eliminates errors in pricing," he said. "If the system goes down, I have to go back to the old way, and I don't want to do that."

Next to go on the system were bills of materials.

"This is the critical cornerstone in our manufacturing system," Kerner said. "However, it's been a slow process getting the data base entered. Before we can enter any bill of materials, we need to clean it up — making sure all of the parts numbers are correct and all bills are properly structured and modularized."

A major problem is that almost every Goss & DeLeeuw machine is built to customer specifications; thus, almost every machine is custom designed. That means a great number of bills of materials — each with its own slight difference from the others — has to be checked and entered.

As the bills of materials are completed, the parts numbers are cross-indexed by the computer to compile a where-used listing. Now, engineers can cross-reference any parts number at any time. If the configuration of a part on any bill of materials should be changed, the engineering department can immediately check all other bills of materials in which that part is used to determine how the change affects the entire line of products. All of this information is available either on the terminal screen or on a paper printout.

Data on all of the items in the inventory and bills of materials can be retrieved by parts number. However, Kerner also has developed programming to retrieve the data by generic key words, using a natural-language program.

Automation of bills of materials has speeded machine specification for the engineering department, Kerner noted. It formerly took about one-half day to find and check out the bill of materials for a new machine order. Now, it takes 15 minutes.

Order processing, one of the earliest IMCS II modules to be installed, has been adapted to two different types of orders: parts orders, which are handled by the customer service department, and machine orders, usually handled by the office of the president.

Parts orders, when keyed into the computer, are sent to the stockroom computer terminal. When the parts are picked and packed, an acknowledgment is sent to the computer, which then prints shipping documents and labels. The day after shipment is made, the computer prints the invoices.

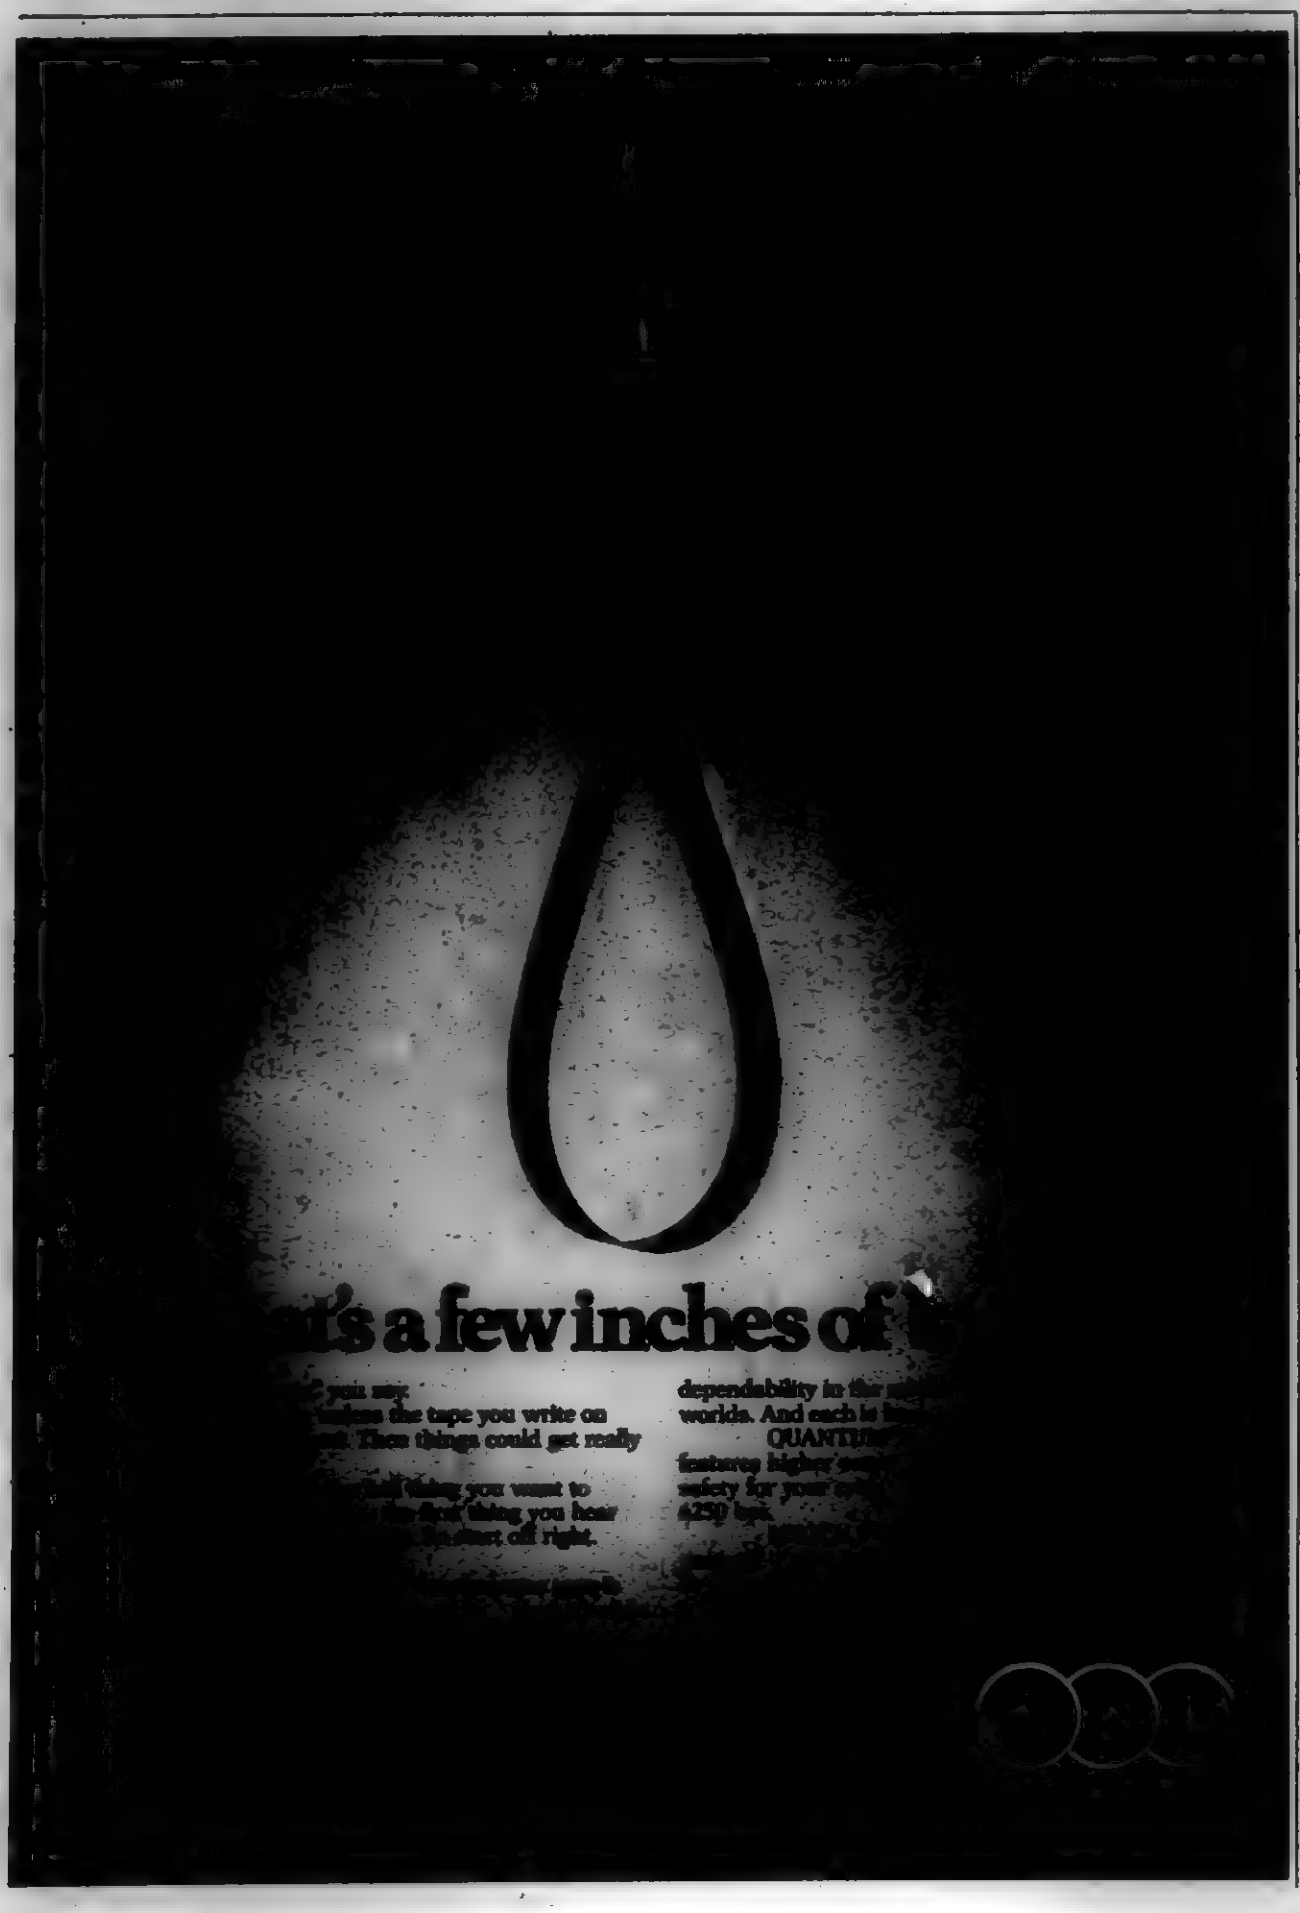
Time savings

"Because it's so automatic, the order processing program has saved huge amounts of time," Abell said. "With partial shipments, we used to type the information eight or nine times. Now, we only enter it once and let the computer do the rest."

New machine orders are configured directly from the customer's purchase order onto a computer-prepared machine specification sheet. This becomes the bill of materials for that specific customer's machine. A shop order is generated from which the computer will order parts, prepare pick lists, issue shortage lists, prepare shop orders and eventually ship and bill.

"To date, we only have three of the seven modules of IMCS II up and running," Kerner said. "Our slowdown was caused by our own need to correct and update all bills of materials."

Five terminals were originally installed for the computer system: a master terminal in the DP department, a second unit shared by customer service and engineering, a third terminal in the order entry department, a fourth in the factory production control department and the fifth unit in the stockroom. Since then, two more terminals have been added.



NEWS

Manufacturing system helps firm control growth

STOUGHTON, Mass. — Vansetti Systems, Inc., a Mass.-based high-technology firm, last fall shipped its first $200,000 laser inspector to Texas Instruments, Inc., where it is used to identify and repair solder defects in printed-circuit boards. The shipment represented years of product development for the growing firm, and the investment is already paying dividends — Vansetti's sales went from $1.7 million in 1982 to $2.6 million last year.

The company added 15 employees in 1983 and now has a payroll of 75. As much as these numbers indicate a positive future for the company, they foreshadow a problem common to rapidly expanding firms: Could Vansetti's managers control this growth?

The 15-year-old firm, located here in a 25,000-sq-ft plant, anticipated this need well in advance, and early in 1983, Vansetti hired a financial analyst to choose a computerized control system for both production and accounting requirements.

The manual reporting procedures then in use were slowing down manufacture and sale of the company's industrial temperature control devices, as well as its Laser/Inspect product, a combined laser and infrared detector that eliminates visual inspection of printed-circuit boards. Vansetti incorporates state-of-the-art infrared radiation, fiber-optic and laser technologies to manufacture these electronic controls, which range in price from $3,000 to over $200,000.

Increase efficiency

Michael Dostoomian joined Vansetti a year ago as financial analyst and systems manager with specific instructions to select a computer system that would increase the efficiency of the company's manufacturing and financial reporting operations.

After a selection process that began last fall with 14 firms, Vansetti selected the FM/3000 productivity system developed by Computer Solutions, Inc. of Burlington, Mass.

The financial, manufacturing and inventory control system combines Hewlett-Packard Co. HP 3000 minicomputers with Computer Solutions-developed productivity software.

Vansetti expects complete pay back of the $110,000 system in less than three years. "Previously, we were facing an eventual increase in our staff of at least four people at an annual cost of $60,000," he said. Dostoomian estimates that within a year two employees would have been added to the accounting department, another salesman and another person for inventory control.

He decided the best approach to automating Vansetti's production and accounting procedures was to coordinate a number of the company's operations. He reviewed each department's needs, developed a request for proposal addressing those needs and then held a tour for vendors.

Vendors submitted responses to a series of yes or no questions from each department as to whether a particular service could be provided. After reviewing the 14 proposals with various department heads, they narrowed down the list of vendors to three finalists. Before making a final decision, Vansetti officials visited a number of sites where the three systems were in use.

The software programs of FM/3000 are menu-driven and include financial and manufacturing functions, such as general ledger, accounts payable, accounts receivable, materials requirements planning and inventory control.

Noting the company's expansion of on-hand and on-order inventory, Dostoomian said control of parts inventory for the company's products is critical to on-time client delivery.

One-Two Punch!

Charles River Data Systems OEM super microcomputers just keep leapfrogging the competition. Now it's a knockout combination of operating systems: UNIX System V on one hand, and real-time UNOS on the other.

UNIX System V for Development

Derived from AT&T-licensed UNIX System V, our new UN/System V includes a full set of UNIX development tools, Bell license, Berkeley extensions, access to UNIX application programs, and support for Fortran, RM/COBOL, C, Pascal, BASIC, and Unify relational database.

UNOS for Real-Time/Run-Time

UNOS, our proprietary UNIX-compatible operating system, has real-time capabilities that UNIX can't offer. Capabilities, like eventcount synchronization, priority scheduling, and enhanced file system reliability, that are essential in industrial and scientific applications. And application programs written using UN/System V run under UNOS without modification and without a UNIX license, a saving that OEMs can pass on to customers.

Plus 32-Bit Power

UN/System V and UNOS run on our Universe 68 family of computers. They are true super micros, with a 32-bit, 12.5MHz 68000 processor, a second 68000 front-end processor, 32-bit 4Kb cache, 32-bit bus, up to 5Mb of 32-bit RAM, high-capacity disk drives, and 1.25 MIPS performance. Quantity-one OEM prices start under $10,000.

For more on UN/System V, UNOS, and Universe 68 computers, return coupon to Charles River Data Systems, 983 Concord St., Framingham, MA 01701. Or call (617) 626-1000.

PBX seminar set for May 2-3

NEW YORK — A two-day seminar on "Office PBXs: Crucial User Issues in Voice and Data Integration" will be held May 2-3 at the Plaza Hotel here by Probe Research, Inc.

The seminar will focus on communications standards, wiring the facility, shared tenant services and influence on industry structure.

The seminar registration fee is $795 for each attendee and $695 for each additional registrant from the same organization.

More information is available from Probe Research, Box 590, Morristown, N.J. 07960.

OA users' views topic of Syntopican XII

Scheduled for July 17-21 at Chicago's McCormick Place

CHICAGO — User viewpoints on office automation will be the focus of the Syntopican XII conference, which will be held at McCormick Place here July 17-21.

The conference, which is sponsored by the Association of Information Systems Professionals (Aisp), will have as its theme "Communicating Information: People, Systems, Networks."

According to the sponsor of the conference, the conference is designed to give attendees a closer look at the theory and practice of office automation.

During the "User Applications and Perspectives" session, Henry C. Ancona, manager of office and information systems marketing for Digital Equipment Corp., will speak on "The Payoff in OA and Personal Computing."

Ed Odisho, a senior systems analyst for the National Aeronautics and Space Administration, will moderate a panel on "Implementing Integrated Office Information Systems" at the conference.

In addition to this, a forum titled "Realizing Automation: User Views on Vendor Integration" will be moderated by Jean Green Dorsey, deputy director of MIS for the city of New York.

Three case studies in systems communications and compatibility will be presented at the Aisp-sponsored conference by Carolyn Giovannini, director of office automation for the New Jersey State Department of Community Affairs.

Registration fees for Syntopican XII are $275 for Aisp members and $350 for others.

Aisp Conference Services is located at 1015 N. York Road, Willow Grove, Pa. 19090.

CONDOR
on-line programming that reaches new heights in productivity

To get the most from your IBM mainframe, you need CONDOR – a reliable, easy-to-use, high-performance system that soars above the rest through improved programmer productivity and low resource consumption. CONDOR's highly efficient processing methods and I/O facility improve system response time and can substantially expand the capacity of your CPU while minimizing personnel requirements.

You can write and edit programs with CONDOR and submit them for compile or execution. You can view and modify data from input and output queues, release or cancel jobs, and spool output to local and remote printers.

CONDOR's built-in library management system automatically reorganizes as you process for optimum conservation of disk space. In addition to offering stringent security against unauthorized access and supporting multiple versions, it provides detailed audit reports and program cross-referencing – both batch and on-line.

Boosting productivity even more, CONDOR's own high-level interactive programming language lets you create programs and JCL in a fraction of the time required with other languages. And a powerful set of interactive utilities makes system maintenance a breeze.

CONDOR operates standalone or as a task under CICS and the other major TP monitors to give you total flexibility, and it supports DOS/VS(E) and MVS operating systems for versatility and upgrading capabilities.

No wonder respondents to a recent Datapro survey rated CONDOR tops in reliability, efficiency, ease of use, ease of installation, support, and realized financial savings.

So for a system that out-performs the others and gives you complete control of all your data processing, choose CONDOR. Call for a free trial. You'll be glad you made the right choice.

For more information contact Phoenix Computer Corporation, 11949 Jefferson Boulevard, Culver City, California 90230. Toll-free (800) 255-5049 or (213) 827-4500 in California.

Graphics group seeks students to help at meet

ANAHEIM, Calif. — The National Computer Graphics Association is looking for student volunteers for its annual conference, which will be held at the Anaheim Convention Center here May 13-17.

Volunteers are needed to answer phones, assist registrants, monitor sessions, deliver messages and assist with light clerical work. In return, the organization offers benefits packages that may include, depending on the amount of work performed, free registration to tutorials and technical sessions and admission to the exhibition.

More information is available from the National Computer Graphics Association, Suite 601, 8401 Arlington Blvd., Fairfax, Va. 22031.

AI symposium to begin Aug. 6 at university

AUSTIN, Texas — Artificial intelligence will be the subject of a national conference to be held here Aug. 6-10 at the University of Texas by the American Association for Artificial Intelligence (AAAI) and the university's departments of mathematics and computer sciences.

The conference will feature seminars, exhibits and panel discussions to examine the latest developments in the field.

Sessions on social, philosophical and economic issues influencing artificial intelligence in the U.S. and abroad will also be offered at the conference.

Prior to June 18, conference registration fees are $100 for AAAI members, $140 for nonmembers. Prior to July 18, registration fees are $130 for members and $165 for nonmembers.

Further information is available from AAAI, which is located at 445 Burgess Drive, Menlo Park, Calif. 94025.

NEWS

Radar parts builder goes on-line to track shop floor

EL SEGUNDO, Calif. — A Hughes Aircraft Co. radar parts manufacturing division here found it needed something better than radar to keep track of its parts.

Hughes' Radar Systems Group's manufacturing division turned to an on-line shop floor control system based on a Tandem Computers, Inc. Non Stop II system with Epic Computer Products, Inc. Data Collection Equipment terminals and controllers to provide information about each manufacturing part to be used in the production of radar systems for the U.S. armed forces F-14, F-15 and F-18 jet fighters.

The considerable task of integrating the Tandem system into the Epic data collection front end and IBM IMS data base manager was accomplished relatively quickly, according to Kenneth Dalgleish, head of user training in publications and development.

Dalgleish noted that a complete Cobol rewrite of some existing software and much new software was required to enable the Tandem system to transfer data between the shop floor and the IMS system on the existing IBM mainframe. Despite the size of the job, the Tandem Non Stop II system, with 8M bytes of main memory and 900M bytes on disk, was installed in November 1982 and was operational two months later.

Nonstop service

Dalgleish said that the automated shop floor control system is in service seven days a week, 24 hours a day, making the fault tolerance of the Tandem Non Stop architecture a critical feature of the data collection operation.

Hughes Aircraft's shop floor control system is used for several data collection applications to improve scheduling and manufacturing control. It also provides cumulative data needed for strategic planning on the IMS system in the Radar Systems Group's manufacturing division.

Dispatchers and assembly line workers can track the location of all parts throughout the factory, while managers use the data on a cumulative basis for weekly planning reports. Because information about every part in the manufacturing process — from the time a part is ordered to the time it leaves the shop — is now constantly available to shop floor people, managers are better able to prevent the production of defective parts.

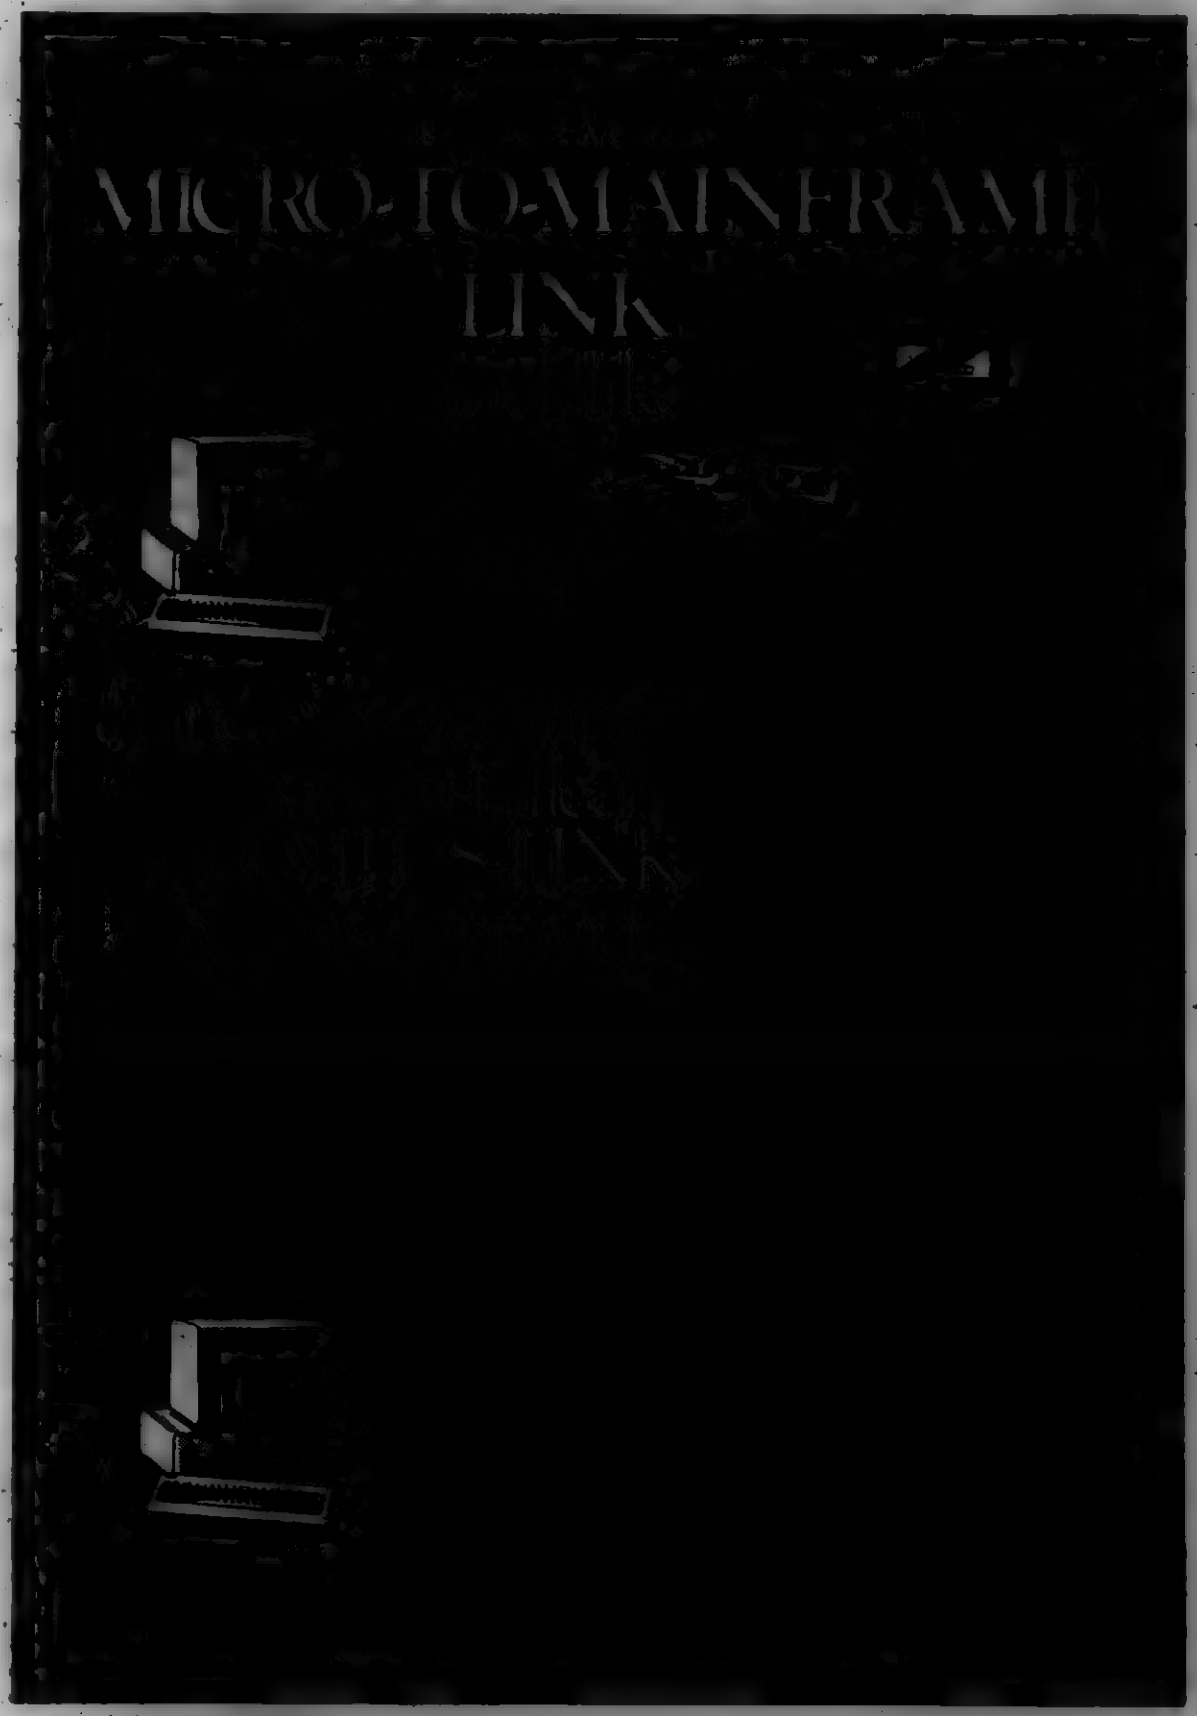
By improving the shop floor control program through increased knowledge of each part, either on the assembly line or in the fabrication process, managers also can improve the company's material requirements planning (MRP) to monitor and control the manufacturing process.

Operators who used to move parts — antennas, receivers, transmitters, power supplies or programmable computers — through the radar system production line press a function key on their terminals to access an assembly mode. Employees enter their names and the identification numbers of the parts to be moved within the factory. Using Epic's bar code wand reader, they can scan a menu of specific factory assembly locations. Information is transferred to the terminal, and the operator then physically moves the part to the desired location.

Assembly workers and dispatchers can input data into any of 90 terminals on the shop floor and then send this data through communications lines to a system control unit, which formats the transactions and forwards them to the Tandem system. The shop floor control system tracks the location of all tools on loan to the shop floor from the central warehouse. It also monitors employees' hours by scanning badges.

Because most contracts for producing radar systems are negotiated with the federal government, Hughes must record accurate information on itemized labor costs for hourly employees. Within a five-year period, the Radar Systems Group expects to integrate a network of 900 terminals to improve monitoring, quality control testing and any necessary rework to manufactured parts, Dalgleish said.

The group plans to expand the system's data communications capabilities so that the Operating Systems Department, which handles business systems applications, can send data to and receive data from the Computer-Aided Manufacturing (CAM) Department, which controls all the design and test data bases as they enter manufacturing from Radar Systems Engineering Design divisions. A second Tandem Non Stop II node currently resides in the CAM Department.



NEWS

Order processing system ties Toyota dealers worldwide

NAGOYA, Japan — Success brings problems peculiar to itself. Having gained a competitive position in the worldwide automobile market, Toyota Motor Sales U.S.A., Inc. here found that it needed to exert itself to maintain its place. With spare-parts stock levels on the increase and with an expanding worldwide customer service network, Toyota was in need of an order processing system accessible to Toyota branches and dealers throughout the world.

Major factors that Toyota's management considered were the requirement to reduce the time and cost of data captire and the need to simplify the processing of invoices. A computer-based, international order service system was needed.

Working closely with Toyota's Data Systems Department, General Electric Information Services Co. (Geisco) provided an international order service system that allows Toyota's branches on every continent to use a worldwide teleprocessing network for ordering spare parts and new vehicles directly from corporate headquarters in Japan.

Two of the companies involved are Toyota Germany, with its headquarters in Cologne, West Germany, and Ernst Frey oHG, Toyota's agent in Austria, with its head office in Vienna.

Supplies 1,000 dealers

More than 300 people work in the West German branch of Toyota, with departments for training, new vehicle marketing, customer service, administration and the central spare-parts store, which supplies spares to some 1,000 dealers located throughout West Germany. In total, 65,000 parts are held in inventory ready for immediate delivery to stores.

"Our larger authorized dealers, with their own spare-parts centers, are supplied with terminals that they use to send us the correct details when ordering spares," said Gunter Kirberg, head of operations and data processing for the West German branch. "Our own data processing department combines this information with details from our smaller dealers, and the parts needed are automatically booked out of the warehouses. Spares are dispatched the same day."

The current store's inventory is the basis on which the orders are compiled, and once the details have been entered into the local system, the orders are sent through Geisco's Mark III teleprocessing network. Ordering covers several thousand parts each month. In the other direction, order confirmations and invoices are received from Nagoya through the system.

A recent enhancement to the spares ordering system was the inclusion of new vehicle ordering. Previously, new vehicles were ordered via telefax, and advice notes from the works in Japan did not indicate the chassis numbers. Shipping notices now include the chassis numbers and are transmitted over the Mark III network. As Toyota handles about 5,000 vehicles every month, this part of the system is concerned with allocating vehicles to specific orders and entering the details on the local records.

"We now have totally accurate data handling and confirmation, and we have eliminated the errors that arose in the manual system," Kirberg said. The data is also more useful because it is more up to date, and the ordering process has also been simplified, he said.

'Useful extension'

"I think the system is a useful extension of our internal data processing resources and consider it to be especially important to the overall efficiency of our business," Kirberg concluded.

Because the spare-parts order entry system was already in use in West Germany, it was possible to expand it to include Austria without having to develop a completely new system. Frey, chief importer for Austria of Toyota and Bridgestone products, has its headquarters in Vienna and is currently the focal point for 200 appointed dealers throughout Austria.

The central stock of spares is housed in a modern, three-story warehouse, which covers an area of 48,000 square feet and holds 45,000 different items. Four thousand orders comprising some 30,000 items are handled every month. The volume of items and the amount of information involved eventually burst the seams of Frey's old ordering system.

Previous practice was to compile the proposed monthly spares order and then feed the order into the local data processing system, after which the orders themselves were airmailed to Toyota headquarters in Japan.

With the central data input and processing system in Nagoya, this meant that national organizations would receive acknowledgements and order confirmations about 12 weeks later, together with invoices, a reject list and a list of all technical modifications.

Long turnaround time

This long turnaround time on order acknowledgements was caused by the order data being sent monthly to Nagoya by mail for further processing. The information was then sent on a monthly schedule back to Vienna after additional data processing took place.

The uncertain time lag in the order scheduling and the consequent need for high stock levels led Frey to participate in the order processing system developed by Toyota and Geisco.

The orders submitted by dealers are now collected at the Vienna headquarters. The information is then entered and transmitted via the Geisco teleprocessing network to Toyota's Nagoya headquarters for further processing, with no need to send orders physically.

INTRODUCING KIE-3682
THE INTELLIGENT CHOICE

Today the intelligent Datapoint® user is demanding the KIE-3682. Why?. . .Because of the performance, economy and the service. Some of the standard features of the KIE-3682 are self diagnostics upon power up, printing from the screen directly to a serial printer, and displaying all control codes passed to the terminal. The KIE-3682 recognizes all DATABUS® software commands, and also enables the user to take advantage of Datapoint's® 5 function keys. An on site service contract is available through Western Union. The KIE-3682 carries a full 12 month factory warranty.

With all of the performance, economy and service, you can see why the intelligent Datapoint® user relies on the KIE-3682. Call today for more information, and be sure to ask about our 30 day, no risk plan.

Introducing The Masters.

The world's only series of reusable software for application program development.

The Masters are the very first—and the only—integrated series of reusable software productivity tools which support the entire applications software development cycle.

The development of the Masters is based on the fact that only 20 per cent of any given program is application-specific. Approximately 60 percent of each program is comprised of logic structures common to all programs, and the remaining 20 percent of any given program is comprised of generic—or non-application-specific—functions.

The Masters automatically generate these common program functions throughout the program's life cycle.

The result. The Masters automate up to 80% of the program development process. And cut development costs by 80% while increasing productivity by up to 400%.

Unheard of? Yes. But not for long.

Now available in the Masters series are:

PrograMaster System

The PrograMaster System exploits the fact that application program functions are repetitive. These functions are organized and easily accessible to the developer so that they may be used to produce new application software.

PrograMaster™ produces this software in structured, documented COBOL source code for IBM OS or DOS batch processing environments. PrograMaster/OL™ integrates the screen functions of PrograMaster/SG™ and builds complete source IMS DB/DC™ COBOL on-line applications. Integrating the reusable portions of systems so that the entire application can be produced from standard structured designs, logic structures, program modules and source code.

Imagine. Between 60 and 100 percent of the code needed to develop the new application is provided by the PrograMaster system. You'll receive a fully structured, documented COBOL source program. Complete and tested.

Further, program quality improves due to highly structured, efficient code. And testing new programs becomes a predictable, manageable process.

PrograMaster/SG™

PrograMaster/SG is the screen generator portion of the program. It simplifies the design and coding of screens used in on-line applications. Through a simple painting process, screens are created in minutes. Automatically.

ManageMaster™

ManageMaster gives management the control it needs with data processing. ManageMaster lets you control the libraries of both your batch and on-line systems. It updates you on changes in the programs, monitors and cross-references files, and provides an extensive documentation system of the source code library.

With ManageMaster, you have the control you need right where you need it. At your fingertips.

Add it all up and you can improve productivity 15 percent in the design phase, 100 percent in the implementation phase, and 150 percent or more in the maintenance phase.

And also give programmers and analysts the freedom to spend more time on the creative aspects of development, and give MIS and data processing managers greater control over the methods by which application programs are implemented and maintained.

There's a whole lot more we can tell you about our unique Masters series. Information that you can't afford to be without. All you have to do is fill out and mail the coupon. Or call 617-924-0052.

I never want to begin at the beginning again.
Tell me more about the Masters.

MVS training offered

NAPERVILLE, Ill. — Deltak, Inc. has introduced three training series for applications programmers, systems programmers and data processing managers who work with MVS.

"The Impact of MVS/XA," a two-course video series, covers enhancements to the MVS/SP operating system as introduced with MVS/SP Version 2 (MVS/XA) and describes four project phases for moving to MVS/XA.

The second multimedia course, "MVS/SP Catalogues," is for applications programmers, system programmers and other individuals who will be creating and updating MVS/SP catalogues.

The five-unit "MVS/SP-JES2" multimedia training course explains how to respond to hardware and software errors, prepare for and perform an initial program load, handle special IPL and system dump procedures and monitor mass storage, according to Deltak.

The courses are available for an average rental of $50 to $125 a month per course, depending on volume.

Courses also are available for purchase at $1,750 each. More information is available from Deltak, Inc., East/West Technological Center, 1751 W. Diehl Road, Naperville, Ill. 60566.

Local nets for micros subject of summer seminar in six cities

MINNEAPOLIS — "Personal Computer Local Networks," a two-day seminar sponsored by Architecture Technology Corp. here, will be held in six cities in June and July.

The seminar will discuss techniques and issues for connecting and installing networks and software, the sponsor said.

Software and important trends will also be explored, according to the sponsor.

The seminar will be held in Chicago, June 4-5; Minneapolis, June 6-7; Washington, D.C., June 13-14; San Diego, June 18-19; Boston, June 28-29; and San Francisco, July 11-12.

The seminar costs $645, the sponsor said.

Architecture Technology Corp. can be reached through P.O. Box 24344, Minneapolis, Minn. 55424.

Booklet details product entries, market changes

PENNSAUKEN, N.J. — Auerbach Publishers, Inc. has launched a newsletter, "Datagram," that will be available free of charge to subscribers of the company's *Microworld*, *Data World* and *Electronic Office* publications.

The purpose of the newsletter is to give subscribers "up-to-the-minute coverage of new products or significant changes and improvements" in the computer industry, according to a company spokesman. The six-page newsletter will be published "as often as necessary" to cover major announcements in the industry.

Datagram will include critical evaluations of hardware and software products, the spokesman said. The newsletter also can be accessed through Newsnet, Inc.'s Newsnet online information retrieval service.

More information is available from Auerbach Publishers, Inc., 6560 N. Park Drive, Pennsauken, N.J. 08109.

Handbook on local nets to be revised

MINNEAPOLIS — The 1984 revised edition of Architecture Technology Corp.'s *Localnetter Designer's Handbook* will be available in late April. The 550-page handbook will consist of local network product summaries, design issue summaries and design guidelines, along with a special section on IBM.

This year's edition of the handbook will cost $65 ($80 outside the U.S.) if ordered by March 15. Orders after that date will be priced at $77 each ($93 outside the U.S.).

The price of the 1983 edition after the discount-buying deadline was $65. The handbook is available from Architecture Technology Corp., P.O. Box 24344, Minneapolis, Minn. 55424.

A growth market.

The kids of today are the real growth market of tomorrow. They are the doctors and nurses, the engineers and scientists, the teachers and journalists, the leaders who will create tomorrow's prosperity.

It will take your company's help to assure these children a first-rate college education because today colleges are having a hard time coping with the high costs of learning.

Invest in the future of America by giving to the college of your choice.

You'll be making an investment in the leading growth market of America. And you couldn't ask for a better investment than that.

Send for our free booklet: "Guidelines – How to Develop an Effective Program of Corporate Support for Higher Education." Write CFAE, 680 Fifth Avenue, New York, NY 10019.

Invest in the future of America. Give to the college of your choice.

Shrimp processor's system stresses fast turnaround

BRUNSWICK, Ga. — Between the time a shrimper hauls in his nets and the moment a chef serves a shrimp cocktail delicacy, a metamorphosis takes place in the seafood industry. Frozen seafood processors such as King Shrimp Co., based here, utilize basic process-manufacturing techniques similar to other food companies. The raw seafood is received, graded out to size, prepared, processed, packaged, frozen and stored.

Because shrimp and other seafood are more perishable than most foods, the U.S. Food and Drug Administration has set strict standards on the processing of seafood. No more than 20 minutes is allowed for seafood to remain off ice during processing. This short lead time forces King Shrimp and other food processing companies to plan for fast inventory turnaround. When a company such as King Shrimp processes 40,000 pounds of perishable seafood a day in a highly dynamic processing environment, efficient materials control is essential. The problem most food processing companies have, according to Robert M. Duncan, manufacturing resources planning (MRP) project manager for King Shrimp, is that the "commonly accepted bill of material has a foreign flavor."

King Shrimp does not manufacture discrete items into subassemblies and assemblies, as do the discrete manufacturers. Instead, as pounds of raw material flow down fixed production lines, several manufacturing processes can be performed. This means that for the bill of material to be useful to King Shrimp or any food processor, it must do more than just tie discrete items together — it must also tie processes together.

Like many companies, King Shrimp had built its automated information system piece by piece, without any long-range plan. This approach limited the ability of King Shrimp's DP department to support the continued growth of the company. An inflexible system design, untimely reporting due to batch processing and the use of an IBM System/3 Model 12 computer became serious problems.

In 1980, King Shrimp management established an organization that was responsible for overcoming these problems and providing the company with an information system to support expected growth. The project was named Oasis, for One Accurate Simple Information System.

The Oasis project team chose Martin Marietta Data Systems, Inc.'s online MAS manufacturing control system, with a Hewlett-Packard Co. HP 3000 computer as the base, for a solution called the by-product bill of materials.

The by-product bill can specify an unlimited number of output items from a production work order, regardless of the number of input components. Every task in the by-product bill of materials grades and inspects for uniformity of the seafood products; nonuniform materials for one seafood product will be processed for another product. Thus, one lot of shrimp may be processed into six by-products.

Planning for by-products makes obsolete the standard processing philosophy, "If the produced item is not what was intended, rework it or scrap it." Unlike scrap, the by-product can have a greater value than the intended primary product. To King Shrimp, the only zero-valued scrap are the shrimp shells; almost everything else is a usable, valuable by-product. In simple terms, Duncan said, the bottom-line benefit of planning for by-product materials is, "If you don't plan for them, they're a liability — if you do plan for them, they're an asset."

Employees at King Shrimp work to meet their 20-minute processing time limit.

CALENDAR

WEEK OF APRIL 22

APRIL 25-27, COLUMBUS, OHIO — Data Communications Systems. Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

APRIL 25-27, SAN FRANCISCO — Data Base Management Systems: A Comparative Analysis of General-Purpose Systems. Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 25-27, BALTIMORE — Local-Area Networks. Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

APRIL 25-27, BOSTON — Computer Awareness: Basic Concepts, Capabilities and Terminology. Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 25-27, NEW BRUNSWICK, N.J. — Network Communications Protocols. Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

APRIL 25-27, CHICAGO — Computer Operations: Effective Production Scheduling and Control. Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 25-27, SAN FRANCISCO — Personal Computers and Networking. Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

APRIL 25-27, ORLANDO, FLA. — PC Introduction. Contact: Harris Education Center, 6220 S. Orange Blossom Trail, Orlando, Fla. 32809.

APRIL 26, CLEVELAND — A Rational Approach to Relational and Decision Support Systems. Contact: Lynn Kolenich, Coopers & Lybrand, 2800 National City Center, Cleveland, Ohio 44114. Also being held April 27 in Boston.

APRIL 26-27, DENVER — Data Communications: Advanced Concepts, Products and Services. Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 26-27, SAN FRANCISCO — Computer Networks: Protocols, Standards and Capabilities. Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 26-27, BOSTON — Business Aspects of Data Communications. Contact: The American Institute for Professional Education, Carnegie Building, 100 Kings Road, Madison, N.J. 07940.

WEEK OF APRIL 29

APRIL 29-MAY 2, PHOENIX — Personal Computing: Productivity Tool for Business. Contact: Diane Testa, International Data Corp., 5 Speen St., Framingham, Mass. 01701.

APRIL 29-MAY 2, SAN FRANCISCO — The 1984 North American Society for Corporate Planning (NASCP) Conference: "From Steel to Silicon." Contact: NASCP, P.O. Box 1288, 300 Arcade Sq., Dayton, Ohio 45402.

APRIL 29-MAY 2, CLEVELAND — Association for Systems Management (ASM) Annual Conference. Contact: Richard B. McCafrey, ASM, 24587 Bagley Road, Cleveland, Ohio 44138.

APRIL 29-MAY 3, SAN DIEGO — Electronic Printing Systems/Directions in Digital Imaging Conference. Contact: Dunn Technology, Inc., 759 E. Vista Way, Vista, Calif. 92083.

APRIL 29-MAY 4, ARLINGTON, VA. — The International Society for Optical Engineering (Spie) Technical Symposium East 1984 and Instrument Exhibit. Contact: Spie, P.O. Box 10, Bellingham, Wash. 98227.

APRIL 30, PHILADELPHIA — Custom Software Systems for Rehab Facilities. Contact: Management Information Systems, National Easter Seal Society, 2023 W. Ogden Ave., Chicago, Ill. 60612.

APRIL 30, NEW YORK — Introduction to the IBM PC. Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

We wrote the book on portability. In nine different languages.

To every software developer who'd written off portability as an impossible dream, Digital Research humbly announces a few monumental breakthroughs.

We not only offer languages that are portable from 8 to 16 to the 32-bit chips of the future, they're portable across all popular operating systems, too. What's more, we supply the broadest range of quality languages and development tools available today. And will tomorrow.

So rest assured. Whether you design applications at a major corporation, plan to become a major corporation or just qualify as a hobbyist, you only have to write it once.

Simply pick the Digital Research language that's right for you. From Personal BASIC™ to Digital Research FORTRAN-77.™ The newest member of our remarkable family.

To complement languages, we offer a complete workshop of development tools. Our Display Manager™ and Access Manager™ simplify the design of screen displays and data bases. So you spend less time and effort.

If you write in COBOL, our Animator™ source level debugger will get your software running in record time.

And for programmers skilled with IBM mainframe SPF, we offer micro/SPF.™ An editor that helps turn your invaluable experience into valuable new software applications.

At Digital Research, we work as hard for you after the sale as we do to get the sale. With backup like quality documentation, software updates and a phone line to our technical support team.

With so much productivity and service to draw on, it's small wonder IBM chose our languages for its IBM® PC, XT and the new IBM 3270/PC.

For more information, call your IBM representative. Or, for the Digital Research retailer nearest you, call 800-227-1617, ext. 400. In California, 800-772-3545, ext. 400.

Announcing the birth of the *Personal* Information Center™— a new concept in intelligent data access for your company's end users. And you're invited to a FREE, half-day Seminar to learn all about this innovative *first* from Informatics.

At this free Seminar you'll see how the *Personal* Information Center can help you:

- Manage and control the confusing proliferation of hardware and software in your Information Center.
- Integrate your Information Center with today's mainstream DP and IBM® Personal Computer tools.

But that's only the beginning. At the Seminar there will be a lively discussion of such vital Information Center issues as...

- Selecting appropriate hardware and software for your users' needs.
- Offering immediate versus deferred processing.
- Using production data bases or duplicating files.
- Balancing unlimited data access with system security concerns.

The Seminar will also address the entire issue of the micro-mainframe connection, and many more topics of immediate interest to data professionals like you.

Plus, we will introduce Informatics up-to-the-minute solutions to your Information Center needs, including reporting and inquiry systems and micro-mainframe integration tools.

The *free* Personal Information Center Seminar is being offered in or near your city. But attendance is limited. So, mail the coupon or call toll free today to reserve your place at this valuable *free* Seminar.

Pre-register for the *free* Personal Information Center Seminar and get a free bonus. We'll send you a reprint of the *Computerworld* article, "The Micro/Mainframe Link," by Merritt Lutz.

Mail this coupon or call toll free...

Political football out of bounds

The political football known as export control was kicked out of bounds by President Reagan's recent order giving the U.S. Department of Defense selective export license review of high-technology shipments to many of our allies [CW, April 2].

National security interests notwithstanding, that sort of control clearly should not reside in the hands of military strategists. In this case, the proper bureau is the U.S. Department of Commerce or, because of the poor job Commerce has done in this area in the past, the U.S. Customs Service.

The military will take too parochial a view in deciding the propriety of export license applications, likely assuming a conservative posture that does not always recognize the legitimate concerns and needs of U.S. manufacturers, not to mention the needs of our allies. Defense has in the past demonstrated a knack for ignoring such legitimate concerns. Consider, for example, 1981, when it stonewalled efforts of U.S. manufacturers to sell pipeline equipment to the Soviets for a line that would carry oil to Western Europe.

But the real problem at hand is not direct Defense intervention into trade matters. The real problem is congressional policy or, to be more specific, its absence. In this year, as in other election years, Congress remains a house conveniently divided on several key issues, one being the renewal of the Export Administration Act, which governs exportation of potentially strategic products and materials.

In effect, the president has seized an opportunity presented by the ongoing differences between the House and Senate to ensure that sensitive U.S. high technology stays out of the hands of the Eastern bloc. The president, no doubt, garnered more support for his order with several recent arrests of individuals trying to smuggle computers and computer-making equipment into the East.

Computerworld has always maintained that shipments of computers that can be plugged into military applications should be restricted. But shipments to whom? Our allies? And who or what agency should decide what needs to be restricted?

By this Friday, April 13, the House and Senate are supposed to hammer out the differences between their versions of the Export Administration Act. The compromise — if, indeed, one is reached (the Export Administration Act expired last September) — must somehow straddle the fine line between protection of our technology and protection of our commercial interests.

Both the House and Senate versions of the Export Administration Act recognize that it is futile to place strict export controls on goods that are readily available from non-U.S. sources. But a key difference between the two bills is the Senate's inclusion of a greater Defense role in the review of export licenses.

Not only will congressional passage of this feature lead to more costly delays for license approvals, but it will also place too much control in the wrong hands. Defense's track record in matters such as these speaks for itself.

LETTERS

Cartoon is entertaining, but it places Fortune under wrong light

The cartoon alongside the article "Reorganization seen way of life for micro makers" [CW, Feb. 13], featuring a crocodile ascending toward five computer companies, is entertaining but, at least in one significant sense, incorrect.

Fortune Systems Corp. does not belong in the group of hapless, soon-to-be-devoured computer companies any more than any of the most established companies in the business does. We at Fortune do not spend our days outrunning creditors for several good reasons. To begin with, there is little company debt. As of Dec. 31, we had over $53 million in our bank accounts, and we have adopted a strongly conservative fiscal policy at the company.

In addition, Fortune is committed to a strong product program and currently assigns over 15% of annual revenues to research and development of our products. Our customer base is solid and growing fast.

We understand that the perception of Fortune's misfortunes has in recent months outrun the reality of the situation, and we are correcting those impressions.

We seem to be succeeding in correcting the impressions: Industry analysts and the trade press are now seeing the error of including Fortune as a member of the unlucky group.

James S. Campbell
President
Fortune Systems Corp.

Computerworld welcomes letters from its readers. Preference will be given to typed, double-spaced letters of 150 words or less; they may be edited for the purposes of clarity and brevity.

Letters should be addressed to Editor, Computerworld, Box 880, 375 Cochituate Road, Framingham, Mass. 01701.

MIS and a state-of-the-art environment

THE DATA CENTER
John P. Murray

The use of available technology, both hardware and software, to snowplow MIS concerns, the installation and subsequent aggressive use of data base management systems, of fourth-generation programming languages and information centers are not only valid concepts, they are necessary if MIS is to realize its potential.

While the benefits that can be obtained from the effective, aggressive use of state-of-the-art technology are many, moving to that environment and maintaining that environment are time-consuming, frustrating and, of course, expensive propositions.

In spite of these considerations, the continuous pursuit of a state-of-the-art environment is not only a most desirable goal, but also a necessary one. The eventual success or failure of the organization may rest upon the determination of the organization's MIS management to move to and then to maintain the state-of-the-art environment.

Indeed, in some organizations, this will be a massive task; in some organizations, it may be too late to make the transition successfully. It is hard to say what the future holds for such organizations, but difficult times are bound to be ahead.

These situations are usually the result of failure in several areas. Organizations do not overnight fall into situations in which they become captives of obsolete technology and practices. They come to such circumstances as a result of indifference and neglect on the part of MIS management and, to varying degrees, the organization's senior management.

MIS managers should be criticized for failure to move the organization to a state-of-the-art environment, but senior management must also accept some of the responsibility, particularly in those instances in which they have been indifferent to the needs and the potential of MIS. MIS must work to build a state-of-the-art case; senior management should listen and should support the effort.

Sooner or later, the issue of the expense associated with the development of the state of the art will arise. Moving to a state-of-the-art MIS environment is not and probably never will be inexpensive. However, there are options available, some of which are less expensive than others. It is as true with these considerations as it is with anything else that while in most cases you get no more than what you are willing to pay for, you can, as a number of organizations have discovered, get much less than you pay for. So use caution when considering the various options.

The process of movement to a state-of-the-art environment should begin with the development of a plan that assesses the current level of information processing technology within the organization and then lays out a course to reach the desired state-of-the-art level. The most ambitious, practical plan is the one that should be pushed. However, lower cost contingency plans should also be developed for consideration in the event cost becomes a paramount issue.

Employers working through Nova . . . have cut their costs dramatically. . . . Also, feedback from the employers to the college helps make the academic program more responsive to the needs of the workplace.

The best approach is to press for the ultimate plan; if that cannot be attained, go for the next level.

Beginning with the assumption that the best solution will not be approved is not a positive method to use to gain a state-of-the-art position; you never know what will happen until you try. MIS should press for whatever plan it feels is best for the organization. Cost should be a secondary issue if the results justify the expense.

The proposed state-of-the-art plan that is presented to the organization's senior management should be as comprehensive as possible. The plan must be realistic. The goals identified in the plan must be attainable. The plan itself should be developed on a phased basis; everything cannot be done at once. The use of a phased approach will reduce the pressure, and it will also help spread the cost over a longer term.

The temptation to engage in game playing, not to own up to all the known costs because of a fear of rejection, must be resisted. Of course, as progress is made, as the technology changes, unanticipated costs may arise. Such costs can be dealt with as they arise. The practice of hiding or ignoring known costs is not the way to sell the state-of-the-art venture.

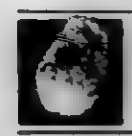
There is a definite advantage to developing the state-of-the-art plan in a comprehensive, factual manner and in addressing the issue of expense at the onset. As progress is made, the issue of the cost is almost certain to arise. Being able to go back to the original plan to demonstrate that these costs were considered and included and that the issue of cost has been handled in a candid and consistent manner not only helps increase the MIS manager's comfort level, but also adds to the credibility of MIS.

MIS management must become aware of the urgency of bringing its organization to a reasonable state-of-the-art status. It must do the best it can to impress upon senior management the correctness of such an effort. In addition, the issue of the funding of the effort must be addressed. The ultimate decision, of course, rests with senior management. That decision must be made with full knowledge of the probable costs involved.

Considering the vast number of organizations that have little in the way of state-of-the-art processing and have no plans to do anything, this is an issue that will gain increasing attention in the future. The potential in many organizations is great; those who have responsibility for the information processing function should act now to get the effort under way. The funding of the effort must be addressed and resolved so the work can begin. ‡

Murray is director of management information services for Bayovac Corp., Madison, Wis., and author of Management Information Systems as a Corporate Resource, *published by Dow Jones-Irwin.*

Work/study course nurtures budding DPers



HUMAN CONNECTION
Jack Stone

Information processing centers are rapidly becoming recruitment nightmares, if not reaching a crisis level. Experienced professionals cost an arm and a leg, and there is no guarantee they will easily integrate into the current teams after coming on board. Combing campuses for juniors is very expensive, as is the inevitable follow-up training, and all too frequently, the recruitees are rejected after the trial period. The process tends to put a drain on resources, especially on the patience of the senior DP staff. There has to be a better way.

One approach that seems to be working well is that taken by Northern Virginia Community College (Nova), Alexandria, Va., where cooperative education programs in data processing — perhaps better known as work/study — operate in full swing at each of its five campuses.

The basic idea behind the program is the integration of academic work with on-the-job training. However, Nova has to an exceptional degree refined the concept:

- The college refers candidates for entry-level positions ranging from systems analysts to systems programmers and from data base managers to programmer/operators.
- The college prepares its students with a basic understanding and skills in all major programming languages.
- Various education patterns are offered: two students taking turns in a single full-time position; one student in part-time employment and part-time college; and a combination of the two.

Many advantages accrue to employers who participate with the college. For one thing, a continuous supply of temporary employees is available, most of whom can qualify for permanent status. In fact, a high percentage of students has been offered and has accepted full-time work with participating employers. Moreover, the employer can select employment candidates whose educational backgrounds meet specific requirements.

Employers working through Nova . . . have cut their costs dramatically. . . . Also, feedback from the employers to the college helps make the academic program more responsive to the needs of the workplace.

Employers working through Nova, rather than handling recruitment and training on their own, have cut their costs dramatically, because Nova handles the initial recruitment and training and refers candidates only after careful screening. Also, feedback from the employers to the college helps make the academic program more responsive to the needs of the workplace.

One of the major reasons for the success of the program is that employers must make a strong, but not unreasonable, commitment. They must recognize that the on-the-job segment of the program is intended to meet educational goals primarily and business goals secondarily. As a consequence, the employer must provide job experiences whose goals are closely coordinated with those of the academic program. To help assure the commitment, a program coordinator from the employer's staff is assigned the responsibility for student supervision and evaluation. In addition, the student must receive a salary commensurate with others in similar situations who perform similar tasks.

Nova presented a survey with impressive data: recruitment yield, that is, persons hired vs. those offered jobs, was 13 times greater for cooperative education students than for recent college graduates. Employers rated work performance of cooperative education students about comparable to that of college graduates, yet recruitment costs were about one-tenth as much. ‡

THE WAY SOME TERMINALS TAKE OVER AN OFFICE, YOU'D THINK THEY OWNED IT.

Of course, you can't blame the display terminals themselves for being big and overbearing. Most were designed to work in the not-so-crowded office of the past.

Today, things are different. You've got a lot more people and a lot more work stations. But not a lot more room.

That's exactly why we created our unassuming little 1700 monochrome display.

The 1700 couldn't crowd a person's desk if it wanted to. Its footprint is a tiny 13 x 12 inches (24% smaller than our biggest competitor's 3178).

The unassuming ITT Courier 1700 display.

Its keyboard is smaller, too—to give your operators extra elbow room.

And its smaller price gives relief to an upper management constantly being squeezed into financial corners.

Yet, even with its tiny price, our 1700 has some immensely valuable features.

Things like a high-resolution screen just as readable as a full-size 3270 screen. Diagnostics to save you troubleshooting time. Plus a head that tilts and swivels for the best possible viewing angle.

Still, the most valuable feature of our 1700 display is the small impact it has on a person's desk. And, in today's office, that can be a big comfort.

Contact your nearest ITT Courier Representative. Or call the ITT Courier Sales Support Department at 1-800-528-1400, toll-free.

Implementing contingency disaster/recovery planning

READER'S PLATFORM
Alvin Arnal

In relatively few years, the phrase "contingency disaster/recovery planning" has acquired a meaning in information processing center management. Security and disaster planning personnel and departments have increased in number at an almost phenomenal rate during the past few years. Although in many instances contingency disaster/recovery planners hardly embrace all the things that are required to be done, contingency disaster/recovery planning has so implanted itself in people's minds that it seems to be recognized by officials in industry and government as an acceptable requirement and as a necessity of everyday business.

Yet with all the recognition and acceptance of the necessity to protect vital records and computer systems, management pays little but lip service to the implementation of a contingency disaster/recovery program.

The nature of computer systems and installations varies substantially between companies and government agencies. The organization structure, and the management charter under which the computer operation and utilization operates, has an important influence on the types of security and data protection programs that are undertaken. Furthermore, the procedures and operating personnel have a direct effect on limiting or increasing the degree of complexity of the security and disaster planning activity.

What exactly is the field of contingency disaster/recovery planning? Where does it fit into the total picture of computer operations and information processing? Who is responsible for the concept, organization, design and implementation of the plan and for monitoring the plan? What does the person responsible for the program do?

First, contingency disaster/recovery planning is a top-down/bottom-up responsibility. The development of a program requires substantial support on all levels of management, that is, recognition of the problem; provision of the economic and physical resources that will enable the project to be undertaken and followed through to a conclusion; and maintenance support in monitoring and testing the plan at reasonable intervals.

Why should management be concerned about the continuity of operation of a data processing center? The answer is dependency, total and complete dependency on the capability of computer operations to perform continuously to provide daily information processing in virtually every phase of business activity — the very survival of our modern corporate structures and governmental operations dedicated to our national security. What company or government agency can return to manual operations?

Management must be involved in deciding, doing and evaluating the things to be done to protect this vital asset.

'At-risk' posture

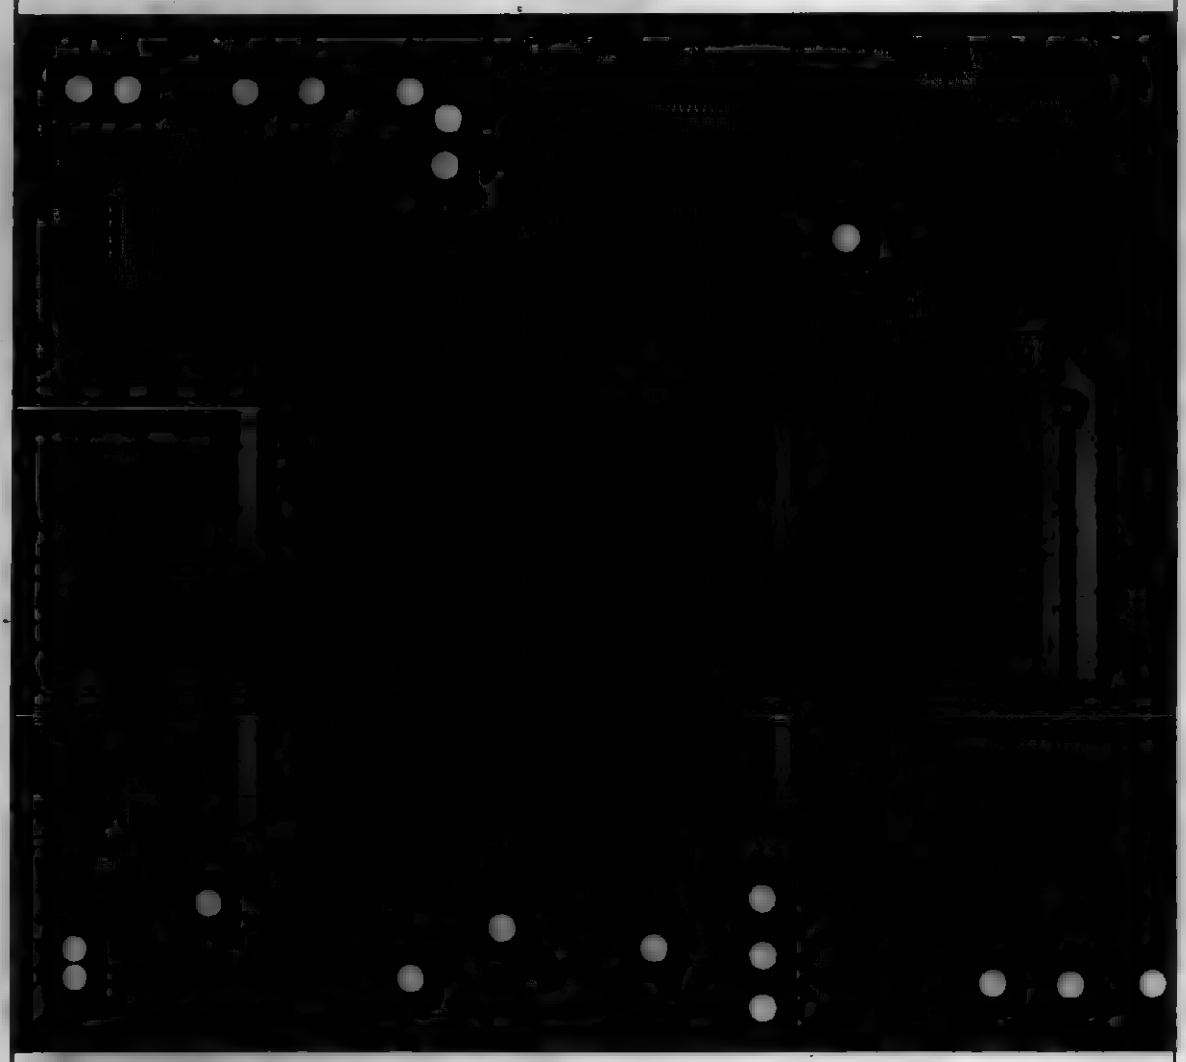
Disasters, natural or man-made, pervade the computer installation every hour of every day. What executive in today's modern business environment will accept the risk of losing his company's data base or operating system? If executives and government officials accept the fact that computer operations are the core of their survival, then why, with the capability of doing something about its protection, do they continue to accept an "at-risk posture?"

There is no magic formula or potion that, once applied, will insulate critical and sensitive computer systems from disaster. Yet it is possible to provide for, implement and manage a system that will eliminate or mitigate the potential hazards and vulnerability or, in the event of a catastrophe, provide for recovery within a reasonable and acceptable period without jeopardizing the survival of the company.

Some guidelines for contingency planning are:

- **What must be done.** This includes planning, management policy-making, establishing work objectives, identifying all user departments and operations and determining necessary servicing goals of various departments.
- **When it must be done.** Contingency planning should be done immediately. Establish the critical requirements, list and review priorities, and see that they conform to management's needs. Then program the results.
- **Who must do it.** Management must delegate authority and coordinate the work being performed. Establish the functional relationships between user departments.
- **How is the job to be done.** Develop all of the parameters, systems, procedures, methods, qualitative goals and standards.
- **What is needed to do the job.** Management must apply its efforts and financial and personal resources

TIME



Making yourself memorable.

You don't have to be a giant in the industry to attain a leadership position. Just having your name among the leaders can make a noticeable difference.

Your advertising presence in TIME Magazine can do more than gain you the attention and interest of the business community. It can position you among the major companies who already know the value of reaching greater numbers of purchasing influentials with greater visibility.

TIME's audience offers you both selectivity and reach – with the right demographic and geographic patterns for increasing your share of market as well as building awareness within the business and financial communities, and among your dealers. Being in the world's foremost news magazine puts you in the main arena. And TIME has specific demographic and geographic editions to accommodate your budget and implement your marketing strategy.

Your reputation is probably the most important element in your continued growth. Now that you're making a name for yourself in the industry, perhaps it's time to make more of your name.

To learn more about how you can use TIME and its various editions, call Charles Craig at (212) 841-2831.

VIEWPOINT

to ensure a satisfactory conclusion to the project.

■ Get the job done. Procrastination is a company's worst enemy. If all of the above is implemented, the time, effort and financial resources must be applied immediately.

■ Does what has been done make sense. Is the plan that is developed practical? Can it be implemented?

■ Is the plan complete. Can the plan be tested? Will it work?

■ Can the plan be improved. Can the plan be modified in any significant way?

■ Management must support the plan on a continual basis. The plan must get support throughout its development and after it is completed.

Approaching contingency disaster/recovery planning is no different from any other business planning activity. It involves the analysis of corporate policies, procedures, requirements, forms and equipment applied to the protection, security and maintenance of continuity of the data processing or information system.

Other corporate functions — production, marketing, finance, purchasing, industrial relations, employee protection and safety — all have objectives, and the objectives lead to plans.

Then why not contingency disaster/recovery planning for the very heart and soul of the company?

Evolutionary nature

Contingency disaster/recovery systems and plans are evolutionary in nature. As the system changes, expands and decentralizes, so does the need for new concepts and new approaches.

In light of the revolutionary nature of the computer industry, contingency disaster/recovery planning works on the system function itself and its evolutionary cycle.

The first phase of contingency disaster/recovery planning should start the day the first piece of DP equipment enters the administrative planning and control scene.

At that moment, management should recognize and introduce the planning and controls necessary to protect this precious environment. Unfortunately, management is sometimes more anxious to play with this environment than to determine how it could be hurt by it.

The second phase occurs when the corporate user community determines that it could benefit from this multifaceted benefactor. Again, sometimes the toy-like aspect of it all, rather than procedures planning and forward thinking on an organizational level, becomes important; possible future problems are overlooked or ignored.

As the enterprise continues to grow, organizing the procedures to solve the problems becomes more complex. The consequence is the constant increase in DP demands without attendance to the potential vulnerability of the system. As often happens in such a situation, the work loan increases, diminishing the availability of time on the part of operating supervisors and managers to address themselves to the growing problem. The decision is to abandon even a part-time planning procedure in favor of no planning at all.

The third cycle of abandonment comes at a time when it is important to enter the fourth phase — procrastination — in favor of establishing and applying company economic and personnel resources to expand the DP operation.

The final cycle is then set in place: the introduction of outside consultants. Again, issues of vulnerability are ignored.

The long-range information handling system plan can be achieved by applying new equipment and new technology to the solution of the data processing operation.

But the planning and design of improved MIS and data processing operations cannot be considered solely in terms of equipment, technology and mathematical techniques.

There is no alternative to not improving a company's information system. But management must address itself to the issues that will protect, secure, preserve and maintain the continuity of DP and corporate operations. ‡

VIEWPOINT

Mumps 1983 needs second look

READER'S PLATFORM
Charles Volkstorf

Standard Mumps, a general-purpose programming language, is undergoing its five-year American National Standards Institute (Ansi) revision. As a member of the canvas list, I am responsible for voting on the acceptance of the new standard, titled Draft Ansi X11.1-1983.

Since Mumps' original standardization in 1977, the Mumps Development Committee has taken two polls (in 1977 and 1980) of Mumps users and vendors. Both polls showed that the top two deficiencies of Mumps are a lack of parameter passing and block structuring. Parameter passing allows programmers to interface independently written programs without concern for variable name conflicts. Block structuring allows one to declare and access sections of code in a modular fashion. Both capabilities are almost universally available in other programming languages. Mumps 1983 includes neither.

Altogether, 14 changes were made to Mumps. Ten are simple conveniences, and two others round out the language's capabilities. The other two changes to Mumps, $ORDER and SET $PIECE, are significant additions to the language.

Nonnegative integers

Subscripts (keys to direct-access files) in 1977 Mumps are nonnegative integers (0,1,2,3, . . .). $NEXT is used to read all records with given subscript values. A value of -1 indicates the end of file. Mumps 1983 allows free-text subscripts, which would include -1. To detect the end of file, a new function, $ORDER, has been added, which performs the same functions as $NEXT, but with the empty string (zero length) as the end-of-file indicator.

Having two features that perform almost the same function confuses the issue. The existing function, $NEXT, is discarded as deadwood, while a new function, $ORDER, "is strongly encouraged in place of $NEXT." It would be simpler to use $NEXT as is. How to do this best depends on what subscripts are allowed to occur.

Here the Mumps Development Committee is inconsistent. Page I-20 refers to "negative numeric subscript values," while Page III-2 states that subscripts are "nonnegative only." In practice, negative subscripts (keys) are rarely used. Furthermore, if ever needed, they can be avoided by adding a large number to the value to convert it to a positive number before using it as a subscript. The Mumps Development Committee already limits subscripts to no more than 31 printable characters. Negative subscripts could likewise be disallowed.

Without negative subscripts, we could use $NEXT as is. We could also allow the empty string to be a subscript. Then we could compile free-text field value statistics without having to make a special check for the empty string. Programmers sometimes overlook this until the program aborts when the empty string is first encountered.

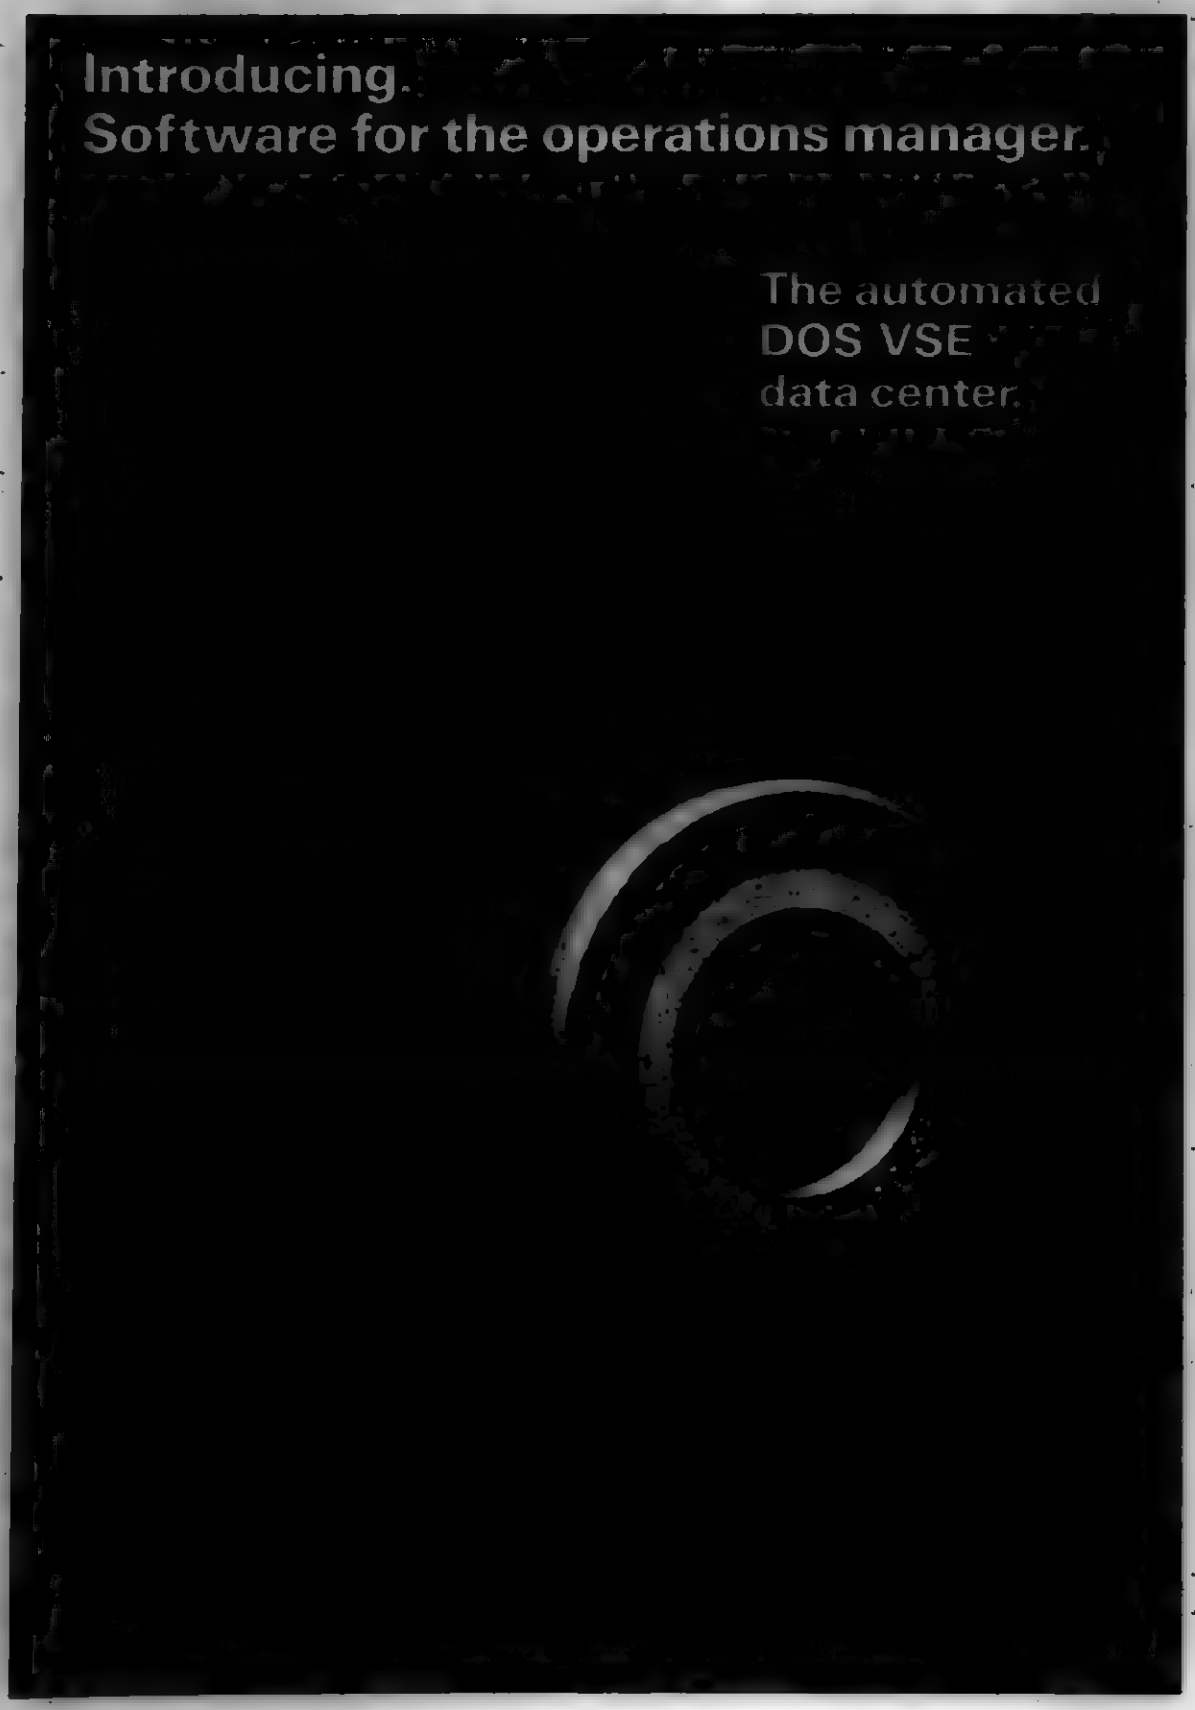
The subscript ordering scheme could also be better defined. Currently, the order is: empty string, numbers, other strings. The empty string could remain with the other strings to simplify the order: numbers, other strings.

If we do allow negative subscripts, we can still continue to use $NEXT as is. $NEXT is not actually ambiguous. When we reach -1, if the prior subscript precedes -1 and -1 is a defined subscript, then we have reached subscript -1. Otherwise, we have reached the end of file.

Alternately, we could declare, with a new command, that the end-of-file indicator for $NEXT is the empty string. We would do this just once, at the beginning of any application package, and use $NEXT throughout instead of $ORDER.

Mumps allows multiple fields to be concatenated together into one value so that they may be stored and retrieved in one file access. To allow us to change easily a single field stored this way, the syntax SET $PIECE has been introduced. However, it uses functions and arguments in a manner that does not occur anywhere else in Mumps. It is very legible because it is in the Cobol style of having an arbitrary sequence of reserved words and expressions for each construct. However, Mumps consists of a small set of well-chosen functions and operators that can be combined to perform complex operations.

The capabilities of SET $PIECE can be provided with a normal Mumps function that returns the new value after one field is changed. Simply adding another argument to $PIECE would accomplish this. This would be more general than SET $PIECE, as we could use this function in conjunction with the existing functions and operators. We could even pad fields with arbitrary characters. In 1977, the representative from Massachusetts General Hospital in Boston (where Mumps originated) identified two uses for alternate padding values: "a string of dashes" and



VIEWPOINT

"a string of alternating dashes and spaces."

This would also generally be more efficient in terms of disks. Typically, the user identifies an item, then enters new values for one or more of its fields. In this case, SET $PIECE retrieves the existing fields, alters one, then stores them back into the file. A new function would determine the new value, then store it into the file, making only one file reference instead of two.

Furthermore, SET $PIECE specifies that references to files that are not defined will use an empty string for their value. This principle is useful in tallying statistics in which the first occurrence of a value is assumed to have a total of zero without initializing it beforehand. However, SET $PIECE is changing a single field value. If the file entry is missing, it will initialize all other field values to empty strings. It should abort and be fixed.

Shorter expressions

Many of the changes to Mumps debated by the Mumps Development Committee serve only to shorten frequently used expressions.

Rather than shrinking the syntax of each reference to concatenation or $PIECE, we can make Mumps even more concise and efficient by combining multiple occurrences of these operations into one. A new function, for example, $KONCATENATE, could concatenate its arguments together. Similarly, allowing multiple piece (field) numbers in $PIECE would allow us to move several fields at once into individual program variables. (Both the piece numbers and variable names could be separated by, say, a dollar sign.) We would then be manipulating sets of values, which mathematicians call "tuples."

We could also use tuples to retrieve an interval of subscripts from a file. Then we could move sets of field values back and forth between files, local arrays and individual program variables. Using the Mumps FOR loop, we could cycle through these values, providing another solution to the $NEXT/$ORDER problem. Using the WRITE command, programmers could examine selected local arrays.

This would encourage programmers to use sets of variable names, such as NAME, DR and DEPT, rather than array references, such as P(1), P(2) and P(3), which are now easier to use, but harder to understand.

What other sets would make useful tuples? We can answer this by examining loops in existing programs to determine what sets of values programmers manipulate. To do so, I wrote a Mumps program to list out every loop in a given program and ran it against two major systems. Altogether, 414,365 characters were examined, containing 2,038 loops, one loop per 203 characters of code. These loops were manually classified. A total of 10 types of loops were detected: reads (36%), file subscripts (24%), sequential lists (13%), local array subscripts (12%), fixed sets of values (3%), string pieces (3%), sequential search (3%), fixed numeric intervals (2%), from/to intervals (1%) and individual characters (1%).

The Mumps FOR loop handles 26% of these, while the tuple proposal handles 36%, leaving the 38% READ loops.

A READ loop performs no initializing or incrementing. It only reads a value from a terminal, repeating until no more input is entered. The Mumps QUIT command terminates a FOR loop, so all we need is a FOR with no argument to loop until we QUIT, due to there being no more input. Then all 10 types of loops could be easily represented without using GOTO.

The WHILE command is useful in eliminating the GOTO command in such structured languages as Algol and Pascal. However, it eliminates only the GOTO. We still must initialize, increment and check for the end of the loop. The tuple construct, in contrast, performs all of these chores for the programmer.

It is also the case that the algorithms and data structures being utilized in a number of popular implementations of Mumps could be improved.

Integer subscripts (72% of all subscripts, by my own tally) could be stored two digits per byte, instead of one. A disk set should process independently of the program initiating it to allow the program to continue simultaneously. The disk queue should be processed in the order of the blocks on the disk, rather than in the random order in which the requests occur, to eliminate most of the seek time. Each disk drive should have its own queue to allow all drives to be active simultaneously. Mumps should be totally compiled, except for the .6% that is execution and indirection, rather than semicompiling all of it.

A thorough examination of 1977 Mumps, 1983 Mumps and the deliberations of the Mumps Development Committee shows the following:

- The top concerns of users and vendors, parameter passing and block structuring, are still missing from 1983 Mumps.
- For the changes being made to Mumps, alternate approaches that are simpler, more general and more efficient should be considered.
- The document itself (Draft Ansi X11.1-1983) should be examined closely for inconsistencies and erroneous definitions. Examples of each Mumps construct and the intended result should be given to rectify ambiguities and implementors' misinterpretations.

It is clear that the proposed revision to Mumps should be withdrawn and further studied. ‡

Personal computers changing perception of office work

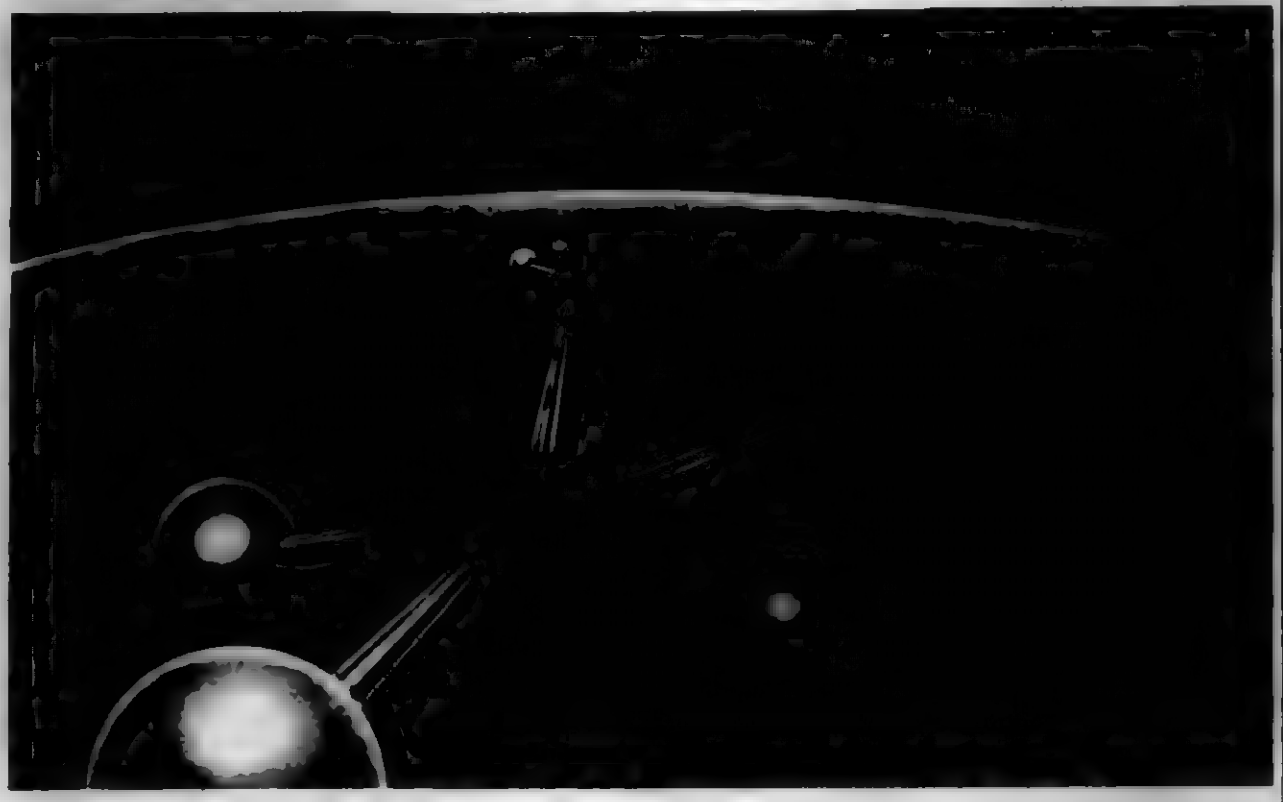
LETTERS

The remarks made by David Kearns, in the article "OA efforts lack focus, Xerox chief charges" [CW, Feb. 27], reminded me of that classic headline: "Pot calls kettle black."

Office automation vendors and their customers have found it mutually advantageous to preserve the conventional notion of the office as a place where people handle information. Both sides have benefited from limiting changes to a succession of modest improvements in discrete aids for paper-oriented and manpower-dependent office functions. Buyers of OA have thus been enabled to maintain or expand their work force — the traditional measure of power and prestige. Sellers have been able to build an apparently reliable long-term market for their products. This situation seems unlikely to persist much longer, however.

Personal computers, especially in their portable form, are changing the perception and the performance of what is usually classified as office work. People, paper, place, procedures, communications and information assume different priorities and relationships in the new working arrangements that are beginning to evolve. Such an environment demands the design and assembly of customised systems that are readily adaptable to changes in personnel and goals. How long before this reformulation of practices has a significant impact on the current approach to OA? The answer depends on whether established producers and users elect to resist change or promote it.

Brian Leibert-Francis
Falls Church, Va.



Statistical Multiplexers From Paradyne

Paradyne's series of Intelligent Networking Multiplexers is now a family of network solutions. With User Switching and Auto Rerouting, hundreds, even thousands of your employees and customers can depend on your network.

User Switching For Efficient Communications. To be productive you need computer resources. User Switching provides a way for users to tap into the variety of your company's resources, regardless of where those computer resources are in the network. Paradyne's DCX multiplexers find the most efficient communications path to each computer.

Auto Rerouting Means Increased Productivity. Auto rerouting maintains the connection to the computer and insures user productivity in the face of degraded telco lines. When a link fails, DCX automatically looks for alternate routes in the network to reroute communications traffic, insuring continued productivity.

Advanced Networking Diagnostics. Paradyne offers the most advanced networking diagnostics in today's market. Both data and controls can be viewed to and from any channel in the network. Problems at a remote site can be isolated and diagnosed through DCX, quickly and easily.

Productivity and Efficiency. Another Paradyne systems solution. If you would like to know more about Paradyne's Series of Intelligent Networking Multiplexers call **1-800-482-3333**. We'll answer your questions and give you the location of the Paradyne sales office nearest you.

DCX 815...four or eight channels. **DCX 825**...four to 32 channels. **DCX 840**...240 channel data networking exchange. **DCX 850**...240 channel intelligent networking processor. **DCX 861**...four or eight channel statistical multiplexer with an integrated 9,600 bps modem. **DCX 871**...four to 32 channels with integrated 9,600 bps modem. And **Paradyne's NEW T1 Multiplexer**...combining the channel capacity of T1 facilities with the versatility and networking capabilities of the DCX product line.

Meeting the Communications Challenge of the 80's

Paradyne Corporation P.O. Box 1347
8550 Ulmerton Road, Largo, FL 33540

Solution already given

The article "The problem you may not know you have" [CW, Feb. 13] on the programming problems that will be encountered in the year 2000 stated that the issue has attracted little industry attention. However, an excellent solution to the problem appeared less than two years ago in *Computerworld* itself.

In a letter published in *Computerworld's* Sept. 27, 1982 issue, Richard L. Conner suggested using an absolute date in data base files that could easily be converted to month/day/year format when the date is to be displayed or printed. The two conversion algorithms discussed by Conner were written in Fortran by H.F. Fliegel and T.C. Van Flandern and were published in the October 1968 issue of *Communications of the Association for Computing Machinery*. This absolute or serial method of reckoning dates is widely known to astronomers, especially those specializing in celestial mechanics and time determination (one of the authors, Van Flandern, is on the staff of the U.S. Naval Observatory in Washington, D.C.).

The absolute date method is simple, ingenious and free of charge.

SOFTWARE & SERVICES

Loans processing system out for IBM CPUs

By Paul Gillin
CW Staff

DALLAS — Hogan Systems, Inc. last week announced for IBM mainframes the Integrated Loans Processing System which, it said, covers the full scope of lending activities from original application to final disposition.

The system uses common data bases, processing routines and operating procedures and is fully integrated with the Hogan Deposit Systems, Prophet Customer Management System, On-line Delivery System and Hogan Collection System. The Integrated Loans Processing System also generates transactions for direct entry to a general ledger, the vendor said.

Modules are included for tracking loan applications, loan accounting and servicing, secondary marketing, collateral control, commitments, investor accounting and reporting and charged-off loans. Support is provided for multicompany, multioffice environments with the ability to define different options for each branch.

User-defined control information includes variable factors, processing routines and report and transaction definitions. The system satisfies all federal requirements and can be modified through Hogan's maintenance service to accommodate changing requirements.

The software can accomplish daily processing using a random approach that processes only loans that have seen activity rather than reading files sequentially, the vendor said. On-line operation is offered as well as batch processing and combinations of the two. Conversion to the new software can be carried out gradually.

Automated loan origination allows the terms of each loan to be entered on-line with changeable parameters, Hogan claimed. When data on a new loan is entered, the system automatically submits subsequent screens for that particular loan type.

The loans-in-process feature provides loan application status reports and on-line inquiries and highlights overdue documents, verifications and appraisals. It also automatically prints documents associated with different types of loans.

Other modules include a borrower system, which contains profiles on each borrower; a collateral system with a common data base; a payee system that tracks funds recipients; an investor servicing system with a common data base; standard reporting features; standard processing functions; and a variety of common computations.

The total system includes 771 programs, 243 batch and 66 on-line reports, nearly 2,400 total librarian members, 46 hierarchical data bases and 54 sequential data bases. It licenses for $500,000.

Hogan is located at 5060 Spectrum Drive, Dallas, Texas 75248.

Cutting project management risks

The traditional role of the project manager — having responsibility for a project, with little or no authority — is risky business. A person assuming the job of project manager risks his personal image and career as well as the careers of all associated with the project. This article will discuss two methods that are effective in limiting the risks associated with being a project manager. These are called the performance contract and planning horizons.

The performance contract is simply an explicit agreement of what the project manager and the user and management expect from each other and how they are going to work together. Though it is usually verbal, it should be committed to writing. Why not call it a working agreement? The word "contract" is useful in two ways. First, it calls attention to the need for specific actions in the relationship between the project manager and the rest of the organization. Second, the legal connotations of the word are applicable to the project manager's situation.

Contracts contain two basic elements that apply to the project manager's relationships: mutual consent and valid consideration. With mutual consent, both parties enter the agreement of their own choosing and are not coerced into working together. Valid consideration is the exchange of considerations between both parties. It is common for the user and management to express their needs and wants, but the project manager also has needs and wants that must be considered. These include:

- Access to people and information relevant to the project.
- Time to do the job properly.
- Resources to deliver a quality system in the time frame desired.

The performance contract for a project manager contains an integrated project plan, which specifies the resources and time required to deliver a system of specified quality and the assumptions

Spreadsheets get link to CPU data

WAYNE, Pa. — Unicalc Corp. has announced a data selection utility that reportedly allows users of microcomputer-based electronic spreadsheets to access data on IBM mainframe printed reports.

Dubbed Dif-Maker, the software is said to operate on any mainframe print file and convert the file into Software Arts, Inc.'s Data Interchange Format (DIF). The DIF formatting permits the interchange of data between micro spreadsheet packages such as Visicorp's Visicalc, Lotus Development Corp.'s Lotus 1-2-3, Microsoft, Inc.'s Multiplan and Sorcim Corp.'s Supercalc.

Dif-Maker reportedly enables a user to select data from any mainframe printed report by indicating the pages of the report to be used and assigning the print positions to columns on a spreadsheet.

Dif-Maker is written in Ansi Cobol and operates on IBM's MVS, MVS/XA or DOS/VSE operating systems. It is available now, priced at $2,500 for an on-site license.

Unicalc is located at Two Academy Lane, Wayne, Pa. 19087.

Generic coding: giving text files portability across systems

By Steven A. Brown
and Dana Messecher
Special to CW

Computers have a substantial contribution to make in simplifying and speeding up the process of document production. But the industry has suffered from a lack of industrywide standards. Text files created for one system cannot be composed on another system because they contain, along with the text, system-specific markup coding. This coding describes to the system the typographic attributes of each section of a document — type size, typeface, page width, distance between lines, indents and so on.

The issue of making text files portable is generally referred to as generic coding, or gencode. This refers to any nonambiguous method of tagging document elements according to their intellectual, rather than typographic, attributes. The distinction is important. According to the philosophy of generic coding, for example, a document section might be marked for emphasis, but never for italics. This concept is vital to the gencode approach.

A generic coding scheme might work as follows. When a publication is entered into the data base, it could be broken into its composite data elements and each element tagged. For example, every paragraph might be preceded by "<P>," and every table by "<T>". Sections to be emphasized could be marked "<E>," with "<END>" designating the end of the section. Quotes could be preceded by "<Q>." But, consistent with the principles of gencode, quotation marks themselves would never be tagged.

The next step would be to write markup coding formats that correspond to your tagging scheme. Each tag would call a format. This is where the link between intellectual elements and their typographic attributes would be made.

The "official body" of generic coding is the Graphic Communications Association. After more than 15 years of effort, it has come up with a proposed Ansi/X3J6 standard.

After throwing out many approaches as being too restrictive, the committee agreed to standardize a language for describing rules for recognizing tags. The proposed Ansi/X3J6 standard is not a standardized markup language, standardized tagging scheme or set of rules for recognizing tags. It is simply a "metalanguage" that describes how to describe tags. The standard does contain a mechanism for registering document tagging schemes in order to encourage further standardization.

Prepress systems can be divided into two approaches — interactive and batch. Interactive systems show the user a close facsimile of the finished page. These systems are much appreciated by those who deal with custom pages. Interactive systems do not make decisions themselves — they put type into place and let the operator do the thinking.

Batch systems do not show finished type during input. Instead, they take complete text files and compose them into finished pages. A good batch pagination system will

SOFTWARE & SERVICES

SYSTEMS SOFTWARE

SOFTWORKS, INC.
VIO Plus

Softworks, Inc. has introduced VIO Plus (Vsam I/O Plus), an IBM Vsam utility that is said to reduce unnecessary I/O operations.

The VIO Plus utility reportedly improves system performance by reducing I/O operations, thus reducing CPU. time, disk/channel activity and elapsed time. Elapsed time savings range up to 75%, a spokesman said.

The cost for VIO Plus is $12,500. A 36-month lease plan is available at $538 per month.

Softworks, 7700 Old Branch Ave., Clinton, Md. 20735.

APPLIED INFORMATION DEVELOPMENT, INC.
Version 2.0 of JCLWTR

Applied Information Development, Inc. has introduced Version 2.0 of its JCLWTR System Software product.

The product, designed to manage the retrieval and storage of JCL Sysout listings, eliminates printing and filing of JCL listings and supports Datagraphix, Inc.'s Microcom and Kodak Corp.'s Komstar interface to computer-output microfilm (COM), plus an off-line interface for COM service bureaus, the company said.

The new version includes generic retrieval by subsystem; automatic scan of JES (Job Entry Subsystem) messages for exceptional conditions; an expanded exit facility; support for IBM's Roscoe and TSO/SPF interfaces; expanded microfiche control; improved customization features; and support for IBM's JES 3. JCLWTR is priced at $7,500 for a one-time license fee.

Applied Information Development, 823 Commerce Drive, Oak Brook, Ill. 60521.

JMS SOFTWARE, INC.
DYLOG/TCT

JMS Software, Inc. has introduced a software product that reportedly reduces the static storage requirements of the IBM CICS Terminal Control Table (TCT) by allocating only the storage capacity needed for terminals actually in use.

The product, Dylog/TCT, reportedly reduces the storage needs on the CICS/VS region in large terminal networks by 1M byte or more. It also reportedly eliminates the need to bring the CICS region down when reconfiguring the network.

Dylog/TCT is said to operate on any IBM computer that supports CICS and operates within any CICS/VS region using release 1.5 or later. Dylog/TCT is leased for a one-time fee of $16,500 for IBM OS systems and $11,500 for IBM DOS systems, on a single CPU basis.

JMS Software, Suite 7967, One World Trade Center, New York, N.Y. 10048.

GREENE SOFTWARE
Queue/36

Greene Software has introduced Queue/36 for IBM System/36 users.

According to the vendor, Queue establishes an auxiliary batch job queue that allows user jobs to run independently of and concurrent with jobs in the System Job Queue.

No modifications are required with Queue/36. Users have control of their job's position in the queue, status, start time, execution priority and completion messages through interactive screens. A one-time license fee for the product is $295 per CPU.

Greene Software, P.O. Box 89, Victor, N.Y. 14564.

PRODUCTIVITY AIDS

MARATHON SOFTWARE AND SERVICES, INC.
Mudsam on UFO/CICS

Marathon Software and Services, Inc. has announced its UFO Documentation System and More (Mudsam) for users of Oxford Software Corp.'s UFO/CICS software on IBM mainframes.

The software produces a system documentation index for UFO programs and generates multiple listings of program components in a single pass. It also flags program code that wastes memory and response time.

Mudsam is available for UFO/CCS releases 2.4, 2.4.1,

HAVE YOU BEEN BLIND COMPUTER WITH THE

NEC's Advanced Personal Computer offers the sharpest color graphics of any personal computer.

NEC's Advanced Personal Computer offers the widest range of quality graphics.

One reason the APC is better is that it lets you do more kinds of graphics than any other personal computer.

In fact, it gives you the kind of graphics you'd expect only from a much more expensive computer.

With the APC, you can produce color transparencies, color slides, or output to a variety of printers and plotters.

You can even do Computer Aided Design (CAD).

Our screen is graphically better.

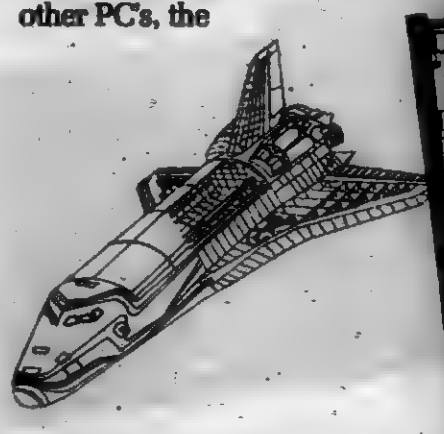
Seeing is believing. And one look at our color screen will prove it's the best.

But it's no accident. It starts with the NEC 7220 graphics processor, the most advanced graphic chip available.

Then, unlike other PC's, the

Graphics are being used more and more by businesses every day. They give companies a clearer picture of their place in the market. They make for more effective presentations. And with slides and color transparencies, they can let a room full of people see the same thing at once. Although most people see the value of graphics, very few are aware of the personal computer that lets them create the best color graphics.

It's the Advanced Personal Computer from NEC.



This slide was produced from the screen using Videograph™ software, an inexpensive Screen Shooter™, and Polachrome™ 35mm film, in less than 5 minutes. For less than $1.00!

Context MBA is a trademark of Context Management Systems, Inc. Graphwriter is a trademark of Graphic Communications, Inc. Graphplan is a trademark of Chang Labs, Inc.

2.4.2..It is priced at $500.

Marathon Software and Services, 145 Porter Ave., Bergenfield, N.J. 07621.

APPLICATION PACKAGES

PLYCOM SERVICES, INC.
Fixed Assets System

Plycom Services, Inc. has announced the Fixed Asset System for use with Digital Equipment Corp.'s VAX-11 processors under DEC's VMS operating system.

A spokesman said the Fixed Asset System features screen-formatted data entry, on-line file maintenance, an edit log of all master file changes and automated period and year-end closing procedures. A variety of reports allow reporting of depreciation, acquisitions, disposals, transfers and audits.

The spokesman said the system can handle up to three complete sets of books for internal, state and federal reporting and can accommodate multicompany or multidivision corporate structures. It is written in VAX Basic using standard file and data structures. Prices for the system range from $1,500 to $14,000.

Plycom Services, Suite 150, 4242 Piedras E., San Antonio, Texas 78228.

DATA DESIGN ASSOCIATES, INC.
Financial systems for IBM IMS/DC

Data Design Associates, Inc. has announced versions of its general ledger, accounts payable/purchase control and fixed-asset accounting systems for the IBM IMS/DC environment.

According to the vendor, the versions provide on-line processing capability for IBM 370 series users, running under IBM's OS operating system. The system also runs under IBM's CICS.

The IMS/DC on-line version of the general ledger system is priced from $87,000, the accounts payable/purchase control system starts at $57,000, and the fixed-asset accounting system starts at $49,000.

Design Data Associates, 1279 Oakmead Pkwy., Sunnyvale, Calif. 94086.

COMPINFO, INC.
Moneypack

Compinfo, Inc. has introduced a portfolio management system called Moneypack for use on the Wang Laboratories, Inc. VS series of computers. Moneypack is said to be an on-line, interactive package that integrates trading, accounting performance and appraisal functions.

Among Moneypack's features are tax reporting, including tax lots going long-term; management retrieval; cross-referencing; trade entry; trading; and billing, the vendor said.

Moneypack is reportedly menu-driven and includes an on-line help feature. Security is available at both the functional level, for reports and screens, and the individual account level.

Moneypack is available in a price range from $40,000 to $60,000, depending on options.

Compinfo, 1500 Broadway, New York, N.Y. 10023.

MINCRON SBC CORP.
Hardgoods Distribution System

Mincron SBC Corp. has introduced a software package designed for wholesale distributors that use an IBM System/38 mainframe.

The Hardgoods Distribution System handles accounts payable, accounts receivable, order processing, inventory control, purchasing and sales analysis, a spokesman said. The package's menu-driven design is said to consolidate functions to enable a user to handle cash or credit sales, deliveries or will-calls and exchanges or back orders from the same screen. Orders can be entered by using the manufacturer's product number or the company's generic code or by passing a wand over the bar code printed next to each product in the company's catalog, the spokesman said.

The modules allow all product codes, the chart of accounts, branch codes, three-level stock locations, salesman codes and sales territories to be user-defined.

The modules are grouped in three ways — financial, purchasing and distribution — with prices ranging from $25,000 to $50,000. Dis-

TO THE PERSONAL BEST COLOR GRAPHICS?

Context MBA® runs in high resolution color on the APC. But it can only run in one color on the color monitor of the leading brand.

APC graphics option has its own dedicated memory, so there's never a tradeoff between color and resolution.

Software will make you a big-time producer.

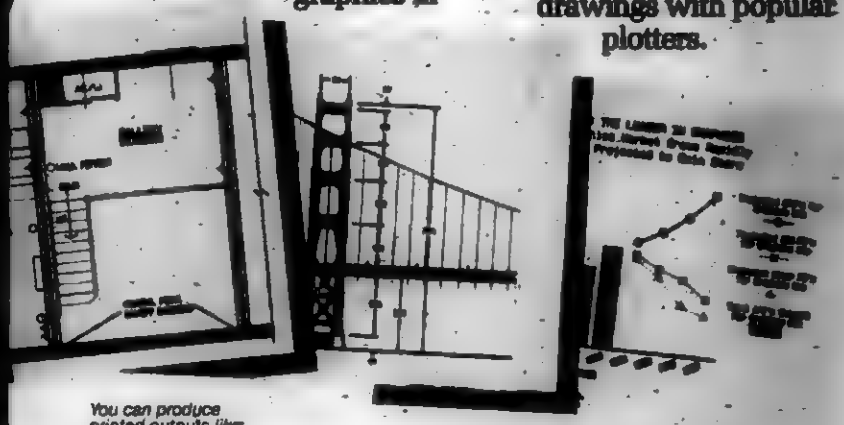
Better hardware alone isn't enough. You also need better software. And NEC provides that, too.

Take Graphplan™ for example. Graphplan can take spreadsheet format data and produce customized business graphics on paper. Instantly.

Graphwriter™ will let you produce professional color graphics in over 20 different formats. Then turn them into transparencies or hard copies using the most popular pen plotters.

Videograph™ makes creating free-form color images for slide presentations easy and inexpensive.

Autocad™ lets architects, engineers and designers create sophisticated graphics and designs, then produce precise drawings with popular plotters.

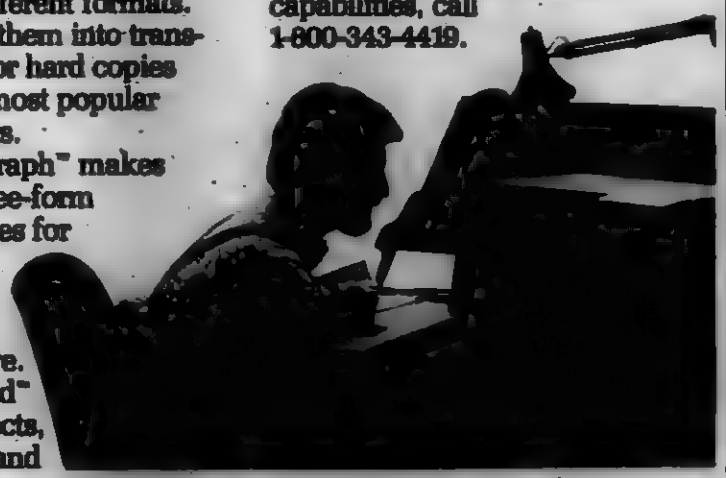


You can produce printed outputs like these with the APC.

This software combined with the APC hardware will give you the best graphics you can get on any personal computer.

For the complete picture, call NEC.

For product literature on any of NEC's APC graphics capabilities, call 1-800-343-4419.



Designers can use Autocad™ to make the design process faster and easier.

In Massachusetts, call 1-617-264-8635.

And find out why more and more graphics users with vision are saying "NEC and me."

NEC AND ME

Continued from page 79

counts are available for purchase of the full package, the vendor said.

Mincron SBC, Suite 2810, 350 Fifth Ave., New York, N.Y. 10118.

LLOYD BUSH
Simple Basic; Model version

Lloyd Bush has announced that its Simple Basic personal computing software is now available for Prime Computer, Inc. computers and Digital Equipment Corp. VAX-11 and Rainbow computers.

Also announced was a new version of Model, Lloyd Bush's planning and analysis system, for the Hewlett-Packard Co. HP 3000.

Simple Basic products, which come with a built-in full screen prompter, were designed to help overcome the initial anxieties of the personal computing novice, the vendor said. Simple Basic is said to be an implementation of the Model Decision Support application building language.

Simple Basics Budgeteer costs $6,900 for most DEC and Prime hardware, $3,500 for Prime P2250s and P250s and $595 for DEC Rainbows. The Generalist costs $4,900 for most DEC and Prime models, $2,500 for P2250s and P250s and $395 for Rainbows. Prices for the VAX-11/730 begin at $2,500.

As an introductory offer, any Simple Basics order received by July 23 will receive a 20% discount.

A Simple Basics product line for the HP 150, reportedly upwardly compatible to Model on the HP 3000, is priced from $395 to $995. New release pricing of Model (starting at $9,000) is available until Aug. 24, with discounts of 30% to 50% and a free HP Image interface for large configuration orders.

Lloyd Bush, 165 William St., New York, N.Y. 10038.

MCBA, INC.
General Ledger

MCBA, Inc. has announced a general ledger package written in Cobol for Digital Equipment Corp. VAX-11 processors.

The MCBA package, called General Ledger, reportedly offers a built-in report generator and allows adjustments to future and prior periods to be made. It is also said to allow account inquiries via terminals and to permit consolidation of statements from multiple companies.

The product is licensed for the following DEC systems at the following prices: Micro VAX-11, $2,000; VAX-11/730, $3,000; and VAX-11/750 and VAX-11/780, $4,000.

MCBA, 3441 Honolulu Ave., Montrose, Calif. 91020.

WESTMORELAND SYSTEMS, INC.
Enhancements to Calendar Scheduling System

Westmoreland Systems, Inc. has enhanced its Calendar Scheduling System for the IBM System/36. The enhancements reportedly include the addition of reminder dates and messages and the addition of help text to aid users.

The Calendar Scheduling System reportedly maintains and prints a tickler file and schedules appointments and messages by date and user. It can be used to track group projects for individual scheduling and is priced at $300.

Westmoreland Systems, Suite I, 226 Park Ave. N., P.O. Box 2726, Winter Park, Fla. 32790.

PAYMENT SERVICES GROUP
Continuous Information Exchange

Payment Services Group has introduced a software system that reportedly provides electronic cash management and funds transfer services between banks, corporations and the Automated Clearing House.

The system, called the Continuous Information Exchange (CIX), reportedly operates in a manner similar to a time-sharing system with settlement capability and is said to provide a bridge between traditional paper transaction processing and electronic processing.

Operating in either on-line or batch mode, CIX reportedly permits corporate treasurers or credit managers to access data on the bank's mainframe to conduct fund transfers. CIX runs on IBM 4300, 370 and 30 series computers.

The CIX software is priced at $60,000 for batch-mode operation. Additional software to conduct on-line operations is priced at $30,000.

Payment Services Group, 230 E. Main St., Branford, Conn. 06405.

CHASE DECISION SYSTEMS
Bankplan2

Chase Decision Systems has introduced a strategic planning software program for banks that operates on a variety of IBM or compatible mainframes under IBM's VM/CMS operating system.

Bankplan2 reportedly can simulate the financial effects of an acquisition, using either purchase or pooling methods of accounting. The package is for banks considering the financial impact of alternative investment strategies, deal structures, regulatory policies and economic conditions before making an acquisition decision, a vendor spokesman said.

The software simulates the combination of two bank holding companies, two commercial banks or a bank holding company and a commercial bank, the spokesman said.

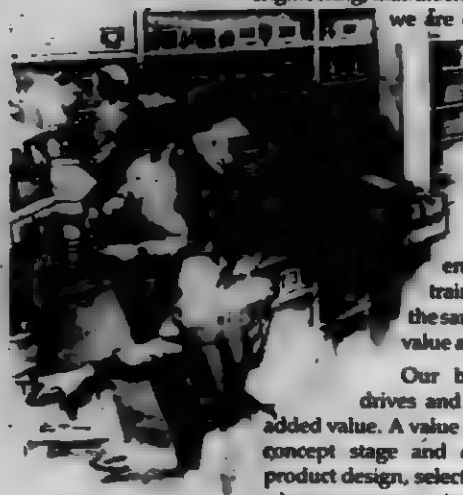
A permanent license for Bankplan2 is priced at $25,000; a monthly lease also is available.

Chase Decision Systems, 1000 Massachusetts Ave., Cambridge, Mass. 02138.

Now is the Time to Take a Look at

FUJITSU

In today's information revolution there is one company well worth watching. A company which brings experience and expertise to the development, manufacture, marketing and support of OEM and consumer computer peripheral products in America. That company is the Storage and Peripheral Products Group of Fujitsu America. And through continued expansion of engineering, manufacturing and marketing facilities in the United States, we are dedicated to sustain our position of delivering products of unequaled quality and value.



The Group's presence in the United States market has been solidified through our commitment to quality. A commitment which begins with our employees and is carried through to product design, manufacturing and support.

Wherever you look in the Group you will see people serving your needs. Whether it's engineers developing a timely product or specially trained service representatives, their goals remain the same; to insure the product they deliver offers added value and is of the finest quality.

Our broad line of disk drives and printers all deliver added value. A value that is built-in at the concept stage and carried through in product design, selection of raw materials and components, and consistent workmanship at the assembly line. This added value and the myriad quality checks that every product must pass, translates into industry standards for reliability and product performance.

At Fujitsu we will always strive to be your first choice. The one choice where you can be sure that commitments to superior product quality, added value and outstanding service help to facilitate your future growth.

Now is the time to take a look at Fujitsu. With tomorrow right around the corner, there is no better time than today.

For more information contact Fujitsu America, Storage and Peripheral Products Group, 3055 Orchard Drive, San Jose, CA 95134, 408-946-8777.

STORAGE AND PERIPHERAL PRODUCTS GROUP

We add more Value to take You Further.

FUJITSU

SOFTWARE & SERVICES

INTERACTICS, INC.
Home Builders

Interactics, Inc. has announced a software package for home construction firms that runs on Prime Computer, Inc. 50 series computers.

Home Builders reportedly offers cash forecasting, "what-if" job estimating, loan control, budget control with variance tracking, cost and control by building stage, purchasing, general ledger, accounts payable and complete audit control. Written in standard Cobol, the on-line package provides hard-copy reporting as well as real-time inquiry functions.

Home Builders costs $19,000 for a perpetual object code license; the source code is optional and is priced at $19,000.

Interactics, 7303 Marisol Drive, Houston, Texas 77083.

OAK SOFTWARE, INC.
Interface to Ecom

Oak Software, Inc. has announced that its Word Processing System for the IBM System/34, System/36 and System/38 has been enhanced to provide an interface with the U.S. Postal Service's Electronic Computer Oriented Mail (Ecom) system.

With the Ecom feature, a spokesman said, users can create messages using text entered and stored as a regular document in the Word Processing System and can use addresses entered and stored in the system's Customer File for destination addresses.

Also, the feature allows users to use a user-created file in the Ecom format for destination addresses and to key destination addresses on-line in the Ecom format.

The Word Processing System sells for $2,500 for the System/34 and System/36 and $3,500 for the System/38. The Ecom feature is priced at an additional $500.

Oak Software, Suite 215, 300 S. Duncan Ave., Clearwater, Fla. 33515.

3M CO.
Crimestat

A report generator for police applications has been announced by 3M Co. for use with its Micrapoint II hard-disk micrographic filing system. Called Crimestat, the software automatically prints uniform crime reports onto Federal Bureau of Investigation forms.

The Crimestat software reportedly is able to predict the number of calls a police agency will receive in the coming month by using an algorithm with a margin of error of 10% or less to interpret the previous month's projection. A date report feature reportedly prints a call rate history by district for any day of any month, including the average number of calls per day for that month.

Crimestat is also said to be able to produce on demand a current list of wanted persons, including juveniles and those wanted for questioning, and wanted vehicles. It licenses for $4,809.

3M, P.O. Box 33600, St. Paul, Minn. 55133.

IBM
3680 restaurant management program

IBM has introduced a restaurant management program for use with its point-of-sale terminals. The program is designed for use with IBM Model 3680 programmable store system equipment, including the IBM Model 3684 point-of-sale terminal/controller unit and the IBM Model 3683 point-of-sale terminal.

It reportedly can generate 23 reports, including sales, labor costs, menus and food and beverage inventory. It is capable of either standalone use or network connection.

The 3680 program provides payroll information in automated form for processing by payroll departments. Information recorded includes employee time and attendance, tips and up to four job codes for employees whose work involves multiple wage rates, a spokeswoman said.

Sixteen different menus reportedly can be stored in the 3680, with two in use at a time, enabling the system to automatically process orders entered by servers. The program can track 99 raw products and provide reports based on predetermined usage of each product.

A one-time license fee for the 3680 restaurant program is $1,000. It will be available in April 1984.

IBM, 900 King St., Rye Brook, N.Y. 10573.

DESK TOP FINANCIAL SOLUTIONS, INC.
DT/FPS for VS

Desk Top Financial Solutions, Inc. has announced a version of its Desk Top/Financial Planning System (DT/FPS) for Wang Laboratories, Inc. VS series of small business computers.

The Wang VS version of DT/FPS is fully compatible with currently installed Wang OIS systems.

DT/FPS for VS systems reportedly supports data bases as large as 500 columns by 100,000 lines. It also allows concurrent manipulation of several data bases for consolidation and selective extraction of data.

DT/FPS operates with VS workstations with 32K bytes of memory. It requires 700K bytes of disk storage and is written in Wang VS Basic. Price ranges from $4,750 to $9,500.

Desk Top Financial Solutions, 407 Main St., Spotswood, N.J. 08884.

FUJITSU PRINTERS

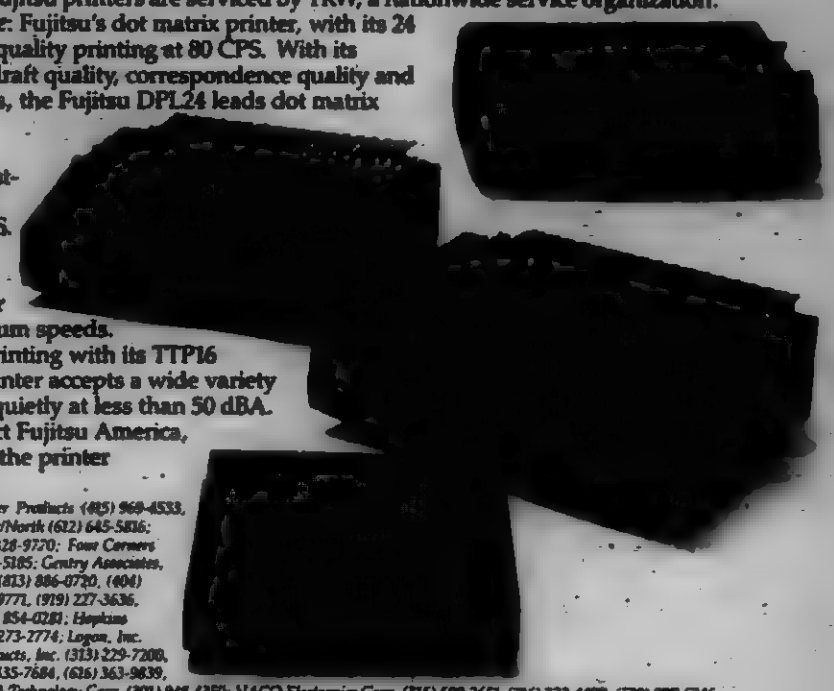
You can't buy more Performance for the Price.

Finally, there is a full line of quality printers available to meet a variety of needs. And all from a single manufacturer... FUJITSU. From dependable dot matrix printing to advanced thermal printing, you can't buy more performance for the price.

Quality That's Built In: Fujitsu quality is built into every printer manufactured. That quality translates into high reliability (MTBF), versatile print capability, low maintenance, low noise, and high speeds. And Fujitsu printers are serviced by TRW, a nationwide service organization.

A Complete Printer Line: Fujitsu's dot matrix printer, with its 24 wire head, offers letter quality printing at 80 CPS. With its ability to also produce draft quality, correspondence quality and high resolution graphics, the Fujitsu DPL24 leads dot matrix technology.

In daisy technology, Fujitsu's SP830 is the fastest letter quality printer in the industry at 80 CPS. Fujitsu's SP320 daisywheel printer also provides cost effective letter quality printing at medium speeds. Fujitsu offers thermal printing with its TTP16 printer. The low-cost printer accepts a wide variety of papers and operates quietly at less than 50 dBA.



Call Us Today: Contact Fujitsu America, Inc., at 408-946-8777 for the printer distributor nearest you.

FUJITSU

Hewlett-Packa surge in office

Introducing the Person

The principle is simple. Boost the productivity of individual PCs. Your people, your department, even your entire company will follow suit.

The first boost occurred when we introduced the touchscreen HP 150 as an office and managerial workstation. This made personal computing so much easier and faster that individual productivity soared.

Now the Personal Productivity Center combines the flexibility of the HP 150 with the power of our HP 3000 family of distributed computer systems.

You can shape each Productivity Center just the way you want it by adding other office and computing products from our extensive range.

You can link managerial and secretarial work stations. Create impressive presentations, merging business graphics and word processing. Store them on large disc files. And print them out on laser printers and color plotters.

Your PCs also grow more productive by increasing the range of software they can run. In addition to leading PC programs like 1-2-3™ from Lotus™ and popular word processing packages, they can use HP 3000 business software like our exclusive DeskManager. This combines electronic mail, quick memo

rd touches off a productivity.

al Productivity Center.

writing, personal filing and calendar functions. And each PC can access data processing systems and large corporate data bases.

Personal Productivity Centers can communicate with similar networks in other parts of your company, as well as your mainframes. Each system can expand to handle more than 100 workstations. And you can grow without involving your programmers in any software conversion.

So if PCs alone are making your people more productive, just wait till you see them all working together. And you can see them right now by calling your local HP sales office listed in the white pages. Or write for complete information to: Hewlett-Packard, Dept. 03191, 19447 Pruneridge Avenue, Cupertino, CA 95014. In Europe, contact Henk van Lammeren, Hewlett-Packard, P.O. Box 529, 1180 AM Amstelveen, The Netherlands.

It could turn your whole company into a productivity center.

Productivity. Not promises.

universal logic design simulator on its Apollo Computer, Inc.-based CAE 2000 computer-aided engineering workstation.

Hilo-2 is a tool for integrated board design, design verification, structural and functional modeling, detailed timing analysis, fast fault simulation and test validation. It can be used for designing chips, boards, modules or complete systems. It costs between $15,000 and $20,000.

CAE Systems, 1333 Bordeaux Drive, Sunnyvale, Calif. 94089.

SHOPPING CENTER COMPUTER SYSTEMS, INC.
Infocenter

Shopping Center Computer Systems, Inc. has announced Infocenter, a set of products for shopping center developers and managers.

The set offers accounting functions such as general ledger, financial reporting, accounts payable and payroll. The tenant accounts receivable system offers options for lease escalations, common area maintenance charges, dun letters and retail sales analysis.

Infocenter runs on Applied Digital Data Systems, Inc.'s Mentor business computers. Costs range from $9,500 to $23,500 for the complete package.

Shopping Center Computer Systems, Suite 255, 10900 Sunset Drive, Miami, Fla. 33173.

RADIAN CORP.
CPS-1

Radian Corp. has announced its CPS-1 contour plotting software on Digital Equipment Corp. VAX-11-based graphics systems sold by Intergraph Corp.

According to a spokesman for the vendor, the system was designed for geological mapping applications, allowing Intergraph computer-assisted design and manufacturing systems to create contour maps for oil/energy exploration and other specialized seismic applications.

The two versions of the contouring software include a standard version as well as a fault-contouring version.

The price of CPS-1 software on the Intergraph systems begins at $24,000, according to the spokesman for Radian.

Radian, P.O. Box 9948, 8501 Mopac Blvd., Austin, Texas 78766.

3270 Networking: No More No Man's LAN.

Imagine. 3270 Processing. Integrated Personal Computing. Local Area Networking. And SNA Compatibility. In One System.

Imagine a system that successfully settles the uncharted territory of 3270 local networking—that "no man's LAN" of unlinked and unrealized potential.

Imagine a system that delivers the power of 3270 processing, and the flexibility to build two local area networks from a single controller. Imagine being able to attach up to 120 devices to that controller. Or attaching four distinct controllers—and multiple coaxial links of up to 10,000 feet each—to any of those LANs.

Imagine the economies of a system that handles that networking with standard 3270 coax. That requires no commitment to special architectures or non-standard LAN technologies. And that, thanks to a multi-drop, station-to-station design, can eliminate thousands of feet of new coax.

Of course, such a system would have SNA compatibility. But it would also have a set of capabilities to dramatically increase throughput, while reducing hardware and support cost in *any* environment. Capabilities like multi-host and multi-personality support, application and address switching, and system printing.

This system would have multi-user personal computing "built into" the network—allowing you to assign true 16-bit computing power, maintain overall MIS control and share expensive disks and printers.

Such a system would boast an intelligent display station that displays a mastery of ergonomic and aesthetic design. With multi-screen formats, anti-glare screen, low-profile keyboard, and a tilt-and-swivel pedestal with the smallest footprint in the industry. Such a system would also include a full line of printers.

Imagine. 3270 processing. IBM-compatible personal computing. Versatile, economical, powerful local area networking. In one system.

Braegen has imagined just such a system. They have designed it. Built it. And called it the ELAN™ System.

If such a system sparks your imagination, give us a call. We know the feeling. The Braegen Corporation, 525 Los Coches Street, Milpitas, CA 95035 (408) 945-8150; TWX: 910-338-7332

PRODUCTIVE SOFTWARE PRODUCTS
EFS Financial Calculator

Productive Software Products has begun marketing a financial software program for IBM System/36 users.

The Executive Financial Software (EFS) financial calculator program reportedly can perform calculator functions, percentage functions, amortization schedules, depreciation schedules, investment analysis of cash flow, interest calculations, lease analysis and bond analysis.

According to the vendor, EFS allows the program to ask "what-if" questions on various financial calculations. It also enables the user to switch calculations without re-entry of factors. EFS is available for $250.

Productive Software Products, 10857 Reading Road, Cincinnati, Ohio 45241.

CALIFORNIA INTERACTIVE COMPUTING, INC.
Permanent Disability Rating System

California Interactive Computing, Inc. has introduced the Permanent Disability Rating System, designed to determine permanent disability benefits for workers' compensation.

The package calculates permanent disability rating tables from a program module to facilitate the rating function and determine disability benefits, the vendor said. The system quantifies the elements of the rating and includes an override function that allows injection of subjective judgments into the rating process.

The system runs on Pick & Associates, Inc.'s Pick operating system on a variety of computers, including Honeywell, Inc.'s Level 6 Ultimate, the IBM Series 1 and 4300 series and any Prime Computer, Inc. Information series. It is priced at $11,000, the vendor said.

California Interactive Computing, 12517 Chandler Blvd., North Hollywood, Calif. 91607.

TECHNICON DATA SYSTEMS CORP.
Materials Management

Technicon Data Systems Corp. has announced inventory control for hospitals using the Wang Laboratories, Inc. VS series of processors.

Materials Management can function in a stand-alone mode or can be integrated with Technicon's Medical Information System software. It is said to increase efficiency for hospitals' inventory, purchasing, receiving and accounts payable departments through interactive files updated from many sources and shared with other files. Updated information reflects inventory levels at all points in the inventory cycle, the vendor said, and is available on-screen to all users.

A series of standard reports are included. Automatic purchase order generation and automatic general ledger and accounts payable interfaces are also included. Materials Management is priced at $125,000 on Wang VS80 and higher systems.

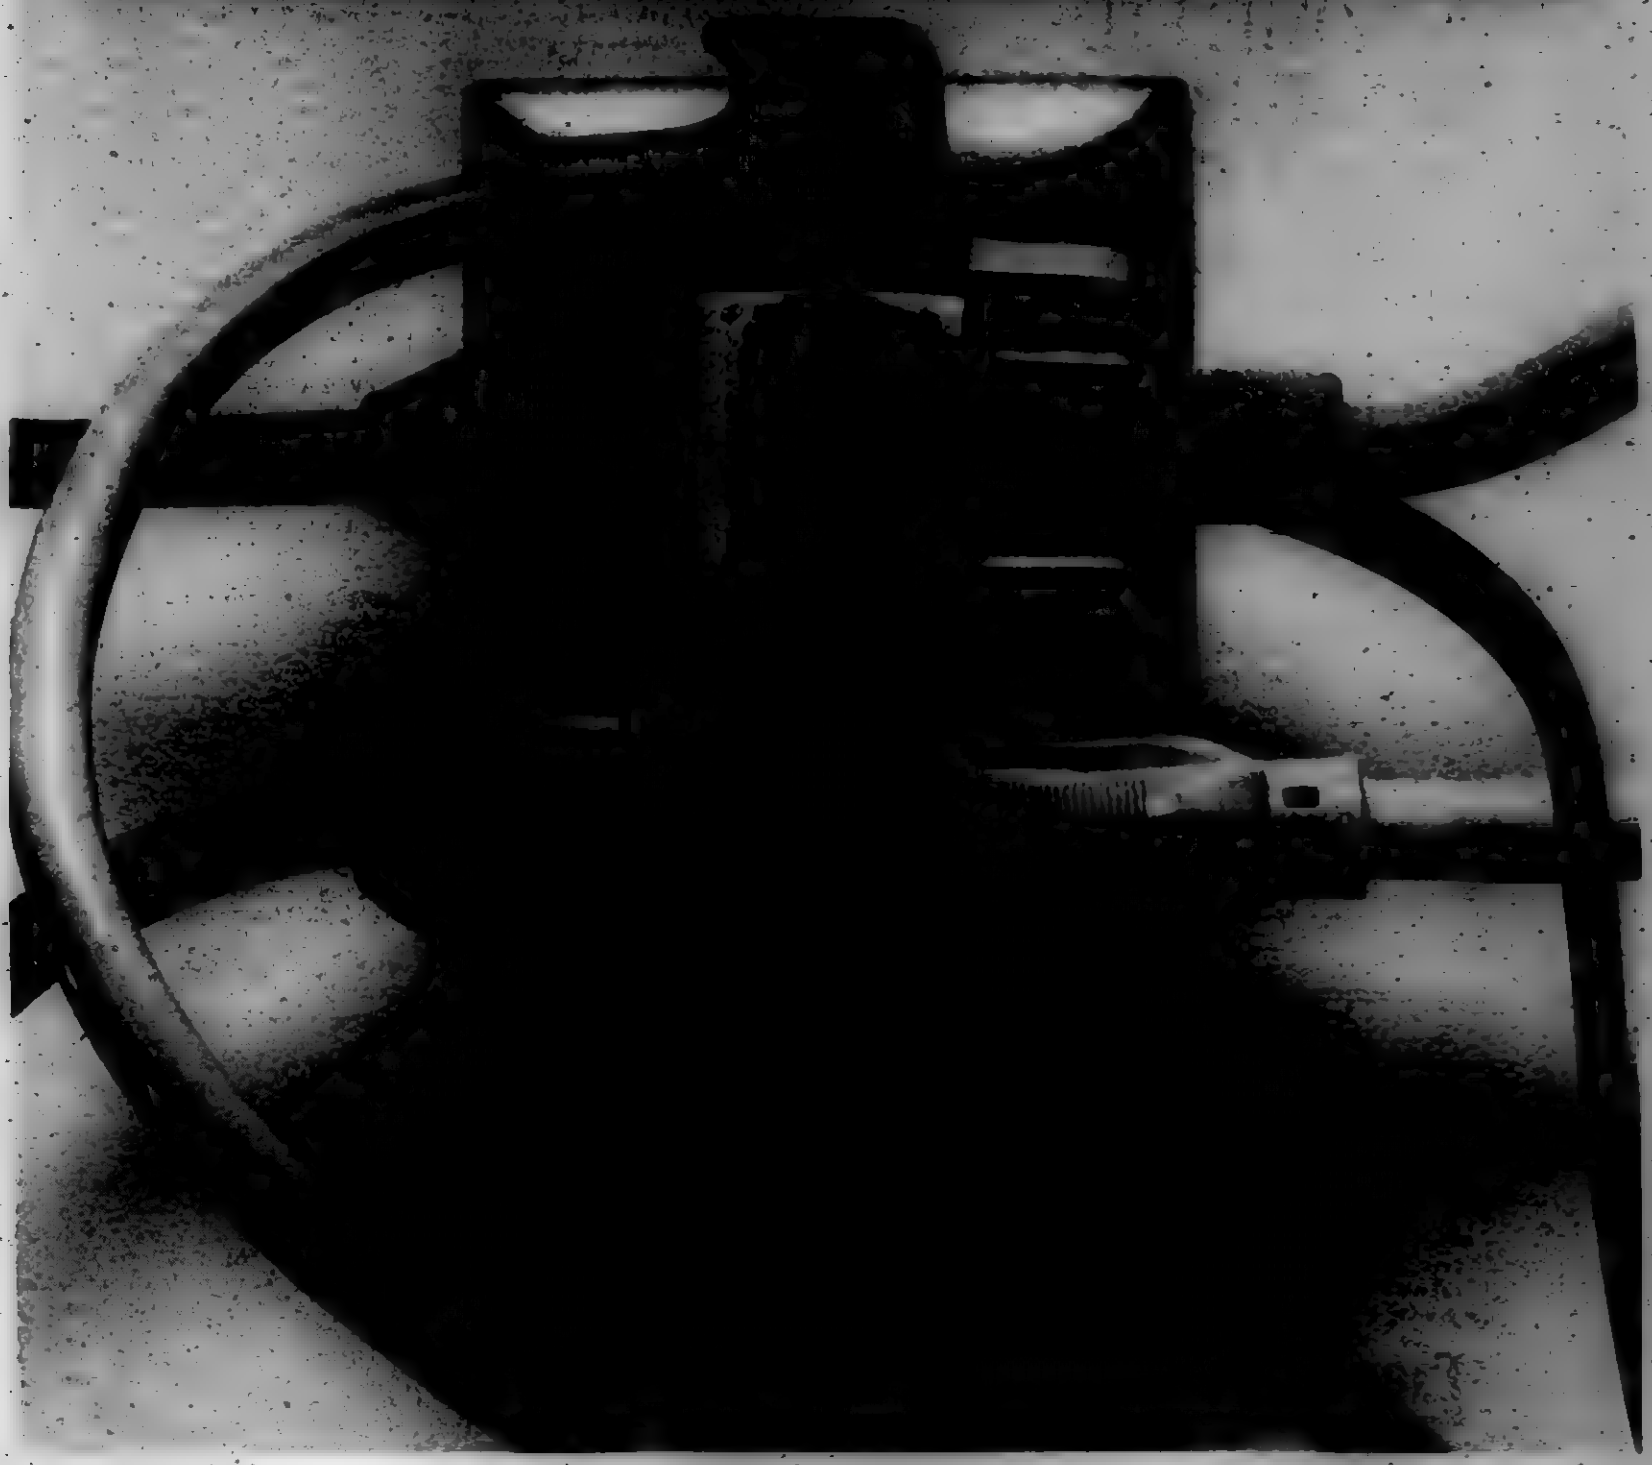
Technicon Data Systems, 5885 Glenridge Drive, Atlanta, Ga. 30328.

SYSTEM DEVELOPMENT CORP.
Interface translator programs

The Stardyne Division of System Development Corp. has announced

Continued on page 86

LEAVE PAPER AND PHOTOGRAPHICS OUT OF YOUR OFFICE AUTOMATION PLANS.



When most companies move into office automation, the first thing they do is plug in a computer and some peripheral equipment.

That's smart. But unfortunately that's also where they stop, leaving some unfilled opportunities for improving their office procedures.

Take filing for instance. While computers are good for storing data, they can't store the documents you must keep for evidentiary purposes.

That's where the 3M micrographic concept of file management can help. Micrographics is the use of microfilm instead of paper to store and retrieve important documents.

With one of our computer-assisted retrieval systems, for example, you can bring your filing system up to speed with the rest of your automated office. By making files easier to retrieve and virtually eliminating lost documents. All while reducing the space you now devote to document storage.

3M even offers a wide range of software programs to link its micrographic equipment to the computer system you may already have.

The result is a system that not only improves the efficiency of workers, but saves your company time, space and money.

Find out how micrographics can fit into your office automation plans and give you more control of your files. Call 1-800-328-1684 (1-800-792-1072 in Minnesota or 1-800-268-9055, Operator 13 in Canada) or return the coupon for a free booklet.

GET CONTROL. GET FILE MANAGEMENT.

interface translator programs that tie together the company's Structural Analysis System and PDA Engineering, Inc.'s Patran-G.

The two translators provide three conversion options: conversion of geometry and static loadings contained on the Patran-G Neutral File to Stardyne input data, conversion of existing Stardyne input data files to Patran-G Neutral Files and conversion of the Stardyne-generated output results file to a Patran-G Neutral Results File to allow Patran-G to post-process apalysis results, the vendor said.

The programs are written in Fortran 77 and can be used on Control Data Corp.'s Cyber and Cray Research, Inc. mainframes; minicomputers such as Digital Equipment Corp.'s VAX-11/780 or Data General Corp.'s MV series; and microcomputers such as those made by Apollo Computer, Inc. The price is $1,500.

Stardyne Division, System Development, Suite 3001, 360 N. Sepulveda Blvd., El Segundo, Calif. 90245.

INFO PROJECTIONS, INC.
Info System Plus

Info Projections, Inc. has announced Info System Plus, a modular mail-order processing package dedicated to interpreting market trends.

The system is menu-driven and is available for installation on the IBM System/34 and 36. Some of the product's applications include on-line order processing, on-line customer service, inventory and back-order control, sales and media analysis, list maintenance, returns system, physical inventory system and hold system, the vendor said.

The package provides custom format for invoices, back-order cards, list maintenance and four-up labels. The price is $24,000.

Info Projections, P.O. Box 3369, Evergreen, Colo. 80439.

SHLAES & YOUNG INFORMATION SYSTEMS, INC.
Creams and Ream enhancements

Shlaes & Young Information Systems, Inc. has announced a series of enhancements to its real estate software systems for the Wang Laboratories, Inc. 2200 series minicomputers.

The vendor said the enhancements to the Comprehensive Real Estate Asset Management System (Creams) and the Real Estate Analytical Models (Ream) packages were designed to improve ease of use, add analytical capabilities, provide additional reporting capabilities and respond to changes in the way leases are written on commercial properties.

Menus were redesigned to reduce their number and to permit movement through the systems with fewer keystrokes. The packages now also offer the user a choice of tenant-by-tenant market rent data entry or a global creation or update facility.

The Creams package is priced at $36,000, and the Ream package is priced at $9,000.

Shlaes & Young Information Systems, 405 N. Wabash Ave., Chicago, Ill. 60611.

ADAGE, INC.
INTERMETRICS, INC.
Sphere-3000

Adage, Inc. and Intermetrics, Inc. have announced a three-dimensional, molecular display package for use with Adage 3000 Color Raster Systems on Digital Equipment Corp. PDP-11 and VAX-11 series processors.

Sphere-3000 reportedly is organized as a Fortran-callable set of subroutines providing real-time display of color, three-dimensional, space-filling models of complex molecules up to 700 atoms. It is said to include full hidden-surface removal, shading, clipping and joystick-controllable rotation and pan and zoom functions. Initial object license price for Sphere-3000 is $20,000. Source license price is $75,000.

Adage, One Fortune Drive, Billerica, Mass. 01821.

WEISS ASSOCIATES, INC.
DIF added to Venture

Weiss Associates, Inc. has announced the addition of a Software Arts, Inc. Data Interchange Format (DIF) file interface to its Venture business planning software.

The addition of DIF file support reportedly enables Venture users to move their data from Venture to other programs that also support DIF files. Once the data is moved to another program, the user can make changes and transfer some or all of the changed data back into Venture.

The Venture program with the new DIF file facility costs $495. It operates on IBM's Personal Computer, Personal Computer XT and compatible systems.

Weiss Associates, 187 Michael Drive, Red Bank, N.J. 07701.

SUPEREX BUSINESS SOFTWARE
Energy Accountant

Superex Business Software (SBS) has announced a package that tracks energy conservation efforts and operates on IBM Personal Computers or compatible systems.

The Energy Accountant reportedly takes two to five minutes of work to enter and produce reports. It accommodates any fuel sources; normalizes for weather, facility size and changes in energy systems; prorates fuel and utility bills to monthly consumption; develops energy targets based on past performance; and can handle up to 75 buildings on floppy disk and 200 buildings on hard disk.

Priced at $1,000, the system includes a variety of management reports and problem-alerting features.

SBS, 151 Ludlow St., Yonkers, N.Y. 10705.

SUMMAGRAPHICS CORP.
Parpac

Summagraphics Corp. has introduced a printed-circuit board design automation package called Parpac for use on its computer-aided design (CAD) systems.

Parpac is reportedly capable of automatically placing digital and analog components, pin arrays, chip carriers and discrete components. It also can reportedly override the automatic placement at any point to preplace certain components manually or interactively.

The product also is said to be able to produce net error and spare element lists, parts lists and connector summaries. It also reportedly includes complete documentation capabilities to produce fabrication and as-

Continued on page 92

BGS SYSTEMS FOR DP MANAGEMENT

SOFTWARE & SERVICES

Continued from page 96

sembly drawings, drill schedules, silkscreens and solder masks.

Parpac is available for the Summagraphics Icon Series CAD system and for the firm's Summadraft hardware at a base price of $40,000.

Summagraphics, P.O. Box 781, 777 State St. Ext., Fairfield, Conn. 06430.

INTERNATIONAL TECHNOLOGY MARKETING, INC.
CAD/CAM service

International Technology Marketing, Inc. (ITM) has announced a service that provides in-depth information on the computer-assisted design and manufacturing (CAD/CAM) industry.

According to ITM, the service helps companies track industry trends and growth and provides financial and technical product data for more than 50 CAD/CAM system, hardware and software vendors.

Subscriptions to the service include unlimited use of the vendor's telephone information service, an annual report with interim supplements and a three-day seminar.

Corporate annual subscriptions are available at a cost of $12,000. Secondary company annual subscriptions cost $6,000 each.

ITM, 120 Cedar St., Wellesley Hills, Mass. 02181.

THE BRIDGE, INC.
Release 2.1 of Trak

The Bridge, Inc. has enhanced its Trak on-line project management system for IBM mainframes to include an additional level of security, a new project subdivision, the ability to create new projects and activities by copying existing data and extended capabilities for automatically calculating costs.

The new security allows project leaders to create projects and perform maintenance but prevents them from maintaining tables. An intermediate level called Phase has been added between project and task. Phase records and totals are automatically generated and maintained. When new projects are created by copying an existing project, all estimated and actual costs are automatically zeroed, and activities can be copied to create the activity codes for a new department. Estimated task costs are now automatically calculated. If the estimated costs for a task are left blank, Trak is said to multiply estimated hours by a responsible employee's rate.

The software costs $9,500 on IBM's DOS operating system and $16,500 on IBM's MVS operating system.

The Bridge, 199 California Drive, Millbrae, Calif. 94030.

DATA BASE MANAGEMENT SERVICES

VISTA COMPUTER, INC.
Datascan enhancement

Vista Computer, Inc. has enhanced its Datascan data base software to include a cross-tabulation feature that reportedly permits users to create singularly changeable and individualized cross-tabulations.

The cross-tabulation feature is said to permit creation of comparative tables from any subset of the data base with no need to work with the entire data base.

The enhancement can reportedly deal with 250,000 records and hundreds of data fields. It is available for $20,000 for Data General Corp. Nova and Eclipse series processors and $25,000 for DG's MV series computers under AOS/VS.

Vista Computer, 85 Executive Blvd., Elmsford, N.Y. 10523.

NDX CORP.
Createbase

NDX Corp. has announced a new price schedule, including some decreases, for perpetual licenses of its Createbase data base management software. It also has established a monthly rental plan to introduce Createbase.

The new prices for perpetual licenses of the Createbase software, listed with the systems on which the product runs, are: Sperry Corp. Univac 1100/40, 1100/60, 1100/70, $35,000; Univac 1100/80, $45,000; Control Data Corp. Cyber 176 and 875, $50,000; CDC Cyber 175 and 170/750, $35,000; Cyber 170/760, $40,000; IBM 4341 series, $25,000; 3080 series,

SOFTWARE & SERVICES

$45,000; 3030 series, $35,000; Hewlett-Packard Co. HP 3000 System 3, $10,000, and HP 3000/64, $20,000; Wicat Systems, Inc. System 150, $2,500; Systems 200 and 220, $5,000; Cray Research, Inc. 1/M, $75,000, and X-MP, $95,000.

Perpetual licenses are available for Tandem Computer, Inc. Non Stop and Non Stop II computers, with pricing based on their number of CPUs. Prices begin at $15,000 for two CPUs and range to $60,000 for 16 CPUs. Monthly rentals of Creatabase range from a low of $150, for use on a Wicat 150, to a high of $4,750, for a Cray X-MP, the vendor said.

NDX, 8360 Greensboro Drive, McLean, Va. 22102.

SIGNAL TECHNOLOGY, INC.
Smartstar 30-day trial

Signal Technology, Inc. is offering 30-day trial packages and dial-in demonstrations of its Smartstar integrated data management software. Smartstar reportedly consists of two fourth-generation software productivity tools, Smartdesign and Smartquery.

Smartdesign is the system's applications designer and Smartquery is the fourth-generation query program for execution of those applications, according to the vendor. The Smartstar software will reportedly run on any Digital Equipment Corp. computer under the VMS operating system.

The 30-day trial package for Smartstar is available for $300 and includes a set of documentation, a nine-track magnetic tape and demonstration materials for VAX/VMS 3.1. The price of the trial package will reportedly be refunded if Smartstar is purchased within 60 days. The Smartstar dial-in demonstration is available over phone lines from the vender's computer system.

Smartstar is available for the following computers at the following prices: VAX-11/730, $4,000; VAX-11/750, $5,600; VAX-11/780, $7,000; and VAX-11/782, $7,000.

Signal Technology, 5951 Encina Road, Goleta, Calif. 93117.

VALUE COMPUTING, INC.
IDMS Accounting Subsystem

Value Computing, Inc. has announced the IDMS Accounting Subsystem, which produces performance and accounting reports and provides utilization statistics for users of Cullinet Software, Inc.'s IDMS data base management system.

The system reportedly extracts data from the IDMS log and reports IDMS internal task and transaction activity, external run units for batch programs and for tasks executing in another region and terminal activity. It includes an interface to Value's Comput-a-Charge data center accounting and billing system.

The system runs on the IBM 370, 30 series and 4300 series processors under IBM's DOS/VSE, VS-1 and MVS operating systems, according to the vendor.

The purchase price is $5,000. A 12-month lease is available for $460 per month.

Value Computing, 498 N. Kings Highway, Cherry Hill, N.J. 08034.

LANGUAGES

CLARITY CONCEPT SYSTEMS CO.
Enforcer I

Clarity Concept Systems Co. has introduced Enforcer I, which is said to help data processing departments eliminate the practice of speed coding.

Speed coding, according to the vendor, occurs when programmers use too many abbreviations and too few comments in their programming. Enforcer I reportedly consists of on-site instruction provided by the vendor and a program that checks the work of programmers to warn them against speed coding as they work.

The software is said to operate during programming without interfering with the programming's progress. The software reportedly will operate on any system that supports Cobol.

Enforcer I licenses for $9,600 per year, including software and orientation instruction. For installations outside New York, users must provide travel expenses

Lear Siegler
Quality and Reliability You Trust. High Touch™ Style You'll Prefer.

This new generation of Lear Siegler video display terminals brings elegant High Touch™ style to our American Dream Machine (ADM™) tradition. The family features three new ergonomic terminals designed to meet the needs of OEMs and end users alike: the ADM 11, the ADM 12 and the ADM 24E.

Here is a whole new way for terminals to relate to people. Dozens of little touches add up to the convenience and comfort of High Touch.

For example, we put the power "on/off" switch and contrast control knob in front where they're easy to reach.

The monitor not only tilts and swivels, it stops positively in almost any position.

The clean, crisp display features a large character matrix on an easy-to-read green or amber non-glare screen–made even easier to read by the hooded bezel. Screens are available in 12" or 14" sizes.

You get the best in style and ergonomics, plus all the outstanding performance features you'd expect from Lear Siegler (see chart).

Lear Siegler High Touch terminals are backed by the broadest network of full service centers anywhere, serving 3000 cities nationwide. And they're made in America–designed, engineered, manufactured and shipped from Anaheim, California to provide you with the best local support.

Place your order today by calling your local Authorized Distributor or, for quantities in excess of 500 units, your Regional OEM Sales Office.

Lear Siegler's new VersaPrint™ 500 Series printers combine with Lear Siegler video display terminals for hard copy output.

Low-profile, tapered, DIN-standard keyboards with Selectric layout feature logical key groupings and adjustable tilt for comfort and efficiency. ADM 11 shown above.

Clarity Concept Systems, 14 Washington Place, New York, N.Y. 10003.

HARRIS CORP.
Harris C; VHIL

The Computer Systems Division of Harris Corp. has announced the addition of Harris C, a compiler for the C programming language, and VHIL (VOS Harris Implementation Language), an added-function C enhancement. Both are available for use on Harris superminicomputers.

A full implementation of the C language, Harris C is said to be compatible with other C compilers. Designed for extensive porting ability, Harris C reportedly performs record I/O, the Harris VOS I/O and byte-stream I/O.

The shared common-area interface on Harris C permits it to operate with Fortran on the same data, according to the company. Using this interface, programs can be written in both languages.

Other features include error checking and automatic error recovery, data checking and debugging.

Offered with Harris C for further program development uses, Harris' VHIL compiler is an extended version that is said to provide a friendlier programming environment than standard C compilers.

Harris C and VHIL compilers are available together for $7,500, with a monthly maintenance fee of $55.

Harris Computer Systems Division, 3101 W. Cypress Creek Road, Fort Lauderdale, Fla. 33309.

TOWER SOFTWARE, INC.
Sleuth

Tower Software, Inc. has introduced Sleuth, a debugging package for Cobol users on Hewlett-Packard Co. HP 3000 systems.

According to the vendor, Sleuth creates a running audit trail in an easy-to-read format. It can be displayed on a screen or printed.

Sleuth sells for $1,500 for a long-term license. Demonstration kits are available.

Tower Software, 338 15th Place, Manhattan Beach, Calif. 90266.

TARTAN LABORATORIES, INC.
C and Modula-2 compilers

Tartan Laboratories, Inc. has announced C and Modula-2 language compilers for Digital Equipment Corp. VAX-11 processors and National Semiconductor Corp. 16032-based Unix systems.

The compilers are said to provide optimized code while allowing program portability across architectures. The compilers' error diagnostics not only provide a line number and cryptic phrase for an error message, but also display the incorrect line and the ones surrounding it for context, point to the error and explain the problem and how the compiler attempts to recover from it, a vendor spokesman said.

Each compiler reportedly incorporates a tool called the Production Quality Compiler. This takes machine and language definitions and produces a compiler for specific languages on specific machines, the spokesman said.

The C and Modula-2 versions for VAX/Unix systems are priced at $2,000. Versions for 16032-based Unix systems are priced at $1,000 each.

Tartan Laboratories, 477 Melwood Ave., Pittsburgh, Pa. 15213.

SIGNETICS CORP.
C cross-compiler

Signetics Corp. has announced a C language cross-compiler that allows routines written in C to be combined or linked with routines written in the Signetics SC68000 macro assembler.

A vendor spokesman said the cross-compiler is designed for system engineers developing products based upon Signetics' SC68000 16- and 32-bit microprocessor family. The cross-compiler reportedly allows users to create programs in the most appropriate language and to manipulate hardware via the program's linking capability.

The system is said to conform to Version 7 of Unix C and to produce assembler code.

The operating environment is based upon any Digital Equipment Corp. VAX-11 processor.

The Signetics C programming language cross-compiler is available immediately at $3,400, including the C cross-compiler and the SC68000 macro assembler on ½-in. magnetic tape.

Signetics, P.O. Box 409, 811 E. Arques Ave., Sunnyvale, Calif. 94086.

REMOTE COMPUTING SERVICES

GENERAL ELECTRIC INFORMATION SERVICES CO.
Financial planning from Cali

General Electric Information Services Co. (Geisco) has announced that it will market financial planning software from Cali Computer Systems, Inc.

The Cali software reportedly includes a financial aid planning program and other Cali personal financial planning programs. The software will be downloaded to subscribers via the GE Mark III worldwide teleprocessing network and will be updated as enhancements are produced.

The Cali financial planning software runs on IBM Personal Computers and compatible machines. Subscriptions are available for $500 per machine per month, with a minimum order of 20 required.

Geisco, 401 N. Washington St., Rockville, Md. 20850.

Computerworld/Espana makes talking to the Spanish computer market easy.

Spain has become a major and fast-growing market for U.S. exporters. There are currently 4,000 general purpose computers at 3,000 sites in Spain at an installed value of $2.2 billion. In addition, there are more than 11,000 office computers in operation. Industry revenues are increasing 20% to 30% yearly contributing to Spain's GNP growth of 9% annually for the last three years. To meet this growing demand for DP equipment, products and services, computer professionals read *Computerworld/Espana* when they look to buy. *Computerworld/Espana* is the only EDP newspaper serving the Spanish data processing market. Modeled after its sister publication *Computerworld*, it is a weekly tabloid with the most up-to-the-minute information for DP professionals and users who need to keep informed on the fastest growing industry in the area. And now, *Computerworld/Espana* makes its mailing list of 9000 EDP and MIS executives available for rental. This is a unique opportunity to test your product or service in this burgeoning market.

INTRODUCING YOUR NEW NIGHT SHIFT.

BiComM-3700 lets your personal computer communicate with a mainframe even when you're asleep. Telephone costs are lower. Mainframe time is cheaper. And how many people can reckon to use your computer at 2:00 AM?

[illegible]

The BiComM-3700 communications package emulates the popular 2780/3780 series of RJE stations, with many added features. You can prepare a simple command file to direct it's operation when no one is around. Of course, you can also transfer files in an interactive, menu-driven mode day or night.

[illegible]

You'll be able to sleep soundly because BiComM-3700 uses the BISYNC communications protocol—tried, tested and proven effective for over fifteen years. It contains powerful error detection features to insure that your data arrives safely and securely, writing a complete time-stamped record of everything it does.

[illegible]

Your new night shift works faster than others because it can communicate at speeds up to 19,200 baud, and up to 9600 baud over dial-up, voice grade telephone lines using standard modems. That means no extra costs are incurred for specially treated lines. When you arrive the next morning you'll already have a big head start on the day's activities.

BiComM-3700

Put your night shift to work for you tonight!

Packaged Solutions
INCORPORATED

[illegible] BISYNC communications for IBM Mainframes, BiSynchronous and many RS232 equipments. Available now at list prices starting at $695.

[illegible] Packaged Solutions, Inc. One Washington Quadrangle, Suite 3CW, Melville, New York 11747, USA (516) 753-1049. TELEX 144654.

The BiComM-3700 was developed by Wilcox Systems Inc.

SOFTWARE & SERVICES

GENCODE from page 77

have the ability to "learn" document styles, then compose them with no operator intervention. It takes longer on a batch system to set up the initial job of a series than it does on an interactive system. But once the style has been learned, a batch system will compose subsequent jobs with little assistance from the operator. Batch systems are good for directories, technical documentation and financial and legal documents.

Batch systems are clearly the choice for composing generically coded text files. Recall that document elements, such as paragraphs, tables and emphasis points, are coded for their intellectual, not typographic, attributes. It makes far more sense to have the computer go through the document and make it look the way it should (batch approach) than to have a human operator go through the document page by page (interactive system).

To maintain the integrity of the gencode approach, a prepress system must not require manual intervention. This spells disaster in a gencode system for a number of reasons.

Suppose the style dictates a maximum of three consecutive hyphenated lines. After composition, a proofreader notices a paragraph with four consecutive hyphens. Since the system has no provision to allow the user to specify the maximum number of hyphens, the job must be called up on the screen and a hard line ending code inserted.

We now have several problems. First, we have coded a typographic parameter into the text file that is philosophically incompatible with gencode. Second, we now have system-specific markup coding in the file, so it is no longer portable, which defeats the purpose of gencode. Third, if text is added later and the job precomposed, many of the lines following the additional text will break differently than they did before. Yet a break will automatically occur wherever the hard line break code has been inserted.

Prepress system attributes

This is only one of hundreds of stylistic parameters that may have to be specified before a complex document will paginate correctly with no manual intervention. As a result, a prepress system that can build pages without manual intervention must have two attributes.

The first is a markup language that can specify the entire spectrum of stylistic considerations. These include provisions for automatically generated headers, footers, footnotes and more.

The system also must have powerful formatting capabilities. These are necessary to make the link between tags and markup coding. Ideally, they should include in-stream processing capabilities that will manipulate text, automatically call formats, perform logical operations and so on. The importance of avoiding manual intervention cannot be overemphasized.

Brown is president of Datalogics, Inc. in Chicago and a member of the board of directors of the Graphic Communications Association.

Moucher is Datalogics' director of marketing.

PROJECT from page 77

that went into that plan. As with any contract, both parties must fulfill their obligations if the agreement is to work.

The second method for limiting high risk in project management is the use of the phase-limited commitment based on planning horizons. One of the functions of the project manager is to predict the future: what and when things will happen on the project.

It is not unusual for a data processing project manager to be given a big project assignment that will extend far into the future. It is the foolish project manager who pretends that one can accurately predict the end of the project. In these cases, the project manager should only predict the portion of the project that can be planned with reasonable accuracy. The appropriate length of time for the project manager to plan is known as the planning horizon.

Determination of what is the appropriate planning horizon depends on the definition of the organizational environment and the nature of the project. The project manager should consider three factors when selecting a planning horizon:

- The stability of the organization.
- The precision of the project definition.
- The complexity of the project.

The stability of the organization is reflected by the frequency of reorganizations and reassignments, the employee turnover rate and the frequency in which the organization's priorities change. A planning horizon should also take into consideration how clearly defined the project's scope and objectives are. Another factor affecting the appropriate length of a planning horizon is the complexity of the project itself. The more complex a project is, the greater the risk tends to be for the entire organization, thus the greater the risk for planning the project. For more complex projects, a shorter planning horizon is appropriate.

Usually, a project manager will select a planning horizon that coincides with the phases of the system development life cycle. This concept of planning only part of a big project is known as rolling project management or phase-limited project management. The wise project manager only commits what can be reasonably planned, thus making a phase-limited commitment to management.

The concepts of the performance contract and a phase-limited commitment can help the project manager minimize the risks associated with the position. The performance contract clearly defines the responsibilities of the project manager, the user and the organization's management. The contract approach makes it easier to define where pressure should be put in order to complete the project. The phase-limited commitment of a project manager commits only to those activities which can be reasonably planned and managed. With a clearer picture of responsibilities and obligations, project managers can more easily complete their jobs.

IN DEPTH

Pick steps out

Comparing Pick to Unix is a nice way to start a religious war. Both have extremely loyal followings who are quick to rush to the defense of their systems. Both products also have definite, nonoverlapping strengths and weaknesses.

By Rick Cook

The operating system *Business Week* called "the computer industry's best-kept secret" won't be a secret much longer.

More than a decade after its first implementation, the Pick operating system is beginning to attract attention outside a small fraternity of devotees. And Pick Systems, Inc., the company founded by Dick Pick to promote his brainchild, is getting ready to move the product into a much larger arena.

The company will attempt to go head to head against AT&T's Unix in the mini and micro worlds and to gain more visibility and credibility in the mainframe area.

In the time that Pick has been available, it has gained a considerable underground reputation as a system for business applications. Some observers see parallels between Pick's present-day cult status and vocally loyal following and Unix's situation just before it burst into public consciousness.

In its latest effort to broaden its market appeal, Pick Systems announced a release called Pick Open Architecture; developed a coprocessor called the Vulture to speed up the system on minis and high-end micros; and brought out the system for $495 on the IBM Personal Computer XT, the hard-disk version of that machine. The company is also mapping its first major advertising campaign and planning an educational and documentation program to make Pick more accessible and easier to use. To finance all this, Pick Systems is looking for outside capital for the first time and hopes to make an announce-

ment on that score in the next 60 days.

Basic space

Pick is a multiuser, virtual memory operating system with a built-in relational data base with a dictionary file structure. It has an English-like nonprocedural query language, a considerably extended compiled version of Basic, a stored-procedure language and a number of other high-level features. The system is optimized for business and management applications rather than scientific, engineering or systems development use.

In Pick, almost all of the details of hardware and file handling are hidden from the users and programmers. The system concentrates attention on the data and the relations among data. There are no fixed file or record lengths, for example, and files and records automatically expand or contract as data is added.

One area in which Pick excels, according to supporters, is in generating the kind of special reports that are the bane of most DP operations. Access, the Pick query language, is reportedly easy enough to use that a manager can start making his own queries with just a couple of hours' training.

To the user, it appears that the data is kept in a single mass. Relations are defined by means of items in special files called dictionaries, and they can be changed at will. To see how this works, consider the problem of converting a system from five-digit to nine-digit Zip Codes. With Pick, the task is easy. The dictionary item defining Zip Code can be called up and changed from a five-character field to a nine-character one in less than a minute. Since all dictionary items can be defined by name, the item would probably be called "zip.code."

In a well-designed data structure under Pick, the change need be made only once, because there is only one dictionary entry for Zip Code. All of the programs and procedures that use Zip Codes will reference that entry. Of course, if the user needs to maintain both five-digit and nine-digit codes, that can be done, too. The programmer would create a new dictionary item for nine-digit Zip Codes and indicate which addresses need which codes. Since each user has his own dictionary, the Zip Code size can be different for different users.

One area in which Pick excels, according to its supporters, is in generating the kind of special reports that are the bane of most DP operations. Access, the Pick query language, is easy enough to use that a manager can reportedly start making his own queries with just a couple of hours of training. Alternatively, even junior members of the data processing staff can produce complex reports quickly.

"Generally, we can get a report back to a manager within a couple of hours," says Brad Holland, a systems analyst at the Nichols Institute, a medical laboratory in San Juan Capistrano, Calif. "Some take longer, but the original analysis of the file structure that was done for our system doesn't take full advantage of Pick. Generally, in the event of a special request, we can get back to them at the latest the next day." The institute uses Pick on its Microdata Corp. 6000 and 8000 minicomputers.

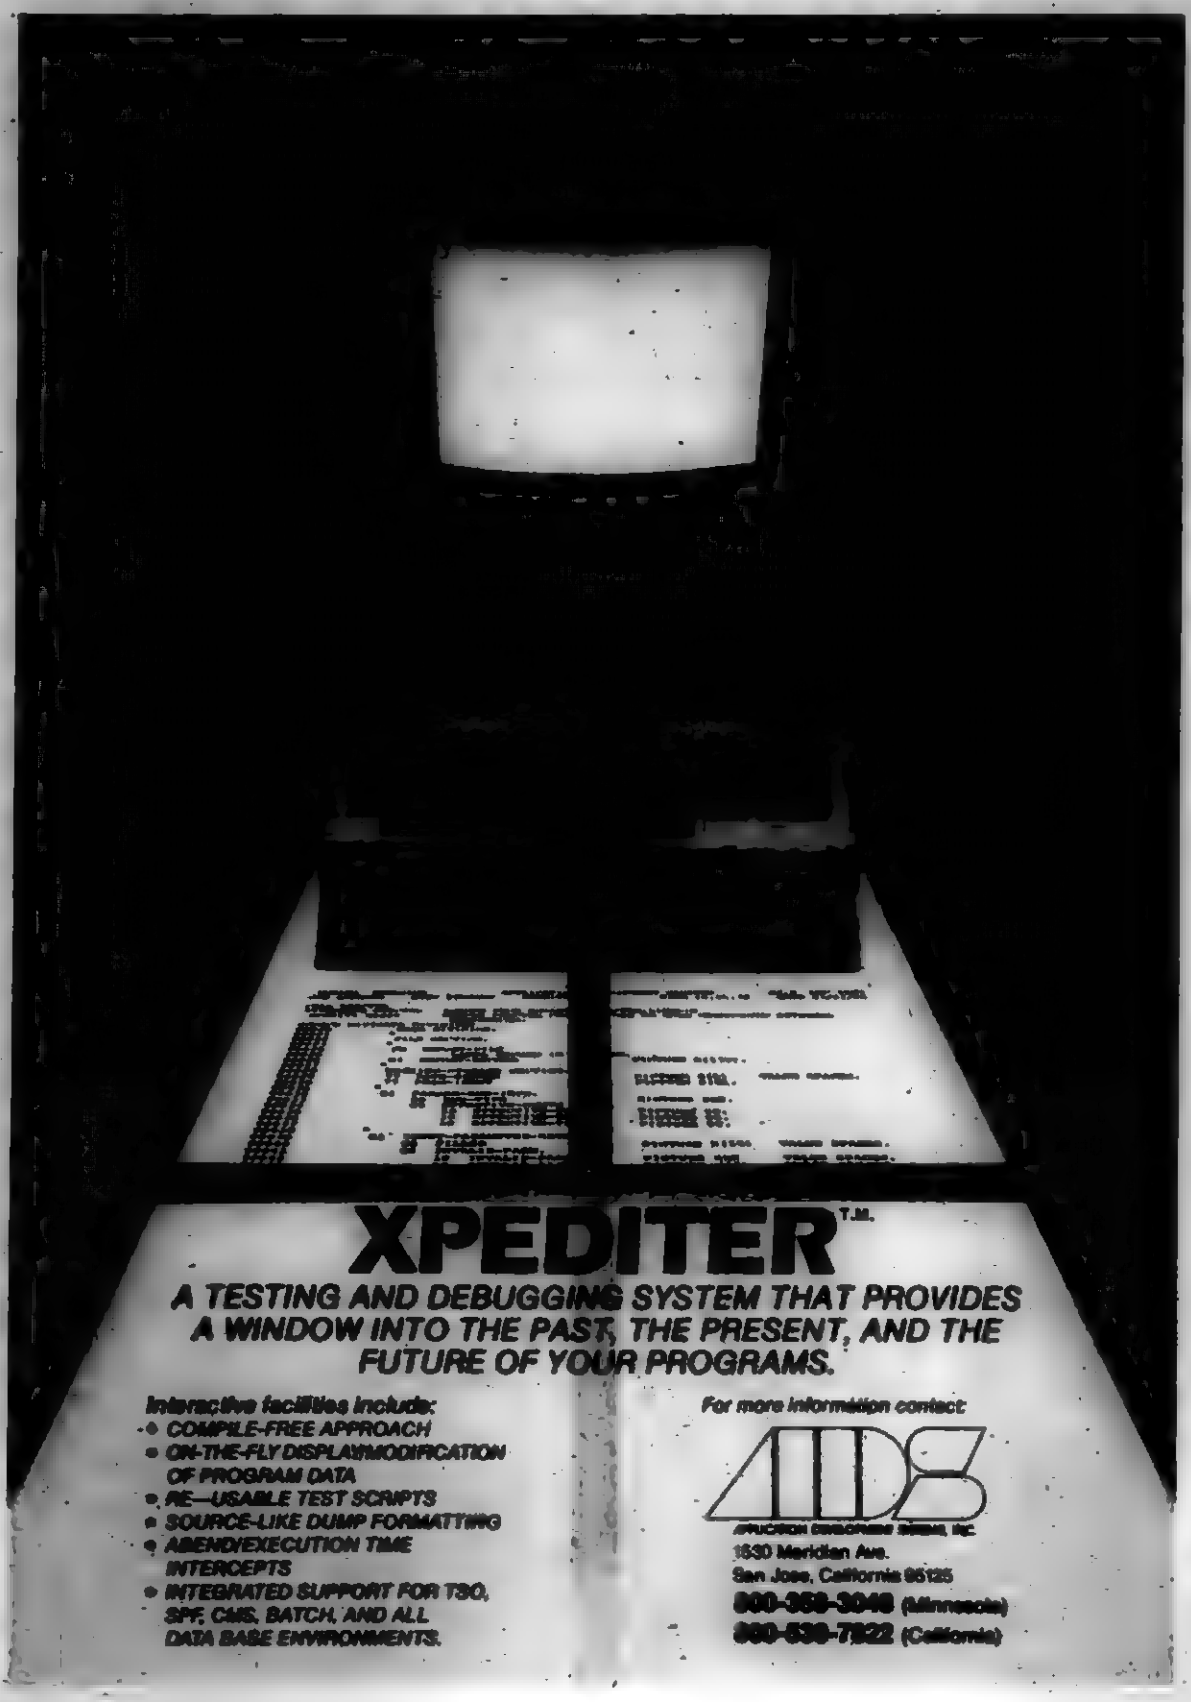
Complex series of commands can be created, named and stored as procedures, or "procs," to be called and used as needed. With the appropriate procs, even relatively naive users can perform complicated operations as easily as simple ones.

Pick dictionaries also allow users and programmers to define synonyms for dictionary items. If the user feels more comfortable calling something "electric bill" instead of "utilities," it is the work of a minute to define the terms as synonyms. This situation applies to the commands in Access as well. For the user, "list" can become "show me," or whatever. Words can also be defined as throwaways, to be ignored by Access.

This flexibility leads some users to set up their own simple form of natural language processing by replacing items and commands in their dictionary with their own words. More important, the English-like structure of the language and the ability to concentrate on the data rather than the system encourages free-ranging searches in the data base. A user can start with a general idea and follow where it leads, refining it with successive commands.

Structurally, Pick is a virtual machine entirely implemented in software or firmware. Even the memory management unit for the virtual memory is a construct. The Pick virtual machine has its own pseudo assembly language, which is rich in commands needed for data management. It also has about 600 instructions — one of the reasons that not many people try to write in Pick assembler.

The virtual machine is hooked to the hardware through a software module called the monitor. The first Pick implementations were on minicomputers, with the operating system in firmware. On microcomput-



Presenting the Stratus Office Solution™ (SOS). It Will Integrate Your Collection of Information-hungry IBM PCs into a Fault Tolerant Office System.

Somehow the personal computer revolution has become your personal problem, hasn't it? They're lined up with their IBM™ PCs demanding access…access to the corporate data files …access to shared data and hardware…

To compound the problem, the IBM PCs represent, for many of these users, their very first relationship with a computer of any kind.

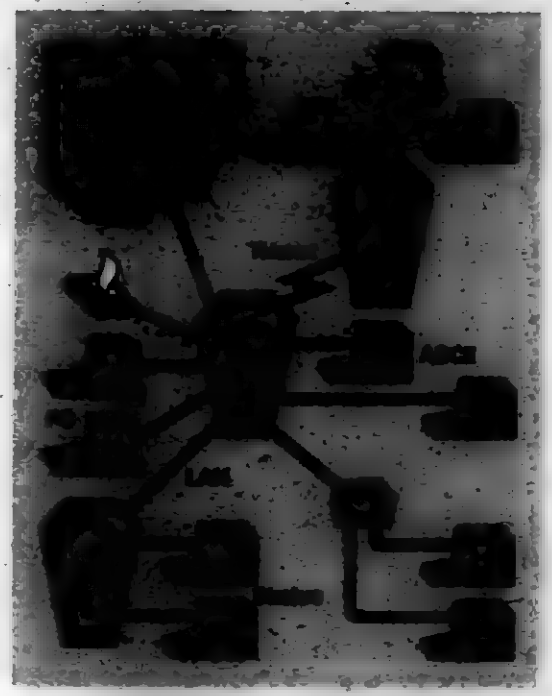
You need a solution right now and it has to be comprehensive and so easy to understand that even your neophytes will be in high gear on day one. And if they're going to depend on it, it should be fault tolerant. What you need is the Stratus Office Solution (SOS).

SOS Combines Comprehensive Software and Fault Tolerant Hardware

Stratus is the company that made its mark with its hardware-based fault tolerant super-mini. Now it is offering a turn-key software package built around this super-mini that is made to order for companies with an IBM host and from 20 to several thousand independent IBM PCs and/or 3270 and/or conventional terminals.

Here's a quick look at what you get with SOS (without having to write a single program):

- ❑ Controlled IBM PC access to mainframe data
- ❑ Data exchange between IBM PCs



- ❑ Data conversion to 1-2-3™ and VisiCalc™ formats
- ❑ Electronic mail at IBM PC, 3270, or ASCII terminals
- ❑ Word processing on IBM PCs using WordStar,™ or MultiMate™ (a Wang-like word processing package)
- ❑ Text conversion from WordStar and MultiMate formats
- ❑ Stratus Word processing
- ❑ Shared access to Stratus printers and disks
- ❑ Calendar management at IBM PC, 3270, or ASCII terminals

SOS lets your collection of isolated PCs become part of an integrated, electronic office system. And unlike any other office system in the world, it is based on fault tolerant Stratus/32 hardware that provides continuous availability and transparent networking. Not only can you count on it to work well, you can count on it to always work.

Call Stratus today. Ask for Keith Johnson: 1-800-255-1515 or in Massachusetts: 1-617-653-1466. Turn those "personal" problems into personal success stories… and instant company assets.

VisiCalc is a trademark of VisiCorp, Inc. 1-2-3 is a trademark of Lotus Development Corporation. WordStar is a trademark of MicroPro International. MultiMate is a trademark of Software Systems, Inc.

Stratus
CONTINUOUS PROCESSING™

Now that the world relies on computers it needs a computer it can rely on.

era, the system is in software.

The setup is complex, and getting it running efficiently on a new machine takes some doing. On the other hand, once it is running, it will run any Pick software. Because of the virtual machine design, all computers appear to be exactly the same machine to a Pick application. Programs written on a multiuser micro under Pick will normally run on a mainframe with Pick and vice-versa.

Divergence with Unix

In this respect, Pick is the opposite of Unix, as Pick supporters like to point out. Unix is a highly portable operating system, but it exists in a number of flavors, and applications written for one version of Unix won't always run on another version. There is basically only one version of Pick, so while porting Pick is more work, applications load and go.

Perhaps Pick's most serious deficiency is in communications capability, particularly when compared with Unix. Users are limited in designing distributed-type systems.

"As Pick is portable across the hardware, we look at which hardware suits each installation and put in the same software everywhere," notes Zamir Hassan, director of information systems for Greenman Brothers, Inc., the parent company for several chains of wholesale distributors and toy and sporting goods stores with locations from Texas to New England. Hassan says the software is being developed at the company's Farmingdale, N.Y., headquarters on a Honeywell, Inc. Level 6 minicomputer with the assurance that it will run on everything from an IBM 4300 down.

Like many users, Hassan also praises the ease of applications development with Pick: "Pick Basic has a lot of power in it. The main programming language is not really Basic, I would call it very close to Pascal. If you are comparing it with Cobol, 10 pages of Cobol could be put in maybe 200 lines of code in Pick Basic. It's very easy to produce applications programs."

Because applications development is so easy, several microcomputer companies, such as Altos Computer Systems, Inc., offer Pick in addition to Unix for their multiuser systems.

According to Bob Boseman, director of marketing at Altos, the company offers Pick in special sales situations. "You always have some customers with unique needs and you have to have a fundamental tool kit to provide unique solutions." Boseman says Altos doesn't push Pick widely because "we are afraid of our dealers having to worry about too much."

Communications lacking

Perhaps Pick's most serious deficiency is in communications capability, particularly when compared with Unix.

"The basic thing available is standard 3780/2780 capacity," Hassan says. "That's the best you can do right now, and it limits you in designing a distributed-type system."

Pick also lacks floating-point ability. Holland says that is the reason the Nichols Institute uses another system to handle the data reduction of its laboratory tests and Pick for business functions.

"Pick is great for business, but it would be nice to run the processes of the company on Pick, too," he says.

Other common complaints about Pick are the lack of a high-level language besides Pick Basic and the fact that the system is not multitasking in the sense that Unix is. Each terminal can run only one thing at a time instead of several tasks at once, the way Unix can.

Open Architecture

Pick Systems' response to all this is Open Architecture, a series of enhancements for Pick which will offer multitasking, floating-point arithmetic, better communications and a number of other features. It also offers a 20% to 25% performance improvement, the company says. The package was formally announced at Pick Spectrum, the annual Pick get-together, last February, and it is supposed to be completely implemented in the next 18 months.

"That is the basis for the future," says Wayne Wahlenmeier, Pick Systems' vice-president of marketing. "We're opening ourselves up more and more to additional things."

Pick sees Open Architecture as a further generalization of the concepts of the operating system. "In the most simplistic terms, what Open Architecture is all about is generalizing that underlying operating system to where it is not just suited to run our system, but it can run anything — like [Microsoft, Inc.'s] MS-DOS or Cobol."

"It's the culmination of a 20-year project," Pick says, "and I'm willing now to say there is better underlying architecture for a multiuser time-sharing system than what you're looking at now." He adds that when Open Architecture and the associated tools are completed over the next year to 18 months, he will be ready to move on to new things.

Open Architecture was designed to make it easy to add other features to the system as it is developed. Among those Dick Pick wants to add are artificial intelligence features.

"If you look at what we have today, it is generalized information management. You can abstract information from the real world and

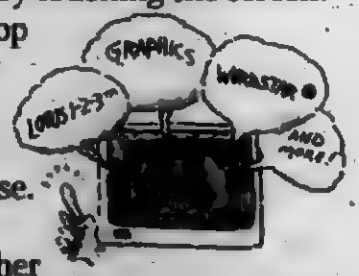
Is your office operating at a crawl...

Maybe the one thing you need to get off the ground is the Touchscreen Personal Computer. The HEWLETT-PACKARD 150. Because it's no ordinary machine. Remember the first time you approached a personal computer? If it wasn't exactly love at first sight, it was probably because a lot of machines can be pretty intimidating. Especially for first-time users.

HP 150

We've made the Touchscreen Personal Computer so easy to use that people like to use it. Very simply, we've taken out the intimidation factor. We've made the new Touchscreen Personal Computer so easy to operate that even first-time users can use it. Which means they'll quickly grow to love it.

For example, to select the software you want to use, just touch the screen. So whether you want to work with words, numbers or graphics, all you have to do to get started, is touch the screen. And once you get going, you can change a number in a spreadsheet, or make a chart for a presentation just by touching the screen. No complicated commands to remember. No desktop gadgets to manipulate. All that's required is the touch of your finger. MultiPlan,™ Graphics, WordStar,® Lotus 1-2-3,™ dBase II,™ VisiCalc® and a world of popular software become easier than ever to use.



The Touchscreen Personal Computer not only communicates with people. It communicates with other computers, too. Your people are your most valuable asset. But the more information they have at their fingertips, the more valuable they become. The Touchscreen Personal Computer delivers again.

structure it in the computer. The next big thing is what I call generalized decision management, where I can come up with some kind of a structure with which I can describe how decisions are made in terms of a man-machine interaction."

Pick also wants to add voice recognition. He points out that after the initial analysis of the waveform to get the phonemes, a process that can be handled by a dedicated microprocessor, the rest of the problem is a matter of data management.

From Girls to Pick

The basis for the Pick operating system as it exists today is the structure that Dick Pick and his co-workers developed in the mid-1960s for TRW on an Army project called Generalized Information Retrieval Language and System (Girls, later General Information Management [GIM]). The Army was looking for some method of managing the information flow in complex projects, specifically the Cheyenne helicopter.

The basis for the Pick operating system as it exists today is the structure that Dick Pick and his co-workers developed in the mid-1960s for TRW on an Army project called Generalized Information Retrieval Language and System (Girls, later General Information Management [GIM]).

The system that Girls/GIM came up (and which Pick later refined) used a paper machine optimized for information management. As much as possible, the hardware details were to be handled by the machine rather than the user, leaving the user free to concentrate on the data. The Girls/GIM project implemented this paper machine as a virtual machine on an IBM 360.

"In terms of the general concept of data management and the kinds of tools, it was complete. Now we're just trying to get in all the things we conceived of 20 years ago," Pick says.

The Cheyenne proved to be unmanageable, but it launched Pick on the path he has followed ever since. "I've spent the last 20 years trying to disprove the old saying that if you build a better mousetrap, the world will beat a path to your door," he says of his and his company's career.

After the Army project ended, Pick acquired the rights to the system and set out to develop it to meet his conception. In 1973, it appeared on Microdata minicomputers as the Reality system. Pick eventually left to market the system elsewhere. A lawsuit over the rights to the operating system was finally settled out of court in 1981. That suit was one of the reasons Pick has remained relatively unknown.

Another thing that helped keep Pick a secret was the penchant of Pick licensees to market the system under different names. In addition to Reality, Pick is known as Ultimate on Honeywell Level 6 machines and Adds Mentor on Adds/NCR minis. While the lawsuit was active, Pick Systems encouraged this kind of proprietary nomenclature.

Pick's licensing agreements were also stringent and expensive. The one-time license fee to implement Pick was $1.1 million — a provision that has since been considerably modified. Because of the system's complexity, ports were, and still are, done in-house at Pick Systems. This situation ensured that everyone's version of Pick was software-compatible, but it limited the number of systems that could be supported.

Although Pick applications are highly portable, the operating system itself is not, at least not compared with Unix or other operating systems written in high-level languages. To make Pick operate efficiently, parts of the code must be optimized for each new processor, and that takes time. Even though a new implementation involves rewriting only about 5% of the code in the system, the company estimates it takes about nine months to bring Pick up on a new processor. For an implementation on a new machine using a microprocessor that already supports Pick, the time is cut in half.

Until recently, Dick Pick has had the reputation of being more interested in refining the system than in selling it. "Up until now, selling has been a reaction — we'd answer the telephone," says Barbara Young of Pick's marketing efforts. "Now we're actually calling people."

"It wasn't until the later part of 1981 that we really started to expand," says Wahlenmeier, "so we're really only in our second year of formal growth."

In 1982, the company became more aggressive. Pick Systems started long-range market planning and began to promote itself in the DP and business communities.

Between 1972 and 1981, according to Wahlenmeier, the company only did five implementations of Pick. In 1982, "once the company was released from the stigma of the lawsuit," it did five more implementations and added eight in 1983.

Most of these implementations have been on high-end multiuser microcomputer systems, where Pick's ease of use and software portability are major assets. Among the micro

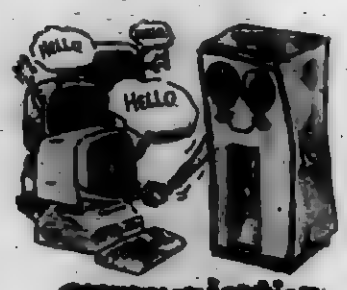
when it could be flying?



The HP 150 is fully compatible with the big HP 3000 computers and, with the addition of our new 3278 communications capability, the 150 can talk to IBM* mainframes as well. Your people can call up data, work with it and send it back to the host computer. All this with the use of the keyboard. The HP 150 can also send electronic mail and operate a range of peripherals at workstations. Needless to say, this can really move things along. The Touchscreen Personal Computer is a Hewlett-Packard product. This, after all, could be the most important thing you need to know about it. Your professional reputation depends on the key decisions you make. Office automation is one of those decisions. You need to know and trust the company you go with. Hewlett-Packard's long-standing reputation for excellence is a given in the industry. And our service and support will make sure you aren't standing still when you should be flying. See the HP 150 at your local dealer or for information call (800) FOR-HPPC today. Find out how a personal computer with a sense of touch makes a lot of sense for your office.

'We've always been oriented to on-line processing'

By Dick Pick

Pick was conceived 20 years ago with the recognition that for the simple data management tool required, a new logic was also required. We proceeded to define and then implement a rather sophisticated relational data base model. Our entire system was built upon this model and still is today.

Each datum you store in Pick is actually an "item," or, if you insist, a "record," and like items or records, they are stored together as a set in a file. For example, employee records, accounting transactions — and programs created with Pick/Basic — are all stored as items in some file. Pick/Basic is intended as an easy-to-use high-level programming language and has Pascal-like power.

The way most other computer systems organize and process data has not changed logically since Herman Hollerith invented the card tabulators for the 1890 census. With Hollerith's process, sorted transactions are processed against a sorted master file to produce an updated master file and then an associated report.

That's not so with us. We've always been oriented to on-line data processing. With Pick, a transaction is captured when it happens. With a single entry, it is processed immediately, and that includes updating multiple files on multiple systems. Errors are corrected then and there and that's the end of it. Twenty years ago, I believe primarily as a result of hardware price/performance and reliability limitations, this approach was considered radical.

Our initial appeal was to entrepreneurs or strong-willed managers running small to medium-size businesses — people after solutions and not afraid to try something new. Marketing and selling were left to our licensees.

Surprisingly, this "single entry" concept is still considered radical today, especially among many of my professional data processing colleagues.

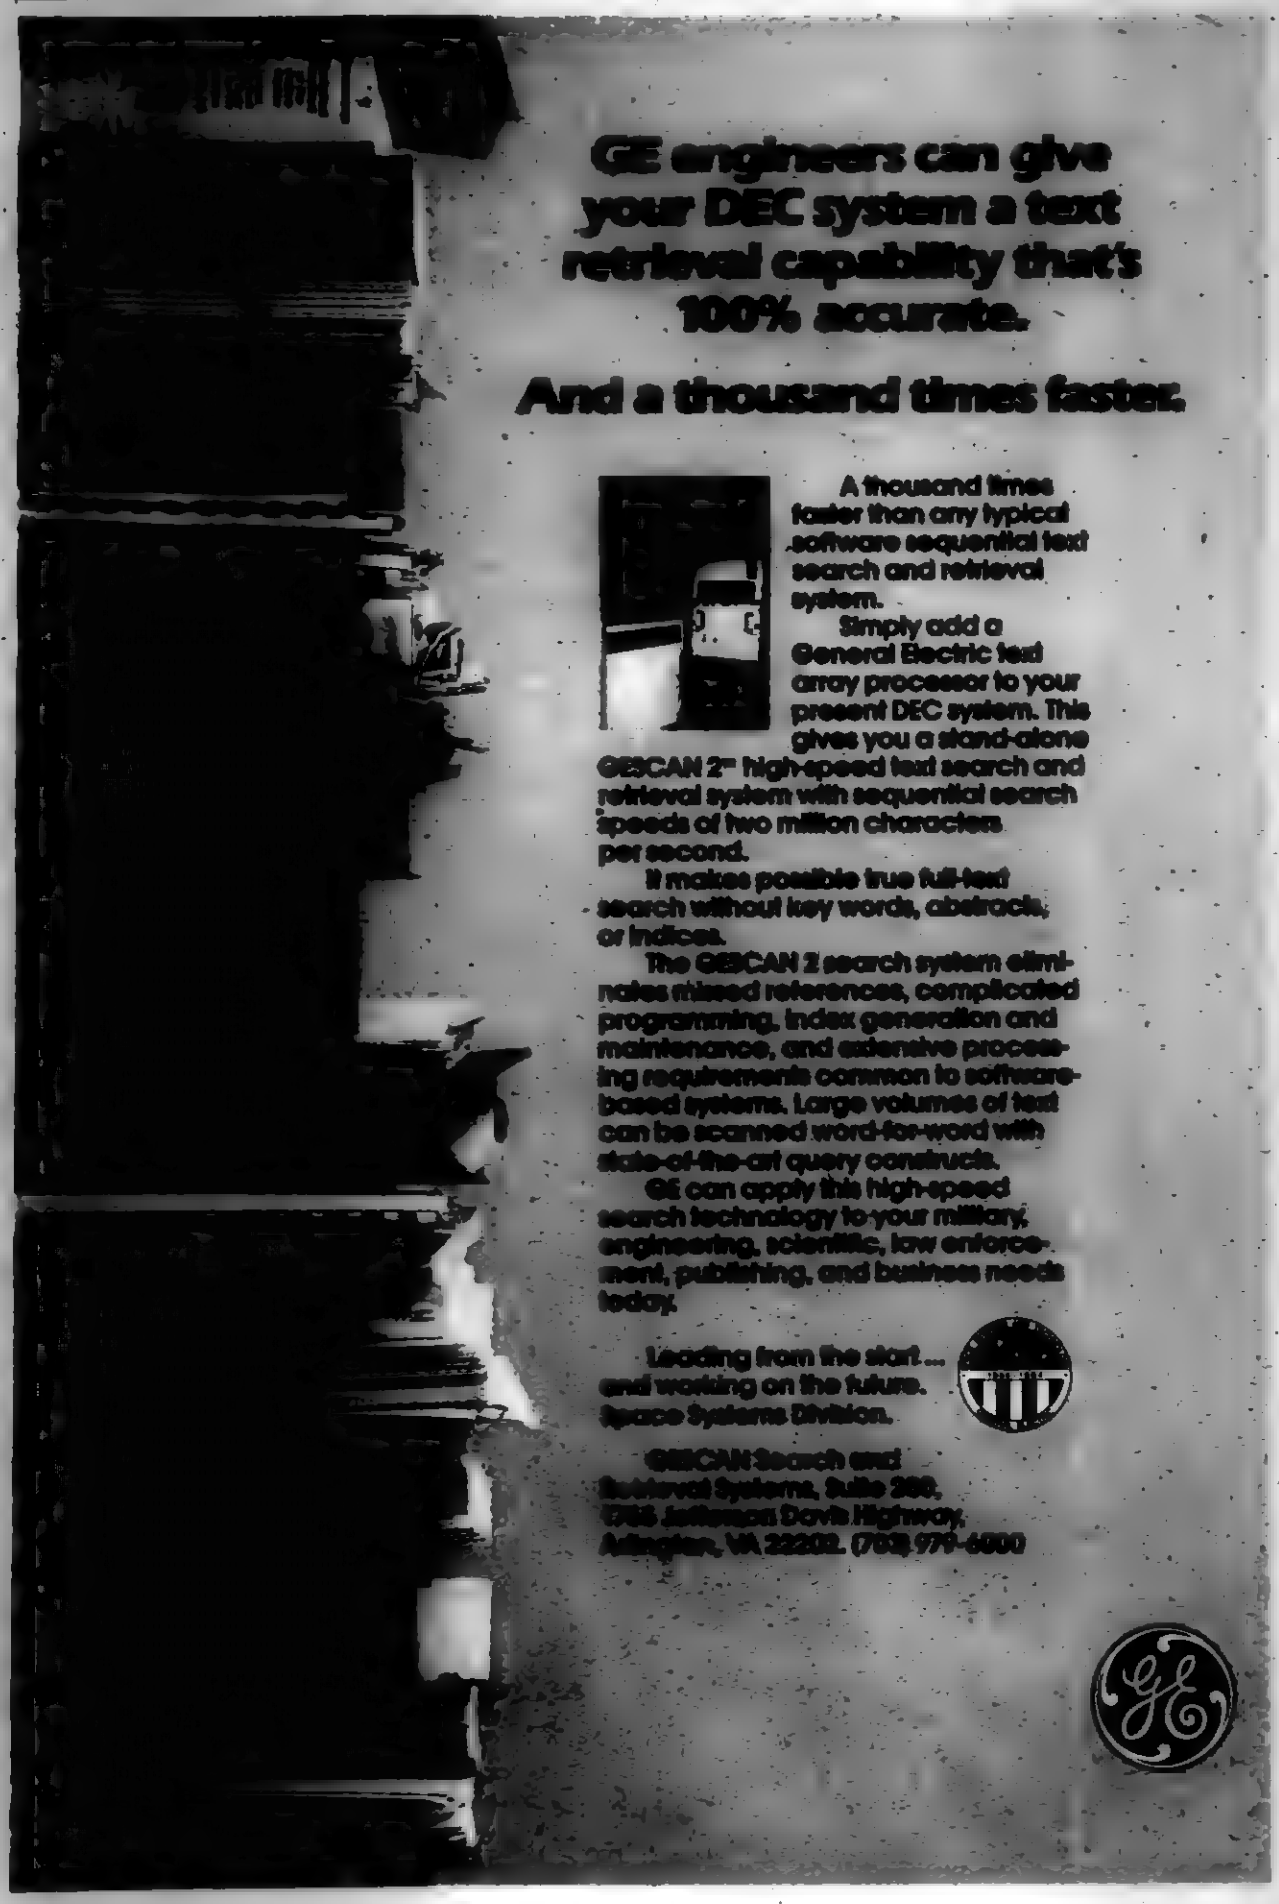
Our initial appeal was to entrepreneurs or strong-willed managers running small to medium-size businesses — people after solutions and not afraid to try something new. Marketing and selling was left to our licensees. And, as might be expected of a technical person, I devoted our resources to making the product better.

In spite of ourselves, we are gaining recognition and converts, even from the elitist ranks. And what is still most important to me, we have made the product better.

Pick with Open Architecture represents the most significant milestone in our history. We feel it will gain us up-scale market penetration at an increasing rate.

Concurrently, we've introduced multiuser, virtual memory computing to IBM Personal Computers with the Pick PC-XT software. We now cover a broad spectrum of IBM systems including Personal Computers, Series/1s and 4300 mainframes. We believe it's truly significant to span the IBM product line with a uniform operating system. Even IBM does not have a single operating system that spans its own product line.

I have spent 20 years leading the development of our system and its concepts. I like to consider these years as "tool building."



Dynamic mainframe looking for suitable personal mate.

If you speak or want to learn IFPS, we could make beautiful decisions together. P.S. Let's meet at the Information Center.

In the past, the hardest thing about financial planning was planning how to do it. That was until Execucom introduced IFPS. IFPS makes problem solving and decision making a lot easier. The tangle of technical details is avoided. And managers are able to master it in a very short time.

Now, financial planners have an opportunity to extend the power of IFPS Decision Support Software to their personal computers, an incredible advantage over any other Decision Support System available.

See Your Mainframe And Personal Computer Work Together At The Information Center.

When IFPS/Personal™ is linked to your mainframe through the Corporate Information Center, the reach of financial planning software is extended throughout your entire organization. You can easily and quickly transfer models and data between your mainframe and desktop computers and solve these models on either end.

You can share and consolidate individual models, reports and data files. You can create them all on your Personal Computer and process them on your mainframe. And IFPS is compatible with the leading general ledger, database and statistics software packages used by corporations.

Do All Your Planning And Modeling In English.

Thanks to the non-procedural language used in both IFPS and IFPS/Personal, you do not have to be a computer expert to build sophisticated models. Or to understand those that other people construct.

Receive The Most Comprehensive Computer Software Training And Service Program Available.

Not only a fact, but a promise. We have developed a support program that offers mainframe-level support on IFPS/Personal. It includes expert technical support for installation, superb documentation, comprehensive training programs, HotLine support, specialized consulting, periodic product enhancements and user associations. We believe that state-of-the-art technology deserves state-of-the-art service.

If the personals ad above looks like it may have been written by your lonely mainframe, call or write Execucom immediately and we'll tell you how you can get it an IFPS/Personal mate. If your mainframe doesn't have IFPS yet, call or write us today and we'll help you make your decision. Execucom Systems Corporation, 3410 Far West Boulevard, Austin, Texas 78731. Call 1-800-531-5038 or in Texas or Canada, call 512-346-4990.

IN DEPTH/PICK STEPS OUT

(Continued from ID/5)

manufacturers now offering Pick are Altos, Datamedia Corp., General Automation, Inc. and Pertec Computer Corp. Pick is also available on some IBM machines. Pick Systems sees its market as business computers, from large micros to mainframes. "We don't appeal at all to hobbyists, nor do we target the scientific area," Wahlenmeier says.

Given that determination not to appeal to hobbyists, Pick's $495 price for its Personal Computer XT implementation looks a little odd. For less than $500, Pick offers a relational DBMS with an English-like query language, an extended version of compiled Basic and a virtual-memory operating system. And the Pick implementation allows partitioning of disk space, so other operating systems, such as PC-DOS, can be run as well.

By contrast, the officially sanctioned version of Unix will cost $900, and the most respected relational DBMS for micros lists for about $750.

On the other hand, as a marketing ploy, Pick's price may be the neatest gimmick since the Captain Midnight secret decoder ring hooked an entire generation of kids into drinking Ovaltine.

Dick Pick says the aim is to "get an attractively priced product out into this boiling personal computer marketplace where people can really start using it."

As the company sees it, Pick's biggest problem right now is visibility. Selling a full implementation for less than $500 is going to build a lot of visibility. At that price, many data processing professionals or business people with access to a Personal Computer XT could afford to experiment.

Paying for it

All these projects — particularly the Personal Computer version of Pick — are going to put new strains on the company. This will be the first time the company has moved into the fiercely competitive world of selling software to end users. Until now, all the training and most of the user documentation were handled by the licensees.

There is also the possibility that Pick will cut a deal with a major manufacturer to market the product on that firm's micros. Dick Pick and his executives say they are talking to IBM, but that so far nothing has materialized.

After years of internally financed growth, the company is going after some form of outside funds. So far, Wahlenmeier says, nothing has been finalized. However, he said the company hopes to have something nailed down in the next 60 days.

Pick vs. Unix

Comparing Pick to Unix is a nice way to start a religious war. Both have extremely loyal followings who are quick to rush to the defense of their systems. Both products also have definite, nonoverlapping strengths and weaknesses.

Broadly, Pick may be superior for applications portability, business applications and managerial-type computing. Unix is regarded as better for operating system portability, multitasking, communications and scientific and engineering programming. Even Dick Pick admits that for scientific work, Unix has the edge.

In a business environment, Pick has the advantage of being designed for it from the ground up, whereas Unix is being brought over from the scientific, engineering and academic worlds.

In a business environment, Pick has the advantage of being designed for it from the ground up, whereas Unix is being brought over from the scientific, engineering and academic worlds. For example, Pick has file and record locking as an inherent part of the system. Only some of the other versions of Unix do.

On the other hand, many more people are familiar with Unix. Most computer science graduates in the U.S. have had at least some exposure to Unix, while almost all the Pick people are working in industry and learned it on the job. Of course, Unix has the weight of AT&T and a host of other companies behind it. Those companies have the money for advertising, promotion and training.

Finally, Unix has a considerable intellectual head start on Pick. It has been touted as the minicomputer and micro operating system of the future for several years.

Still, the people at Pick Systems are confident they can carve themselves a substantial place in the market. "We see Pick becoming more of a standard operating system offering from a multiplicity of vendors," Wahlenmeier says.

Dick Pick likes that idea, but his personal goals are somewhat different. "I'm going to be happy if I can keep making the system better and better," he says. "That's always been my driving force."

IN DEPTH

DB2 complementing IMS

IBM's data base strategy for tomorrow

By Paul E. Hessinger

IBM's current marketing theme for its large system architecture products is "the evolution continues."

In the data base area, IMS represented IBM's only complete data base/data communications resource for more than a decade. As the DP community's understanding of data base-oriented information systems evolved, new requirements were set for effective data base management system (DBMS) implementations. Other data base software vendors moved rapidly into the fourth generation with relational capabilities and integrated software architectures. "Evolution" was neither a guideline nor a constraint for companies like Cullinet Software, Inc. and Applied Data Research, Inc. (ADR).

With IBM's new relational DBMS, the evolution of large system data base/data communications capabilities finally has moved beyond IMS. As IBM's architecture for a fourth-generation data base environment is studied, the marketing theme is evident. IMS remains the workhorse. Database 2 (DB2) emerges as a component of the evolving data base architectures from IBM.

Consider these common data base-oriented questions for a medium-size to large systems environment using or considering IBM data base and data communications products:

- Has your installation taken IMS to the limit

With DB2, IBM's announced relational DBMS, the evolution of large system data base/data communications capabilities finally is moving beyond IMS. IBM's marketing theme becomes clear: IMS remains the workhorse; DB2 appears as a component of the evolving data base architecture.

of its capabilities?

Are development personnel being overrun with requests from end users for variations on reporting capabilities driven by IMS data base systems?

Has the information center concept provided a gateway for non-IBM software products that end users can employ but which need access to data "locked up" in hierarchical data structures?

Are you looking at the architecture of other vendors' data base software products attempting to determine if they represent an alternative to your current environment?

Is your installation considering a data base effort for the first time and are you finding it difficult to ignore all the horror stories about IMS, not to mention the lack of relational data base capabilities and fourth-generation user-friendly tools from IBM?

In the back of your mind are you thinking that just maybe IBM does have an architecture for large data base systems in place and that it is just appearing a piece at a time?

Part I. IBM's emerging fourth-generation data base architecture.

The third-generation concept suffered from too simple a view of the corporate data base, as well as from unreasonable expectations for a single piece of software — the DBMS. As a data base effort got under way, only a small percentage of corporate data resources was under the DBMS' control.

The majority of organizations that were attracted to the potential benefits of a data base approach began the implementation effort with a very simple blueprint in mind. The overall objective of the data base project would be the development of the "corporate data base" — all of the data necessary for business information processing requirements stored with minimal redundancy, to promote consistency, and maximum interrelationships, to promote sharing of data between different business operations and users.

The data base would conceptually support a variety of primarily operational information processing systems. The DBMS was the critical link between applications and data. Early DBMS implementations did not consider information retrieval and decision support capabilities to any significant degree. Most pioneers in the implementation of data base technology felt strongly that a DBMS would provide extensive control and sharing of data and dramatically improve the accuracy and timeliness of application development. These ideas can be referred to as the third-generation blueprint for a data base environment.

This third-generation concept suffered from too simple a view of the corporate data base, as well as from unreasonable expectations for a single piece of software — the DBMS. As a data base effort got under way, only a small percentage of overall corporate data resources was under the control of the DBMS. Other automated non-DBMS files (Vsam and sequential files) as well as nonautomated data were often ignored as potential sources of data redundancy and inconsistencies.

In addition, these other components of the corporate data base represented valuable sources of data for satisfying a variety of information processing applications. But if the data was not required for a specific application being developed under control of the DBMS, it was not considered in the data base design process. As a result, the DBMS apparently was not providing enhanced availability of data.

Following are the most common problems associated with third-generation DBMS:

- There was a lack of understanding about the overall format and usage of data.
- Synchronous Data Link Control (SDLC) was not modified to incorporate data base design techniques and technology (for example, data dictionary).
- Data base programming was complex. Programmers need to know a great deal about a data base in order to navigate through it to access required data.
- There was a lack of organizational responsibility for the data base effort from management and a technical perspective.

As more end users became involved in satisfying their own processing requirements, a conventional DBMS such as IMS was pressed to the limit of its capabilities.

A final evolution of the third-generation blueprint saw the emergence of new DBMS-oriented tools designed for the rapidly growing category of end-user-driven information retrieval applications. These types of applications involved rapid access to data in sequences or formats not previously anticipated by a data base design process.

The use of dictionaries and data modeling techniques helped to uncover some of these requirements, but when it came time to provide access to the data, conventional DBMS often could not support the requirement in a timely manner even if the data was physically present in

ADD TO AND TO

To add markets as well as profits to your business, add Zaisan to your system.

The ES.1 voice/data workstation offers single-key access to simultaneous voice, data or text. With the touch of a button, users can also access internal and external databases, PBX functions and electronic mail.

The ES.1 is also upgradeable. So you can add application and communication software to tailor the ES.1 to the individual information needs of your users. Which can add sales to your business.

Another plus is the price. And the wide range of service options.

Add these all up and you'll see the formula for success is rather elementary. Add Zaisan.

ZAISAN

GET THE WORD ABOUT TRANSACTION PROCESSING. IT'S IN THE BOOK.

In our free 82-page book, "SYNAPSE TRANSACTION PROCESSING: SYSTEM OVERVIEW." And it's a revelation. To non-technical management, technical management, and staff alike.

It spells out how to accelerate development and minimize maintenance of high-performance, fault-tolerant, online transaction-processing systems.

It also discusses miracles: how to get dazzling performance from a Relational DBMS and how to expand a transaction-processing system online under power.

It reveals how to provide fault tolerance without redundant hardware and without programming. How to use a system-wide dictionary to standardize and control all definitions and relationships. How to completely automate database integrity, concurrency and recovery.

It's all there. Chapter and verse. Even a comprehensive index. To get your copy, simply mail the coupon or give us a call at (408) 946-3191. And let there be enlightenment.

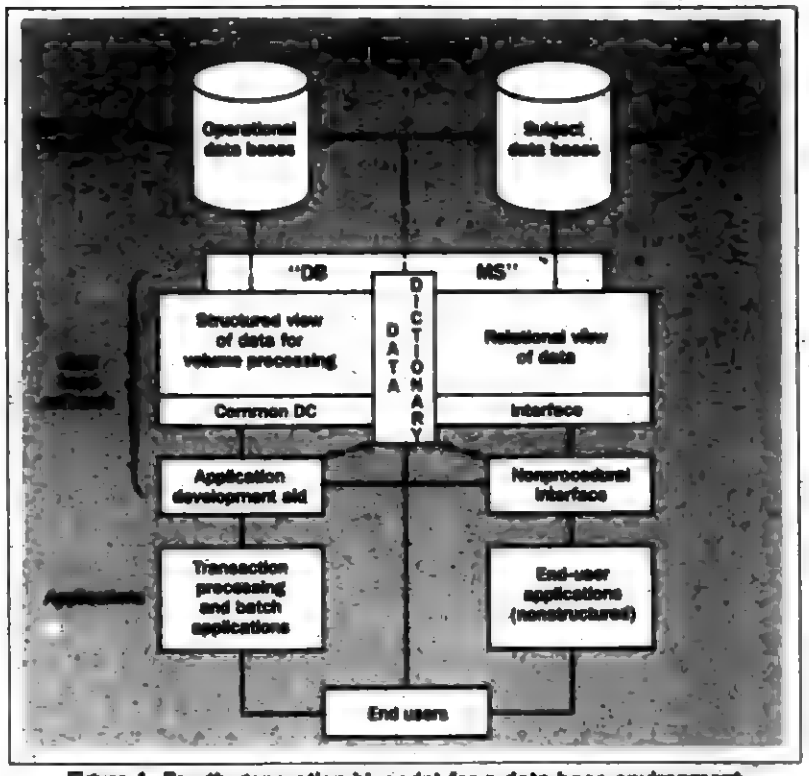

Figure 1. Fourth-generation blueprint for a data base environment

a component of the DBMS.

With this as a brief review, the fourth-generation blueprint for a data base environment begins to unfold (see Figure 1).

IBM's implementation

In the case of IMS, required data was often embedded in a maze of hierarchies, logical relationships and secondary indexes. An end user simply wanted access to data. Data base administration (DBA) personnel could utilize IMS DB's powerful capabilities to build access paths to required data, but they had to be concerned with the performance implications for operational systems accessing the same data.

What the users of IMS experienced was fairly typical of the experience many organizations had in attempting to implement the data base concept. In the case of an IMS DB/DC software configuration, emerging end-user information processing tasks seemed to highlight the "shortcomings" of IMS — and reinforce the need for relational data base capabilities.

IBM's recent direction (IMS 1.2 and 1.3) with its DB/DC products addressed primarily performance issues. Until recently, only *statements* of direction addressed the end-user data base issue.

As the third-generation blueprint was evolving, powerful non-IBM software such as Cullinet's IDMS became established as data base implementation vehicles. IBM, along with its major IMS users, began to migrate IMS into the fourth generation. Many doubted that the migration would be successful if IMS was a key component.

IBM responded to third-generation data base issues not with a replacement for IMS, as many gurus predicted, but with an array of complementary products (see Figure 2). (At one 1979 seminar, a leading IBM watcher predicted the end of IMS by 1980. A standing ovation followed. Tar and feathers almost befell me as I addressed the attendees and suggested that IMS really did work.)

The Application Development Facility (ADF, now ADF II) was introduced by IBM to address productivity of application development. The DB/DC dictionary was promoted as a DBA tool to assist in the design and control of IMS data base structures. As the pressure grew to support end-user-driven applications that utilized *information*-oriented data files — subject data base — a variety of IBM software products came into use, including ADRS-II and Query by Example (QBE). And, as a first indication of IBM's direction with fourth-generation tools, Structured Query Language/Data System (SQL/DS) appeared in 1981. (Unfortunately for MVS environments, SQL was a DOS-only product.)

Move to fourth generation

As a wider variety of data base applications appeared, new requirements were placed upon conventional DBMS. In addition to control and sharing of data and improved development productivity, a full-function DBMS had to provide for:

- Extensive data integrity and security.
- Integrated and automated recovery and restart facilities.
- Dynamic data definition capabilities.
- Utilities that can execute concurrently with application processing of data bases to facilitate continuous operation of the overall data base system.
- Opportunities to take advantage of operating system facilities and hardware architecture (for example, microcode) for physical processing of data.
- Very large data bases.

To be successful, DB2 will have to provide these facilities.

Release 1.2 of IMS in 1981 and Release 1.3 in 1983 have been dedicated almost exclusively to improved internal performance and capabilities consistent with these new requirements for large operational transaction processing data base systems. Among the features were data base recovery control, fast path enhancements, the IMS resource lock manager, multiple systems couplings, data sharing and better utilization of MVS facilities such as the Common Services Area (CSA). These enhancements to IMS strengthened

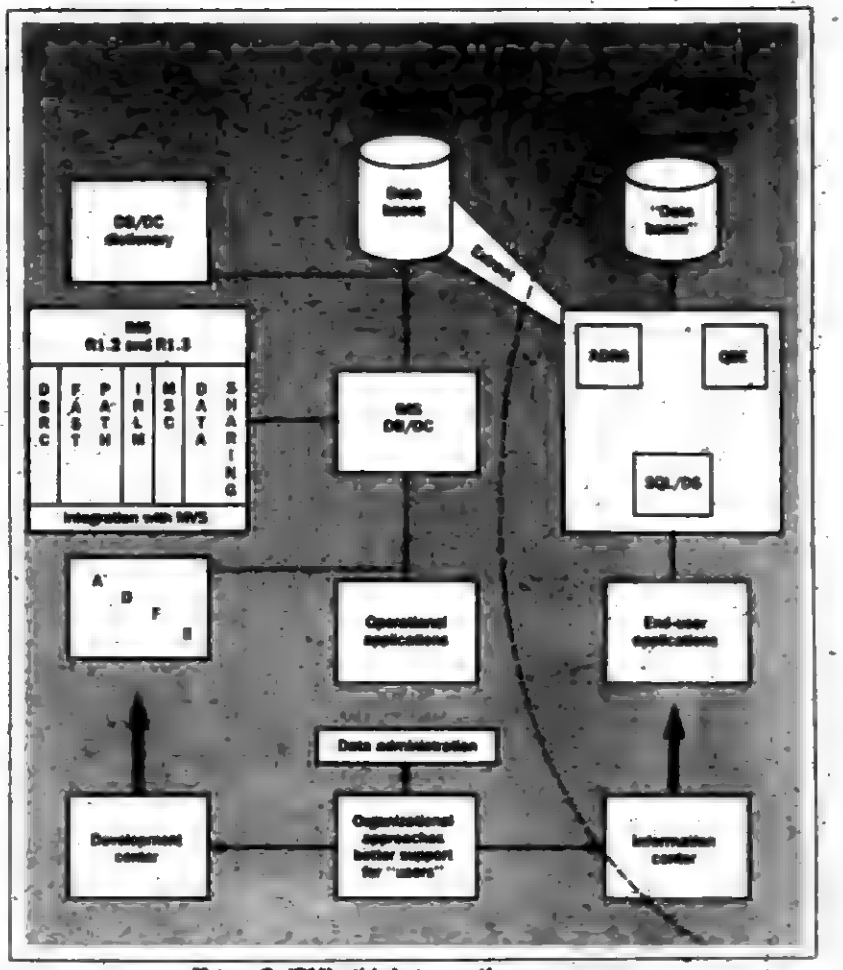

Figure 2. IBM's third-generation response

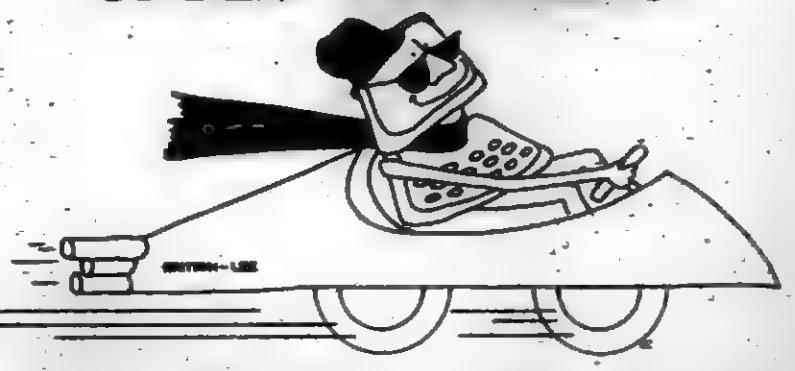
OMNIBASE™/IDM™ BREAKS VAX™ RELATIONAL SPEED BARRIERS



Signal Technology's OMNIBASE software driving Britton-Lee's IDM database machine is breaking records because it:

- Off-loads your VAX
- Has a much faster user response than software-only relational DBMS
- Dramatically increases productivity
- Has streamlined application development

CCA EMACS

The most complete screen editor available for Unix[1] and VAX/VMS[2].

CCA EMACS from Computer Corporation of America has the greatest combination of power, speed, and functionality of any text editor available for Unix or VAX/VMS. With close to 400 built-in commands, CCA EMACS allows virtually any editing task to be accomplished in just a few keystrokes, including tasks that would be difficult or impossible to do using other editors. In addition, a set of more than 60 predefined variables allows each user to customize CCA EMACS to meet various application needs and user styles. All of these features are supported by a full online documentation package that can assist the user at any point, giving information that ranges from the definition of a single command to manual pages that contain complete explanations of major CCA EMACS features.

Operating Environment

Runs on Berkeley Unix (4.1BSD and 4.2BSD), Bell Unix (System III and System V), and VAX/VMS. Requires 500 K of address space.

Price

Prices for a full source license range from $350 to $2400. Contact CCA for further details.

Cut Information Retrieval Down To Size

...with BRS/SEARCH— the Software That Comes in Mainframe, Micro and Mini Sizes.

BRS/SEARCH, the same information retrieval software that runs one of the world's largest online database systems is now available for your mainframe, mini, or micro computer.

BRS/SEARCH gives you instant access to all your own information, regardless of its length or format. Many powerful, easy-to-use features developed through millions of online searches have made BRS/SEARCH the system of choice among information professionals.

BRS/SEARCH runs on IBM and compatible mainframes, as well as 16 and 32 bit mini and micro computers. And because the search query language is the same no matter what size computer, you can use it on a variety of systems without any additional training.

For more information about these three new sizes of database software, call toll free: (800) 833-4707; in New York State (800) 553-5566. Or write BRS Software Sales Support, 1200 Rte. 7, Latham, N.Y. 12110. Dealer and OEM inquiries invited.

BRS SEARCH SOFTWARE
An ITG Company

IN DEPTH/DATA BASE STRATEGY

For an effective migration to IBM's fourth-generation architecture, the operating environment of DB2 will have to take advantage of existing facilities for the integration between the old and the new. IMS will remain a key component of IBM's data base strategy.

its ability to support large systems as effectively as possible in terms of design alternative and processing efficiency.

Unfortunately, from IBM's perspective, these enhancements accentuated the lack of nonprocedural/relational data base facilities for end users' information retrieval and reporting applications which would peacefully coexist with IMS DB/DC applications. IBM seemed entrenched with IMS and appeared to fall behind other data base architectures.

In looking at the facilities of DB2 and related products, the interrelationship between existing IMS systems and new DB2 systems is a key issue.

1. How will the data in hierarchical IMS data bases provide a source of data for relational data bases?
2. How will two separate DBMS *jointly* provide the capabilities essential for a full-function fourth-generation DBMS — automated recovery/restart facilities, for example?
3. Will one type of application (production vs. end user) have access to the other DBMS' data? Will the distinction between production and end-user applications begin to fade away?
4. Finally, will the interfaces between DBA, development staffs and end user be implemented in such a way that the DBMS system will become transparent?

For an effective migration to IBM's fourth-generation architecture, the operating environment of DB2 will have to take advantage of existing facilities for the integration between the old and the new. IMS will remain a key component of IBM's data base strategy.

Part II. DB2 architecture and basic capabilities.

In examining the architecture and capabilities of DB2, there are four items to be addressed:

1. Relationship to IBM large systems architecture (MVS/XA and 3080 series).
2. Terminology and structure for DB2's relational model.
3. DBMS features of DB2.
4. Interfaces to DB2 for data definition, data manipulation and data control.

1. Relationship to XA.

From the outset, it is important to understand that DB2 was designed as a full-function DBMS for the MVS 370 and XA environment (see Figure 3). All too often, "relational data base" conjures up an image of powerful end-user query languages without the need for all "that complex DBMS stuff" (recovery/restart, load utilities and so on). With an image such as this in mind, someone interested in DB2 might not get past Page 2 of the IBM general information manual. Much of that description focuses on "large system architecture" and its relationship to DB2. The next few paragraphs will attempt a painless summary of important technical data about DB2 and its relationship to other strategic IBM products such as MVS and IMS/VS.

DB2 operates as a formal subsystem of MVS. It was designed to take advantage of the architecture of 3080 series processors and MVS/XA. It is difficult to separate one from the other. MVS/XA will exercise 31-bit addressing to take full advantage of the processing power and memory capacity of 3080 series CPUs.

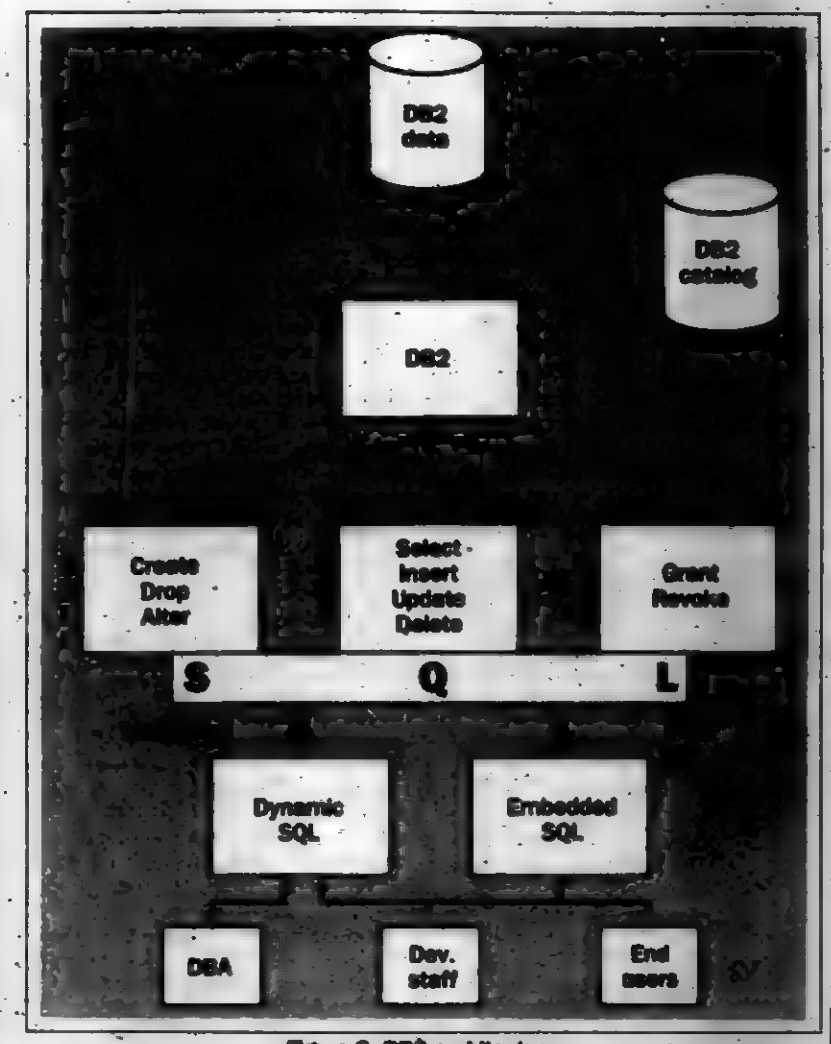

Figure 3. DB2 architecture

At the current high end of this series (3084Q), a simple image CPU complex can provide:

- Up to 2G bytes of main memory.
- Up to approximately 25 million instructions per second (Mips).
- Up to 48 I/O channels, with aggregate transfer rates of 140M byte/sec (allowing 70% channel utilization).

With the dyadic architecture of the 3081 and 3084, up to four CPUs will operate under the control of a single SCP — MVS/XA.

MVS/XA is clearly a key to the effective utilization of a 3080 series complex. However, while much has been made of the above statistics and 31-bit addressing, other features of XA provide powerful support for the data base systems architecture of DB2 and IMS. Two of these, which many IBMers consider to be the most significant aspects of XA, are cross memory services and the dynamic channel subsystem.

Cross memory services provide the ability for two or more MVS subsystems to utilize the same control block of code which has been located in CSA. An example of this in DB2 architecture is the IMS resource lock manager, which IMS also uses. The power and capacity of an MVS/XA 3080 series complex is significant in and of itself. With subtle capabilities, such as cross memory services, the throughput potential becomes even more significant.

The dynamic channel subsystem of XA also offers significant throughput improvement for any subsystem with heavy I/O activity.

Clearly, large data base systems will involve potentially high volumes of data transfer between main memory and direct-access storage devices (Dasd). Aggregate channel transfer rates appear powerful enough on their own. But it is not always transfer rate that determines I/O performance. Contention for a specific access path to a Dasd volume can seriously degrade I/O efficiency.

Currently, when a subsystem issues a start channel command for I/O, MVS will select an access path to the data volume required. When the physical I/O has been completed, that *same* path must be used to return the data to MVS. But a "channel busy" condition could result if a second I/O request had been sent down the same channel.

For this reason, IBM would always recommend that storage be arranged so that channel utilization never exceeded 30% to minimize channel contention. With XA, the subsystem will dynamically select available channels for physical data transfer. The same channel that issued the request does *not* have to be used for the transfer. For this reason, channel utilizations of 70% are feasible. (Currently, the dynamic channel subsystem is limited to 3380 Dasd.)

Clearly, XA provides a solid base for DB2 in terms of CPU and I/O

TESTED THE SAME TO PERFORM THE SAME.

Infoextend remanufactured heads perform "like-new," because we test them the same as new heads. We perform load force, attitude, gap alignment (X-Y calibration), microscopic visual inspections, and full testing of electrical parameters—all to the original OEM specifications.

Infoextend Products are part of Information Magnetics, your assurance that your disc heads will be remanufactured to the highest performance standards—"like-new."

performance. It is a definite possibility that until the supporting features of XA and the 3080 series were available, IBM did not feel that DB2 implementation was feasible.

2. DB2's relational model.

Turning now to DB2 itself, the following material will discuss the logical and physical representation of data in DB2 data bases. The following are the structural components of DB2's implementation of the relational model: tables, views, indexes, table spaces, storage groups and data bases.

A brief definition of each of these will be provided. In general, a relational data base is one that users perceive as a collection of tables, a table being a two-dimensional representation of columns of data. Each column represents a certain domain or field type. Rows of data represent a specific occurrence of each field in the various columns. Rows are similar to our concept of a record in a flat file.

A *personnel data base*, for example, might have an employee table and a department table. Individual tables can have common domains, such as department number. This is the basis for associations between tables and for various information/user views of the data in the tables.

Tables are logical data structures. There are no predefined relationships as in a network or hierarchical structure. The data in the table is the basis for relationships. The relationships are managed completely and, in most cases, transparently by DB2.

The beauty and power of DB2 is that the use of an index is completely transparent to users and almost, so far, to technicians. DB2 indexes are based upon values of data in one or more columns. Programs or users accessing data never explicitly specify indexes; they are used only by DB2.

To summarize, a table in DB2 is a named data object consisting of a specific number of columns and some number of unordered rows.

Not every user of a specific table will need to see each column in that table. DB2 provides for different views of tables. For example, a user of the employee table might only need to see employee number and name.

Once a view has been defined, it can be used by DB2's data management language just as a table would be. A view has three important features as a means of representing data in DB2 data bases:

a) Protecting sensitive data from unauthorized users. For example, the salary column in the employee table would be available only to payroll personnel.

b) Further reducing the complexity of data representation. A user sees only what is required.

c) Reducing data redundancy. A user can access a piece of data without creating a separate physical storage unit for that data.

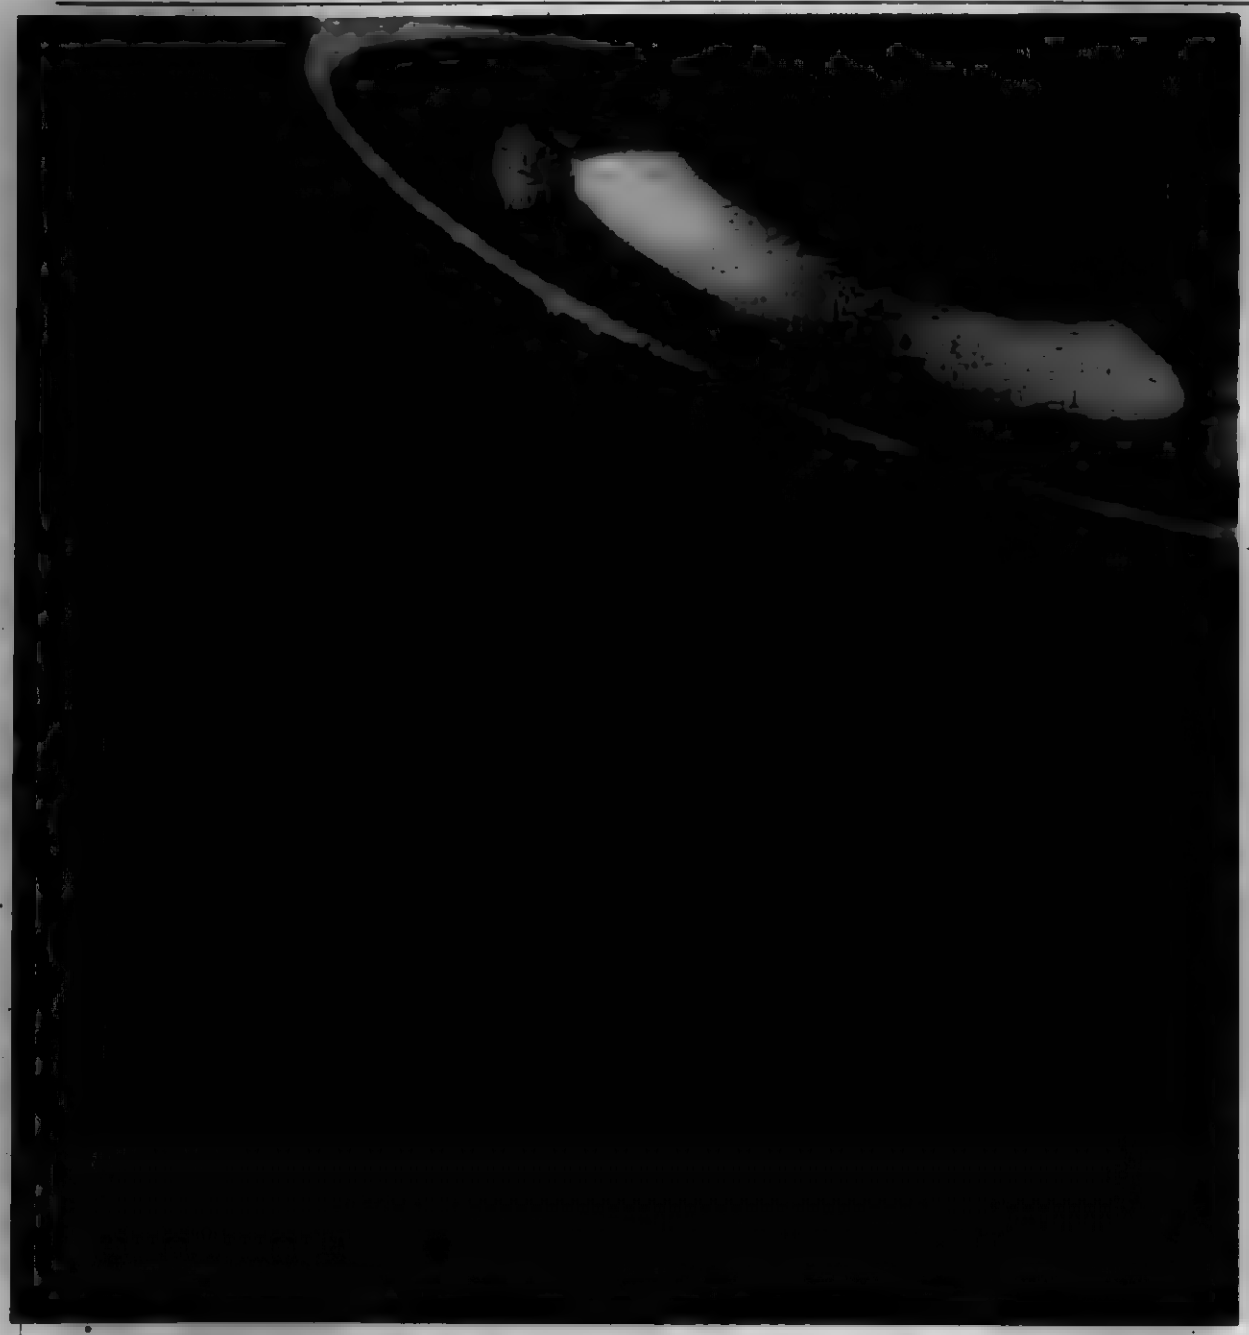
If you are at all familiar with the relational model, you will recall that it is based upon three operations, which provide for all data manipulation activities: SELECT, PROJECT and JOIN. A subsequent section of this article will examine DB2's DML-SQL. But in the context of DB2 views, it should be pointed out that views make powerful use of the relational join capability. The join operation will permit the creation of a view that involves two or more tables. A join operation uses a field which is a column in two or more different tables. Based upon the contents of a common field, a relational join can create a view that contains data selected from two tables. The views are based on user-defined requirements for the data.

Relational data base has always had a mystique associated with it. Management and users are attracted to the simplicity of the table concept, but are skeptical that anything in DP can be that simple. Technicians are intrigued by the power of the technology. To be able to perform an operation like the join just mentioned without five sorts, three merges, four copies and miscellaneous utilities may offend the die-hard progammer and threaten the job security of a few others, but for the most part it will leave most wondering how it all functions.

Random access to data in file-oriented and early data base-oriented systems has been accomplished by keys. A key represents an access path to records based upon one (or more) field. Isam, Vsam, network and hierarchical data structures all employ one or more indexes to permit random access to data.

As you proceed into a summary of DB2's use of indexes, you might begin to think, "Here comes the catch. Someone is going to have to build some pretty fancy indexes in order for tables and views, as defined, to really work." The beauty and power of DB2 is that the use of an index is *completely* transparent to users and almost, so far, to technicians.

The discussion of an index begins the transition from logical to physical representation of data. DB2 indexes are based upon the values of data in one or more columns. Programs or users accessing data never explicitly specify indexes; they are used only by DB2.



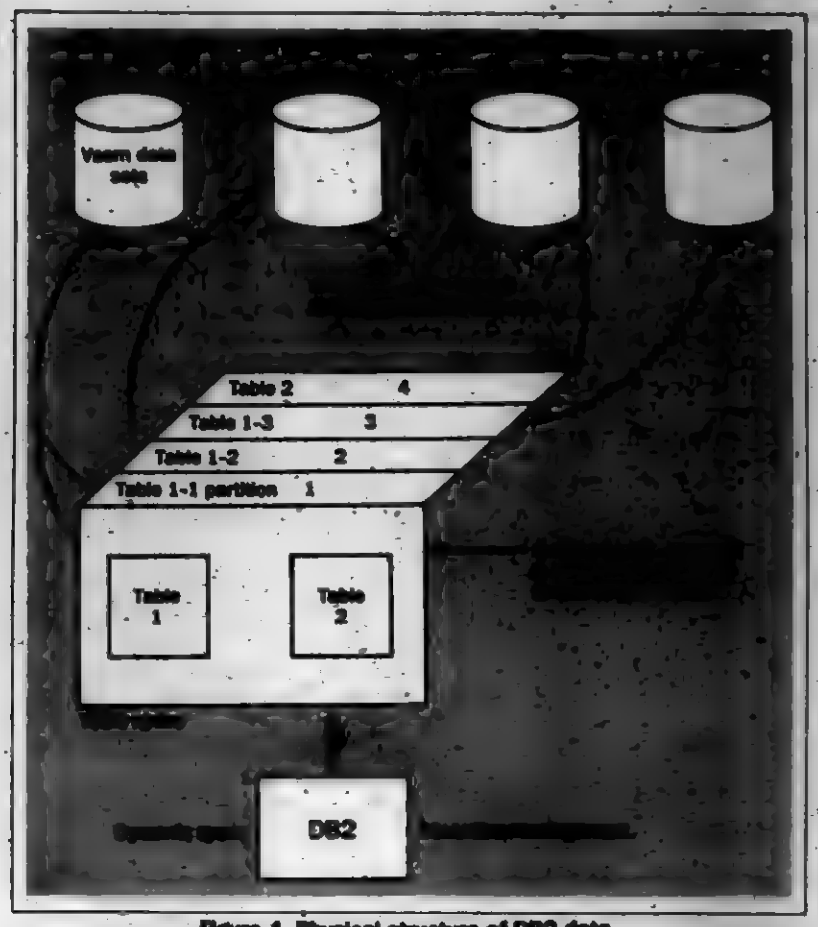


Figure 4. Physical structure of DB2 data

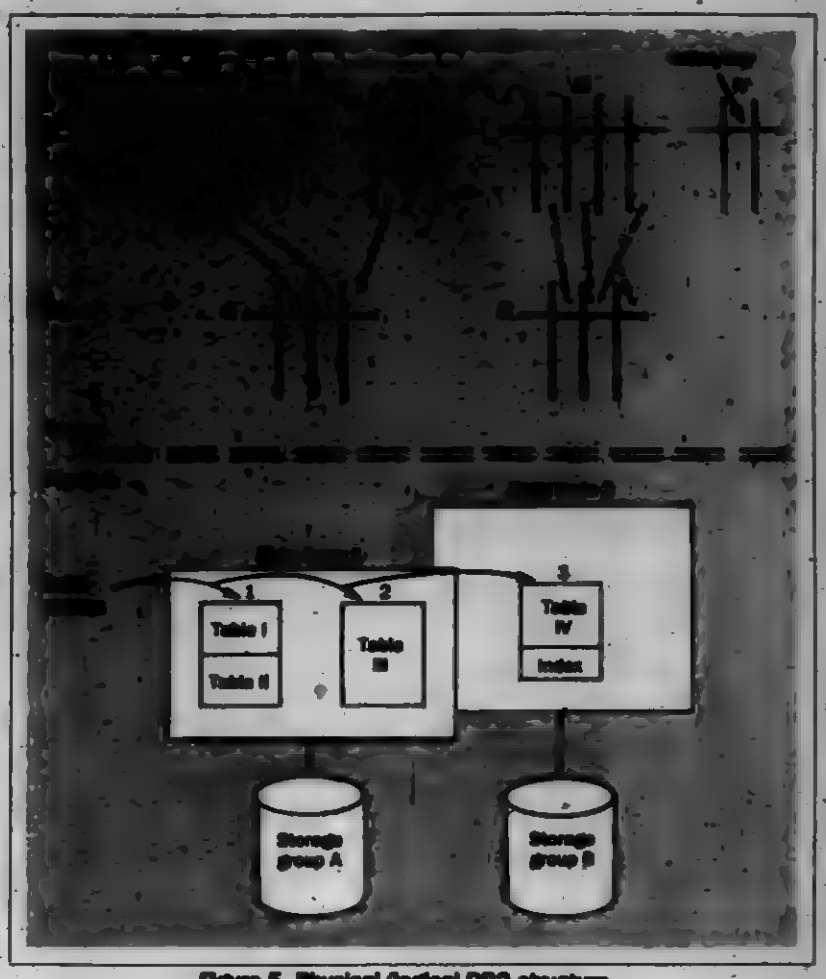

Figure 5. Physical/logical DB2 structure

When you request access to a table, DB2 looks at what indexes are available and uses the appropriate one to retrieve your data. If no index is specified, DB2 will scan a table sequentially. Indexes are primarily a performance tool. DB2 can function without them.

DB2 indexes can be unique or non-unique. A unique index forces uniqueness on the values in the table being indexed. DB2 indexes can also be used for clustering. A cluster index determines the physical order in which rows will be stored; it can be used to store data the way it would be most frequently accessed. The full power of DB2 becomes clear as the dynamic nature of an index is employed to improve accessibility.

In relational data base management and data base in general, "binding" refers to the establishment of the physical access path to data. As DB2 processing is taking place, it is entirely possible that an index to a table might be deleted, say by a DBA for performance reasons. Suppose that an application issued a SQL SELECT command that was bound to that index. DB2 will detect that the index has been dropped and will automatically invoke the bind process to select an alternate access path.

When you request access to a table, DB2 looks at what indexes are available and uses the appropriate one to retrieve your data. If no index is specified, DB2 will scan a table sequentially. Indexes are primarily a performance tool. DB2 can function without them.

To conclude a look at the terminology for and structure of DB2's relational model, we will define the objects for physical representation of data.

A table space is an address space divided into one or more pages of equal size supported by one or more Vsam data sets. One or more tables are stored in a table space.

An important architectural point: In DB2, a table space is the *recoverable structure*. DB2 can support very large tables as a table space can be up to 64 billion bytes of data. However, recovery of such a large space could degrade performance. Structurally, DB2 overcomes this problem by providing partitioned table spaces.

Partitions are established on the basis of ranges of data values. For example, an employee table could be partitioned based upon ranges of employee numbers.

Partitions within a table space can be recovered and reorganized independently. Partitioning also allows data to be stored on different device types — for example, active data on faster devices. This is accomplished by assigning partitions to different storage groups — the next physical component of DB2's relational model.

As the physical structure of DB2 data is presented (see Figure 4), it must be emphasized that DB2 dynamically manages the physical components, such as table spaces and storage groups.

DB2 users and DP support personnel need not be concerned with defining MVS data sets. One or more storage groups are defined at DB2 installation time and are assigned to Dasd volumes. DB2 then invokes access method services functions of the data facility portion of MVS to define, extend and delete physical data

DATATRIEVE'S BEST FRIEND IS SMARTSTAR™

SMARTSTAR 4th generation data management software gives VAX™ Datatrieve a friendly forms-based user interface. Here's how:

- Supports all Datatrieve data-types
- Allows up to 31 overlapped window applications
- Adds, changes and deletes records with easy keypad commands
- Performs queries without special query language

sets within the storage groups.

DB2 automatically allocates space within a storage group as it is required by table spaces as tables are processed by DB2 users. To control access further, a table can be assigned to a specific Vsam data set. If no assignment is made, DB2 handles it dynamically.

The final component of DB2's physical structure is a data base. Unfortunately, IBM's use of the term may cause some confusion. "Data base" is often used as a unidimensional entity. A corporation is building *the* data base: a single storage area for *all* corporate data. This is a very good concept, but as the first portion of this article pointed out, the concept has evolved to the point where the data base is viewed as multidimensional. DB2's use of the term reflects this view. (For example, the relationship of DB2 data bases and IMS data bases requires a multidimensional view of a corporate data base managed by IBM DBMS software.)

"Data base" is often used as a unidimensional entity. A corporation is building the data base: a single storage area for all corporate data. However, the concept has evolved to the point where the data base is viewed as multidimensional. DB2's use of the term reflects this view.

A DB2 data base is a named collection of table spaces and, by logical extension, tables, views and indexes. The data base is an operational tool. Data bases may be started and stopped independently. The DPA will put related tables in table spaces that are members of the same DB2 data base.

To summarize DB2's relational model (see Figure 5):

- A table is the basic object for logically representing data.
- A view provides alternate representations of one or more tables.
- Physically, table spaces contain one or more tables.
- Data bases are defined to contain one or more table spaces.
- Table spaces are assigned to storage groups which are collections of Dasd Vsam data set volumes.
- An index can be defined to optimize access to a table. The index is stored in the table space for that table.

All of this logical and physical information is stored in the DB2 catalog. The catalog is itself a series of tables which DB2 uses to control processing of DB2 data. With proper authorization, a user, for example a data base designer, can access the catalog as if it were a table. In this way, the catalog is a powerful data-dictionary-type facility for the DB2 system. For example, data in the catalog could be used to determine information stored pertaining to employees in the various tables within a personnel data base.

3. Features of DB2.

To summarize the other important features of DB2:

- Dynamic allocation and management of Dasd.
- Simple structures for logical presentation of data.
- Dynamic navigation and access path selection. (Consistent with the concept of fourth-generation and nonprocedural languages, users specify what they want, not how to get it).
- Self-contained automated logging and recovery (automated to IMS interfaces for these facilities).
- On-line utilities for continuous operation.
- Integrated data definition language (DDL), data management language (DML) and data control language (DCL).

4. Interfaces to DB2.

An overview of the architecture and capabilities of DB2 would be incomplete without a brief discussion of SQL — DB2's DML *and* DDL *and* DCL.

SQL is the external interface to DB2 for data definition, data manipulation and data control. As such, the acronym, SQL, is a little misleading. It is much more than a query language. SQL presents a straightforward command language. It is also a compact set of basic commands:

CREATE, DROP and ALTER for the DDL.

SELECT, INSERT, UPDATE, DELETE for the DML.

GRANT, REVOKE for the DCL.

For the tabular data structures DB2 manages in its relational model, the DDL is used initially to create the columns that define the data content of the table. As noted earlier, allocation of Dasd space and other physical tasks are automatically handled by DB2. A DBA would use DB2 utilities to load a table. Other objects (indexes, views and so on) are also created, as needed, by the DDL commands of SQL. Once created, the table is ready for access.

Through the DML, SQL in a single statement can access:

- One or more columns from a row.
- One or more columns from multiple rows of a single table.
- One or more columns from multiple rows of multiple tables.
- One or more columns calculated from other columns.

DB2 catalog, the DCL commands are used to grant and revoke authorized access.

SQL commands can be interactively processed through a variety of interfaces, which will be discussed in an overview of DB2's operating environment. Dynamic SQL commands are almost identical in syntax to SQL commands embedded in standard application programs. Embedded SQL permits transaction processing and batch application programs written in Cobol, PL/I, Fortran and Assembler to access DB2 data and non-DB2 data (for example, IMS DB or Vsam).

The basic intent of this article is to provide you with an overall feeling for DB2's architecture and capabilities. It would be very easy and interesting to delve into the details of any one of the components of DB2, particularly SQL. Unfortunately, that is beyond the scope of this perspective. A brief look at two commonly used SQL commands — CREATE and SELECT — must suffice for now. The following example assumes that a user has logged on to TSO/ISPF under the user ID, PRH. (A subsequent section will discuss the specific facilities for DB2/SQL interfaces in an MVS operating environment [TSO/ISPF and so on].)

The user wants to create a table with three columns: date, client and city. The CREATE command would look like this:

```
CREATE TABLE SCHEDULE
(Date    Char (6),
 Client  Char (20)
 City    Char (3));
```

(SQL commands and keywords are underlined.) The result is stored in the DB2 catalog as PRH.SCHEDULE.

Once data has been loaded into the table, the user could retrieve data using the SELECT command.

The SELECT command has a simple syntax.

```
SELECT   column-names
FROM     table name
WHERE    data meets specified conditions
```

For the schedule table, an example:

```
SELECT   *
FROM     Schedule
WHERE    Date > 830905 and
         < 840101
```

Basically, the user is asking for all columns of data in the table to be returned (the *) for the rows that meet the data criteria specified in the WHERE clause. Specific columns could be retrieved by naming each one required in the SELECT clause. There are many additional features of each command, but they all use the same basic syntax.

Summary: DB2 capabilities

In summary, SQL is a high-level, nonnavigational language for data definition, manipulation and control. It is the interface to DB2.

People often ask, "Isn't DB2 just an MVS version of the DOS/VSE and VM/SP product — SQL/DS?"

The preceding sections of this article have discussed the architecture and capabilities of DB2. This discussion established DB2 as a full-function DBMS. SQL is a key component of DB2 — and it is just that, a component.

The SQL/DS (data system) product announced in 1981 and first released in 1982 for DOS/VSE and subsequently VM environments was IBM's first "official" move into relational facilities. "Official" must be qualified, because as early as 1978 a relational product, QBE, was available as an installed user program (IUP). It was developed by IBM personnel for the VM environment. Apparently, it was never intended for widespread use. It was not even included in "Data Systems" discussions by IBM marketing personnel.

Two points are worth noting. First, the SQL component of DB2 is broadly compatible with the SQL/DS facility. Second, the SQL/DS product is not a complete DBMS when compared with DB2. The products announced in conjunction with DB2 will also support the DOS/VSE and VM environments.

DB2 is really an umbrella for IBM's emerging data base architecture in each of its processing environments. This is particularly important relative to VM, which is itself emerging as a strategic product that provides powerful supplements to both DOS/VSE and MVS configurations.

DB2 operating environment

As this article presents DB2's operating environment, two related products will be discussed: the Query Management Facility (QMF) and the Data Extract Facility (DXT), which provide interfaces between various data system products and between each operating environment and the various relational facilities of DB2 and SQL/DS.

DB2 was designed to operate in an MVS environment for relational data base management. It will employ standard data handling facilities of MVS — access method services, for example. DB2 data sets are modified Vsam data sets that cannot be accessed through IDCAMS facilities. But the same MVS code is used for I/O processing.

The operating environment for DB2 and related products can be approached from the "user's" view. In this case, user must mean DBA personnel, responsible for managing the data base environment; application development personnel, involved in the development of operational applications; and end users satisfying their own information processing requirements as well as utilizing transaction processing applications.

MVS was designed to support a variety of application types: batch for operational processing as well as technical support activity (for example, systems programming); interactive for application development and

utility functions; on-line transactions for inquiry update processing; and end-user-oriented information retrieval and reporting systems. The various users will interact with one or more of these application types in a typical MVS configuration.

For DB2, TSO/ISPF is the primary interface for all but on-line transaction processing. Dialogue manager facilities are used to provide menu-driven panels for access to SQL and DB2 processing. A standard component of DB2, DB2I, provides interactive support for the DBA and development personnel.

The DB2I menu illustrates the facilities available to:

- Submit and test SQL statements which application developers will embed in application programs or to create tables — through the SPUFI facility (SQL Processor Using File Input).
- Develop SQL portions of application programs.
- Invoke SQL and DB2 commands and utilities.

Standard TSO/ISPF facilities such as on-line Help are available.

Either IMS DC or CICS, or both, will be used to support on-line transaction processing. The applications will process data from IMS DB data bases (IMS DC and CICS), and CICS applications can also access Vsam files.

Cobol and PL/I application programs for transaction processing can also process DB2 data. This is accomplished by embedding SQL statements in standard source code. A slightly different compilation process must be followed, because conventional compilers will not recognize SQL.

Cobol and PL/I application programs for transaction processing can also process DB2 data. This is accomplished by embedding SQL statements in standard source code. A slightly different compilation process must be followed, because conventional compilers will not recognise SQL. DB2I is used to "precompile" (see Figure 6 on ID/26) the SQL statements and create an access module stored in the DB2 catalog, which is "called" at execution time. This is facilitated through an attach facility for IMS DC and CICS code, which is provided to interface each product to DB2. You must be at IMS 1.3 and CICS 1.6 to utilise this feature.

While IMS and CICS applications can access both IMS and DB2 data, DB2 applications can only access DB2 data. The interface between DB2 and IMS DC or CICS is not limited to the application program. Other critical processing activities, such as recovery/rollback, will be coordinated by DB2 for data within its domain and for IMS DB data accessed through IMS DC or CICS.

DB2 has been designed for use in operational applications as well as end-user-oriented applications. DB2I provides the primary interface through TSO/ISPF for conventional application development, including IMS and CICS on-line programs which have SQL statements embedded.

DB2 provides the precompiler mentioned above. This precompilation creates a modified version of the application program. This version then is used in a normal compile link edit process, resulting in an object module which, at execution time, will issue a call for the data base request module, which has undergone a "binding." This process is also controlled through DB2I facilities.

The BIND creates an entry in the DB2 catalog and in an internal data set called application plans. This is a control structure used by DB2 to process SQL statements as they are executed. The plan identifies the data to be accessed, where it is and how to get to it. As mentioned earlier, if the internal structure of tables and so on changes, DB2 automatically re-creates the output of the BIND process.

While DB2I is fine for DP personnel, it does not provide an adequate interface to end users.

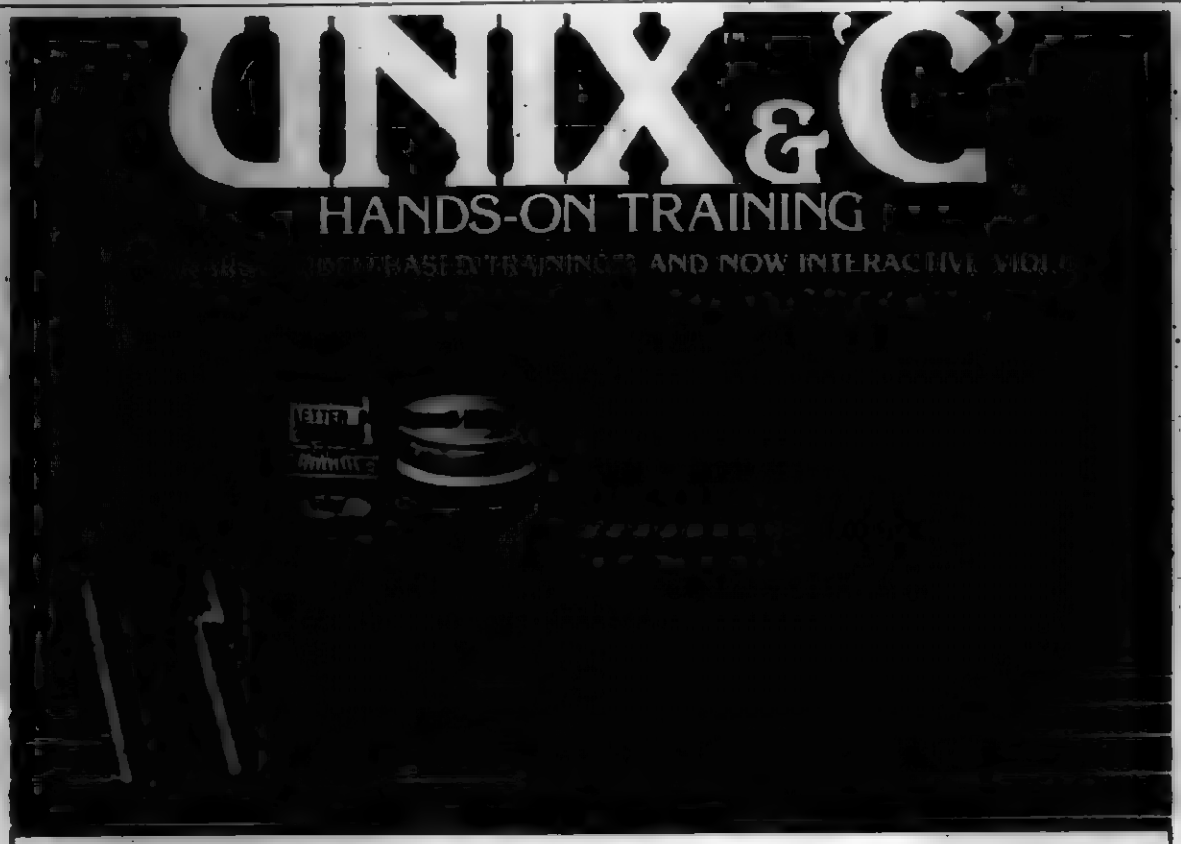
To provide an effective end-user interface, the Query Management Facility (QMF) was developed to support DB2.

QMF was designed for ad hoc query and reporting requirements. It operates as a series of dialogue manager panels under the control of TSO.

QMF provides access to DB2 data through SQL and QBE. SQL provides an English-like command language for accessing data in tables, while QBE provides a graphic representation of tables available and provides an example of the output desired. (Many large IBM installations have "played" with QBE over the past five years. It suffered from two major problems: It lacked support from within IBM and operated in a VM environment.)

Many people in the data base world have long viewed QBE as an elegant, yet effective, data base tool. Its appearance in the DB2 architecture is an example of one of the many subtle strengths the architecture represents. In one sense, DB2 is a home for the "wayward child," which is how QBE was viewed for some time.

The format of a QMF panel used to enter a SQL command demonstrates that it is a relatively effective end-



Select your training medium according to the type of training you prefer and the number of people to be trained.

VIDEO-BASED TRAINING. The Computer Technology Group's Video-Based Training integrates professionally developed and produced video and text material, as well as hands-on exercises, into complete training programs.

Our courses are produced with the highest standards of video quality, applying the latest techniques of instructional design including the use of computer graphics and animation techniques to compress learning time. The students' time is not wasted with the "camera at the back of the classroom" or "chalk talk" approach which is so inefficient, and often ineffective, in transferring skills.

Our Video-Based Training courses are completely self-contained, including the hardware-independent hands-on exercises. All you need is a video cassette player.

COURSE	Number of Modules: Video-Based	Interactive

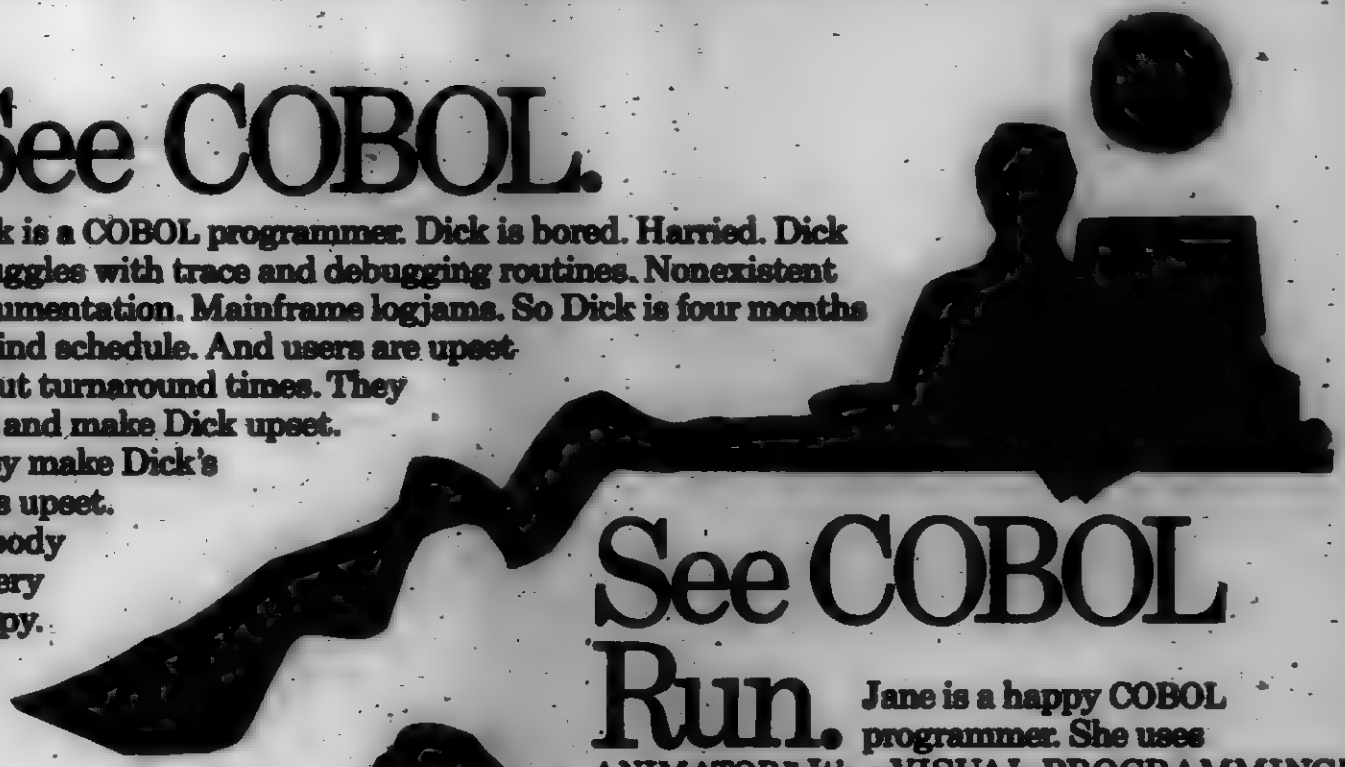
And users are upset about turnaround times. They yell and make Dick upset. They make Dick's boss upset. Nobody is very happy.



See COBOL Run.

Jane is a happy COBOL programmer. She uses ANIMATOR.™ It's a VISUAL PROGRAMMING™ aid for MICRO FOCUS™ LEVEL II COBOL.™ It runs on a micro. It makes child's play of mainframe test and maintenance chores.

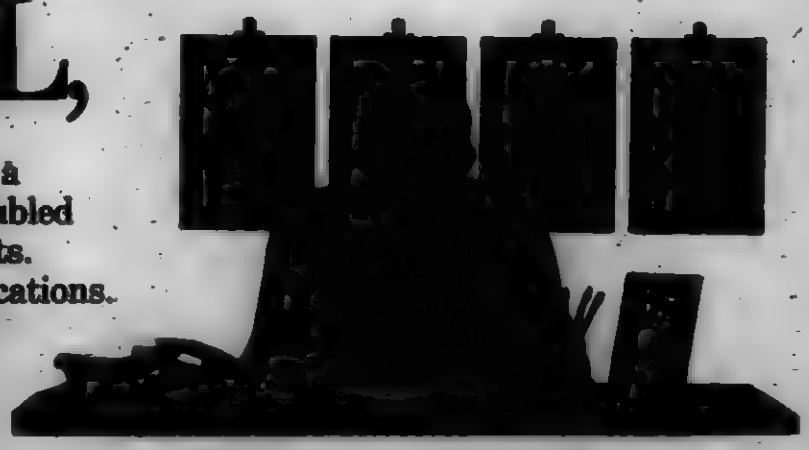
With ANIMATOR Jane sees a picture of the program explaining itself. In live action. In real time. In COBOL source code. ANIMATOR tracks the program's exact execution path. Including subroutine branches.

Jane can have the program run fast. Or slow. Or stop. With one key. This makes it easy to spot problems. Insert fixes. Set breakpoints. Instantly.

Jane's programs sometimes win awards. Yet she always meets schedules. Jane's boss likes this about Jane. Because he doesn't like users to yell at him.

Run, COBOL, Run.

This DP manager got a bonus. Because he doubled productivity. Cleared backlogs. Cut costs. Boosted morale. Produced terrific applications. Quickly. Put control and prestige back into the central DP function. And nobody yells at him anymore. All thanks to ANIMATOR.



See ANIMATOR now.

Let Micro Focus put your DP shop on the fast track.

ANIMATOR runs with MICRO FOCUS LEVEL II COBOL for compatibility with ANSI '74 High Level COBOL implementations. A mainframe-micro communications link is recommended for downloading mainframe programs.

A network of Honeywell computers to improve customer service.

When Metropolitan says they stand by you—believe them.

One way to upgrade customer service is to do more to help the sales representatives responsible for that service.

So the Metropolitan Insurance Companies are installing over 1000 Honeywell DPS 6/40 small computers in their personal insurance offices throughout the U.S. and Canada.

By decentralizing computerized sales support functions, Metropolitan is giving its sales representatives instant access to data that once took days to get.

For instance, they can now obtain sales illustrations and price quotes and process service transactions just by going to a terminal.

The system also helps reps by maintaining their policyholder files and generating quality sales letters and timely reminders for client calls. What's more, Metropolitan's managers benefit by being able to measure sales against objectives more easily. The system is a strong decision support tool. Indeed, its word processing, electronic mail, and other office automation capabilities will go a long way toward speeding operations and decreasing paperwork overall.

The Metropolitan Insurance Companies chose the DPS 6/40 for its reliability, expansion capability, ease of use, and the quality of support available from Honeywell. They also liked its combination of price/performance, local processing power, and communications.

Metropolitan has always been dedicated to the best possible customer service.

We think it's a wise policy.

For more information on how Honeywell computers can help solve your problems, call 800-328-5111, Ext. 2705. (In Minnesota, call collect, 612-870-2142, Ext. 2705) or write Honeywell Inquiry Center, MS 440, 200 Smith Street, Waltham, MA 02154.

Together, we can find the answers.

Honeywell

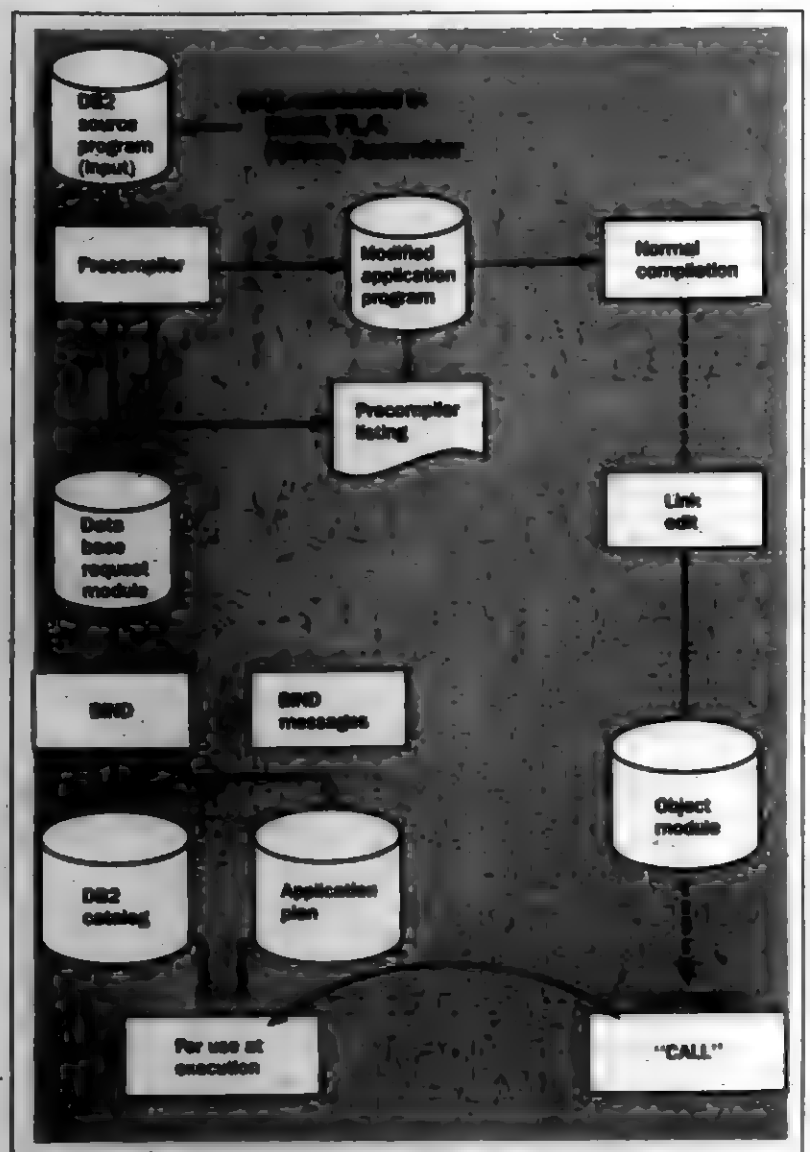

Figure 6. Conventional application development with DB2

user facility. PF keys are used to assist the user in entering the command and reviewing the resulting output.

QMF can be used to develop procedures that will be run frequently. These procedures are stored in TSO data sets and can be executed at the required time through other QMF commands. This is very similar to the CLISTS which we commonly used in TSO and VM/CMS environments. QMF was clearly designed for an information center environment; professional DP personnel would assist users in developing more complex procedures using QMF facilities.

Figure 7. Data systems products for IBM processing environments

One other product will complete this overview of DB2's operating environment. The Data Extract Facility (DXT) addresses the issue of accessibility to data in a mature IMS installation. IMS data bases will contain vast amounts of data at different levels of detail. This data represents the basis for high-level information requirements which DB2 will be used to address. In addition, a typical installation might have a significant number of Vsam files which also contain valuable data.

Some DB2 data bases will be developed "from scratch." But in other cases, IMS and Vsam data will be the source of data for new DB2 systems. DXT was designed to provide extraction capabilities from IMS DB data bases, Vsam files or sequential files. The extracted data is then used by the DB2 load utility to populate DB2 tables.

DXT runs as a batch application that can be initiated through TSO. When IMS data is involved, interfaces to the DB/DC dictionary assist in the preparation of PSBs required for extracting DL/1 data. By the way, this is the only area where interfaces to the DB/DC dictionary product have been defined for DB1 and its complementary facilities (QMF, DXT).

There are interactive facilities available to assist in the preparation of input specifications to DXT. For example, shipped with the QMF product will be a series of data extract dialogues which allow a user to generate and send an extract request to DXT.

In an MVS environment, then, there are a series of subsystems that will be operating to provide DB/DC processing capabilities: TSO/ISPF for interactive, DB2 for relational DBMS, IMS DB/DC and/or CICS for transaction processing and a number of other subsystems for batch tasks such as DXT.

DB2I and QMF enhance interactive access to DB2 facilities for DP and end-user personnel and operate under the control of TSO/ISPF. Attach facilities in IMS DC and CICS provide access to DB2 data from transaction processing applications.

The powerful cross memory services capability of MVS/XA facilitates efficient intersubsystem communication.

The last two components of DB2's operating environment just discussed are also used in VM configurations.

QMF would run in a CMS machine to support SQL/DS applications. SQL/DS would provide access to SQL data. Each would occupy a separate VM machine. DXT will provide data to populate SQL/DS data bases.

Data in SQL/DS could be unloaded with SQL/DS utilities and loaded into DB2 with load utilities. DXT is not required for this.

Several times recently the question has come up, "What about going in the other direction — taking data from DB2 and loading it into other formats?" This may prove to be necessary, but right now there aren't any facilities available to assist in such a transfer; DXT is strictly unidirectional.

To maintain compatibility between various operating environments, QMF is also available for DOS/VSE installations in support of the SQL/DS product (see Figure 7).

From an operating environment perspective, DB2 for MVS installations clearly fits into a fourth-generation architecture for data processing. IBM's approach had to provide carefully for integration between DB2 and other strategic products such as IMS. On the surface, at least, it appears that IBM's architecture is a significant evolution, more so than anything we have seen from IBM in the data base area since IMS was first announced. It remains to be seen whether the continuing evolution will be fast enough for large MVS installations.

Three questions remain to be addressed in this overview of DB2:

1. Does DB2 provide us with any insights into the future direction of other IBM products?

2. Overall, what are the strengths and weaknesses of DB2 as a product and as the architecture for a data base environment which DB2 represents?

3. How does DB2 compare with other data base architectures?

In a macro view of IBM's large system configuration, MVS/XA and the 3080 series are clearly an endorsement of a high-volume, centralized architecture for corporate information systems. That DB2 has been so tightly woven into the fabric of an MVS-TSO-IMS environment is an indication that these are the products that form the foundation for an operationally oriented DP capability for a major business enterprise.

DB2 is significant because it begins a pattern that will intensify in years ahead. The facilities of MVS-TSO-IMS will become much more transparent to all but systems programming personnel. Even clearer is the fact that without the powerful 3080 series, neither DB2 and the data base architecture it represents nor the architecture of "XA" itself would be feasible.

Resource integration

A simple example summarizes the integration between hardware and software resources that will provide efficient high-volume processing using the facilities discussed above. The integration between MVS, TSO, IMS and DB2 will permit alternatives in the implementation of efficient applications.

DB2 data bases will become quite large. The architecture of the tables will permit 64-billion-byte structures. The I/O capabilities of XA and the channel rates on a 3080 series machine will support large data files adequately. Suppose that extremely quick response times are required for large data bases. The architecture of XA and the capacity and speed of a 3080 series machine permit several alternative implementation techniques:

- With up to 2G bytes of main memory, a large data base could be stored in main memory.
- To avoid degradation of overall performance, DB2 could let XA handle the paging of memory for a table in storage without the requirements for repeated physical I/Os to the DB2 data bases.

Alternatively, the large table could be partitioned within DB2 to provide efficient access to high-volume components of an overall data base.

The support for DB2 and related products in the VM environment clearly indicates that the once stabilized SCP has now become a key element in large system architecture. While components of DB2's overall architecture (DXT and QMF) are available for VM, a fully integrated DB/DC system does not exist for a VM environment. This environment is properly focused on end-user interactive computing. DB2 is a step in this direction. Therefore, it would not be surprising if DB2 were available as a VM product before too long.

DOS/VSE appears to be an intermediate product. There are strong indications that IBM will encourage DOS installations to migrate to MVS in the next two to three years. DOS will be supported, but not significantly enhanced. Rather than a DOS version of XA, we can expect to see a subset of MVS/XA available for smaller systems. In this fashion, DB2 will become available to 4300-class installations that would otherwise be excluded from a complete relational DBMS from IBM.

What about the only other SCP still in use in larger IBM environments, VS/1? At a recent meeting with IBM personnel, an IBM product planner was asked what IBM intended to do with VS/1. His response: "We intend to stabilize it." The questioner pursued: "What does that mean?" The response: "We are going to shoot it!"

Clearly, the lack of mention of VS/1 in DB2 indicates that VS/1 has a very limited life expectancy as a supported product.

It probably goes without saying at this point, but IMS/VS is here to stay. Future enhancements will continue to strengthen its internal architecture and performance. IBM has plans for at least

BUSINESS SENSE

INTRODUCING THE DIABLO SERIES 36 PRINTER:

The sensible professional printer, this daisywheel offers more performance for less money than any other printer in its class. Performance like 35 characters per second. Performance like 4000 hours mean time between repairs. A range of options and accessories includes sheet feeders, forms tractors and a library of 100 printwheels.

And Diablo's unique API (All Purpose Interface) lets Series 36 play with all the most popular PC's (including IBM's). But perhaps the most sensible thing about Series 36 is its price. At $1595 suggested retail, Series 36 is a lot more printer for a lot less money than the competition. And that just makes sense.

To find out where you can see Series 36 and the other fine Diablo products call 800-556-1234 ext. 186. In California call 800-441-2345 ext. 186. Diablo Systems Inc., Fremont, California. A Xerox company.

Diablo Printers

three more releases of IMS, taking us out into the 1987 timeframe.

The following are the high-level strengths and weaknesses of DB2 and the overall architecture it represents:

DB2 strengths:

- The integration of DB2 internals with XA and large processor architecture. Result: a solid foundation for efficient processing.
- Complete implementation of the relational model, not just a "fancy" query language.
- Ability to supply data for structured and end-user application requirements as a result of IMS-DB2 interfaces.
- Compatibility across operating system environments. While DB2 itself is not available for DOS/VSE or VM configurations, DB2 demonstrates IBM's attempt to provide a broadly compatible architecture for DB/DC processing in MVS, DOS and VM environments using common data system products.
- For DP personnel (DBA and developers) the interactive facilities employ the dialogue manager of ISPF.

DB2 weaknesses:

- Availability. DB2 itself will not be available until the third quarter of this year. QMF and DXT will be available for VM in the second quarter.
- The lack of an integrated application development system (such as Ideal from ADR or AD6/O from Cullinet) for use by data processing personnel in the construction of transaction processing applications which will use DB2 data.
- The lack of an interface to ADF II, although IBM's statement of direction indicates one will be forthcoming.
- The lack of a comprehensive dictionary facility integrated with all DB/DC products.
- Confusing signals from IBM. For example, IBM has endorsed Artificial Intelligence Corp.'s (AIC) Intellect. This AI-based English language-oriented information management system is at the leading edge of technology, perhaps ahead of its time. But little or no direction has been provided by IBM to determine when DB2 would be more appropriate than Intellect and vice versa. (Note: In the context of IBM's overall data base strategy, the endorsement must be viewed as a definite strength. But relative to DB2, it clouds the evaluation of the product.)
- Continued reliance on the micro software "cottage" industry to develop products for the IBM Personal Computer. What about an extension of DB2 for the Personal Computer? Or will "desktop mainframes" (XT/370) provide the necessary access to DB2?

Apple Computer, Inc.'s Lisa has floundered a bit, at least partially because of a lack of mainframe data base interface facilities.

Cullinet, with the "Information Data Base" concept, extends IDMS architecture to the PC.

DB2 with its announced capabilities does not directly address the Personal Computer environment. This is a major consideration, if not a significant weakness, in IBM's architecture.

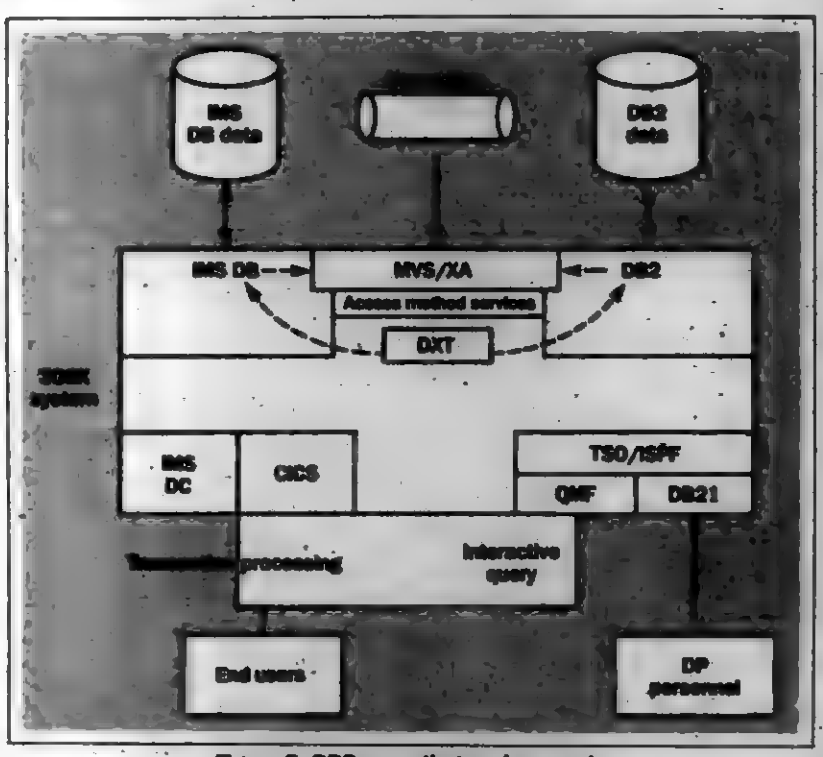

Figure 8. DB2 operating environment

DB2 vs. other architectures

Overall, it appears that the weaknesses overwhelm the strengths. However, each item will be weighted as DB2 is evaluated for a specific environment. As a specific end-user tool, DB2 will probably not fare well in competitive evaluations with Information Builders, Inc.'s Focus or AIC's Intellect, to name just two. As a complete implementation "engine," DB2 will receive stiff competition from ADR and Cullinet, among

CEU ACCREDITED

Environments which are user friendly produce friendly users. Make a friend!

How to stop the grumbling

MANAGER SOFTWARE PRODUCTS' CONTROLMANAGER™ rids your users of the never ending task of having to learn how to interact with yet another software product. It enables them to match the functionality of a software product with their specific requirements, while at the same time removing the need for them to become "system" knowledgeable.

Meet the MANAGER family

CONTROLMANAGER is truly integrated and being a member of MSP's MANAGER Family, is totally dictionary driven. CONTROLMANAGER is initially available exclusively for the other members of the MANAGER Family. These include DATAMANAGER® the data and information resource management system, DESIGNMANAGER,™ the logical data base design and information modeling system and SOURCEMANAGER,™ the Cobol application development system.

Interface with user

CONTROLMANAGER is the interactive interface between the person, the machine and the software. It provides automatic navigation for the user to get where he wants to be. It is simply and logically tailorable.

Let's get together

Find out how CONTROLMANAGER can help you make friends with your users.

Send the coupon today or call (617) 863 5800 (Telex 710 326 0431).

Nobody puts ideas on paper so many ways.

If you're using your printer with a personal computer, you probably need one that can handle a variety of functions.

At the same time, the price should be in line with the computer itself. Low.

The pint-sized Dataproducts printer in the picture costs about as much as one good software package.

It prints spreadsheets, graphics and illustrations, labels, multi-part forms—even letters that look like they were typed.

But let's say you're running a big computer and it's hundred-page reports you need. Pronto. Or documents by the millions.

The printer on the right finishes a full computer printout page in less time than it takes to sneeze. At 2,000 lines a minute, it prints much faster than you can see. Three shifts a day. Year after year.

In between these two special-duty Dataproducts printers are whole families of other Dataproducts printers—daisywheel printers, non-impact printers, high-security printers for the government, and more.

In fact, we make more different kinds of computer printers than any other independent printer company in the world.

Very likely we make one that fits your needs exactly.

Write us at 6200 Canoga Avenue, Woodland Hills, CA 91365. Or phone (818) 887-3924. In Europe, 136-138 High Street, Egham, Surrey, TW 20 9HL England.

Dataproducts computer printers.

others. As a complement to IMS data base systems, DB2 will enter any evaluation with a sizable advantage, represented by the strengths listed above.

From a purist (technical) viewpoint, such as that of a data base software engineer, DB2 does not represent a perfect architecture. From a competitive viewpoint, Cullinet, ADR, Computer Corp. of America and Software AG each possess an architecture that has superior components in relationship to DB2 and to one another.

From a management viewpoint, a simple perspective may be the most pragmatic. If an organization is committed to IMS — face it, many of the Fortune 100 are — then DB2 is a very acceptable alternative. If an organization has the luxury, for whatever reason, of moving beyond IMS and away from IBM products, then the architecture of the vendors mentioned above should be the primary alternatives.

In the long run, the parallel DBMS architecture IBM is promoting with IMS and DB2 is very viable. In the short term, Cullinet, with its fully integrated relational/network architecture, will dominate the data base software marketplace and rightfully so. But the potential power of IDMS/R *cannot* be used as evidence of DB2's weakness. Both are powerful in their own right.

Implementation guidelines

Following are several general guidelines that an installation can follow in considering the implementation of DB2:

- Relative to MVS, a pragmatic approach suggests you should establish an XA environment *before* installing DB2.
- If you must install DB2 in MVS/370, be sure you are not constrained in virtual memory. DB2 would accentuate that problem, perhaps bringing your system to its knees.
- If you are an existing IMS installation, begin the process of analyzing the overall architecture for "subject data bases" as they relate to the data currently handled by IMS. In other words, start planning *now* for a migration to DB2.
- If you are *not* an IMS installation, do not necessarily feel the need to consider implementing DB2 *and* IMS. If your focus will be on end-user-driven applications, DB2 could be sufficient.
- Overall, ensure that your installation is fully aware and utilizing the facilities represented by products such as ISPF, which are key in IBM's large system architecture. This will ease the transition to DB2.

Do not lose sight of the fact that any data base tool is just that: a vehicle that will help move your organization in a certain direction. With "data base" as a conceptual framework, the direction is toward integrated, efficient, accurate and timely information processing systems. Data base software technology is the vehicle. Data base-oriented methodologies for the planning, design and development of applications will chart the course the vehicle will navigate.

In an important sense, DB2's technical shortcomings, which this article has directly and indirectly presented, must not be exaggerated. This is not to defend IBM; it neither wants nor needs such defense. More important, for an organization committed to the direction stated above, DB2 represents another opportunity to deal with the issues which, if properly addressed, *will* chart the course toward a fourth-generation data base environment:

1. Defining information system requirements that are consistent with business objectives — strategic, data-oriented systems planning.
2. Managing data as a corporate resource — data administration.
3. Implementing programs designed to establish an overall data architecture for information systems.
4. Designing systems — from mainframe to micro, from end user to batch operations — that utilize the objectives of the data base concept as guidelines for effective information processing.
5. Selecting data base software tools that suit the business environment *and* information processing requirements of an enterprise.

All too often, an organization undertakes a data base implementation effort from the bottom up (starting with issue No. 5, *perhaps* No. 4, very seldom even considering 3 through 1.)

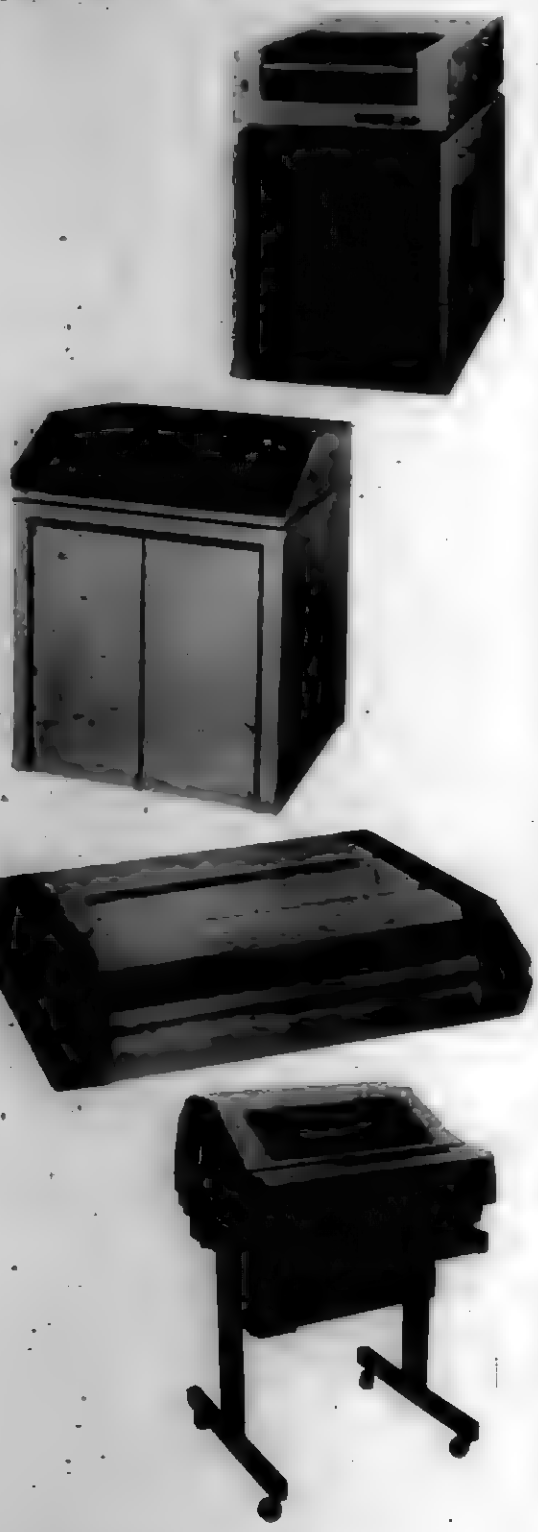
For an organization committed to mainstream IBM technology, DB2 *is* a powerful alternative for fourth-generation data base software. For *any* organization, an evaluation of DB2 is an opportunity to define a blueprint for a fourth-generation data base environment. Any particular blueprint must blend strategies, methodologies and technologies for the implementation of the data base concept. DB2, as a product, addresses only the third component. But as an overall architecture from IBM, it encourages us to deal with the other two.

About the author

Paul R. Hessinger is director of Advanced Technology Research for Computer Task Group, Inc. in Buffalo, N.Y. He is responsible for research in mainstream information systems technologies. He focuses primarily on the current product strategies and future evolution of products from major software vendors, particularly IBM.

Hessinger has been with Computer Task Group for nine years. Prior to becoming director of research, he was project manager for large-scale IMS/VS DB/DC development projects.

CONTINENTAL RESOURCES
We deliver what you need.



We've got Subsystems!

Need a printer, disk drive, or data communication multiplexer? Continental Resources can deliver what you need. Continental specializes in state-of-the-art plug-compatible peripherals for nearly every mainframe environment. Products from industry leaders such as Data Products, Genicom, CDC, Emulex, and C.I.E. Terminals (CITOH).

Printers with speeds ranging from 45 Characters Per Second to 2000 Lines Per Minute. Disk drives with storage capacities of 80, 160, 300, and 600 megabytes. We can even supply interface cables, data transfer switches, and a host of other communication devices to ensure you of a totally integrated system.

Continental's Subsystems group can provide you with the most up-to-date components available — plus professional assistance to ensure proper system integration. We also offer complete technical support and service, competitive pricing, and rapid order turnaround. We're certain to have what you need — when you need it.

Selection. Support. Service. That's what you get when you buy from Continental.

Products of almost every description from virtually every industry leader. Whatever your equipment requirements, we can deliver what you need.

But Continental doesn't just offer great selection. We provide a total support package unmatched in the industry. Our nine offices provide sales, technical, and service support backed by more than 20 years experience. You're assured of the most informative, professional assistance available — before and after your purchase. And Continental even supplies complete on-site service.

Not ready to buy? Continental offers a host of rental and leasing options. One is sure to meet your needs.

And, if you're not sure of what you need, our specialists will assist in evaluating your needs and recommend the right system for you — as well as compatible software and supplies. Ribbons, printwheels, and paper — even complete work stations.

So give us a call the next time you need computer equipment. Continental Resources. We deliver what you need.

IN DEPTH

Turnaround management

With turnaround management, a team of two to four highly qualified managers steps into key managerial posts within and atop the client company's data processing organization. The team's foremost objective is to turn around or reposition the DP organization so that it can move forward in aggressive support of the business.

By Joseph E. Izzo

Stuck with a problem data processing department? Let's get rid of the data processing manager!

No matter that he's working his tail off, never having learned how to say no to user requests. No matter that he's the kind of individual who seldom whimpers, even when his requisition for just one more programmer/analyst is turned down. No matter that he runs a business nearly as complex and demanding as the company it serves and that he may be tremendously overworked and underpaid.

Someone's got to take the rap for that three-year development backlog, that unforeseen 70% jump in hardware acquisition cost, the growing number of service complaints. We need a scapegoat, so let it be him.

Let me not imply that said manager is always without sin. He will, in fact, quite often lack the business skills to complement his technical know-how. To protect his domain, he may resort to high-tech jargon. He may even exude a holier-than-thou attitude. Maybe he should be let go.

In most cases though, the malfunctioning of in-house data processing organizations can be traced to more than one cause — often to a convolution of factors both trivial and significant. Terminating the silhouetted target is usually too simple a solution for a problem this complex.

Let's say that a serious problem does exist. This shouldn't surprise us because computers, despite their enormous propagation, still represent a comparatively adolescent technology and one for which economic use poses many as yet unanswered questions. How should the computer be applied? How should it be controlled? How should cost and benefit be measured to ensure a

fair return? Few corporations have recognized that ascertaining valid answers to such questions may be absolutely prerequisite to development of a responsive data processing resource. Problems, therefore, are not that uncommon.

Available solutions — whether that means fixing a capability gone catastrophically awry or simply creating an environment in which an ailing service will flourish — are comparatively few and exhibit varying degrees of success.

We've found, for example, that the role of the sit-by-your-side consultant seldom carries sufficient authority to overcome the inertia of a major problem. A more drastic approach — that of selling off the existing capability to a facility management outfit — carries with it some more obvious worries.

This kind of attitude shift is not achieved overnight. When turnaround management is called for, it demands a considerable management commitment. In fact, it can easily take as long as a year or more to overcome initial resistance.

"I had considered facilities management as a solution," one manager told us, "until I recognized that many of the very factors that fueled our information processing dilemma would very likely reconfront us when it came time to buy back the capability."

The remaining solution is what The JIA Management Group, Inc. calls "turnaround management." Under this concept, which we believe is unique, a team of two to four highly qualified managers literally steps into and assumes key managerial posts within and atop the client company's data processing organization.

These managers offer an average of 25 years of experience in business, computer technology and data processing management. And they come to the client company armed with systems and procedures, largely proprietary, that have been validated by repeated application.

The team's foremost objective is to turn around quickly or reposition the DP organization so that it can move forward in aggressive support of the business. Of course, that positioning must be accomplished in such a way that the department not only performs well during the turnaround team's residency, but also becomes sufficiently well organized, staffed, educated and motivated that a high level of service continues long after its departure.

A secondary objective is to reinforce strongly the credentials and acceptance of the data processing staff by adding to the staff's technical qualifications a familiarity with the principles of business planning and priorities as they might be viewed by the firm's executive offices — in short, giving data processing a business focus. Typically, the team leader, acting as department head and establishing an empathetic interface with the firm's user organizations, is the chief instrument of this achievement.

How well turnaround management can work was demonstrated a few years back at the Lincoln Telephone & Telegraph Co. in Lincoln, Neb. Lincoln Telephone is a utility whose data processing shop — despite the best of intentions — lacked the ability to implement the modern-day, online systems so necessary to customer service improvements. Yet after about 12 months of a turnaround management contract, the department proved its ability to design and develop major software systems, and the firm's customer service record improved dramatically.

So taken with its success, Lincoln Telephone recommended the concept to a major Midwest producer of high-fidelity equipment. The company hired JIA to turn around a data processing department that, despite some 50 people and millions of dollars worth of computer hardware, simply was not functioning.

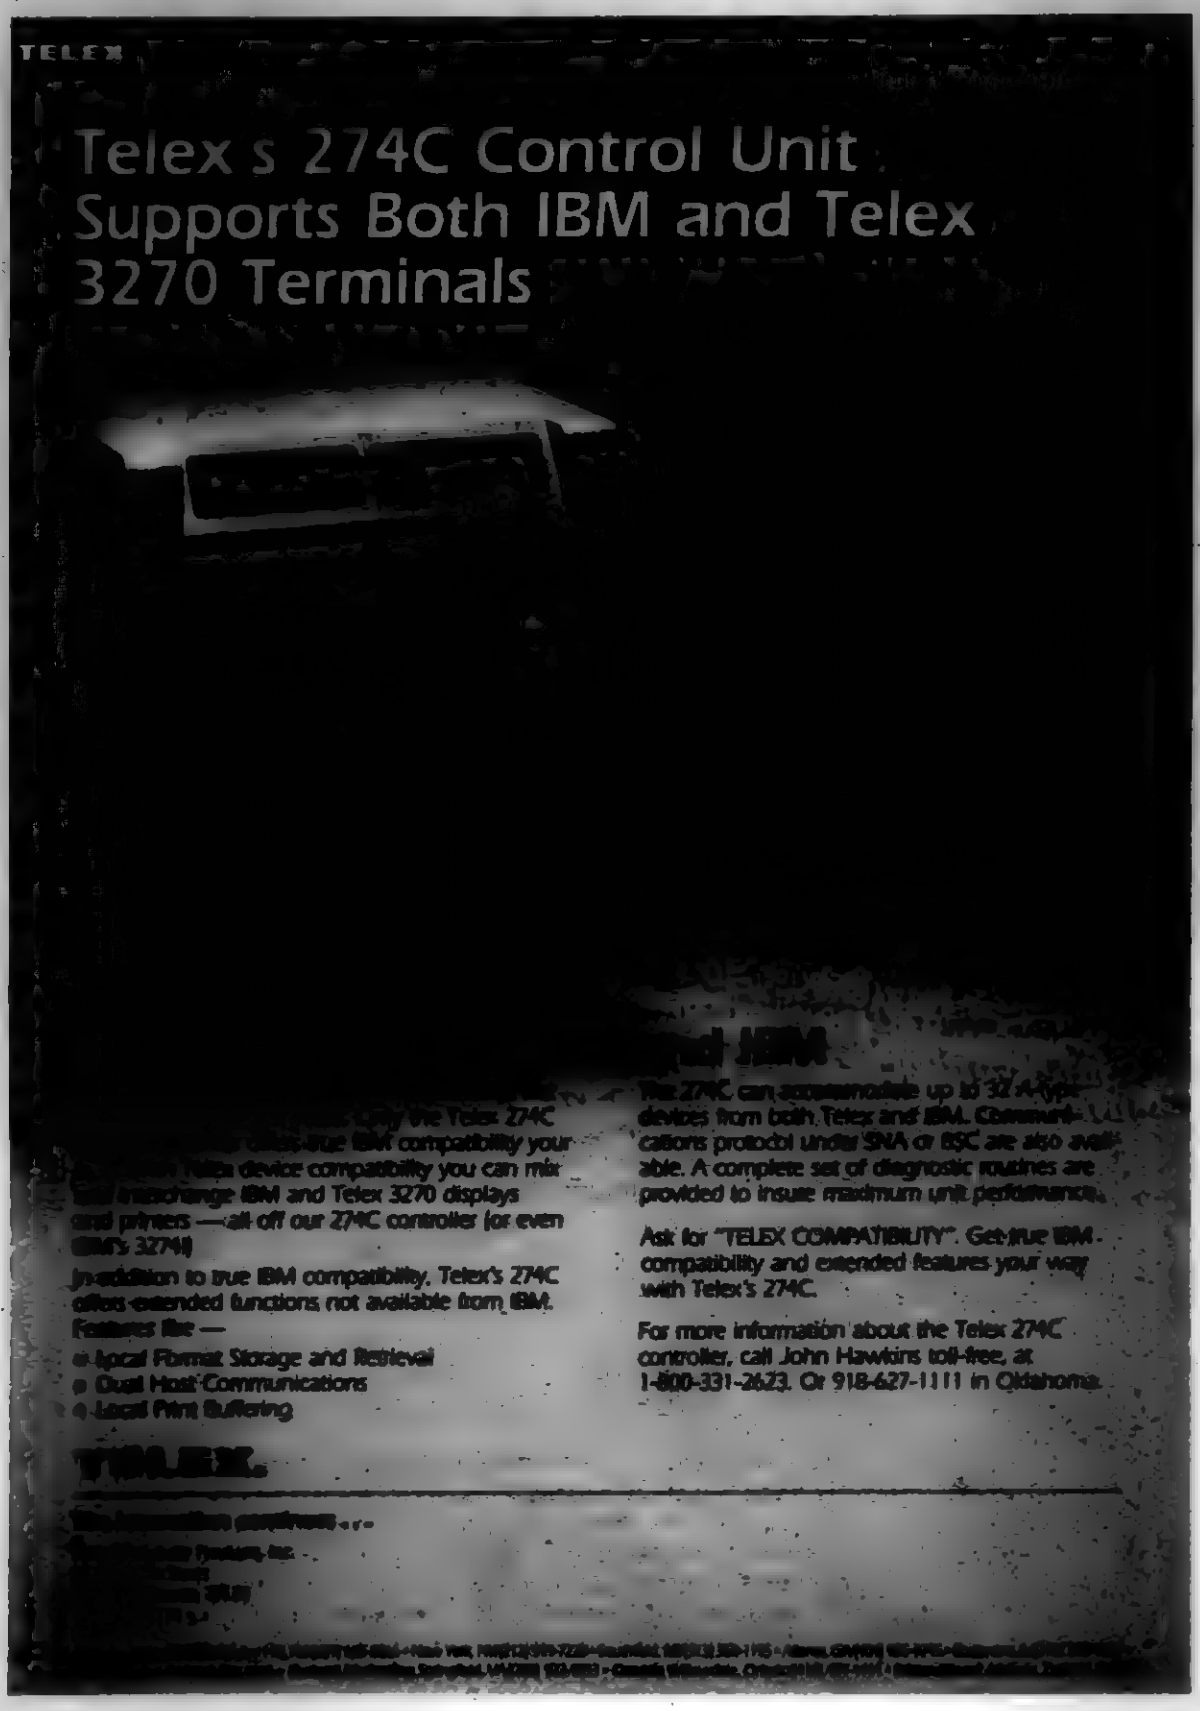
When the turnaround was complete approximately 14 months later, JIA consultants had replaced themselves with a qualified internal management team, had instituted a major training program for the entire staff and had installed the company's first set of data processing standards and procedures covering everything from proposal format to quality assurance requirements.

One of the client firm's key executives found a changed company attitude. "When JIA arrived," he reported, "everyone in our company hated the DP department. It was not reliable, it fouled up and the like.

"By contrast, the department has now gained the confidence of our organization," he added. "Now there's dependability and good communications."

Not an overnight solution

This kind of attitude shift is not achieved overnight. When turnaround management is called for, it demands a considerable management commitment. In fact, it can easily take as long as a year or more to overcome initial resistance, to educate the staff and to install new ideas, policies and procedures, while simultaneously maintaining and upgrading day-to-day operations. The greatest results are usually reaped toward the end of the contract, long after the JIA consultants are gone.



At last, a system with a head for numbers, an eye for pictures, and a mind of its own.

Introducing the Kodak KAR-4000 information system. Take the processing power of a stand-alone computer. Add a "photographic memory" to access original document images. Top it off with comprehensive, one-source software and service.

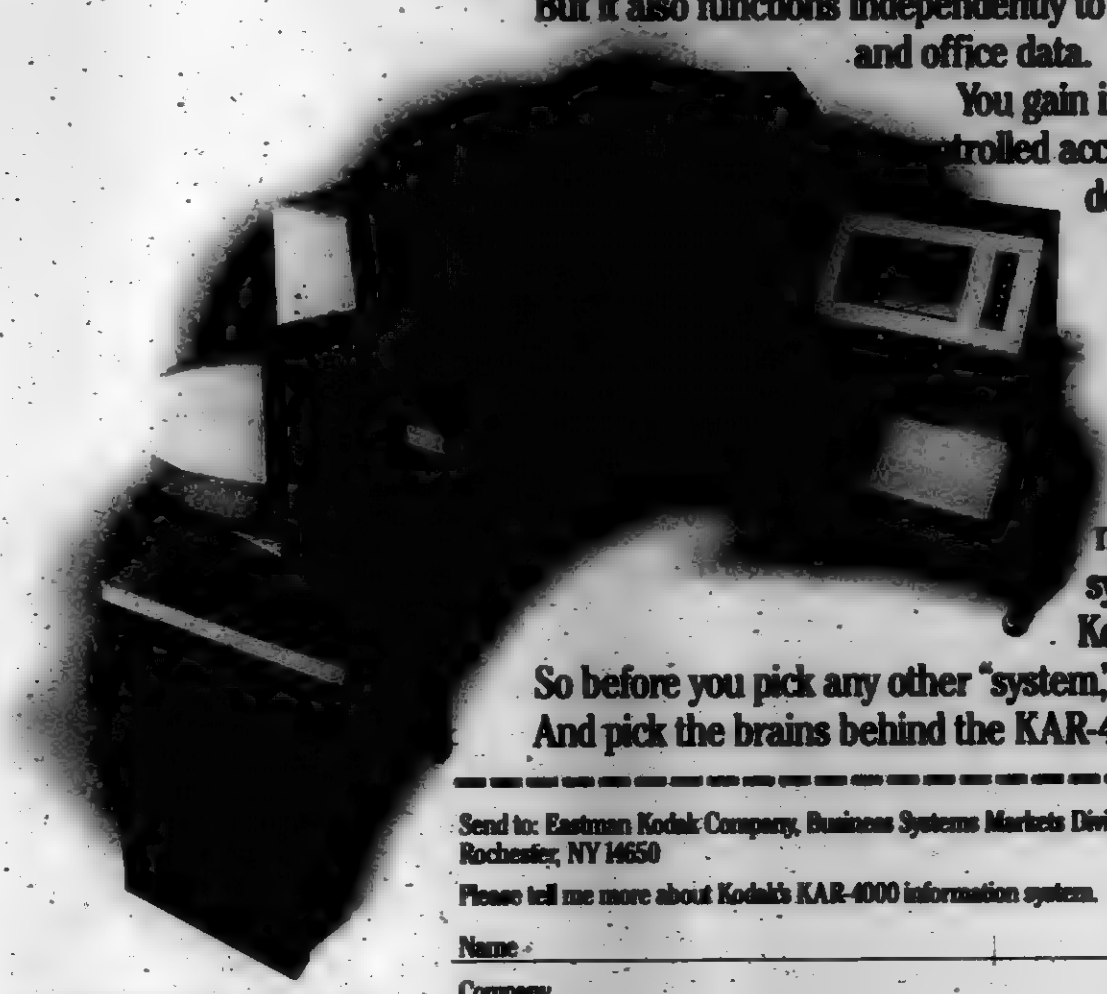
The result: a Kodak KAR-4000 information system.

It outperforms any other computer-assisted retrieval system. But it also functions independently to process both documents and office data.

You gain independent computer-controlled access to on-line data and documents. Without the staggering expense of on-line computer storage.

You even gain independence from service—all components in the KAR-4000 system are serviced by Kodak.

So before you pick any other "system," send in the coupon. And pick the brains behind the KAR-4000 information system.



The Kodak KAR-4000 information system. It gives the computer a photographic memory.

Please answer the following:

1. How many incoming documents per day do you process? ☐ 1000-2000 ☐ 2000-5000 ☐ Over 5000

2. How many documents do you normally retrieve each day? ☐ Less than 10 ☐ 10-25 ☐ Over 25

Turnaround management can also be effective on a more limited scale. In many instances, these same methods are applied to a single unit or function within the larger DP department: to systems development, to operations, to quality assurance or to business systems planning, for example.

One of the country's largest suppliers of private-label cheese had such a need. In this instance, the client's growth required major hardware additions coupled with state-of-the-art software and a new, more sophisticated operating environment. The operations staff, then about 30 people, couldn't meet the challenge and probably faced termination if an alternative solution could not be found.

Beginning with an effectiveness review, a JIA team of two individuals tackled the development of a data center operations improvement plan that ultimately established project request procedures, planning methodology and system turnover procedures among its several facets. The team also set up the documented methods to automate tape library management, automate software production and test, establish a viable recovery and restart procedure and implement other needed operational improvements. JIA also played a key role in procurement of a major software package.

Management involvement

True and lasting success of turnaround management almost invariably demands one very significant ingredient — the direct involvement of executive management: first to establish objectives for its data processing resource and then to monitor and control the operation to ensure continued attainment of the desired cost-benefit ratio and other goals.

Classically, top executives have more or less ignored data processing as they would never ignore engineering, marketing or finance — in many cases, simply because of uneasiness in dealing with the unfamiliar technology, compounded at times by the problems of technicians' jargon or aloofness. Yet in working with more than 100 client companies, we've learned that these executives can overcome this distance and learn to make correct decisions about data processing through the vehicle of the executive policy committee.

Properly framed, the data processing executive policy committee is not a discussion group, but a decision-making body made up of the firm's senior executives. Acting much as a corporation's board of directors does in serving and guiding the corporation, this group sets the data processing objectives and policies, appoints the top DP executives and approves their organizational structure, analyzes service responsiveness and reviews — for potential returns — major development projects and other proposed expenditures.

Believing that performance of the executive policy committee would depend largely on the quality of information on which it must act, JIA developed a number of innovative standards for reports and proposals to go before the committee. For proposed expenditures, the committee receives a document known as a decision package, which has proven to work primarily because it presents its case in business language rather than computer terminology. It also demands that the corporate user for whom the development is proposed participate fully in formulating the proposal.

Bergen Brunswig, a JIA client and a distributor of pharmaceutical and health-care products, had been heavily involved in data processing for many years, even operating a computerized inventory control system since 1955. Yet the company's president, Robert H. Martini, and other senior executives felt that until they had established the DP policy committee, they lacked the ability to manage or control the service properly.

"It seems easy to manage other parts of the business," Martini said, "but DP was always a mystical area."

As evidence of committee effectiveness, Bergen Brunswig has since reported about a 50% cut in backlog of DP projects from approximately 20 staff-years at $40,000 per year to about two staff-years . And the firm credits the committee with a drop in DP turnover from 35% to 8% in a single quarter.

Start-up situations

For the company that believes the best cure is prevention, JIA offers a start-up management service that employs many of the same principles of turnaround management. As with the turnaround service, the concepts can be applied to an entire DP department or just a new unit within the department.

In the typical situation (much like the separate case history of the Angeles Corp.), the client used outside services but reached the point where the bureau no longer seemed the most cost-effective or timely answer to data processing needs. In such a start-up, JIA can shoulder the entire burden, beginning with preparation of a detailed strategy plan for the changeover.

Subsequent functions include the actual hardware and software selection process, effecting the transfer from the service bureau, installing necessary standards and procedures, setting up an executive policy committee, designing the computer center, managing it until all the wrinkles are out and finally selecting and training the staff to replace JIA.

JIA's role in starting up a brand new unit within an existing data

How the management contract works

The management contract is one way of quickly repositioning a data processing department and developing it into a professional, high-performance organization in a short period of time. This is accomplished by placing a JIA data processing management team in the department on a temporary basis to "turn around" the performance of the organization. During its tenure, the team's major responsibilities are:

■ To effect a quick turnaround in the performance of a data processing organization.

■ To develop within the client company a strong, reliable, enduring professional data processing organization, which includes finding the training replacements for the temporary management team.

■ To install methods and practices for ensuring an ongoing, quality organization with appropriate management reporting and control.

In bringing about the turnaround of a data processing organization, the management contract has some basic advantages over the more conventional methods of hiring a new management team or promoting managers from within.

The motivation is different. Under a management contract, the goal is to develop a lean but strong organization. Since the outside management team is there for only a relatively short period of time, the interest and focus is to put in place only what is needed; there is no tendency to build an "empire."

The contract management team had no personal ties to existing members of the organization and, therefore, can be objective in evaluating an individual's performance.

The JIA staff is experienced in working as a team to accomplish major DP objectives. In contrast, if a new manager is hired, it may take a minimum of six months before he can form and test a team that can move aggressively forward.

Many of the professional methods and practices required to effectively operate a data processing organization exist within JIA and have been tested and implemented in many organizations.

Therefore, the cost and time required to develop these methods and practices is minimized.

With a management contract, the team's success is measured by its ability to make the required changes on schedule and to select managers who will maintain a high level of performance for the organization in the future. There should be no need for outside management assistance when the management contract is completed.

A management contract is not designed to provide "hatchet men," but to serve as a means of enhancing the skills of in-house talent. Individuals will be replaced only in those cases in which capabilities are below acceptable standards.

Situation dictates size

Based on the size of the data processing installation, the number of JIA managers at the beginning of a management contract will range from 2¼ to five, depending on the complexity of the situation. The contract's duration could be eight to 14 months. The time period is specified at the beginning of the engagement.

A brief scenario follows. For purposes of illustration, we will assume the requirement is for four members of the JIA management staff and the duration of the contract is 12 months.

During the first three to four months, four JIA team members would be assigned to the client site. At the conclusion of that period, one member will be replaced by a trained internal DP staff member, bringing the number down to three. At about the sixth month, an additional member of the JIA staff would be replaced by another staff member. At approximately the ninth month, the third member of the JIA staff would be replaced. The remaining JIA staff person would leave at the end of the 12th month.

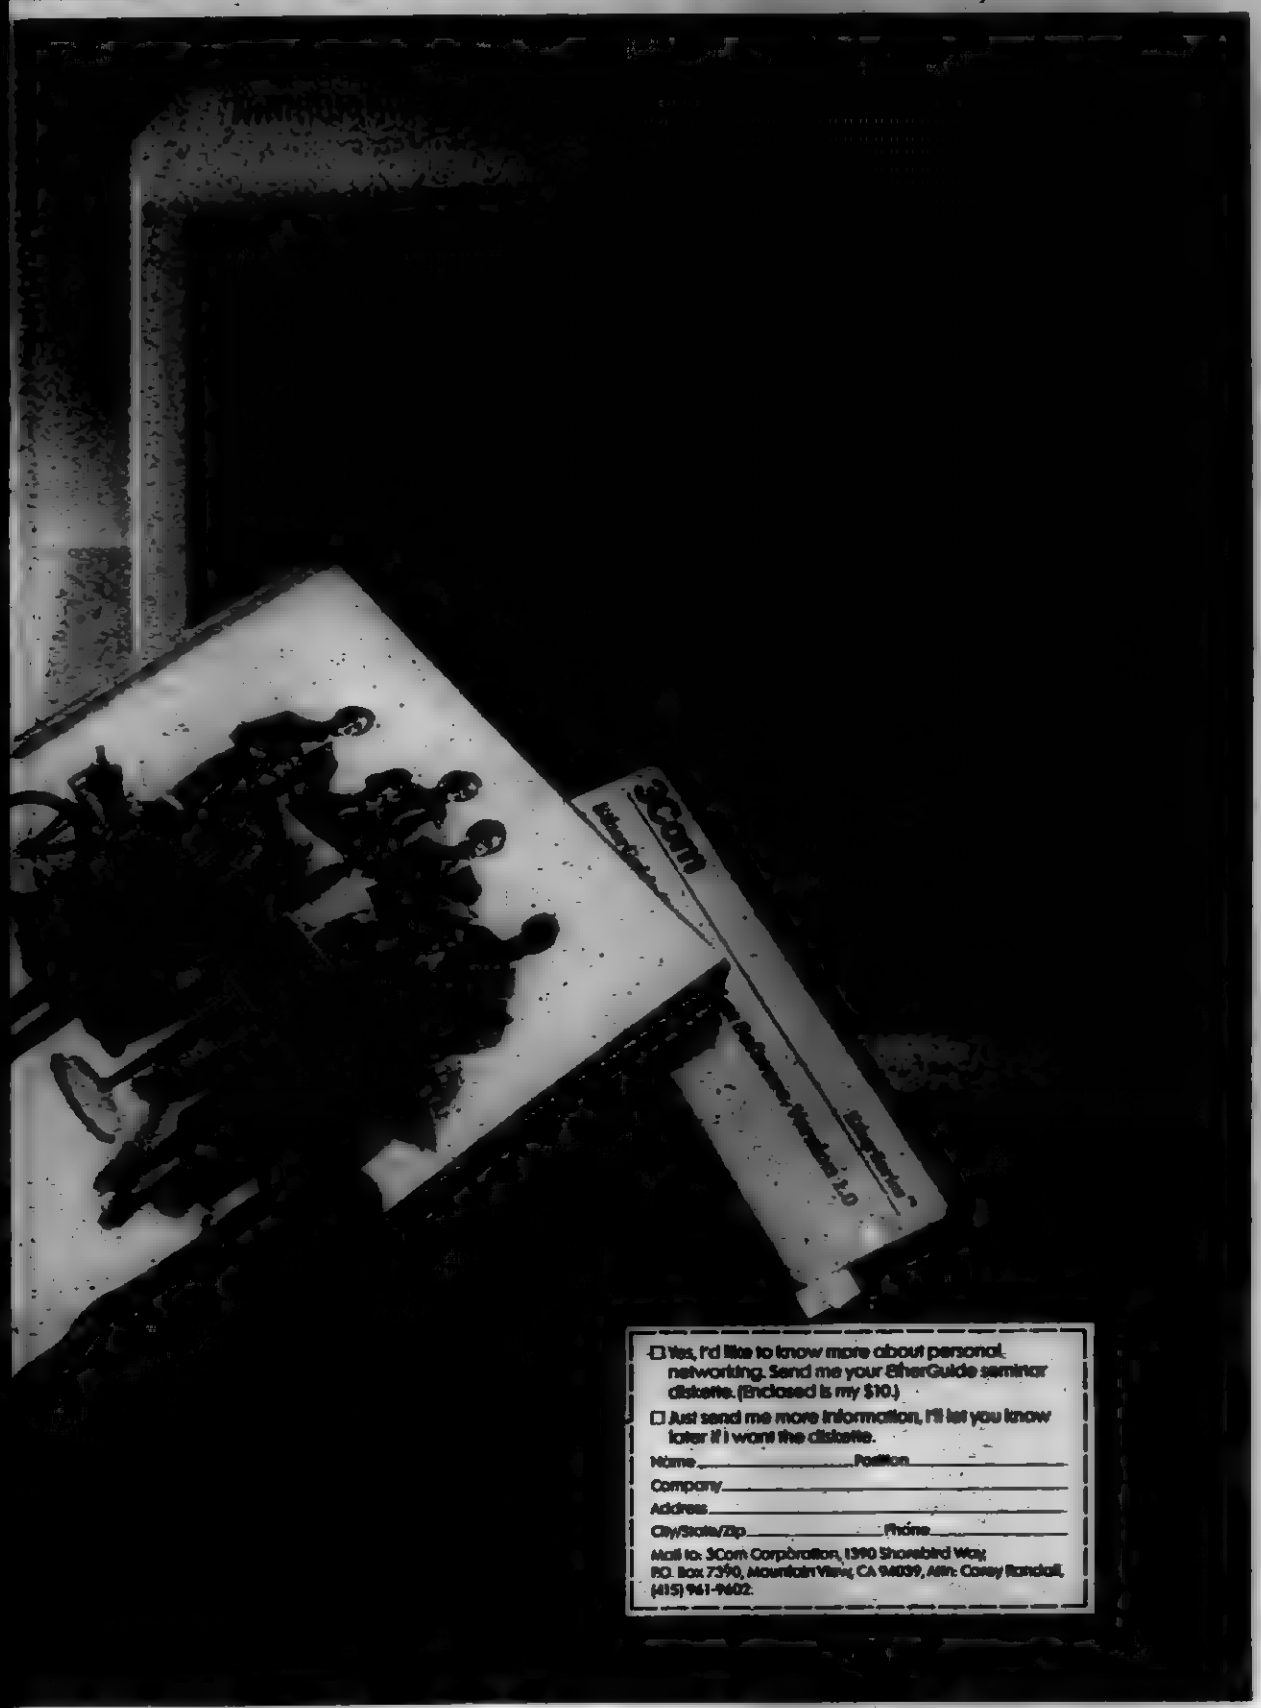
This approach allows for the gradual shift from a JIA-managed organization back to a client-managed organization. The JIA management team brings about this shift and effects change while managing the daily activities of the organization.

Several other general features of the JIA management contract include:

■ The JIA staffing levels are reviewed formally each quarter to determine if reduction of JIA staff can be accelerated. An increase in JIA staff should never be considered since this defeats the purpose of the contract; the goal is to develop the people internally.

■ The contract can be canceled at any time, with 30 days' notice.

■ JIA will assume all responsibility for managing data processing within the client's policies and guidelines and report directly to the executive in charge. Outside advice and counsel will be provided to the contract management team by JIA executive management.



☐ Yes, I'd like to know more about personal networking. Send me your EtherGuide seminar diskette. (Enclosed is my $10.)

☐ Just send me more information. I'll let you know later if I want the diskette.

processing department is normally much more limited in scope. At Bergen Brunswig, JIA helped establish two new units — business systems planning and quality assurance — in addition to formation of the firm's executive policy committee.

For the most part, JIA's clients are firms undergoing a key transition of some sort — entering an exciting growth period, experiencing a product demand that's difficult to satisfy, reconsidering basic objectives or market strategies or even retrenching for one reason or another. In most cases, the transition demands samurai performance by data processing.

When it comes to developing specific solutions to the firm's problems, JIA consultants have been successful almost entirely because they are in a position to apply a vast amount of directly related experience and can do so in an objective way.

Experience level

For example, attaining improved personnel performance requires a well-stocked armory of reliable cause-and-effect experiences. From their work with many other clients, they know the results of adding people, adjusting salaries, reorganizing the department or units within it or even terminating people. And their actions are convincingly objective because their finite "reign" allows them a dispassionate, detached view.

Moreover, their limited time in power demands that replacements be certifiable before that date. To ensure that happens, they begin to inform and educate the entire staff from the first day. Their initial objective is to alleviate the natural trepidation that occurs on arrival. A carefully orchestrated presentation, open to all DP personnel from managers to keypunch operators, explains precisely why they are there, what they propose to do and how long it should take.

Within the subsequent few weeks, the consultants conduct question-and-answer sessions with smaller groups. At one time or another, they talk privately with each individual about his goals and how they might best be achieved.

The consultants are always concerned about developing each staff member to his highest potential in line with the individual's goals. Naturally, those individual wishes sometimes conflict with the client's aims, making changes imperative. At worst, and this has applied to some department heads, it may be suggested that the employee seek another job.

Most often, however, shifting the person to a different function within the organization is the better solution and often benefits the employee directly. For example, switching a middle manager from programming to quality assurance exposes that individual to a new overview of the system development cycle and the tools and techniques by which the cycle is best managed. That person then ends up with a depth of business experience to complement his technical qualifications.

Most often, shifting the person to a different function within the organization is the better solution and often benefits the employee directly.

To illustrate more specifically the firm's approaches to real problems, several brief case histories follow. Studies of the Lincoln Telephone & Telegraph Co. and Itel Corp. demonstrate the approach to turnaround management. A look at the Angeles Corp. shows how start-up management was accomplished.

Lincoln Telephone

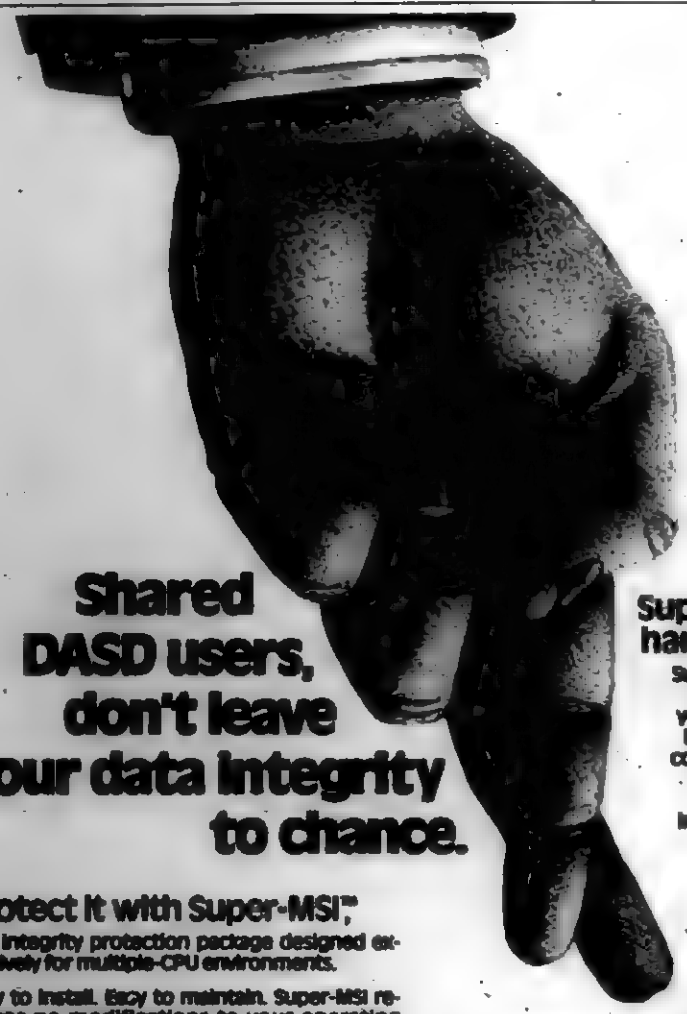
About 80 years of age, the Lincoln Telephone & Telegraph Co. of Lincoln, Neb., is a sparkling example of Middle America's catch-up infatuation with contemporary data processing technology.

Here is a medium-size utility that offers local and long-distance services to 22 counties in southeastern Nebraska. Here's a regional firm that serves some 190,000 customers and 360,000 instruments. Here's a company whose data processing organization progressed in just a few years from operation of a semiarchaic batch-oriented accounting system to modern-day, on-line processing of customer and stockholder records, toll settlements (a major source of income) and sophisticated business management tasks from what-if modeling to inventory control.

Yet in 1977, the DP outlook could not have appeared less promising. Lincoln Telephone's management — including Vice-President and Controller Laurence Connealy — had earlier recognized that the company's accelerating growth was demanding new and better ways to handle customer orders. "At that time," Connealy told us, "it took 3½ days to install service from the time a customer placed an order."

That was unacceptable to a firm that prided itself on service improvements and hold-the-line costs. So it attempted — starting in 1975 — to develop and implement a new computer-based order processing and billing system it called Cars (for Customer Automated Records System). It anticipated that Cars would be followed by other major DP developments.

But things didn't go according to plan. Off the beaten path and reflecting a somewhat provincial understanding of DP technology, the DP staff at Lincoln spent some 60



Shared DASD users, don't leave your data integrity to chance.

Protect it with Super-MSI™,
the integrity protection package designed exclusively for multiple-CPU environments.

Easy to install. Easy to maintain. Super-MSI requires no modifications to your operating system and can be implemented in an active system in as little as ten minutes—assuring complete data integrity from the moment it is installed.

Super-MSI guarantees data integrity.

No complicated job scheduling. No elaborate control schemes. No software changes. Super-MSI spans inter-system activity to give "unified system" integrity to your entire multi-system complex.

Super-MSI preserves integrity under MVS, MVS-SE, MVS-SP, SVS, MVT, VS1 and MFT systems.

Super-MSI prevents data destruction.

Inadvertant modification, simultaneous access ... Super-MSI stops the damaging data abuses that multiply in a multi-systems environment. Prevents the errors that can so easily occur—and too often go undetected—when users operate in a multi-systems complex.

Super-MSI eliminates hardware RESERVEs.

Super-MSI completely protects your data integrity and frees your systems of RESERVEs and RESERVE lock-outs. Super-MSI converts selective RESERVEs to logical controls that securely protect your data without inhibiting system throughput.

Super-MSI does more.

As part of the CGA family of single-image software for multiple-CPU sites, Super-MSI works together with MSM®, our Multiple Systems Manager which manages tape and disk storage devices and GCD®, our Global Console Director which consolidates consoles, cutting costs and streamlining operations. The result is a unified single system image that is transparent, flexible and powerful. Use them together or in any combination. CGA's multiple systems software is a must for large users.

More than 1,000 CGA single-image software packages are in use around the world, preserving data integrity and helping multiple-CPU sites hum like they're supposed to. Call today. Set up a free trial of Super-MSI, GCD or MSM.

Speak software. Talk to CGA.

New family of automatic protocol analyzers interpret and isolate the error source for you

Meet the New Digilog 200, 400, 600, and 800 . . . four revolutionary diagnostic analyzers that can actually describe in plain English what is happening on your data lines.

Until now, analyzers more or less just displayed the data or the protocol. You had to do all the interpreting. . . and figure out the error source yourself.

Now the new Digilog analyzers can decode and interpret the protocol for you. Isolate faults automatically. Exactly. Even statistically analyze performance on your data lines.

Compare the new Digilog technology with anything else. Suddenly, we're a generation ahead of them all.

Digilog 200, automates data comm testing

Now, first time users can perform like experts. And seasoned professionals can do more . . . faster.

The Digilog 200 sets up automatically. Decodes protocols automatically. Analyzes protocols automatically. Tests devices automatically. And, of course, identifies the faults automatically. Sound easy to use? It is.

And, for flexibility, the Digilog 200 has just about any capability you can think of— EE PROM packs for program or data storage, remote control, typewriter-like keyboard, full programming, menu driven traps and triggers, CRT, help screens, six BERT tests, interface breakout, printer output, etc.

Digilog 400 and Digilog 600 For even greater sophistication

Here the emphasis shifts toward versatility, power and higher speed . . . up to 72K bits/second.

You get more programming power, bigger CRTs, built-in 3½" micro disks, soft function keys, graphics, protocol simulation plus all the features of the 200.

Digilog 800, the new technology

Meet the world's first protocol/performance analyzer.

Use the 800 to conquer the toughest data comm problems. Debug software programs. Improve the performance of your network.

The Digilog 800 offers you every conceivable diagnostic capability. Including fully selective and bit image recording, full protocol simulation, automatic protocol analysis through level 3 (X.25, SNA, etc.), and speeds to 256K bits/second.

The Digilog 800 also gives you on-line color graphics, internal 10 megabyte disk with selective logging and comprehensive statistical analysis with reports.
Nothing else comes close.

Digilog is out in front

Want to see what the new generation of Digilog analyzers can do for you? Call now for a demonstration (215) 628-4530.

NETWORK CONTROL DIVISION

man-months in system development, forecast the need for an additional 60 and was finally judged short on system design know-how.

Desperate to solve the growing problem, Lincoln Telephone executive management considered its alternatives: the turnkey development of Cars by an outside firm, commitment to a five-year facilities management contract or simply extensive recruiting and training. The facilities management contract — under which both equipment and data processing staff would be legally absorbed by the contractor — was a drastic solution, but it looked like a front-runner in responsiveness.

"Although the facilities management approach seemed to be a good bet, it also featured some significant drawbacks," Connealy admitted. As he now recalls it, the dominant negatives were potential cost growth, lack of guarantees on return of the capability at contract termination and the utility's definite distaste for the idea of sandwiching a separate corporate entity between the utility and its customers.

Interestingly enough, while the JIA team had termination authority, no firings were found necessary. Even the displaced manager moved into a newly created quality assurance slot.

Lincoln Telephone had heard of JIA and the turnaround management concept. It agreed to a one-year management services contract, with provisions for both cancellation and extension.

The contract's comprehensive work plan addressed the identified problems, called for the immediate insertion of qualified data processing management, defined a program to upgrade its employees and supervisors and specified month-by-month deliverables by which the utility could monitor and control the effort.

Connealy's recall is a bit more vivid. "JIA brought in five managers to run our shop. They moved our people aside temporarily, wrote standards, set up a project control system, prepared a personnel assessment and training plan and began a national search for a new DP manager."

Interestingly enough, while the JIA team had termination authority, no firings were found necessary. Even the displaced manager moved into a newly created quality assurance slot.

Steering committee

JIA also introduced Lincoln Telephone to the concept of the executive steering committee. According to Connealy, this group of top-level executives still meets quarterly to review DP status and proposals.

From the JIA viewpoint, the effort represented a repositioning of the data processing department and the turnaround of an intolerable situation. When the consultants went in, DP facilities could almost have been described as chaotic. Salaries lagged behind the industry, and morale was low.

When JIA left, about five years of learning had been jammed into one year; each employee had a prescribed route to education and advancement. And executive management had begun to understand and pay attention to the data processing operation.

Lincoln Telephone also whipped the order processing problem. With Cars, more than 50% of Lincoln Telephone's service orders are actually filled the day the order is received or, in the case of orders placed late in the day, within 24 hours.

Itel Corp.

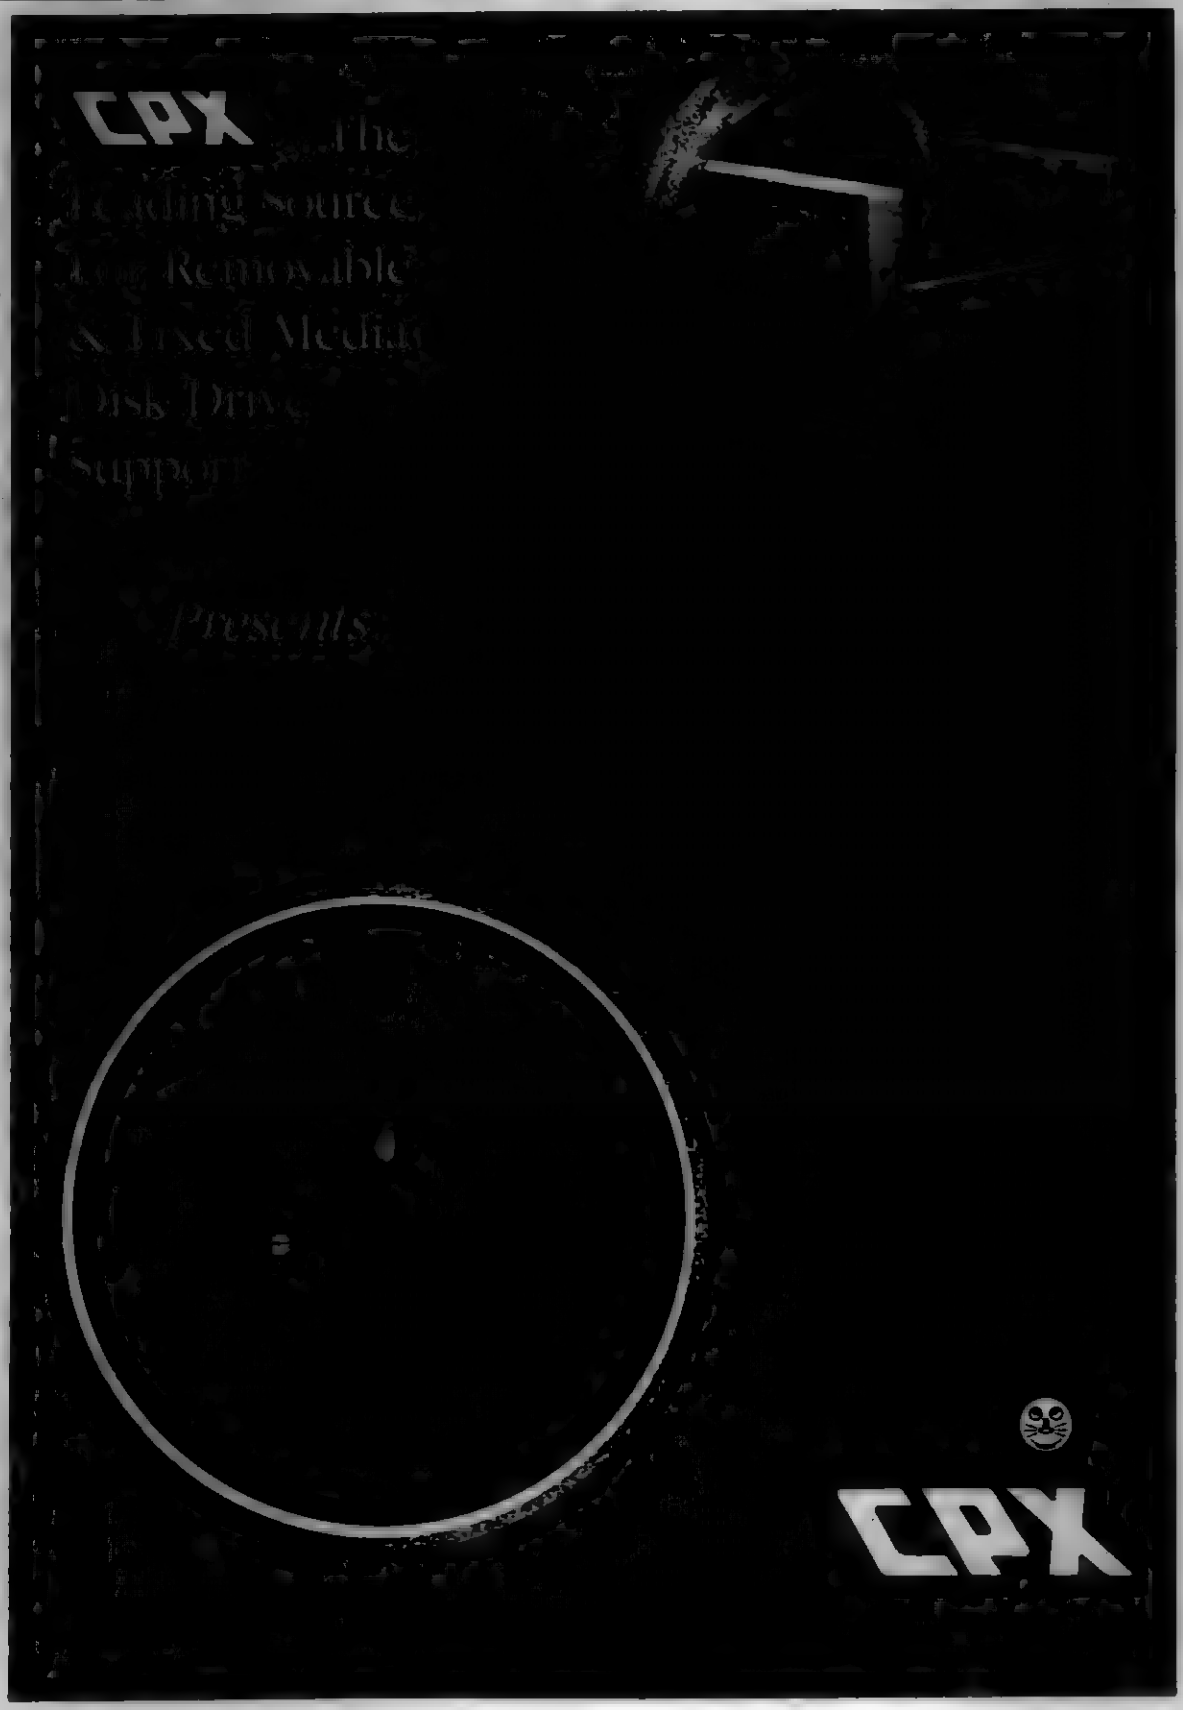
Founded in 1967, San Francisco's Itel Corp. flourished in the next decade, earning Wall Street's favor for the booming revenue from the firm's equipment-leasing business — most notably in the leasing of low-cost alternatives to IBM computers.

But 1979 saw the company stagger enormously as IBM dropped some of its prices, making much of Itel's line uncompetitive. The company lost more than $400 million that year. In January 1981, it entered Chapter 11 bankruptcy.

Today, less than three years later, Itel has gained a new notoriety — this time for the apparent speed at which it has begun to recover. It has pared the number of business units from nearly 30 to only two — container leasing and rail-car operations. It cut its work force from 7,000 to 900.

Itel has installed what is considered to be a unique bankruptcy information support system — a data processing system that has, according to Itel management, contributed so much to the recovery process that it has already been marketed to at least three other Chapter 11 businesses.

However, getting that data processing system in gear was a struggle. JIA was eventually called in. William Twomey, selected to preside over the firm during the later phases of reorganization, saw the basic problem as one of politics. "When we cut back our management staff in the fall of 1982, I — being the vice-president of finance and administration at that time — inherited several departments, including the Corporate Information Systems [CIS] Department. Unfortunately, the manager of the department held strong opinions of his own about the development and sale of the Chapter 11



Introducing APS/IMS

40% Improvement in Productivity Without the "Black Box."

Introducing APS/IMS—the only application productivity system designed specifically to meet the complex needs of the IMS Development Center.

Looking For Productivity Tools?

If you're an IMS user and looking at productivity improving tools, be careful. Most products on the market today have taken a "black box" generator approach to productivity improvement. You may be looking at one right now. While these tools can be fine for putting up simple things fast in a low-volume environment, they fall apart when subjected to the complex application, performance and maintenance issues of the IMS world.

Introducing APS/IMS— The Source-Based, Layered Solution

APS/IMS is the application productivity system that, for the first time, offers a strategic solution for the IMS Development Center. Unlike "black box" productivity tools, APS/IMS offers a source-based, layered solution for IMS users.

Source-based means that APS is engineered to be compatible with your existing source-level interfaces and requires no run-time overhead. With APS, you don't have to adopt a new language or a new design methodology.

The five APS components are housed in a layered architecture. The APS layered approach uniquely addresses the different technical skill levels within your organization as well as the broad range of application development and maintenance requirements you face:

- **Screen Painter**—engineered for end-users, designers and programmers. Using the painter, designers can interactively define screens at their 3270 or PC workstations. After screens are painted, APS will generate MFS, BMS, working storage and hard copy documentation.
- **Command Level Support System**—designed for COBOL programmers and requires no IMS knowledge. Through the use of powerful DB and DC Command Sets in a Structured COBOL programming environment, this facility allows programmers with no IMS experience to write comprehensive batch, DB and online applications.
- **Macro Level Interface**—leverages the skills of senior programmers and analysts who know IMS. This subsystem provides a macro language that enables senior technicians to extend, modify and control the Command Level environment. This additional productivity layer allows senior technicians to control systems performance and integrity without being forced to "exit" to the native IMS level.
- **Data Description Interface**—reads your existing IMS data base descriptions (whether or not you use a dictionary) and automatically provides information about the data base structure to APS/IMS.
- **APS Precompiler**—combines the outputs of the other APS components and generates native COBOL, IMS source. The APS Precompiler traps coding errors, validates IMS calls and adds no run-time overhead.

Increases Productivity By 40%

The productivity gains of these five components benefit every phase of the application life cycle—from initial design through maintenance programming.

Because of the APS layered architecture, you choose the productivity and performance ratios you need based on the specific application requirements at hand. No other product offers you this degree of control.

To date, APS users are reporting design, coding and test savings of 25% to 40% over traditional methods—with savings of 50% during the maintenance phase.

Call Today For More Information

APS/IMS can begin immediately to address your IMS Development Center requirements without forcing you to sacrifice the control and flexibility you need. With APS/IMS, there is no "black box" and there are no traps.

If you think the other productivity systems you've looked at compare to APS/IMS, look again. Before it's too late.

Call now for more information. If timing is critical, ask about the *FAST TRACK* evaluation process. We'll be happy to show you how APS/IMS can address your IMS productivity needs.

YES, I am interested in APS/IMS.
☐ Tell me about the *FAST TRACK* evaluation.
☐ Contact me for a product presentation.
☐ Please send me more information.

APS is available for users of IMS DB/DC; CICS, DL/I;CICS/IDMS; and CICS/VSAM. APS operates under TSO, CMS and CICS or on the IBM PC in a programmer workstation mode.

Recognizing that the CIS manager's threat could have widespread impact on the struggling company, Twomey backed his own hand by planning, with JIA, for emergency management services. Sure enough, three key CIS employees quit, giving only two weeks notice.

software and threatened to quit."

Recognizing that the CIS manager's threat could have widespread impact on the struggling company, Twomey backed his own hand by planning, with JIA, for emergency management services. Sure enough, in a power play, three key CIS employees — including the manager — quit, giving only two weeks notice.

The task facing JIA was unusual in that the Chapter 11 reporting requirements were monumental. Itel was dealing with more than 50,000 creditors and shareholders. The reorganization involved 24,000 separate claims and more than 3,000 executory contracts.

Periodic documentation ordered by the bankruptcy court included statement of assets, statement of liabilities, statement of executory contracts and statement of affairs, also known as Information Schedule 1.

The computer was used to maintain a claims register, to handle mailings to the creditors and shareholders, to call for and tabulate votes on the reorganization plan and even to distribute newly issued stocks and bonds.

Primary tasks

JIA's primary tasks were to see the computer operation resume without a hitch, to improve service to the remaining operating companies, to develop an information systems strategic plan and to develop a business plan for the marketing of computer services to bankruptcy customers.

Another significant contribution by JIA has been a major reorganization of CIS. As recently as June 1983, the two operating companies and corporate headquarters were each serviced by a more or less independent section within CIS. Each group did its own development work, with a high probability of duplicated effort.

Under a department reorganization, all users are served by a unified group that offers several important new functions. A quality assurance and administration group, a business systems planning office and a customer support group were added. The small increase in total head count also accounts for a technical group concerned with network control.

In response to JIA recommendations, Itel formed a four-man executive steering committee that will soon begin to oversee CIS operations and proposed improvements.

Angeles Corp.

The Angeles Corp. is a nationwide financial services organization. Based in Los Angeles and employing about 275 people, it acts as general partner to a number of limited partnerships, investing primarily in real estate developments and motion picture productions. It also manages pension and profit-sharing funds for other corporations and for educational institutions.

As perhaps the best measure of the firm's recent success, the past three years have seen its combined investments in stocks, bonds

More people in your position choose ASK.

After all the sales hype, analyses and benchmarks, the choice of a manufacturing system often comes down to a gesture of faith.

Don't make it blindly.

First consider why ASK inspires the confidence of more MIS professionals. (And why customer referral has made us the biggest in our field.)

Then consider this. Our MANMAN® software integrates manufacturing and financial operations more completely. So you'll never find yourself at a staff meeting accounting for your lack of cost accounting. Or your choice of a system.

Then consider the best part. You can fully implement MANMAN on a VAX or HP 3000 in under a year. So the information burden shifts from your shoulders sooner. And smoother. Because with our comprehensive training and documentation, your users quickly learn to help themselves to all the information they need.

Find out firsthand why more people choose ASK. Contact Carol Singh at (415) 969-4442 or 730 Distel Drive, Los Altos, California 94022. Get a customer referral. Then call and ask someone in your position about MANMAN.

What you hear will answer your every prayer.

ASK

THE PEOPLE WHO KNOW MANUFACTURING.

The CPT Solution that talks with mainframes in an important new way:

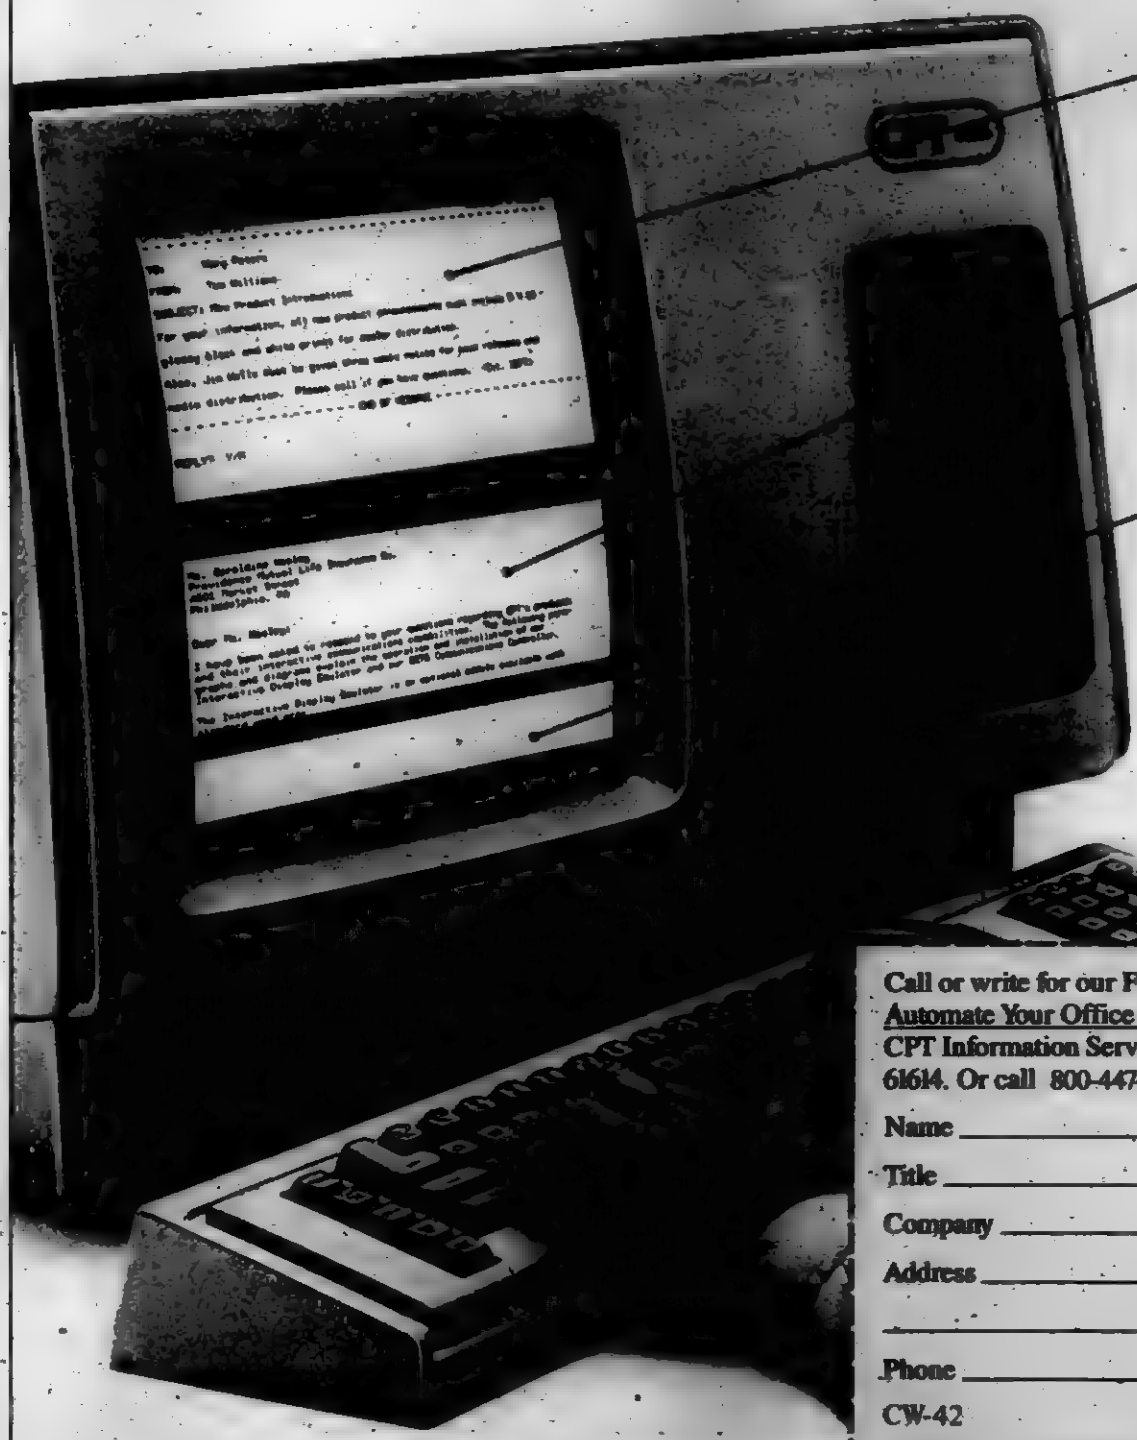
CPT solves the costly, cumbersome problem of separate data terminals and word processors at individual workstations.

An exclusive software breakthrough enables one CPT system to perform both functions. On the same screen. At the same time. We call it the CPT Interactive Display Emulator (IDE).

With this new CPT solution, an operator can transfer data processing information from a host computer (top window) directly to a word processing document-in-progress (middle window). Or vice versa. With just two keystrokes.

In addition, an optional CPT SNA communications controller can link up to 7 CPT systems together as part of an IBM 3270 network.

A few toll-free keystrokes on your telephone will bring you more information. And open some important new windows on the future.



Interactive Communications Window
A full 24-line by 80-column screen that displays information direct from a host computer.

Independent CPT Word Processing Window
A half-page display of the same CPT word processing that's earned a place on the Datapro Honor Roll for the last three years.

Word Processing Preview
Another standard CPT word processing feature. It lets you preview other pages in a document, or scan an entirely different document, without interrupting work in progress.

Specifications are subject to change at the discretion of CPT Corporation.

Office automation you can't outgrow

CPT.

On Angeles' behalf, the JIA team — which varied from two to five people during the contract period — evaluated equipment (eventually recommending an IBM System/38), centralized available DP resources and established a systems development methodology.

and other financial instruments soar to $2 billion from an already healthy $500 million.

Needed unified facility

But, according to Angeles President William H. Elliott, the firm had until recently been somewhat hampered by the lack of a professional, unified data processing facility.

"We were spending a good bit of money on service bureaus," Elliott said, "not too effectively, I might add. To keep up with our growth rate, we needed to significantly enhance our systems capabilities.

"I'm a great believer in systems," Elliott maintained. "And I'm convinced that data processing should be looked upon as a management tool, not simply an accounting tool."

Considered alternatives

The need for significant improvement led Angeles to the JIA group, but not before it considered a number of alternatives ranging from big-name consultants to equipment manufacturers.

"We were offered plenty of 'free' advice," Elliott recalled, also noting that most such advice usually proves costly in the long run.

"We needed a sophisticated data center, with plenty of growth potential, and knew that we faced a painful, extremely challenging job because we were starting two or three years later than we should have."

JIA started to work early in 1980, beginning with development of a strategic data processing plan. On Angeles' behalf, the JIA team — which varied from two to five people during the contract period — evaluated equipment (eventually recommending a System/38 IBM minicomputer), centralized all the available DP resources and established a system development methodology.

Cost of the new facility ran to about $2 million.

The software task was one of implementing existing applications on the firm's new hardware and designing new applications. JIA also provided an extensive amount of training for the in-house staff.

As it does in the majority of instances, JIA also recommended and helped to implement an executive steering committee by which Angeles management can monitor and control the new centralized function.

Joseph E. Izzo is president of JIA Management Group, Inc., a Santa Monica, Calif.-based management consulting firm specializing in data processing.

SCIENCE/SCOPE

NASA's Project Galileo may provide clues to the origins of the solar system when it explores the planet Jupiter later this decade. Project Galileo is scheduled to be launched from the space shuttle in May 1986 and arrive at the giant planet in August 1988. The mission consists of two spacecraft. One is an orbiter that will circle Jupiter for 20 months. The other is a Hughes Aircraft Company-built probe that will plunge into the planet's brightly colored clouds and relay data about the atmosphere. The probe is expected to operate for about 50 minutes before succumbing to temperatures of thousands of degrees, limited battery capacity, and pressures up to 10 times that of Earth's at sea level. Because some scientists believe that Jupiter's atmosphere is a sample of the original material from which stars are formed, the probe's findings will be closely studied.

A prototype electronic map developed for the U.S. Air Force makes map reading as simple as pushing a button. The Airborne Electronic Terrain Map System stores digitized terrain data to provide a moving, color-coded computer map of the area over which an aircraft is flying. The map can be projected on standard color or black-and-white cockpit displays or on the head-up display. Like paper charts, the Hughes map can show the aircraft's actual position or be "unfolded" electronically to let the pilot look ahead. It can be presented in a shaded relief plan view, much like a standard paper chart, or in a perspective view as though the pilot were looking at terrain ahead of the aircraft. Tactical symbols can be selectively added to reduce clutter and improve display readability.

Extremely sensitive high-speed photodetectors, key components in microwave fiber-optic communications links, have been fabricated by Hughes research scientists. The devices are gallium arsenide Schottky barrier type photodetectors. They have demonstrated a flat frequency response to at least 20 GHz and have the potential to approach millimeter wavelengths. They also have quantum efficiencies as high as 70%, roughly a 2 to 5 db improvement over existing high-speed detectors.

Two broadband gallium arsenide field-effect transistors, operating in the 13- to 15-GHz frequency range, have been introduced by Hughes for use in satellite communications. The new single-cell and dual-cell power transistor chips are mounted on internally matched chip carriers and are guaranteed to operate in a 50-ohm system over a full 2-GHz bandwidth with no additional matching. The chip carriers are compatible with 25-mil alumina microstrip circuits and have 25x1-mil gold ribbon leads. The single-cell device is rated at 0.5 watt minimum output; the dual-cell at 1.25 watt minimum. Highest output is from 14.0 to 14.5 GHz.

Hughes is seeking engineers to develop advanced systems and components for weather and communications satellites, plus the Galileo Jupiter Probe. Openings are in applications software development, data processing, digital subsystems test, microwave/RF circuit design, power supply circuit design, component engineering, GaAs design, digital communications, signal processing, spacecraft antenna design, system integration test and evaluation, and TELCO interconnection. IN DEPTH

OA forcing organizational change

By Leon Jackson

Most large companies are in the midst of planning for office automation, and yet they often overlook significant organizational issues. Resolving these issues usually involves political and cultural factors, the kind that cannot be handled by middle management. Top management should be involved in directing the office automation planning process.

Before the full benefits of office automation tools can be achieved, an organization must change in two distinct ways: first, in the "supplier" organization, which is the group responsible for implementing and managing office automation facilities, and second, in the user organizations.

Although fully integrated office automation systems are not yet available, many of the component pieces are now being purchased and implemented. To avoid risking this investment, most large organizations should plan now for fully integrated systems. These systems will combine the technologies of data processing, office systems and telecommunications.

Since fully integrated systems will eventually affect the majority of white-collar workers, human factors issues cannot be overemphasized. Education and training are vital. Physical offices will also change as the new technologies are implemented, thus bringing the building facilities' organization into the process.

There are very few large organizations in which data processing, office systems and telecommunications report to an individual below the level of chief operating officer or chief executive officer.

Data processing is often the responsibility of

The new streamlined organizations will benefit from a reduction in clerical and administrative chores that all levels below executives have to perform. We will all spend much less time searching for information and for people.

the chief financial officer. Office systems have developed under many vice-presidents of administration. Telecommunications functions are often split, with data communications in the data processing department and voice communications in some other area.

Training, with the exception of data processing personnel, is usually the responsibility of human resource departments. For a large organization to implement an effective integrated office automation system, all of these functions need to be brought together under a single executive.

These functions are not independent of each other. They are all part of information management, which is an area of growing importance as companies recognize that they are now in the information age.

Data processing people developed their own languages and set themselves up as high priests of data; they separated themselves from the user in order to maintain the integrity of the data.

Outdated distinctions

The distinctions between data, text and voice are a legacy. Data processing was kept separate from the other two because of the high level of technical skill required to program and operate computers.

Data processing people developed their own languages and set themselves up as high priests of data; they separated themselves from the user in order to maintain the integrity of the data.

In the office environment, word processors grew up as extensions of typewriters managed by office administration personnel, who were very often independent of data processing. The voice communications area, based upon its history of regulated service, maintained its own individuality with little connection to the other forms of information.

Changed environment

How different things are today. Microcomputers are proliferating throughout the organization at an incredible pace, following on the earlier, though less dramatic, success of on-line computing. Data processing people, who initially resisted the personal computer, now recognize its importance as a way to extend the capability of the computer to the user.

Word processors have been extended in capability: first to allow communications between word processors and then to add data processing capabilities leading to the first multifunctional systems.

Data communications systems have developed to allow high-speed data transfer between devices. In the area of local-area networks, they can respond to the ever-increasing needs of communicating terminals.

In the telephone area, the private branch exchange switch is now a fully integrated voice data system; no longer can it be considered as independent of data processing and office systems.

The establishment of an information management organization is the only way to coordinate the activities of these information management functions.

It is a difficult task to restructure an organization. Top management must be convinced of its importance. Justifying comprehensive office automation systems is difficult.

During the planning process, companies try to project the amount of hard-dollar savings. Other justifications include productivity improvements and strategic implications.

"If I invest in a multifunction workstation, how can I be sure it'll communicate with what I already have?"

One solution is to establish a new organization to handle all the information management aspects. The title for the head of this new department would be chief information officer or information resource manager.

A major goal is to demonstrate to senior management the importance of office automation to the future of the organization. Unless management is convinced of the value of improved information access and communication, it will not support the type of organizational changes necessary.

Political implications

There are considerable political implications. For example, which should be the surviving organization? Should it be one of the present organizations, such as data processing or office administration? In some organizations, the political difficulties have been so great that the responsibility has been given to the human resource department.

One solution is to establish a new organization to handle all the information management aspects. The title for the head of this new department would be chief information officer or information resource manager.

Another important question concerns to whom this new organization should report. Traditionally, it would report to the chief financial officer, but a strong case can be made for establishing this position at the executive level, directly reporting to the chief operating officer. If this is done, then a clear message is given to everyone in the corporation of the importance of information management.

The new organization has advantages that go beyond the implementation and management of the integrated office automation system. Many large corporations have diverse and autonomous business units that reserve for themselves major decisions on equipment purchase and systems architecture.

The information management organization should provide a strong leadership role to set standards by which all parts of the corporation can implement systems, while at the same time providing compatibility for communications and information transfer.

The central organization should also be responsible for listing preferred vendors, providing education and training, determining justification criteria and ensuring information security and integrity. The leadership and management skills required to cover such a wide range of issues can only be handled by a well-focused organization supported by top management.

User organizations

Office automation provides a set of tools to improve the effectiveness of people performing office-related work. Ultimately, this will apply to all levels of the organization, from senior executives to clerical employees. Initially, clerical and professional employees will benefit, followed by managers and then executives. These tools will provide significant improvements in the following areas:

- Access to information of all types, such as personal, departmental, divisional, corporate and external.
- Communication of documents, messages and data.

Northern Telecom's information processing products have the communications capability you need.

The 500 Family

Besides being compatible with each other, Northern Telecom's 503 desktop computer and 565 and 585 information processing systems communicate effectively with a multitude of mainframes, including IBM, Burroughs and CDC. They also talk to other minis such as DEC, Hewlett-Packard and Data General. Not to mention word processors such as Lanier, and even micros such as TRS-80 and Apple.

This means you'll have more flexibility—and more control over your information system. Even if more and more personal computers are becoming a part of it. Our 500 family supports the CP/M® operating system software, so employees can have the personal computing capabilities they want, while your company keeps the organizational unity it needs.

At the same time it's running CP/M, the family can also be running its own unusually powerful operating system which is compatible across the whole 500 line. It permits a unique approach to multitasking—with a few simple keystrokes, up to 16 tasks can be performed simultaneously on the same terminal. Data processing, personal computing, spread sheets, word processing, information management, electronic mail, whatever task needs to be done can be done at the same time. An incredible timesaver.

All in all, the 500 series is quite a family. Versatile, reliable and a perfect example of Northern Telecom's OPEN World® commitment to compatibility. Northern Telecom is a world leader in digital technology and we're using this expertise to make sure our products fit comfortably into a multivendor world.

For more information, call 800-621-6476 (in Illinois 800-572-6724), or write to Northern Telecom Inc., P.O. Box 10934, Chicago, IL 60610.

That's what we're here for.

■ Document generation, storage and retrieval.

■ Personal computing at the user's desk.

■ Personal management tools.

These tools will be used in various ways by different levels of the organization, but they will all improve the way information is accessed, processed, communicated, stored and retrieved.

Technology allows us to improve the effectiveness of these information management functions and, therefore, to reconsider the way the organization is structured once the technological tools are implemented.

Sole purpose

In all organizations, there are departments that exist solely for the storage and retrieval of information. An example of this is a department that stores information on the Environmental Protection Agency rules and how they are implemented in each state.

The individuals who work in this department do not process or analyze the information; they act merely as custodians and retrievers of the information upon request. Once the technology is available to provide this information, these people can be reassigned.

Another example concerns the answer to the question, "What does your department do?" In many cases, the response is to describe the process that the individuals go through, rather than describing the actual work product of that department.

People in offices think in terms of processes rather than a product. Yet each department has at least one product that is provided to another department. An example might be an engineering department's products, which are provided to manufacturing engineering in the form of drawings, part lists, test specifications and component specifications.

Classical approach

The classical approach to automation is to automate the process by which these products are produced, rather than to go to the internal customer, the user of the product, and ask him how the product could be improved. Then, by working with the engineering department and encouraging it to produce a better product, the productivity of that department can be improved in a real sense.

Concentrating upon the process could, on the other hand, lead the engineering department to produce a bad product more effectively. The processes should be changed, often requiring organizational changes.

An even more significant example is the potential effect on middle management. We hear constantly about how much more efficient Japanese companies are. There is always talk about reducing middle-management bureaucracy in order to improve efficiency. Office automation tools provide a mechanism for doing just that.

Vertical structure

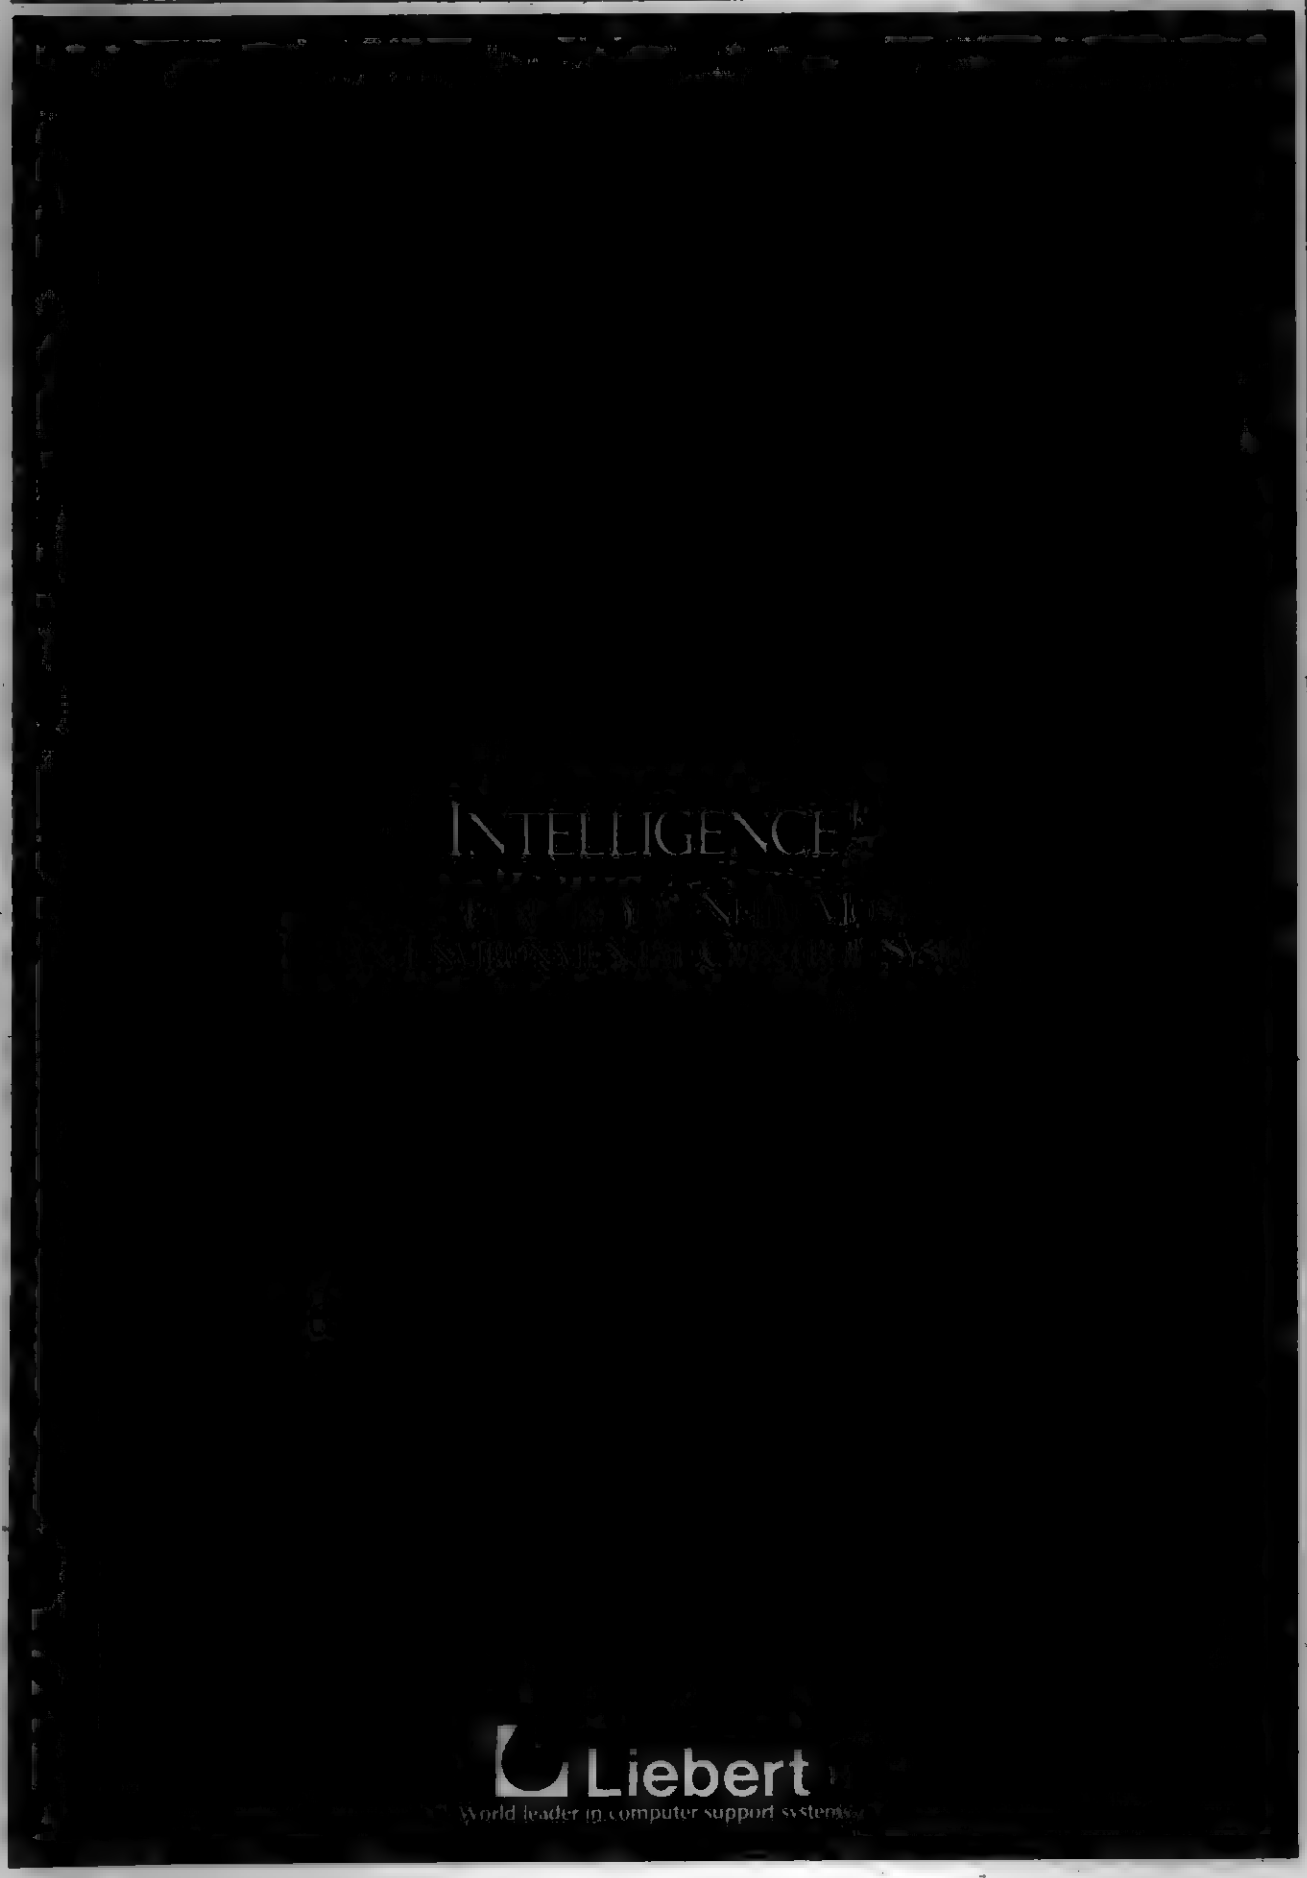
If you consider a typical organization chart in a large structured and bureaucratic organization, you readily notice the vertical nature of the structure. Let us consider Manager A who has a whole series of people reporting to him to support the office information functions for which he is responsible. Manager B also has a vertical structure reporting to him to handle his area of responsibility.

If an individual working deep down in Manager A's department needs information from a peer in Manager B's department, he may have some informal method of obtaining that information by telephoning or meeting with his source.

However, if he is to use this information officially, he is required to pass his request up the ladder to Manager A, who requests the information from Manager B. Manager B sends the instruction out to the source, who responds up the ladder to his manager. Manager B reviews and approves the information and hands it to Manager A, who will then send it down his chain of command to the person who requested it.

This sounds ridiculous, but in many cases this process is absolutely necessary if the information is to be reliable and approved within the structure of the organization.

Now consider the same



The Star of Team Xerox.

XEROX

The Star 8010 professional workstation has always been known as a computer of dazzling capabilities, especially in its graphics, information processing and document preparation.

Team Xerox

But what some people may not know is that the Star is also the key element in Team Xerox, a system of office machines designed to work together like a team.

When part of an Ethernet network, the Star can work with a wide array of word processors, mainframes, personal and business computers, printers, electronic mail and file services, facsimile terminals, communicating Memorywriters, other networks and, of course, other Stars. It also provides 3270 and TTY emulation.

Its full 17" bit-mapped screen lets you view two full pages simultaneously and open up to six documents at a time without covering up a previous document.

It's also the only workstation that can create and print documents in more than a dozen languages, including Russian and, for the first time, Japanese (Katakana, Hiragana and Kanji).

While other workstations may use Xerox innovations like the mouse, icons, windows, property sheets and combined text and graphics, the Star simply does more with them.

For example, the Star's extensive software is fully integrated, to allow you to work with text and graphics simultaneously. You can draw a flowchart right in the middle of a full page of text without having to resort to a separate program and limited buffer "scratchpad" or "clipboard."

In terms of capabilities, ease of use and overall value, the Star would have to be considered the stellar workstation in the industry.

situation once an effective office automation system has been implemented. The information will be contained in a data base. Access to the information will be limited to those people who have the authority for its use.

It will not be placed in the data base until it has the approval of Manager B. Manager A knows that if his employee uses this information then it has gone through all the validation procedures specified by Manager B's department.

Thus, corporate departments can access information from business units. On the other hand, business units can have access to corporate human resource policies without going through extensive chains of command.

If it is necessary for one business unit in a diversified corporation to enter the market in a foreign country, then it will be possible for the vice-president of marketing to learn the extent of involvement of other business units already doing business in that country.

This information will further improve communication between departments that today are somewhat artificially separated.

The new streamlined organizations will benefit from a reduction in clerical and administrative chores that all levels below executives have to perform. We will all spend much less time searching for information and for people. The number of meetings called purely for information-gathering or progress-reporting purposes will be drastically reduced. We will go a long way toward eliminating telephone-tag problems.

Managers will have more time to make decisions and for planning. Professionals will have more creative time to process information and to evaluate the results of their work. More time will lead to more thoughtful analysis, better planning and better information for making decisions.

Clerical people will be provided with the necessary tools to support professionals, managers and executives in meaningful ways that improve "management-clerical team" effectiveness and make the clerical job more interesting and valuable.

Different organizations

Clearly, fast-growing or changing organizations will benefit more quickly from the implementation of office automation systems. They can use office automation tools to help them build an organization to meet strategic goals.

A current example of a rapidly changing industry is the financial services industry, in which banks, stockbrokers, insurance companies and major retailers are making extensive use of office automation technologies in the battle for market share.

Major manufacturing companies, recovering from the recent recession, are implementing office automation tools in an effort to keep their organizations lean as the economy improves.

Even some of the more staid and conservative industries are finding significant advantages to office automation. Electrical utilities now under severe pressure because of criticism of their atomic power stations are using office automation tools to ensure accuracy of reporting information to regulatory bodies. Commodity chemical companies are using these modern technologies to improve their competitive positions by placing terminals directly in customers' locations for on-line ordering and expediting services. Even government departments under extreme pressure to be more efficient and economical are making use of office automation technologies to reduce their manpower.

The rate at which the technologies are implemented will vary from industry to industry; however, the common factor that runs through them all concerns the changes that must take place within their organizations for them to benefit from the use of these technologies. Companies that plan for such changes will reap their benefits much faster.

WHEN THERE'S NO CHOOSING, CHOOSE ICOT.

More personal computers. More workstations. More remote locations.

Everyone seems to be demanding *more* of your 3270 network. And management says, "Do it—but do it for less."

It's a tough spot to be in, unless you know about ICOT's Virtual Terminal System™ protocol converters. In place in your network, they deliver the compatibility everyone wants and the economy and flexibility you need.

You can make inexpensive asynchronous terminals and printers compatible with your BSC or SNA/SDLC network. A single terminal can access multiple applications and multiple hosts. And personal computers can be included easily in your network. All without expensive software modifications.

You have the flexibility of either dial-up or leased-line communications, letting you choose the option that's least expensive for your situation. Plus the option of adding ICOT's value-enhanced 3270 lookalike terminals.

It can all be done easily. Economically. With a built-in flexibility that makes future expansion fast and simple.

And when you use ICOT's protocol converters, we back them up with our expert installation, service and engineering support.

Now you don't have to choose between expansion and economy. Just choose ICOT. To find out more about the ICOT Virtual Terminal System, call or write:

AT&T's 'Gazelle' expected in May

According to the grapevine, May 1 is the tentative date for the first showing of the "Gazelle," AT&T Information Systems, Inc.'s second digital private branch exchange (PBX), although a company spokesman said that date may be a bit premature.

The new switch, to be officially known as the System 75, will be the little brother to the Dimension System 85, AT&T's first digital switch, announced at the beginning of last year. It will be compatible with that switch, but, significantly, it is believed that the System 75 will have a different architecture.

The System 75 is rumored to be a single-cabinet switch capable of supporting 400 lines, as compared to the System 85, which, when not interconnected with other System 85 modules, supports 1,000 lines.

When it is first revealed, it is expected that the System 75 will lack some of the networking features of the larger switch. In particular, it is believed that initially the System 75 will only be able to work as an end point in an Electronic Tandem Network (ETN).

If this proves to be true, it would mean, for example, that an ETN configured with a System 85 in Philadelphia and linked with another one in San Francisco could not be passed through a System 75 in Chicago. Instead, the mid-continent PBX would have to be tied into the network through one of the switches on the coast.

But more important than rumored announcement dates and the fact that the new PBX might initially lack some networking capabilities are the architectural differences between the forthcoming switch and the existing System 85.

The expectations of a new architecture have, in fact, caused some users to hedge on the System 85, wondering if AT&T really intends to build its future on that architecture.

Manfred Zerbe, director of communications services at Colgate-Palmolive Co., said recently that AT&T Informa-

Doelz unveils concentrator

Claims to solve common networking problems

IRVINE, Calif. — Doelz Networks, Inc. recently unveiled a multipoint concentrator switch that reportedly eliminates traditional networking problems associated with differing architectures, gateway approaches, installation requirements, network management, network diagnostics and network maintenance.

Elite One, touted as the first product in a family of data communications networking systems, is said to embody the architecture and technology that will be used in forthcoming products.

Elite One supports all traditional networking transmission media, including both analog and digital lines, at speeds up to 72K bit/sec. Data is transmitted and managed over continuous bidirectional transmission paths that are independent of transmission media, attached devices and their protocols. User ports accept multiple concurrent asynchronous, synchronous, Systems Network Architecture, Synchronous Data Link Control and X.25 protocols, the vendor reported.

According to Frank T. Conners, president and chief executive officer of the company, Elite One will enable users to operate a single network, instead of multiple networks, for varying types of traffic (for example, batch or interactive) and/or varying types of vendor-specific hardware.

"The form of the data, its protocols, the transmission media it will travel across and the system it was generated on should not be the deciding factor in network design," Conners said. "Our technology is suitable for all data communication networking requirements."

A single Elite One switching node can accommodate up to 32 users' ports with either asynchronous or synchronous protocols. Each Elite One can address up to 60 nodes.

Networks are created by tying together two nodes to form a single network link or by interconnecting a series of network links, the vendor reported. Several functions are said to be performed simultaneously: virtual switching, data traffic management, data priority, data packaging and overall network management.

Conners said that a user-programmable, multiple-priority scheme enables interactive and batch traffic to be intermixed on the network. This is achieved with a traffic optimization algorithm that gauges the priority of communicated traffic and en-

See ELITE page 99

Message system lets *Newsweek* eye more late-breaking news

NEW YORK — Messages are moving to and from the headquarters of *Newsweek* magazine here with greater speed and fewer foul-ups with the recent installation of a $1.5 million computer-based message-switch system, reported Bob Monterola, Newsweek, Inc.'s director of data communications.

The message switch translates the communications protocols of reports and queries coming from the magazine's 21 bureaus, mostly via teletypewriter, into the protocol used by headquarters. It also uses its store-and-forward capacity to send outgoing messages in bundles at high speed to save on long-distance charges.

The switch, installed early in January, handles most of the magazine's asynchronous data communications and, because of modifications, several bisynchronous links as well. It carries the majority of *Newsweek*'s telegrams, TWXs, telex messages and direct-dial data transmissions. It also converts protocols and meets the communications software needs of ITT, RCA Corp. and all international record carriers, Monterola said.

When it is fully phased in, the switch will link all of the magazine's New York editors directly with the bureaus via their Atex, Inc. text editing terminals. That connection will eliminate the need for bureau writers to have their reports rekeyed into a Teletype machine prior to transmission to New York.

"We were starting to die with all of those old Teletypes," Monterola said.

Bypassing the Teletypes will also eliminate the need for couriers to carry messages directly to each of the magazine's 10 floors of offices. With a circulation of three million, *Newsweek* employs more than 400 editors and reporters.

See NEWSWEEK page 99

Modems, data service units, terminal out from Paradyne

LARGO, Fla. — Paradyne Corp. has announced six new communications products, including three modems, two data service units and an asynchronous terminal.

The MP-192 SM is a voice-grade, 19.2K bit/sec modem with an integral, full-feature statistical multiplexer. The modem reportedly provides eight or 16 channels of statistical multiplexing with up to a 2:1 concentration ratio resulting in aggregate speeds up to 38,400 bit/sec in most applications. Its price is $16,900 with the eight-port, integrated statistical multiplexer and $18,900 with the 16-port statistical multiplexer.

The Challenger 144 is a 14,400 bit/sec modem based on a single circuit card. Its price is $4,800.

The LDM-100 is a full-duplex, limited-distance modem for unloaded, four-wire metallic circuits. Synchronous data rates from 1,800 to 19,200 bit/sec as well as asynchronous data rates between 2,400 and 9,600 bit/sec are supported. Its price is $1,100.

The DS-500 and DS-556 are data service units for use with AT&T's Dataphone Digital Service. The DS-500 accommodates data rates of 2,400, 4,800 and 9,600 bit/sec, and the DS-556 operates at 56K bit/sec. The DS-500 is priced at $895, and the DS-556 costs $1,095.

The 7811 is an asynchronous terminal that transmits data over an RS-232 asynchronous link at selectable rates from 300 to 19.2K bit/sec. Features include ergonomic design; tilt-and-swivel terminal; and a 12-in., nonglare, high-contrast CRT. It is priced at $695. Paradyne can be reached through P.O. Box 1347, 8550 Ulmerton Road, Largo, Fla. 33540.

Ark Electronic unveils host of products

MELBOURNE, Fla. — Paradyne Corp. subsidiary Ark Electronic Products, Inc. recently announced a number of new products, including a multiplexer, two programmable interface units and a port-sharing device.

The Octamux-1 is a time-division multiplexer that reportedly connects clusters of eight nonintelligent, unbuffered terminals to their associated computer, remote concentrator, polling controller or similar device with a single, four-wire unshielded cable.

The product eliminates interface cables for clusters of terminals located up to 1 km (about 3,300 ft) from their physical port. Its price is $650.

The ICA-2 and ICA-4 are programmable communications interface units that perform speed, code and protocol conversion.

The ICA-2 is based on a Zilog, Inc. Z80 microprocessor and is available with a multiple-purpose, 4K-byte buffer, which provides the user switch-selected combinations of speed, parity and flow control and conversion between asynchronous and synchronous protocols and Ascii/Baudot codes, the vendor said. The device can be programmed by the user to meet specific applications.

The ICA-4 uses an Intel Corp. 8086 with 128K bytes of random-access memory. It can support up to 12 serial asynchronous, synchronous, Binary Synchronous Communications, High-Level Data Link Control or Synchronous Data Link Control I/O channels. Potential user-programmed applications include: protocol conversion, multiplexing, terminal emulation for dumb terminals, serial and parallel printer protocol and/or data conversion, a company spokesman said.

The price for the ICA-2 is $720; the ICA-4 costs $2,450.

The MSD-4 is a new device that is said to provide modem or port sharing in polled or half-duplex data nets.

The product operates at 14 different data rates up to 19.2K bit/sec, including all the common speeds of synchronous modems and terminals. It offers a 4-bit buffer combined with an internal/external clock option on each port, which supplies error-free handling of speed differences between any two differently clocked devices for any block length of data, the vendor said. This reportedly permits a mix of local terminals and remote multidrop lines to share the same computer port.

The price is $795.

Ark Electronic Products is located at 325 W. Hibiscus Blvd., Melbourne, Fla. 32901.

VOICE/DATA COMMUNICATIONS

TELESAVER, INC.
Quick Call 2000

Telesaver, Inc. has announced the Quick Call 2000 autodialer featuring speed dial, memory storage and retrieval and least-cost routing.

With the autodialer, one to 24 users can access alternative long-distance services by dialing only two- and three-digit numbers. The system operates with single-line telephones, key systems and private branch exchanges and works with AT&T and other common carriers as well as international calls, the vendor said.

Features of the product include the ability to store and speed-dial up to 250 local and long-distance numbers; the ability to determine which subscribed common carrier offers the least expensive service for a particular call; the ability to redial a call until completed, with information entered one time only by the user; and a cost accounting feature for billing by person, department, cost center or client, according to a company spokesman. The price for a one-line unit is $455.

Telesaver, 30 Gwynns Mill Court, Owings Mills, Md. 21117.

MULTIPLEXERS/ MODEMS

LOCKHEED-GEORGIA CO.
Data Sentry

The Getex Division of Lockheed-Georgia Co. has introduced Data Sentry, a modem that can reportedly prevent data theft and other security breaches of personal, mini and mainframe computer systems without requiring encryption or changes in systems programming.

The asynchronous modem operates full duplex at 300 or 1,200 bit/sec and has autodial, autoanswer, autospeed and autoparity selection. Terminal interface is a standard RS-232C cable. The telephone interface is a single telephone number drop with an RJ-11C connection. The price is $895.

Lockheed-Georgia, Dept. 8402, Zone 18, Marietta, Ga. 30063.

COHERENT COMMUNICATIONS SYSTEMS CORP.
SPM-94B

Coherent Communications Systems Corp. has introduced the SPM-94B simultaneous voice and data dial-up modem, a device that enables a full duplex, 300 bit/sec asynchronous data stream to be carried simultaneously on a switched telephone line carrying a voice conversation.

A telephone line and local telephone set are plugged into the unit's dual RJ-11C telephone input jacks,

YOU CAN ADD A SECOND IBM® 3270 PERIPHERAL IN MINUTES.

Now you can take any existing coaxial cable in use with a single controller and DOUBLE the cable's capacity immediately. Every cable that is installed can now drive two devices. That's right, TWO peripherals running over ONE cable. We call it the "Coaxial Doubler™".
One Doubler connects two ports of the controller to the shared cable. The other Doubler connects the shared cable to two peripherals.

A real breakthrough! The Coaxial Doubler, our littlest multiplexer, requires no external power connections and comes with a five year warranty. Installation time? Five minutes.
We're so sure you'll like the Doubler that on an introductory basis we'll send you a $490 Doubler pair on a no risk, 30 day, trial.
Call: 1-800-342-5986
or write us at once.

David
Recommends The Diablo 630 Series

David Jamison Carlyle recommends the Diablo 630 Series.

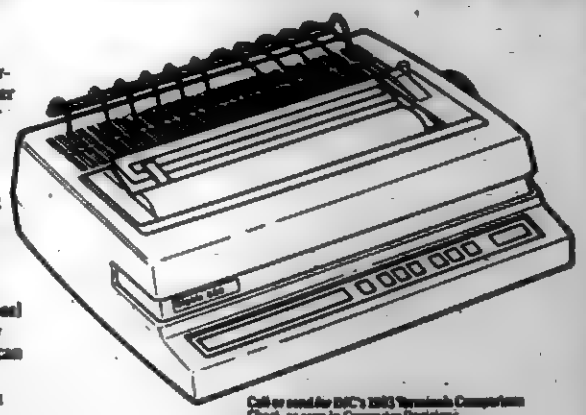
The most versatile line of daisy wheel printers for serious business applications.

630 API—The API's unique all purpose interface makes this 40 cps printer compatible with almost any computer you can name.

630 ECS—All the features of the 630 API plus the ability to print 192 fully formed characters and construct hundreds more. Perfect for scientific, financial, legal and other applications where special symbols and text are needed.

630 ECS/IBM—The only daisy wheel on the market that can truly print any character or symbol that the IBM PC can display.

Diablo from DJC, the first name in peripheral distribution.



Call or send for DJC's 1983 Terminals Comparison Chart, as seen in Computer Decisions.

Soup up your Volkswriter.

Everybody knows Volkswriter, the word processing software package that's become synonymous with high performance. Now, there's a way to get even higher mileage out of your Volkswriter. Hook it up to a Dataproducts P Series dot matrix color printer.

The versatile P Series translates the executive class, word processing capabilities of the Volkswriter into brilliant full color charts, graphs and text. It delivers a full page of text quality print in nothing flat while its sheet feeder automatically prevents loading hassles. And the P Series uses pin feed or plain paper and has the brains to fill every appropriate line with crisp, sharp copy, even if it has to justify to do it. And the P Series color printer has dual speed capability for correspondence quality output for the Volkswriter's many word processing applications and high speed output for draft and spreadsheets.

The Dataproducts P Series color printer. Think of us as a supercharger for your Volkswriter.

For more information go to your nearest computer store and ask about the Dataproducts P Series color printer, or call Dataproducts, 1-800-258-1386.

and a data terminal is connected to the modem via an RS-232C/CCITT V.24 interface.

Once a dialed connection is made, an on-line button is pushed to initiate transmission.

Typical applications of the SFM-948 include electronic blackboards, teleconferencing, field-service communications, help lines for data or word processing systems and business and personal computer networks, according to the vendor.

Five front-panel LED indicators monitor the operation of the unit for system diagnostics, the vendor said. The price is $570.

Coherent Communications Systems, 60 Commerce Drive, Hauppauge, N.Y. 11788.

KINEX CORP.
2400/FDX

Kinex Corp. has announced the 2400/FDX modem intended for full duplex synchronous and asynchronous data transmission at rates of 1,200 and 2,400 bit/sec over two-wire switched or leased lines.

Standard features of the modem include automatic answer/disconnect, automatic rate recognition, transmission status and line signal quality indicators plus internal and remote-controlled digital loopback testing. The price is $1,695.

Kinex, 6950 Bryan Dairy Road, Largo, Fla. 33543.

LOCAL-AREA NETWORKS

ABLE COMPUTER
Easyway/ET

Able Computer has announced Easyway/ET, an Ethernet network controller for Digital Equipment Corp. Unibus PDP-11 and VAX computer systems.

Compatible with IEEE 802.3/Ethernet networks and TCP/IP protocols, the latest product in the Able Computer Easyway line consists of two modules: a Host Protocol Processor (HPP) and a Communications Adapter Board (CAB).

The two modules combined make one complete controller. The HPP module contains the Unibus interface, data line interface and TCP/IP protocols. The CAB provides the data link and physical layer protocol to the 802.3/Ethernet network. It mounts on the HPP as a plug-in module.

Easyway/ET software device drivers are provided for the DEC VMS and RSX operating systems. Supporting layers one through four on the network architecture, Easyway/ET off-loads the host CPU.

The price of Easyway/ET is $7,200. The product will be available for shipment in mid-summer.

Able Computer, 1732 Reynolds Ave., Irvine, Calif. 92714.

CONCORD DATA SYSTEMS, INC.
Token/Net

Concord Data Systems, Inc. has announced its Token/Net local-area network, which the company said is the industry's first local network to meet the IEEE 802.4 token-passing standard approved last September.

The product uses the token-passing access method and a broadband, CATV-type physical medium.

The price is $500 to $850 per port, depending on configuration. A four-port box costs $3,485; a 10-port box costs $5,500.

Concord Data Systems, 303 Bear Hill Road, Waltham, Mass. 02154.

AUXILIARY EQUIPMENT

XYPLEX, INC.
Optical-fiber link for Xyplex

Xyplex, Inc. has announced the addition of optical-fiber transmission capabilities to the Xyplex system, which allow the user to link various coaxial cable segments together with optical-fiber cable.

Coaxial systems in buildings within a 1 km area can be connected using the optical cable. The physical configuration of the link is a point-to-point cable with a coaxial-to-fiber interface unit at each end. Multiple interface units can reside on any coaxial cable segment, according to a company spokesman.

The price is $3,200.

Xyplex, 100 Domino Drive, Concord, Mass. 01742.

AVANT-GARDE COMPUTING, INC.
Net/Guard

Avant-Garde Computing, Inc. announced recently the Net/Guard system to monitor and control access by personal computers to central networks, data bases and computers.

The product reportedly connects any dial-up device to the network, regardless of protocol, and controls access to data bases and applications through use of multilevel passwords. The system monitors, measures and analyzes current and historical status, performance and utilization of dial-up devices attached to the network.

Net/Guard provides three types of alerts to network operators: security, equipment failure and time-threshold alerts. Consisting of front-end processor interfaces, system control unit, user interfaces, modems, analog patch panel, color monitor, printer, disk storage and tape backup, prices for the system begin at $200,000, according to the company.

Avant-Garde Computing, 2091 Springdale Road, Cherry Hill, N.J. 08003.

Timeplex protocol converters debut

Timeplex, Inc. has announced Tru/Blu, a line of protocol converters that offer networking ability to personal computers, multiple hosts and mixed computer types.

The series, comprised of four protocol converters, reportedly performs conversions between synchronous Ebcdic and asynchronous Ascii data characters, between different speeds and between coaxial cable and RS-232 interfaces. They also perform switching functions that permit one terminal or printer to work with two or more host computers of different kinds, according to the vendor.

The four protocol converters and their features include:

■ Tru/Blu 74 — which emulates an IBM 3274 terminal cluster controller, has 10 RS-232 ports supporting up to nine Ascii terminals (each with one individually addressable printer) and up to two synchronous lines connecting to one or two IBM 3705 front-end processors. Prices start at $3,900.

■ Tru/Blu 78 — which allows a personal computer or asynchronous terminal to switch between full screen emulation of an IBM 3278 terminal, via a coaxial cable, and a minicomputer or modem. The device costs $1,695.

■ Tru/Blu 87 — adapts an Ascii printer (RS-232 serial or Centronics Data Computer Corp. parallel) to the coaxial cable of the 3274 cluster controller and emulates the IBM 3287 and 3289 printers. The price is $1,975.

■ Tru/Blu 80 — emulates IBM 2780, 2780, 2770 and 3741 (bisynchronous) protocols using an asynchronous terminal and an Ascii printer. It supports remote job entry or batch terminal functions and, in reverse, allows an asynchronous minicomputer to emulate an IBM host to drive peripherals such as a laser printer. The device costs $1,595.

Timeplex is located at 400 Chestnut Ridge Road, Woodcliff Lake, N.J. 07675.

TALK SENSE TO THE IBM PC.

Introducing PC/204, a link that lets PC users turn mainframe data into spreadsheets effortlessly.

PC/204, the newest productivity tool from Computer Corporation of America, is a powerful, efficient, easy-to-use software link between IBM personal computers and mainframes. It effectively answers the pressing problem of how to let corporate managers take full advantage of today's personal computers for making decisions, while also giving them access to the corporate database in a format they can use.

First, PC/204 guides PC users as they browse through the MODEL 204 database. Then it extracts the data they need and converts it into meaningful management information for spreadsheet analysis. Lotus 1-2-3 for example. And PC/204 does all that automatically. Without the PC user having to understand anything about mainframe technology.

If you aren't already using Lotus 1-2-3, we can supply it along with PC/204. Or you can use any current IBM PC business package.

While PC/204 is helping business managers, it's also helping MIS directors.

PC/204 uses the power and intelligence of the personal computer for increasing the overall efficiency of an application.

For one thing, it improves performance of the mainframe by offloading some of the processing to the PC, while reducing PC users' response time. It also makes communication between the PC and the mainframe more efficient.

What about security and control? PC/204 provides individual management views of the corporate database while still allowing PC users access to all the information they need.

PC/204 is the latest reason to get MODEL 204 DBMS which has been so highly rated for performance and programmer productivity.

For more information or to arrange for a demonstration of PC/204's capabilities, simply return the coupon or write to us on your letterhead.

NEWSWEEK from page 88

Newsweek's News Editor Stuart Seidel said the message switch will get "the right messages to the right people in the *Newsweek* organization much faster than we can do it now, with fewer errors and far less [frenzy]."

Editor-in-Chief Richard Smith, meanwhile, said the system's increased speed "means we can include more late-breaking news in each issue."

The message switch also opens the way for *Newsweek* to create a totally paperless communications path over which reports could travel from the outside bureaus to the editors in New York to the magazine's photocomposition equipment, according to Monterola.

But, he added, such sophistication is still about a year away and requires that the magazine buy at least 50% more Atex terminals and conduct further training.

"We'll never operate totally paperless," Monterola said. The Perma-Net message switch from Progressive Systems, Inc. is linked, via a Perma-Net communications line controller, to a fault-tolerant Tandem Computer, Inc. Nonstop II system, which stores the messages prior to transmission. It was the inclusion of the Tandem that was the big factor in *Newsweek*'s choice of the Perma-Net message switch, Monterola said.

Additional factors, he said, were that the vendor was local and that it was doing an installation of the same equipment at another New York magazine while under consideration for *Newsweek*'s contract.

ELITE from page 83

sures that the most urgent data is passed on first.

End-to-end error control is activated during all transmission over the virtual path, and it can be switched off, on a port-to-port basis, where it might interfere with error-control methods external to the network, the vendor claimed.

Prices for an eight-port unit start at $4,500, with deliveries 30 days after receipt of order.

Doric Networks, 18581 Teller Ave., Irvine, Calif. 92715.

AT&T from page 83

tion Systems has not convinced him that the System 85 architecture is here to stay. He is reserving his judgment until the System 75 can be evaluated.

He should get his chance soon.

If that announcement date pans out, AT&T Information Systems might be able to deliver a few of the systems by year end, which may correspond with deliveries of some System 85s.

So-called "due dates" on the System 85 have been long since that switch was first introduced. Today, stated delivery on a new order for a System 85 Release 1 is 30 to 35 weeks, an AT&T spokesman said. Customers ordering Release 2 of that switch are being quoted delivery dates of Jan. 1, 1985.

The spokesman attributed the delays to market demand for the product. Due dates are expected to shorten as AT&T Technology gears up production, the results of which are expected to become evident by the third quarter of this year.

SYSTEMS & PERIPHERALS

Four-Phase launches 32-bit office info line

By Jeffry Beeler
CW West Coast Bureau

CUPERTINO, Calif. — Four-Phase Systems, Inc. has expanded its business focus with the introduction of a 32-bit office information computer line that reportedly combines an industry-standard microprocessor with the Unix System V operating system.

Like the existing Four-Phase product family it complements, the 6000 series is said to be targeted at the company's traditional user base — the clerical sector of the office automation field.

But unlike its sister systems, the 6000 family is also optimized for additional office personnel, including managers and secretaries, according to Four-Phase Senior Vice-President Edgar Vance.

So, with the advent of its 6000 systems line, the vendor in effect has broadened the scope of its office automation activities, Vance said.

The 6000 series announcement also coincides with a reorganization and enlargement of Four-Phase's service and support operation, which recently relocated from Silicon Valley to Dallas and acquired an additional 400 employees, he added.

Built around a 32-bit Motorola, Inc. 68010 microprocessor, the 6000 series will be sold primarily to end-user organizations. It consists of two models — the 6300 and 6600. The 6300 supports one to eight concurrent users, in contrast to the 6600, which accommodates as many as 16 terminals per application processor, according to a company source.

At present, the 6600 supports just one application processor, for a maximum capacity of 16 simultaneous users. In the future, however, Four-Phase intends to upgrade the system to accommodate up to eight such processors, Vance

See 6000 page 115

Nixdorf adds high-end unit to 8870 systems

WALTHAM, Mass. — Nixdorf Computer Corp. has announced a high-end addition to its 8870 general business systems.

Called the 8870 Model 65, the unit was designed for business applications similar to those performed by the firm's smaller 8870 processors, the 8870 Model 35 and Model 55.

The Model 65 features 512K bytes of internal memory, a hardware arithmetic unit and a 264M-byte Winchester disk drive. Disk storage can be expanded in the field to 396M bytes by adding a 132M-byte fixed disk unit, the vendor said.

Main memory can be expanded to 1M byte by adding memory expansion boards available in 256K- and 512K-byte capacities.

The Model 65 utilizes Version 5.0 of Nixdorf's Niros operating system. Niros 5.0 has a maximum file size of 66M bytes on the 8870 series, according to the company. The operating system also is said to feature a system logbook that records significant activities, such as performance statistics of the hardware and software.

The Model 65 display workstation is a microprocessor-controlled video display, which, with Niros 5.0, acts as a multiplexer for up to three slave devices, including up to two printers, that can be controlled without connection to the CPU, according to the company.

The workstation features a terminal with a 2,000-char. amber display, a low-profile keyboard and two degrees of display intensity control. The keyboard includes a standard typewriter keyboard, a 10-key adding machine keyboard and 15 programmable function keys.

The Model 65 reportedly is available with Nixdorf's Com-

Will IBM's 4300 take over as top DDP CPU?

By Tom Henkel
CW Staff

MEDFORD, N.Y. — IBM's recently announced 4361 and 4381 processors have taken over as the premier distributed data processing (DDP) systems offered by the firm.

That is the opinion of a market research firm here, which stated the 4361 and 4381 hardware, coupled with software enhancements such as a cross-system program generator, makes the latest 4300 series processors ideal for DDP.

While other industry analysts are convinced IBM's 8100 line is still the top DDP system (see related article), Applied Management Services Corp. (AMS) said IBM has made an about-face in its 4300 systems strategy.

"Prior to [the 4361 and 4381] announcement [CW, Sept. 26], IBM had stressed mainframe processing, while portraying DDP as inefficient, uncontrollable and costly. It is apparent that IBM sees DDP as being the most important component of its future growth," the report noted.

What makes the 4361 and 4381 more efficient distributed processors?

First, the report said, technological improvements offered by the two new processors boost internal performance and offer users a more attractive price/performance ratio. For example, the older low-end 4331 processors offer internal performance of about .3 million instruction/sec (Mips). The 4361 offers internal performance of about 1 Mips. Likewise, the 4381 offers about 3 Mips compared to 1.8 Mips in the older 4341 processors.

The performance improvements were made possible by an air-cooled, very large-scale integration, bipolar chip. For example, the report said, the chips used in the 4361 are four times more powerful than those used in the earlier 4331. Further, high-speed buffers and parallel data paths also serve to boost performance.

Two operating system enhancements also make the 4361 and 4381 more attractive in a DDP environment. IBM made a statement of intent to support its Systems Network Architecture on the 4300's VM operating system. This move, the report said, is aimed at supporting interactive

See IBM page 115

Added features seen keeping 8100 in DDP, local net market

SHOP TALK
William Ackerman

Controversy and confusion have surrounded the IBM 8100 distributed processor since it was first delivered in 1979. To make things worse, until 1982, much of the 8100 software, particularly the DPPX operating system, was plagued with stability and performance problems. These two factors helped earn the 8100 a negative reputation, which persists today. In fact, articles about the 8100 in the U.S. and European trade press have often included predictions from industry analysts of the 8100's impending demise.

With 8100 sales figures far below projections and with considerable opposition within IBM from 4300 groups, IBM was considering discontinuation of the 8100 project in the early months of 1982. Since it had just consolidated its development efforts in the small systems area, IBM formed a task force to evaluate the possibility of reducing the burden of supporting so many small systems (Series/1, System/34, 36 and 38, 5280, 5520, 4300 and 8100).

IBM finally decided not only to keep the 8100 project alive, but also to commit additional funds to help make the 8100 a successful product. Reports indicate that IBM budgeted $100 million per year and a development staff of 600 to 700 individuals (most located in the Kingston, N.Y., area) to develop products for the 8100 line.

IBM's decision to continue funding the 8100 project was influenced by several factors:

- IBM had invested $300 million to develop the 8100.
- A significant number of IBM's largest customers had installed 8100 systems.
- Almost all of DPPX's technical problems had been eliminated.
- Orders for the 8100 systems had suddenly increased.

As would be expected with a development effort of this size, many new 8100 hardware and software products have been announced recently. These include 8130-BXX, 8150-AXX, 8150-BXX, 8102, DPCX/DOSF Release 4, DPPX/SP Release 2, Personal Computer loop adapter and so forth.

IBM's main marketing thrust for the 8100 continues to emphasize its strengths as a host-managed distributed data processing system. However, recent announcements indicate a new role for the 8100 — that of a local-area network controller for intelligent workstations

See 8100 page 112

Four-Phase is helping more than 2,000 DP managers win the productivity game.

Now it's your turn.

It's easy to win the distributed information processing game when you play it with the Series 4000 from Four-Phase. The Series 4000 is an integrated, growth-oriented system designed to communicate within your IBM environment. No other vendor gives you so many functions for so many years at such affordable prices. In the distributed processing arena, that's the way to score points with both end-users and top management.

You win the DDP games with software.

Four-Phase provides one of the most impressive and complete collections of software ever offered from one company. Our packages make integrating Four-Phase computers remarkably easy. And guarantee a logical growth path for years to come. Here's just a sample of what we provide:

Interactive processing: VISION®—For creating custom applications from order entry to transaction processing. It provides a high level of functionality that can be used in any distributed environment. And VISION is easier and faster to program than COBOL.

Word processing: FOREWORD®—Our powerful shared-logic word processing system allows text to be entered, stored, edited, distributed and printed.

Graphics—For business graphics, the Graphics Management System (GMS/IV) gives you an easy way to condense and conceptually present data that's easily understood by decision makers.

COBOL—Industry standard COBOL is used to write programs for handling keyboard-entered data and general batch processing.

When they want PC's, we've got them.

If your end-users are like most these days, they're clamoring for their own personal computers. We play that game, too. Because at the flick of a switch, our multifunction terminals suddenly become stand-alone PC's. So now you can give your users the distributed processing capabilities they need, AND the personal computers they want. All in one integrated system.

The action starts with the Multifunction Executive.

The key to the Series 4000 game plan is the Four-Phase Multifunction Executive (MFE). This unique and powerful control program monitors each multifunction terminal in your system. Its ability to run multiple software programs allows your users to perform 16 different tasks from any terminal on the system. And each of your users can access all of our software packages with one keystroke. You get maximum distributed processing capability and control.

Plus, MFE dynamically allocates selected peripherals so that each device can be used by more than one program. The result—MFE eliminates the need for multiple processors, duplicate terminals and other peripheral devices at installations that require concurrent execution of software.

[illegible]

Four-Phase was the first company to introduce the integrated approach to multifunction distributed processing. Today, there are more than 15,000 installed Series 4000 systems, helping people like you manage the information needs of over 150,000 end-users. And every machine is backed by our Customer Support Operation and over 1,000 field service people to provide continuing support and reliability at every level.

Four-Phase customers have been winning the DDP game for years. You can, too. To find out how, call us today at 1-800-529-6050, ext. 1599. In Arizona, call 1-800-352-0458, ext. 1599. For a free poster of this illustration, write to us at 10700 North De Anza Blvd., M/S 52-6A9, Dept. P., Cupertino, CA 95014.

SYSTEMS & PERIPHERALS

DG to offer array processors with Eclipse MV superminis

WESTBORO, Mass. — Data General Corp. has announced that it is marketing International Imaging Systems array processors and software with its Eclipse MV superminicomputers.

Under the marketing agreement, the Model 75 Image Processor and System 575 Image Processing Software are available on the Eclipse MV line.

The Model 75 is a general-purpose image array processor designed to implement a variety of image processing algorithms, according to the vendor.

The System 575 application software is said to include capabilities for satellite data analysis, medical image reconstruction, geologic and environmental mapping and nondestructive testing.

Model 75 is priced at approximately $50,000 and the System 575 at about $12,000, depending upon application requirements.

Additional information is available from DG's Technical Products Division, which is located at 4400 Computer Drive, Westboro, Mass. 01580.

PICK UP WHERE IBM LEAVES OFF.

Portable or desktop, you're way ahead when you pick up CORONA PC™ Because we give you everything you've ever wanted in an IBM[1]-compatible PC and more. For a great deal less.

COMPATIBLE AND MORE.

Our systems run all software that conforms to IBM PC programming standards. And the most popular software does.

We deliver twice the memory, with room for eight times as much.

We deliver a fast-access 320K floppy drive, a communication port and an improved IBM PC keyboard with indicator lights.

Our systems include high-resolution monitors (12" desktop, 9" portable) for crisper, cleaner displays, and both have built-in high-resolution graphics (640 x 325).

You get a complete system, ready to go to work.

MORE VERSATILITY.

With all the necessary features built into the main unit, the four expansion slots can be used for your special needs. For example, color or our optional 10MB hard disk.

MORE SPEED.

Our RAM-disk software gives you temporary disk-type storage that works many times faster than disks.

PLUS SOFTWARE.

Our systems come with the operating system: MS-DOS.[2] A programming language: GW BASIC.[2] A training course: PC Tutor.[3] A professional word processor: MultiMate.[4] Plus DOS utilities and demonstration programs. Or you can get the p-System[5] from N.C.I. and write or run portable Pascal packages.

ALL FOR A GREAT DEAL LESS.

Even with all the extra features and performance, our systems still cost significantly less than the equivalent IBM PC.

Drop by your nearest CORONA PC dealer for a very convincing demonstration. Or contact us at 31324 Via Colinas, Westlake Village, CA 91361. (213) 991-1144 or (800) 621-6746 toll-free. Telex 658212 WSLK, in Europe 76066 CDS NL.

Laser printer out for office

WINDSOR, Conn. — Royal Business Machines, Inc. has announced an electronic laser printer said to produce up to 20 letter-size or legal-size pages per minute for office or data processing uses.

The 2800, designed for operation in an office environment, prints 23 fonts and character sizes ranging from eight to 24 points, according to the vendor. Maximum on-line font memory is eight character sets in operator-changeable cartridges, with 126 characters per set.

The printer reportedly accepts 500 sheets of 16- to 24-lb standard bond paper, as well as letterhead, colored papers and address labels. An optional 1,500-sheet cassette is available.

The 2800 is targeted toward users who want to decentralise mainframe computer printing operations by placing units directly in offices, rather than in a printer room or data processing center.

The printer provides graphics flexibility with a choice of type styles, type sizes, reverses and line spacing for creation of charts, graphs, customized business forms and logotypes, the vendor said.

It features a 240- by 240-dot matrix that gives 57,600 dot/in. The printer uses Ascii character codes and has built-in interfaces, including Centronics Data Computer Corp. and Qume Corp. Sprint 3 parallel interfaces and EIA RS-232C asynchronous and standard IBM bisynchronous 2770, 2780, 3770 and 3780.

Scheduled for delivery in the first week of July, the 2800 costs $19,500. It also is available on a rental basis.

Information is available from Royal Business Machines, located at 800 Day Hill Road, Windsor, Conn. 06095.

Capable COBOL.

For over twenty years, COBOL has proved it can handle the most awesome data handling requirements of the business world.

And Microsoft® COBOL brings this power to the MS™-DOS environment in an even more flexible version. It's the ideal choice for transporting and adapting the thousands of mainframe and minicomputer programs now on the market.

Microsoft COBOL was designed after the ANSI COBOL standard. Its quality and performance has been fully certified by the GSA.

Microsoft COBOL includes a complete set of file handling facilities including support for sequential, line sequential, relative and B+ tree indexed sequential (ISAM) files.

MICROSOFT.
The High Performance Software

The advanced screen handling features and compatible with Data General,® make it easy to create forms and menus for interactive user programs. Direct cursor positioning, highlighting, automatic format conversion, projected fields, and automatic field skip are just some of the capabilities.

An interactive source code debugging tool allows you to step through your program in symbolic form. There is no need to wade through object code and addresses in memory to see what is going on. It's a complete development package.

Applications developed with the compiler can be distributed without a runtime support charge.

Like all Microsoft languages, the standard linking interface makes it easy to combine assembly language subroutines.

Call 800-426-9400 to order the capable COBOL. $700.*

In Washington State, call 206-828-8088. Ask for operator F4, who will rush you your order, send you more information, or give you the name of your nearest dealer to see Microsoft COBOL in action.

*Price exclusive of handling and Washington State sales tax

Micro-to-mainframe:

Before you settle for a simplistic solution, ask a few serious questions.

Choosing a micro-to-mainframe communications system is no game.

So before you toy around with "easy" solutions, ask some serious questions.

Will this product support full IBM Terminal Emulation?

Make sure the system can emulate remote batch and interactive IBM terminal systems.

Does the company offer a variety of products?

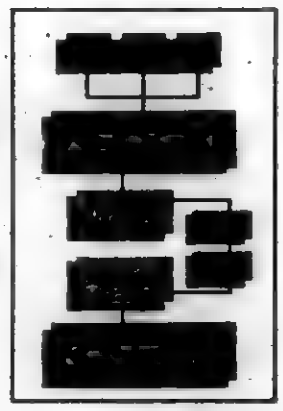
You should have your choice of stand-alone front-end processors, IBM PC or XT boards, or an OEM board. All ready to run on the most popular operating systems.

Can I get fast answers to my questions?

Insist on toll-free access to qualified service personnel before and *after* the sale.

What if I need a quick analysis of a problem?

Ask if the manufacturer has a Communications Test Center for product testing over public phone lines. And find out if the system has internal diagnostics.



Suppose something goes wrong with the unit?

The company should offer a 30 day money-back guarantee and a 12 month warranty that includes a free replacement unit.

What about future product development?

Make sure the products you're going to need soon will be available soon.

Who am I dealing with anyway?

How long have they been in business? The longer, the better.

How much is all this going to cost?

Here's a point of reference: Our own DataTalker product line will give you all the capabilities and services just described for as little as $695. Complete. If you'd like to know more, contact our Marketing Support Group at 1-800-321-7785.

SYSTEMS & PERIPHERALS

TERMINALS

MYSTIC VALLEY ENGINEERING, INC.
Annunciator Terminal

Mystic Valley Engineering, Inc. has announced a graphics terminal designed to allow industrial users to draw characters up to three inches high using a single Ascii code.

The Annunciator Terminal can be used on a stand-alone basis or, if major plotting is desired, with Mystic Valley's Ugraph format development software on the Digital Equipment Corp. PDP-11 minicomputer under DEC's RT-11 operating system. It uses a standard RS-232 channel, the vendor said.

The terminal is said to construct messages in a combination of eight colors, with letters up to three inches high and a blinking feature. It reportedly stores up to 96 full screen formats in permanent memory.

According to the company, Ugraph allows formats to be designed using a stored library of standard objects, as well as special, user-defined library objects. The terminal format is said to be nonvolatile and capable of being modified on-line.

A message terminal-level configuration is priced at $4,395, a low-resolution graphics system at $4,700 and a high-resolution graphics system at $6,200. Ugraph is priced at $2,995 for object code.

Mystic Valley Engineering, Suite 3600, 400 W. Cummings Park, Woburn, Mass. 01801.

I-O MARKETING
I-O 1191

I-O Marketing has announced a twin-axial, plug-compatible display station designed as an alternative to the IBM 5251/11 and 5291 workstations with the IBM System/34, 36 and 38 processors.

The I-O 1191 reportedly features an IBM 5251/11 character set, autoscreen dimming, high-resolution screen with interlaced refresh and screen dump to the RS-232C serial printer port. It is said to come with built-in help screens and diagnostics. Its 14-in. nonglare screen is designed to tilt 28 degrees and swivel 360 degrees.

A printer port option permits interface with any RS-232 asynchronous Ascii serial interface printer. The port reportedly can be configured to emulate an IBM 5224, 5225 or 5256 printer.

The display station is priced at $1,595, and the printer port at $395, the vendor said.

I-O Marketing, 3647 W. 1987 S., Salt Lake City, Utah 84104.

AMPEX CORP.
Ampex D175 DP; D175 PR

Ampex Corp. has announced special emulations for Datapoint Corp. and Prime Computer, Inc. video display terminals.

The Ampex D175 DP terminal reportedly performs most of the functions of the Datapoint Model 3601 and 8200 Rev 1 terminals, while making available to the user additional features that are standard in the Ampex D175.

The Ampex D175 PR is said to provide an alternative to the Prime Model PST100 terminal. Both systems are available from Ampex distributors, who also offer a software installer that automatically changes terminal tables in the Prime operating system.

The Ampex D175 DP and D175 PR each cost $995.

Ampex, 401 Broadway, Redwood City, Calif. 94063.

TELETYPE CORP.
Model 5410

Teletype Corp. has introduced the Model 5410 asynchronous terminal, a telecommunications terminal with an optional modem/dialer.

According to the vendor, the modem/dialer operates at either 300 or 1,200 bit/sec and is compatible with the Bell 212A modem. It provides intelligent functionality through autodial and automatic logon features. Users can preset three autodial keys, each of which can access its own CPU or time-sharing service.

It features an 80- or 132-col. display screen, with display in either white, green or amber. The entire screen can be put into reverse video mode, and a screen saver feature blanks out the screen if no keys are depressed within

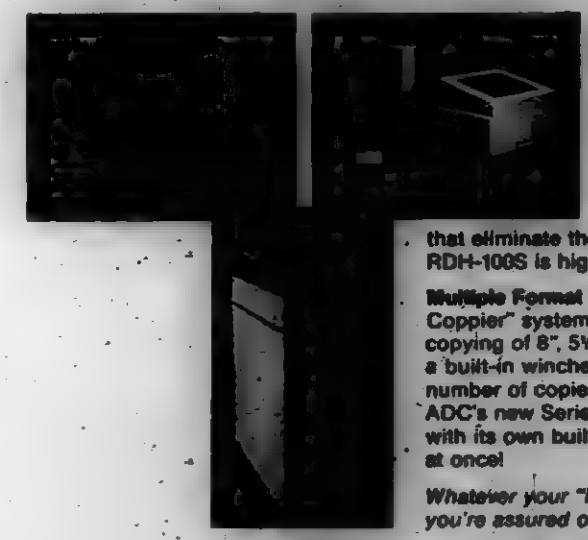
RDH-100S ADC's standard-setting disk handling peripheral that allows any computer to mass-produce diskette copies!



Now PC-to-minicomputer users can easily make either multiple 8" or 5¼" "floppie coppies"—and convert the RDH-100S from one to another in under 4 minutes!

Single-Format Software Developers, System Integrators and Large Distributed System Users: Your computer can get the added capability of "Floppie Coppier™" with the simple RS232 interface of ADC's high-performance Robotic Disk Handler—Model 100S. Automatically loading and unloading up to 100 diskettes without operator intervention, the RDH-100S uses patented gentle fingers that eliminate the disk destruction risk of other, not-so-sophisticated handlers. The RDH-100S is highly reliable, too—over 4000 hours MTBF and only 0.5 hours MTTR!

Multiple Format Users: ADC offers you both low-volume and high-volume "Floppie Coppier" systems to choose from—the IC-455 controls simultaneous dual sided copying of 8", 5¼" and 3½" diskettes. ADC's IC-475 loads all your floppy data into a built-in winchester which can then direct the RDH-100S to produce the desired number of copies for each successive floppy. And for high-volume production, ADC's new Series 4000 can control up to 16 simultaneous diskette handlers—each with its own built-in RDH—and you can copy both sides of double-sided diskettes at once!

Whatever your "Floppie Coppier" needs, ADC has the system to suit you—and you're assured of high-speed efficient duplication with the Robotic Disk Handler!

APPLIED DATA COMMUNICATIONS

an hour's time.

The terminal sells for $915, the vendor said.

Teletype, 5555 Touhy Ave., Skokie, Ill. 60077.

LIBERTY ELECTRONICS CO.
Freedom 110

Liberty Electronics Co. has announced a low-end, smart video display terminal, the Freedom 110.

The Freedom 110 features tilt-and-swivel styling; a detached, 94-key, European DIN-standard keyboard with numeric key pad; and a non-glare, green-phosphor display.

Standard features include a 24-row by 80-col. display with user-accessible 25th status line, 10 programmable, nonvolatile function keys and flexible full-page or status-line setup modes.

The Freedom 110 sells for $595, with quantity discounts available.

Liberty Electronics, 625 Third St., San Francisco, Calif. 94107.

FALCO DATA PRODUCTS, INC.
Fame-2 enhancements

Falco Data Products, Inc. has announced an enhanced version of its Fame-2 CRT terminal.

The terminal is said to include as standard features a 14-in. green-phosphor screen and 132 col. of data. Those features had previously been options. Options now include an amber screen.

The terminal continues to feature 20 user-programmable function keys, and it has room in nonvolatile memory for up to 1,000 char. It also features transparent print mode, split screen, underline, reverse video, blinking and blanking.

The enhanced terminal is scheduled for April shipment.

It is priced at $795.

Falco Data Products, 1250 Lawrence Station Road, Sunnyvale, Calif. 94089.

COMPUTER DESIGN & APPLICATIONS, INC.
Deltapro

Computer Design & Applications, Inc. (CDA) has announced a tabletop workstation for processing and viewing image data in medical, scientific and engineering applications.

Deltapro is said to provide retrieval, manipulation and evaluation of image data in the fields of nuclear magnetic resonance, ultrasound, planetary geology, commercial printing, earth satellite resources and geophysical exploration.

It was designed to be attached to Maxdelta, CDA's imaging system, which uses a Digital Equipment Corp. VAX-11 superminicomputer.

Deltapro is said to use a CDA MSP-3000 array processor with the VAX-11 and a color raster display system.

According to the company, the array processor's architecture allows it to perform specialized matrix-oriented arithmetic operations. It is said to transfer image data only once over the DEC Unibus, which gives Deltapro processing access to data from the centralized data base.

The 2M-byte, local-display refresh memory is expandable to 8M bytes to store, process and display images of frame sizes from 32^2 to 512^2.

The terminal is said to display images, curves, text and overlay information in 4,096 colors and 256 gray levels on a 13-in. monitor with a display resolution of 512 by 480 pixels.

Deltapro uses CDA's imaging command language Medici.

Now available, Deltapro is priced at $47,000 for the 2M-byte version and $75,000 for the 8M-byte version.

CDA, 411 Waverly Oaks Road, Waltham, Mass. 02154.

MASSCOMP
Workstation 500 addition

Masscomp has announced the addition of a dual-terminal, single-processor workstation to its Workstation 500 family of Unix-based products.

The dual system includes two independently functioning color or monochrome raster displays running on a single 32-bit CPU. According to the company, each display has a dedicated microprocessor that generates its own graphics images while freeing the CPU to run computer-aided design, engineering, scientific and technical applications programs.

It is said to enhance applications such as solids modeling, very large-scale integration design, simulation and numerical analysis.

The company claims that the dual-display configuration reduces the per-display price by up to 40% in comparison to the single-user Workstation 500.

The Workstation 500 products are said to be compatible with the company's MC-500, a 32-bit, Unix-based superminicomputer.

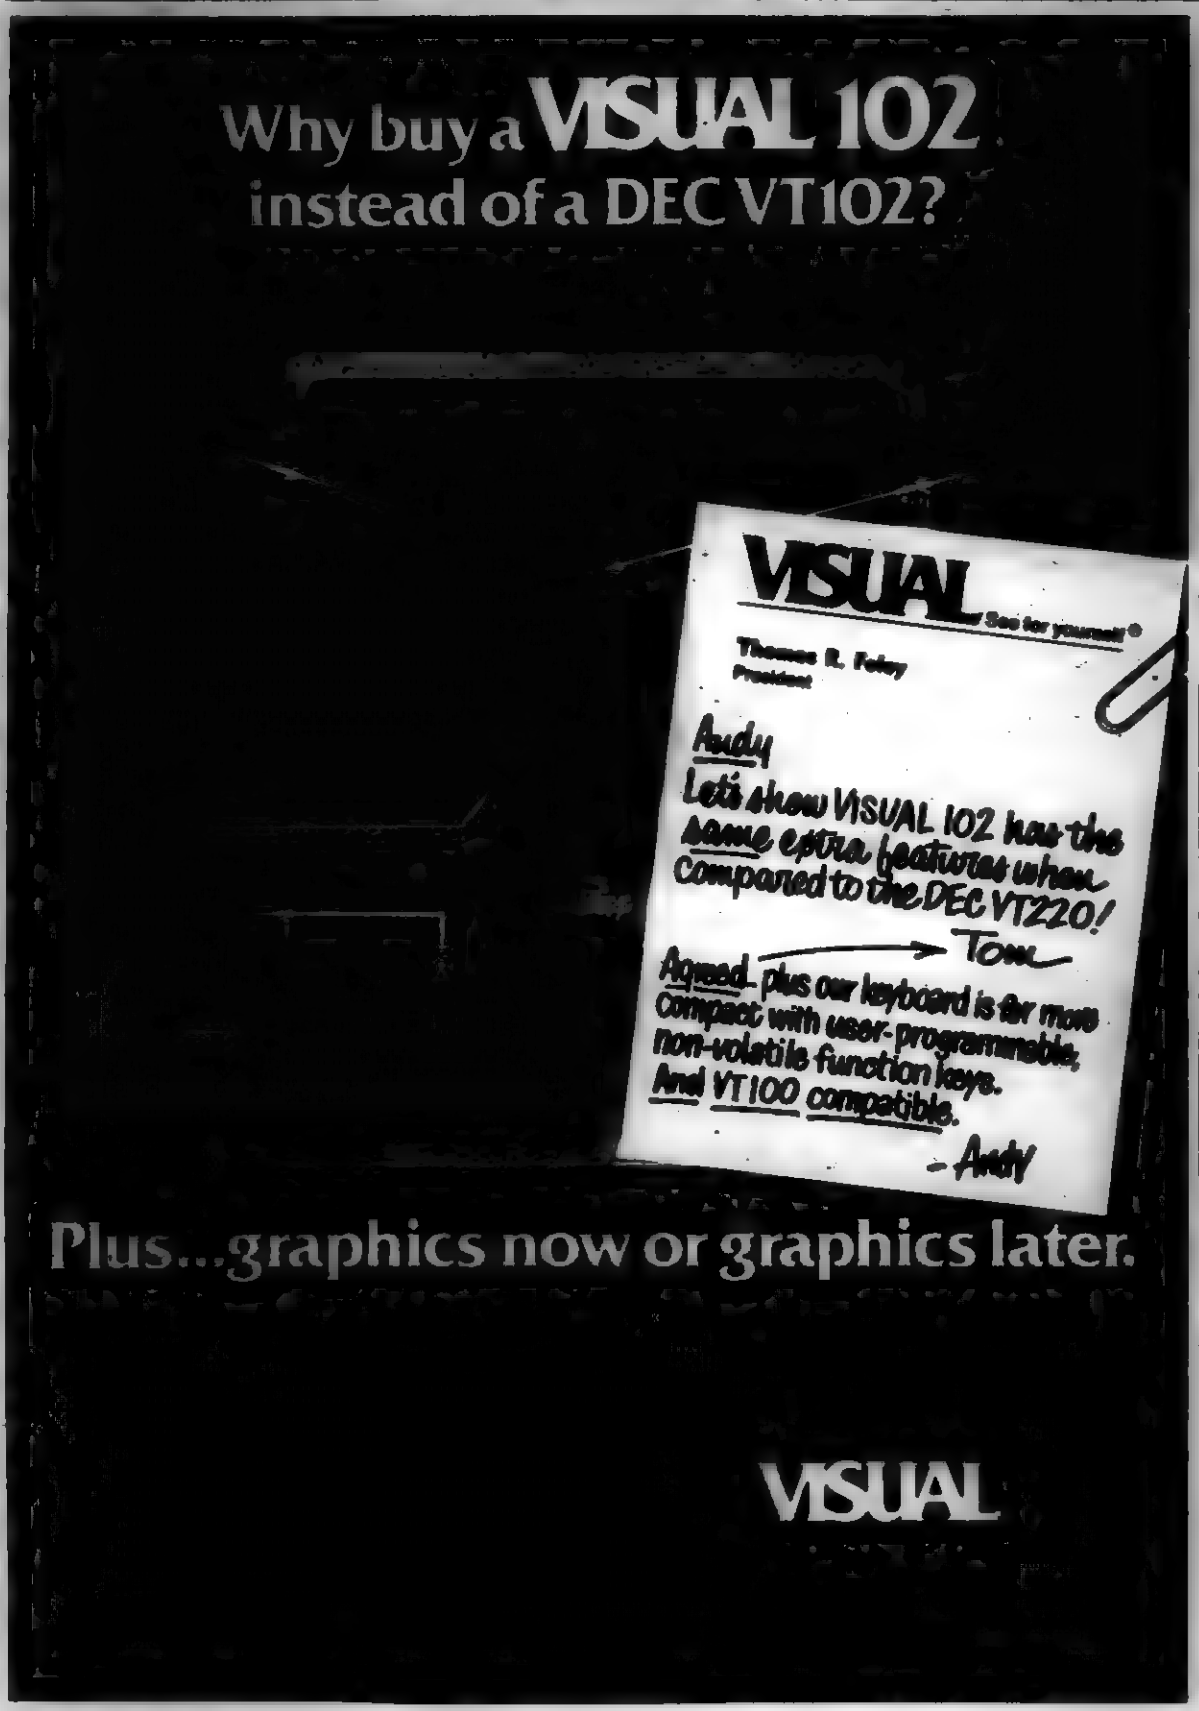
The dual-user workstation supports two Masscomp 19-in. raster graphics displays in monochrome or color. Each display has a dedicated graphics processor with a 128K-byte program store and can be located up to 150 feet from the host.

The system uses Masscomp's RTU, a real-time, virtual memory Unix operating system.

A typical dual-user Workstation 500 system with CPU, 1M byte of error-correcting memory, the Unix operating system with C and Fortran compilers and a dual, 19-in., 1,024-by 1,024-pixel monochrome graphics display costs $11,370 per workstation display in quantities of 100. A similar system with twin 19-in., 832-by 600-pixel color displays costs $15,270 per display in quantities of 100.

Masscomp, One Technology Park, Westford, Mass. 01886.

See TERMINALS, page 109



SYSTEMS & PERIPHERALS

TERMINAL from page 108

SYNTREX, INC.
Places

Syntrex, Inc. has announced an office workstation designed to allow concurrent tasking using multiple windows.

Called Places, the unit is said to allow the user to communicate with a mainframe through one window while editing or doing document merge or other tasks in another window. The workstation can communicate with the IBM 370 and 4300, Hewlett-Packard Co. and Digital Equipment Corp. mainframes.

Places consists of a screen and keyboard with the Intel Corp. 186 processor and 384K-byte internal memory. The standard storage module is a 10M-byte mini-Winchester.

It is priced at $7,500 with a removable keyboard and $9,190 with an electronic typewriter. Delivery is scheduled for April.

Syntrex, 246 Industrial Way W., Eatontown, N.J. 07724.

GRAPHICS SYSTEMS

RAMTEK CORP.
9460; 9465 display systems

Ramtek Corp. has introduced medium-resolution versions of its 9460 and 9465 graphics and imaging display system.

According to the vendor, the products are for users who want high-performance graphics processing, but don't require high resolution — specifically, for markets where an image background is displayed with a graphics overlay.

The 9460 and 9465 medium- and high-resolution systems are compatible with each other, as well as with Ramtek's earlier 9400 and 9450 display systems, the company said.

The 9460 and 9465 are configured with either the Motorola, Inc. MC68000- or Zilog, Inc. Z80-based controllers. The MC68000 models include 240K bytes of random-access memory (RAM), while the Z80 systems have 12K bytes of user RAM,

Just got the word from Gary. Increased our share by 6%. If trend holds, we'll pass competition by third quarter!

Smartcom II communications software, currently available for IBM PC, DEC Rainbow 100, Xerox 820-II and Kaypro II.

Smartmodem 1200 for all computers with an RS-232C interface; Smartmodem 1200B plug-in board for the IBM PC.

Microcomputer communications? Get control of the situation with Hayes.

Microcomputer communications can present the DP/MIS staff with a tangle of mis-matched hardware, user-hostile software, and a situation that can quickly get out of hand.

Hayes can help you avert that chaos, with a telecomputing system designed expressly for microcomputers.

A system so advanced, it's downright simple. Economical. And requires no handholding from you.

Hayes. The computer's telephone. Our Smartmodem 300™ and Smartmodem 1200™ connect to any desktop computer with an RS-232C port. They operate with rotary dial, Touch-Tone® and key-set telephone systems. At full or half duplex. And both feature self-test capabilities, as well as indicator lights and built-in speakers for monitoring calls.

The lower-priced Smartmodem 300 is ideal for local data swaps and communicates at 300 bps. A built-in speed selector on Smartmodem 1200 automatically detects transmission speeds (110, 300 or 1200 bps).

Smartmodem 1200B™ is also available as a plug-in board for IBM® Personal Computers. And Hayes manufactures the Micromodem IIe® for Apple® II, III, IIe and Apple Plus computers, as well. It comes packaged with Smartcom I™ communications software.

Speaking of software, more programs are written for Hayes modems than for any other. And that impressive list includes our own incomparable communications software.

Smartcom II™ Complete, menu-driven software for the IBM PC, DEC Rainbow 100,™ Xerox 820-II™ and Kaypro II.™ Even first-time communicators will find success with Smartcom II. Screen prompts guide users in the simple steps it takes to create, send, receive, list, edit, name and re-name files.

Tasks like simultaneously receiving, printing and storing data—completely unattended—are easily managed with Smartcom II, because it takes full advantage of Smartmodem's capabilities.

The program reduces lengthy dial-up and log-on sequences to a single keystroke. It stores communications parameters for 25 remote systems.

Plus, there's an on-line help feature that explains prompts, messages and parameters.

Our reputation speaks for itself. Hayes has five years of solid leadership in the microcomputer industry. Nationwide availability through retail computer stores. Trouble-free factory service and call-in assistance. A limited two-year warranty on all hardware. And the most efficient telecomputing system available. Anywhere.

If you're involved in linking micros or setting standards for configurations, remember this. Everything your people need to know about communications can be summed up in one word: Hayes.

Smartmodem Specifications
Low-Speed Data Formats (Smartmodem 1200 and Smartmodem 300): Serial, binary, asynchronous; 7 or 8 data bits; 1 or 2 stop bits; odd, even or no parity (0-300 bps).
High-Speed Data Format (Smartmodem 1200): Serial, binary, asynchronous; 7 data bits; 1 or 2 stop bits; odd, even, or fixed parity or 8 data bits; 1 or 2 stop bits; no parity (1200 bps).
Dialing Capability: Touch-Tone® and rotary dial pulse dialing. Command buffer 40 characters.
Commands (unnecessary with Smartcom II software): A: Intermediate answer. A/: Repeat last command. C: Transparency Carrier. D: Dial command, including complete dialing, waiting for second dial tone, auto-dialing and other functions. E: Local echo. F: Full/half duplex. H: Switch hook. M: Audio monitor. O: On-Line. P: Pulse dialing. Q: Quiet mode. R: Reverse originate/answer mode. S: If "Set" command; speed, change code character, number of rings to answer on, etc. S?: Check operational parameters shown. T: Touch-Tone dialing. V: Verbal result codes.
Result Codes (can be suppressed): Hook; 40DE: Command line; nCommand: Carrier detected; 2Ring: Phone is ringing; 3No Carrier: Carrier lost or never heard; 4Error: Error in command line; 5Connect 1200: Carrier detected at 1200 bps (Smartmodem 1200 only).
Audio Monitor: Two-inch speaker with volume control.
Rear Panel: On-off switch, power jack, RS-232C connector, modular phone jack connectors, volume control.
Operation: Full or half duplex.
Data Rates: 0-300 bps and 1200 bps for Smartmodem 1200; 0-300 bps for Smartmodem 300.
Interface: RS-232C.
Intelligence: Z80™ microprocessor with 4K bytes control program for Smartmodem 1200; Z0 microprocessor with 2K bytes control program for Smartmodem 300.
Modem Capability: Bell System 103 or 212A compatible originate or answer mode for Smartmodem 1200; Bell System 103 compatible originate or answer mode for Smartmodem 300; Smarte Signaling; —Online for Smartmodem 1200; —Online for Smartmodem 300.
Transmit Levels: —6dBm.
Registration: FCC registered for direct connect to the nationwide phone system. Connects with modular jacks (RJ11C, RJ12C, RJ13C, RJ14C, RJ25C).
Power Supply: U.L. listed 117VAC, 60Hz, 15.5VAC output.
Size: 1.5" x 5.5" x 9.0"

SYSTEMS & PERIPHERALS

optionally expandable to 256K bytes.

Configuration options include 1,280- by 1,024-pixel or 640- by 512-pixel resolution.

Prices for the 9465 start at $10,450 for medium resolution and at $11,250 for high resolution. For the 9460, prices start at $19,300 (medium) and $20,100 (high).

Ramtek, 2211 Lawson Lane, Santa Clara, Calif. 95050.

RASTER TECHNOLOGIES, INC.
Model One/80 enhancement

Raster Technologies, Inc. has announced an enhancement that is designed to allow its Model One/80 graphics system to switch from 60-Hz noninterlaced refresh rates to 30-Hz interlaced refresh rates.

The Model One/80 was designed for mechanical and electric computer-aided design, simulation, modeling and geophysical applications.

The enhancement allows designers and other users to perform prototype development work on a less expensive 30-Hz interlaced monitor, while actual production units can use the high-performance 60-Hz noninterlaced refresh rates, the vendor said.

According to a spokesman for the vendor, the feature will allow the use of 30-Hz color hard-copy devices in a system with a 60-Hz. noninterlaced monitor.

The enhanced version of the Model One/80 system is scheduled for delivery this month.

The enhancements will not affect the price, which starts at $20,000, the spokesman said.

Raster Technologies, 9 Executive Park Drive, North Billerica, Mass. 01862.

DATA TRANSLATION, INC.
DT6700 modules

Data Translation, Inc. has announced five plug-in input modules as part of its DT6700 family of solid-state, isolated signal conditioning products.

The modules are said to provide input protection, isolation, amplification and filtering of sensor signals while producing analog outputs compatible with most industrial process instrumentation, including 12-bit data acquisition systems.

The recently announced products are the Model DT6703 isolated resistance temperature detector (RTD) analog input module, designed to accommodate a two- or three-wire 100-ohm RTD device; the Model DT6704 isolated bridge completion analog input module, designed to accommodate a two- or three-wire resistive transducer; the Model DT6711 isolated analog signal conditioning input module; the Model DT6712 isolated analog signal conditioning input module; and the DT6718 1-kHz isolated tachometer frequency-to-voltage input module.

Prices are $250 each for the DT6703, DT6704 and DT6718; $235 for the DT6711; and $240 for the DT6712.

Data Translation, 100 Locke Drive, Marlboro, Mass. 01752.

BOARD-LEVEL DEVICES

EVENTIDE, INC.
WKBP-16 board

Eventide, Inc. has announced a 1M-byte memory board with 256K-bit chips for the Hewlett-Packard Co. Series 200 desktop computers.

The WKBP-16 board is designed to provide four times the memory density of previously available boards, according to Eventide.

The board is intended for use with the HP 9816, 9826 and 9836 computers, providing extra memory without expansion interfaces.

The board is available, priced at $4,200. Quantity discounts are available.

Eventide, One Alsan Way, Little Ferry, N.J. 07643.

AVIV CORP.
Aviv Models 505A and 505B

Aviv Corp. has announced two tape controllers for Intel Corp. Multibus-compatible computers.

The Aviv Model TFC 505A and 505B are ½-in. tape controllers for start/stop drives

"The office automation I bought for everyone in the corporation doesn't incorporate everyone."

Exxon stops the shock...with fully integrated office automation for everyone in the corporation.

Introducing the Exxon Business Support System.

An office automation system that can't support everyone in your corporation can lead to some very shocking experiences.

The right power to the right people

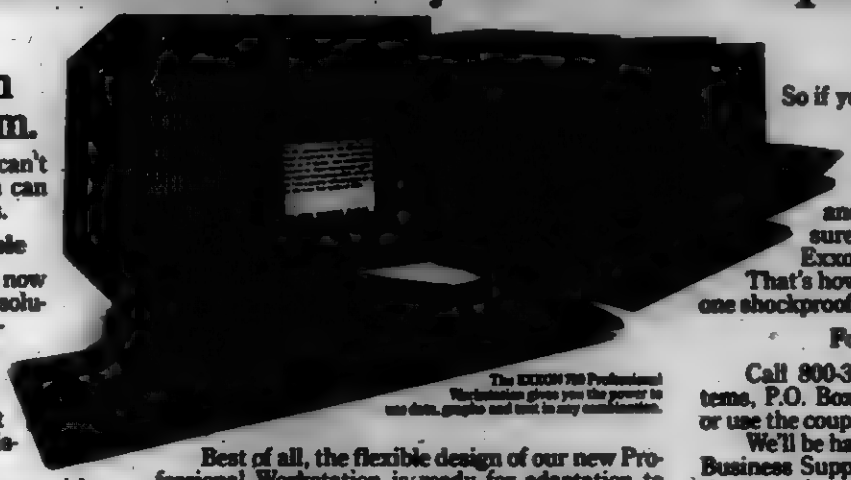
That's why Exxon Office Systems now offers more practical office automation solutions that help everyone in the corporation to be more productive. With the Business Support System, Exxon extends its fully integrated line of office automation products to support managers, professionals, and administrators, as well as secretarial staff.

Exxon puts it together for everyone with a fully integrated system — with full communications flexibility that lets you access outside data bases and interact with most mainframe computers. Without the complications. Without the shock.

Office automation for those who shape the corporation

The Exxon Business Support System features the new EXXON 750 Professional Workstation, specifically designed with powerful, integrated software that lets you move instantly from text to graphics to data processing — without changing programs.

You can divide the high resolution bit-map display into several windows and work in a number of functions simultaneously. You can shift information from one window to another. You can preview the page layout, and produce an integrated text/graphics document on our quiet EXXON 965 Ink Jet Printer. Or on a color plotter.



The EXXON 750 Professional Workstation gives you the power to use data, graphics and text in any combination.

Best of all, the flexible design of our new Professional Workstation is ready for adaptation to the most popular operating systems and network interfaces.

Tying everyone together

At the core of the Business Support System is the EXXON 8400 Series controller. With its UNIX*-based operating system, it can integrate all levels of workstations to share information and programs. Everyone can keep track of schedules and meetings with time management and calendaring functions, whether their workstation is an EXXON 500 Series Information Processor or a new EXXON 750 Professional Workstation. And everyone can send and receive messages easily with transparent electronic mail.

An expandable, shockproof family

Exxon protects your office automation investment by making every workstation — from the EXXON 500 Series to the new EXXON 750 Professional Workstation — fully expandable and upgradeable.

So if you've already begun an Exxon system, the latest Exxon advances are completely compatible with our current product line.

And with our worldwide sales and service organization, you can be sure that when you need assistance, Exxon will be there.

That's how Exxon incorporates everyone—in one shockproof family.

For more information

Call 800-327-6666, write Exxon Office Systems, P.O. Box 10184, Stamford, CT 06904-2184, or use the coupon below.

We'll be happy to demonstrate how the Exxon Business Support System can help your corporation move into the future ... without the shock.

with group-coded recording of 6,250 bit/in. The TFC 505A was designed to operate with the Storage Technology Corp. 125 in./sec Model 1965/35 drive and the TFC 505B to operate with the STC 50 in./sec Model 3930 drive.

Both controllers reportedly are built on a single board and comply to the IEEE-796 Multibus standard.

The controllers are said to be compatible with the Aviv multiport system, a feature designed to allow up to six central processors to share tape drives.

Available 30 days after receipt of order, the controllers are priced starting at $2,950, according to the vendor.

Aviv, 36 Cummings Park, Woburn, Mass. 01801.

AUXILIARY EQUIPMENT

INTERNATIONAL INFORMATION MANAGEMENT CONGRESS

Record Management Technology

The International Information Management Congress (IMC) has announced a training program designed to instruct employees in storing and retrieving manual files and computer memory.

The program, Record Management Technology, includes 297 color slides and a 52-page book, the vendor said.

Topics include records storage and retrieval, reprographics, micrographics and records management trends.

The training program costs $350.

IMC, Publication Sales, P.O. Box 24404, Bethesda, Md. 20817.

TEXAS INSTRUMENTS, INC.

Nubus

Texas Instruments, Inc. has announced that it is licensing its 32-bit Nubus technology to commercial and noncommercial users.

Designed at MIT, Nubus is a 10-MHz synchronous bus that reportedly provides a 37.5M byte/sec bandwidth and a processor-independent, memory-mapped architecture.

Nubus licenses to commercial users for a one-time $2,000 fee. Noncommercial licenses are available for $200.

Texas Instruments, Data Systems Group, 17881 Cartwright Road, Irvine, Calif. 92714.

SIX IBMs ALL IN ONE CIE

It's like getting five IBM terminals free.

In a CIE-7800, you get plug compatibility with the IBM 3178 and all five models of the 3278 series. Yet, a multi-model CIE-7800 costs less than any single one of those IBM terminals.

Both smaller and bigger at the same time

What meets the desktop is a far more compact terminal, too. The CIE-7800 is 40% smaller than any IBM.

But, through the ingenuity of CIE/ACM design, what meets the eye is a screen over one-third larger than IBM's.

The CIE monitor also rotates and has an upward tilt of from 0 to 20 degrees for adjustable viewing. And it weighs less than 20 pounds, so it's easily moved. It's user-friendly to the *nth* degree.

22 keyboards

The detached, low profile keyboard has an 87-key IBM compatible layout. And it can be user-configured into any of nearly two dozen U.S. and international keyboards, all of which give you a continuous adjustment angle of from six to 11 degrees.

Alternate DEC® and HP 2622 personalities

The CIE-7800 is available with *concurrent* alternate personalities. With a single command, you can switch to DEC VT100,® or HP 2622, or IBM 3101-3104, or IBM 3275/3276-2 (bisynch single station), while still retaining IBM 3178/3278 compatibility. No other terminal is as versatile. Not one.

New CIE-7850 "add-in" intelligence

The new CIE-7850 is more than just an add-on. It's an add-in. As shown below on our screen, you simply plug the 7850 into the Coax-A line between the controller and terminal to give you access to both on-line mainframe processing power and local intelligence.

The CIE-7850 conducts concurrent operations in either 3178/3278 or its local intelligence mode, which is *100% IBM PC compatible.*

To learn more, just contact ACM, Inc., Suite 540, 3857 Birch Street, Newport Beach, Ca. 92660. Or call toll free 1-800-854-5959. In California, call 1-800-432-3687.

8100 from page 101

such as IBM Personal Computers. The 8100's local-area network is a twisted-pair Synchronous Data Link Control (SDLC) loop that utilizes a token passing technique similar to the IEEE 802 standard. There are approximately 30,000 8100 local-area nets installed throughout the world.

Among the capabilities that IBM is emphasizing for the 8100 as a local-area network controller are:

■ Connectivity: Most SDLC, bisynchronous and asynchronous devices can be connected to the 8100. Of particular interest is the new interface for attaching the IBM Personal Computer to the 8100's local-area network. Personal Computers attached to the 8100 can access 8100 applications as well as host applications. 8100s can also be peer-connected to other 8100s.

■ Shared disk storage: Intelligent workstations attached to the IBM 8100 can utilize the 8100's disk drive for backup and sharing data. Bidirectional file transfer is supported for IBM Personal Computers and Displaywriters. With the announcement of the IBM 8102 I/O unit, over 1G byte of disk storage is available.

■ Print management: Intelligent workstations attached to an 8100 system can direct workstation data to 8100 printers. The 8100 operating system provides tools for managing multiple printers and print queues. This eliminates the need for each workstation to have its own printer, which reduces the cost of each workstation and allows higher quality and more reliable 8100 printers to be used.

■ Continuous operation: The recently announced 8150-B processor consists of multiple CPUs, data channels and memory banks that allow the 8100 to continue operating (in a degraded mode) in the event of a failure. In addition, the DPPX operating system can automatically maintain multiple copies of a disk volume so that the system can continue to operate if a drive crashes.

■ Programmability: Among the high-level languages supported by the 8100 are: Cobol, PL/I, Fortran and APL. Applications written using IBM's cross-systems product can execute on the 8100 as well as on a host system under CICS, SSX, TSO or CMS. An 8100 data base manager is also available.

■ Processor range: IBM offers 21 different models of 8100 processors, ranging in power from about .2 million instruction/sec (Mips) to over 1.3 Mips and providing support for clusters of a few up to a few hundred workstations.

■ Centralized control: The attachment of any kind of intelligent workstation to any kind of network can be viewed as distributed data processing (DDP). One important factor in the success of a DDP network is central control. The same capabilities that are utilized to manage 8100 networks from a central site can also be used to manage 8100-attached workstations.

■ Systems Network Architecture (SNA) integration: SNA is used in the connection of workstations to the 8100 and in the connection of 8100s to other 8100s and host computers. The 8100 can be viewed as an integration of local-area and wide-area networks into the SNA environment.

IBM clearly intends to exploit

TELEVIDEO MULTI-USER COMPUTERS.
TO EACH HIS OWN.

If you've had your share of sharing a personal computer, TeleVideo® Multi-User Computers mean the end of the line. From two users to 16, and even more, our systems offer the expandability and power to meet your growing needs.

OUR SYSTEMS GROW WITH YOUR BUSINESS.
And with TeleVideo it's easy, inexpensive and controllable. You can add users to the sytems with plug-in simplicity, when and where you need to. Secretaries and bosses can all share the same system without sharing the same computer. And by simply adding to your system as your business grows, your original investment is always protected.

3,000 SOFTWARE PROGRAMS AND MAINFRAME COMMUNICATION.
Our systems support industry standard software, so you'll have access to nearly 3,000 very productive programs. And by emulating IBM® 3270 and 3780 terminals with additional TeleVideo software, you can even communicate with IBM mainframes.

However large or small your business, or department, TeleVideo offers a variety of multi-user computers that offer each user all the conveniences of a personal computer. And all the power of a computer network.

THE LOWEST COST PER USER.
The all-in-one system that's the one for all, the TS 804 is completely integrated into a single desktop enclosure. The system can support up to four users and a wide selection of peripherals. And it's all available for the lowest cost-per-user on the market: under $1500.

TO EACH HIS OWN PROCESSOR.
A powerful desktop micro computer system, the TS 806 offers all the conveniences of the TS 804 and even more throughput. With the ability to provide true multi-user capabilities for up to six stations, any combination of TeleVideo 8 and 16-bit personal computers can be supported by the TS 806.

UP TO 16 USERS AND 16-BITS.
Up to 16 workstations can be used with the TS 816, creating a flexible multi-tasking system. Any combination of 8 and 16-bit personal computers can be supported, with or without local storage.

THE WORLD'S LEADING MANUFACTURER.
TeleVideo is the leader in multi-user computers and the number one independent manufacturer of terminals. And from systems to peripherals to service and support, only TeleVideo offers you the convenience of a single-vendor solution.

For more information, call 800-538-8725 (in California, 800-345-8008).

TeleVideo Multi-User Computers. To each his own.

NIXDORF from page 101

et application software package, which features financial accounting, order processing, inventory control, production control, fixed assets, purchase orders, cost accounting, word processing and a report generator.

Peripherals and software are said to be compatible with other systems in the 8870 family.

The price for a Model 65 with 512K bytes of memory, hardware arithmetic unit, 264M-byte hard disk storage, a 300 line/min printer and four terminals is $92,700, according to the vendor.

It is available for delivery 90 days after order.

More information is available from Nixdorf, which is located at 300 Third Ave., Waltham, Mass. 02154.

8100 from page 112

these strengths to extend the 8100 into the local-area network market. The 8100 may meet its stiffest competition from other IBM products that support the IBM Personal Computer. IBM is expected to continue developing the 8100 as a host for intelligent workstations in SNA networks controlled from a central site.

IBM's efforts to turn the 8100 around may be paying off. It is estimated that IBM has now sold over $1 billion of 8100 hardware and software. Postnatal complications are not unusual — the infancy of the 8100 has been no exception.

Ackerman, a longtime 8100 supporter, is president of DPX, Inc., a Cupertino, Calif., consulting firm specializing in the 8100.

IBM from page 101

computing on the 4300. In addition, IBM announced that its latest top-of-the-line operating system, MVS/XA, will be supported on the 4381.

This, the report said, offers 4300 users functions heretofore only available in the larger 3080 series of processors. In addition, users of the 4361 processor can now directly attach IBM Displaywriters and Personal Computers to their systems, the report noted.

One of the most significant boosts IBM gave the 4361 and 4381 for DDP applications was the availability of cross-system program generators, which enable a programmer to write applications for IBM 8100, 4300 and 3080 series processors simultaneously.

The report noted that IBM's cross-system products make it easier to transfer applications between the 8100's DPPX/SP operating system, MVS/TSO and the VM operating systems. The report speculated that IBM will soon announce a product that will provide a similar capability between the 4300 and the System/36 processor.

Lastly, the report noted that a series of migration aids allowing users of the smaller System/34 processors to switch applications to 4300 processors using the SSX/VXE operating system may be further indication of IBM's intent to develop the 4300 line into the premiere DDP system.

The report, called "IBM 4361/4381 Processors In-Depth Report," costs $85 from AMS through Box 350, Medford, N.Y. 11763.

6000 from page 101

said.

Both members of the 6000 family are aimed mainly at Fortune 1,000 companies and fall into basically the same performance class as the IBM 8100, System/36 and System/38, according to Four-Phase Senior Vice-President Tony Yates.

The two office automation models are also said to be software-compatible down to the object-code level.

Because they run under a Unix-derived operating system that supports demand-paged virtual memory, the 6000 series systems already boast a large library of prewritten application packages, according to Four-Phase Product Marketing Director Roger Breding.

Buffering the two systems' users from their control program is Four-Phase's proprietary Unix shell known as Uniview, which reportedly permits up to eight screen windows to be displayed simultaneously. Information can be electronically exchanged between any of the eight windows, a company source said.

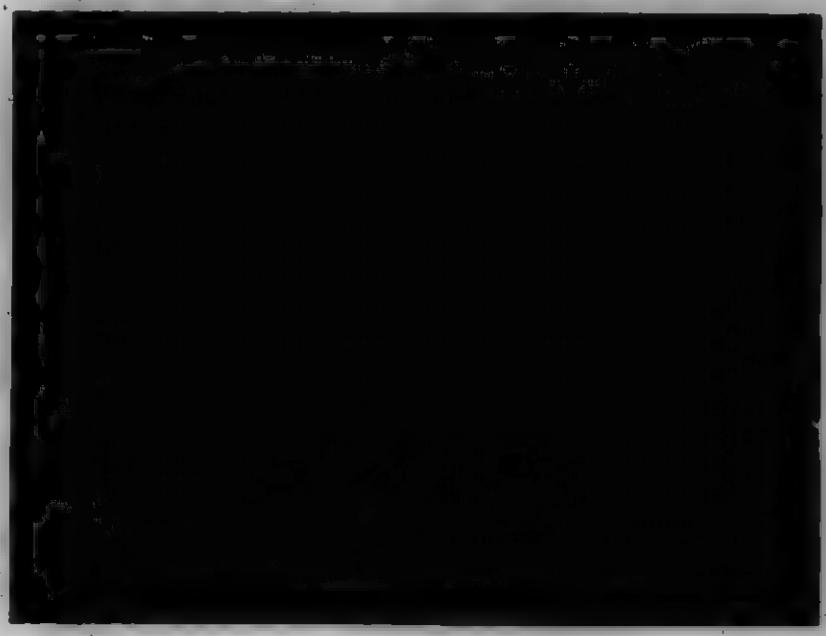
The 6300 and 6600 also support an assortment of programming languages including Cobol, Basic, Pascal, C and Sibol, the latter of which makes the 6000 series machines compatible with applications written under Digital Equipment Corp.'s Dibol.

In addition, the two models reportedly accommodate Oracle Corp.'s Oracle data base management system and various communications protocols like 2780/3780 bisynchronous, 3770 remote job entry and 3270 Systems Network Architecture.

A 6300 system configured with two workstations, a 20M-byte disk module, a 1M-byte main memory and a character printer costs $15,181. A 6600 configuration, with a 1.5M-byte memory, 74M bytes of disk storage and eight workstations sells for $70,650.

Shipments of both systems begin immediately from Four-Phase at 10700 N. De Anza Blvd., Cupertino, Calif. 95014.

"dBASE II helps keep us on our toes."



Robert Hubert
Marketing Director
The Boston Ballet

"The Boston Ballet was a company in search of a computer when I joined the organization earlier this year. And, after discovering that a large computer system was being considered, I urged a smaller, more sensible first step.

"Since almost no one at The Boston Ballet had any previous computer experience, I strongly recommended the purchase of a microcomputer and dBASE II.

"dBASE II, the relational database management system from Ashton-Tate, would give the people in the Company the time and the opportunity to get used to computing before bringing in a larger, more expensive system later on.

"dBASE II is a command-driven, highly flexible system that can be used for a great variety of applications ranging from very simple to highly complex."

A premier performer from Day One.

"dBASE II manages our extensive season subscriber mailings; keeps track of all our advertising insertions, costs and efficiency; and makes project time management a snap. We are now making plans to use dBASE II in handling the special promotions and manpower analyses critical to our day-to-day management.

"dBASE II made an immediate and sizeable impact on the efficiency of our operation."

The real kicker.

"Recently, we hired a custom systems house to develop a long-range computer program for The Boston Ballet. Without prejudice, they came back and said the new system should be based on dBASE II."

dBASE II can provide you with virtuoso performance, regardless of your application.

For more about dBASE II, contact Ashton-Tate today. 10150 West Jefferson Boulevard, Culver City, CA 90230. (800) 437-4329, ext. 217. In Colorado (303) 799-4900. In the U.K. (0908) 568866.

ASHTON-TATE

dBASE II is a registered trademark of Ashton-Tate.
Suggested retail price for dBASE II is $700.

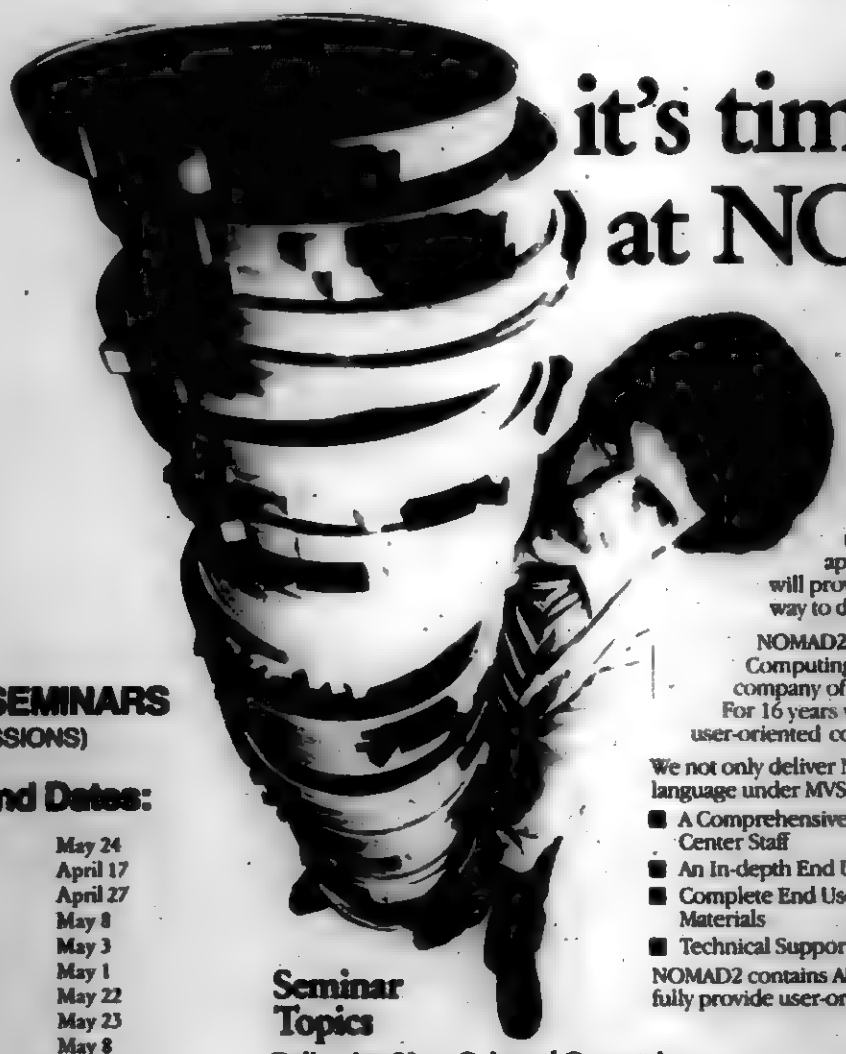
If delivering user-oriented computing is getting you down...



it's time to look at NOMAD2!

Delivering user-oriented computing can be a tricky business. If it's your objective to satisfy the user community in your organization, it's time to speak to the experts. We'll share our experience with you at our FREE NOMAD2 Seminars.

Whether you're interested in an Information Center, Development Center, end-user computing or just quick applications development, our seminars will provide you with a closer look at the best way to deliver user-oriented computing.

NOMAD2 is a unique product created by D&B Computing Services, the information services company of The Dun & Bradstreet Corporation. For 16 years we have been delivering value added user-oriented computing services.

We not only deliver NOMAD2, the premier fourth generation language under MVS and VM, but also provide . . .

- A Comprehensive Training Program for Your Information Center Staff
- An In-depth End User Training Program
- Complete End User Documentation and Training Materials
- Technical Support for Your Information Center Staff

NOMAD2 contains ALL the components you need to successfully provide user-oriented computing services.

MICROCOMPUTERS

SMALL TALK
Eric Bender
CW Senior Editor

AT&T vague on micro plans

Late last month, as AT&T finally unwrapped its first commercial computer offerings — a line of 32-bit systems ranging from a desktop supermicro to a fault-tolerant supermini — the announcements struck many industry analysts as short on technical details.

"It's very typical that AT&T did not release much technical information," noted Brian Boyle of Gnostic Concepts, Inc. in Menlo Park, Calif. Boyle suggested that AT&T's attitude is that "you don't have to worry about details — we're the phone company."

AT&T was vaguest about its new PC interface, a hardware/software combination designed to connect the 3B2/300 supermicro with personal computers. Unlike the other products, the interface was not on display, and its pricing was not released. The interface is not scheduled to ship until the third quarter.

When available, the interface will allow multiple personal computer users to share files on the central 3B2 and to share the 3B2's peripherals, according to AT&T. The personal computers also will be able to function as Unix terminals, the firm said. The PC interface will connect through one of three communications options: an RS-232 port, an Otninet or an Ethernet.

Personal computers represent "an installed base we want to serve," said Jack Scanlon, AT&T's vice-president for computer systems, and the PC interface is "a bridge between Unix and personal computers."

See AT&T page 133

Corona adds hard-disk portable to IBM-compatible micro line

By Paul Kerzenkowski
CW Staff

WESTGATE VILLAGE, Calif. — Hoping to stay one step ahead of IBM, Corona Data Systems, Inc. has added Corona PPCXT, a hard disk portable personal computer, to its line of IBM Personal Computer-compatible microcomputers.

"The PPCXT addresses user requirements for greater disk storage and offers a host of standard features and expansion capabilities that make it a cost-effective alternative to the IBM Personal Computer, Personal Computer XT and other IBM compatibles," said Lawrence Lotito, vice-president of marketing and strategic planning at Corona.

PPCXT features a 10M-byte hard disk, an Intel Corp. 8088 microprocessor, 256K bytes of random-access memory expandable to 512K bytes, a 9-in. amber monitor, graphics resolution of 640 pixels by 325 pixels, an RS-232C serial port, a Centronics Data Computer Corp.-compatible parallel port and four expansion slots. The portable costs $4,595 and weighs 33 lb.

Software bundled with the system includes Microsoft, Inc.'s GW Basic, Software Systems, Inc.'s Multimate word processing package and Comprehensive Software Support, Inc.'s PC Tutor, an online study of basic microcomputer functions.

Docutel Olivetti Corp. has acted as an OEM for Corona's desktops and portable floppy disk computers. "Currently, Olivetti has not ordered the hard disk portable," said Ken Morris, Corona's director of corporate communications. "But we expect them to order it soon."

Docutel Olivetti has not ordered PPCXT because the company has not seen it. "We use Corona's hard disk desktop, but we haven't seen the hard disk portable yet," said George Christiansson, product manag-

DSS 'Optionware' boasts ease of use

By Paul Kerzenkowski
CW Staff

HARTFORD, Conn. — Ian Boyd, president of DSS Development Corp., identified ease of use as the chief reason why many managers do not use microcomputers.

"The industry hasn't grasped that nothing is easy to use if it takes several hours or days to create something useful," Boyd said. "Maybe the industry should adopt a new standard — easy to make useful. The user does not want to buy a HeathKit to build a radio. He wants the radio."

DSS' first product, Optionware, a series of 52 added functions for Lotus Development Corp.'s Lotus 1-2-3, is limited to five commands: enter, review, display, print and graph, Boyd said.

Optionware uses a standard menu and procedure for all modules, which include balance sheet history, regional sales performance, department budgets, sales call reports, fixed asset history and monthly calendar.

"There are some instances where we save a user 320 keystrokes," Boyd said. "The average number of keystrokes each module saves a user is 140."

Users can switch from any Optionware function into Lotus 1-2-3. "A user does not sacrifice any Lotus capability," Boyd said.

"National accounts will be a major market for us," he said. "We are working with two major insurance companies in the Hartford area and tailoring the product for

POS system helps Remington shave delays in stock turnover

BRIDGEPORT, Conn. — With a blizzard of some 200,000 sales tickets pouring in annually from 29 regional sales centers, Remington Products, Inc., the electric shaver maker, was snowed under with paperwork. Worse, stock turnover was slowed because of the delay in inventory tracking.

But that was all before the company turned to a point-of-sale (POS) system that translates handwritten sales tickets into data that can be understood by computers. The system uses Microped, Inc. Micropad data entry terminals, clipboard-size units with a pressure-sensitive writing surface. Clerks in the company's sales centers continue to use paper sales tickets, but the Micropads on which they write the tickets digitize the information and transmit it on a cable connection to their store's Altos Computer Systems, Inc. Model 515 microcomputer, which stores an exact copy of each sales ticket transmitted to it that day.

Those sales tickets are pulled each night, via a modem, by the company's two Altos 8000-10 processors at Remington headquarters here. The headquarters' computers record the sales tickets and return a detailed sales report to each sales center's microcomputer by the time the store's manager opens for business the next morning.

Since conversion to the electronic system, clerks in the regional centers are writing sales tickets that have fewer errors and take less time to complete, according to Remington's data processing manager Jack Welsh.

Welsh said the firm is out from under a load of paperwork that once cost 8 cents per sales ticket to process.

The Microped system still provides both the customer and the store with a paper copy of the sales ticket, but the Bridgeport headquarters no longer needs to have those forms manually keyed into its computer system, a process that Welsh said caused delays of several days in ticket processing and opened the potential for data entry errors.

"This is one [situation] where the cost justification really came through," Welsh said.

Getting to that point, Welsh admitted, took some doing. The company considered 84 different vendors of POS equipment, companies offering everything from key entry to bar-code reader technology. Remington chose the Micropads over key pad and bar-code reader equipment because the Micropads required a good deal less software to be developed in-house before the system could come on-line.

Because the Remington sales centers service as well as sell the company's products, a system that kept the paper sales tickets was useful because "we wanted to give the consumers information on what we had done [for repairs] and to get their name and address," Lee Feist, Remington's president of retail service operations, said.

Once Micropads were chosen, they were installed on an experimental basis in three Remington sales centers. The Micropads were supported at that time by a small Motorola, Inc. computer system that Welsh said could only support two Micropads per store. When the experiment proved successful, the company decided each store would need up to four Micropads and switched to Altos computers because "we just couldn't wait for Motorola's multiuser system to come out," according to Welsh.

The Altos system was also selected because each store's space limitations required that its computer be located in a shaver-repair area, where the equipment would have to withstand the clouds of hair dust produced by shaver cleaning. The Altos computers were recommended by Microped, Inc. as being able to survive in that environment, Welsh said.

Sales clerks fill out sales tickets by placing the form on the Micropad and printing the needed information into each of its boxes, using a ball-point pen or a pencil. Depending on which of the several "start" boxes is

Apple Access 3270 debuts

CUPERTINO, Calif. — Apple Computer, Inc. has introduced data communications software that is said to allow Apple III personal computers to communicate with all mainframes, minicomputers and personal computers that support IBM 3270 communications.

Called Apple Access 3270, the product works with an Apple Cluster Controller or an Appleline coaxial attachment to emulate an IBM 3278 Model 2 terminal, according to the vendor.

Access 3270 provides Apple III users with a variety of data communications capabilities including text file transfer, on-line data entry, inquiry and response, electronic mail and remote data base access, the firm said.

Apple said that program features include support of data transmission rates from 110 to 9,600 bit/sec; customized Help screens; a comprehensive command file that provides autodial, autologon and unattended operation capabilities; 3278 keyboard emulation and communications options; and the ability to filter control characters to or from the host, the vendor said.

The product is available now for $150.

Apple is located at 20525 Mariani Ave., Cupertino, Calif. 95014.

SYSTEMS

JONOS INTERNATIONAL, INC.
Hard disk portable computer

Jonos International, Inc. has announced C2600, a hard disk portable computer.

The portable features a 3½-in. floppy disk drive, a Zilog, Inc. Z80 microprocessor, 128K bytes of random-access memory, a 10M-byte hard disk and Digital Research, Inc.'s CP/M Plus operating system, the vendor said. C2600 is equipped with two RS-232 serial ports, a parallel port, three expansion slots and a 9-in. CRT, according to the vendor.

C2600 costs $5,695.

Jonos International, 1835 Dawns Way, Fullerton, Calif. 92631.

SCIENTIFIC MICRO SYSTEMS, INC.
MDX-11

Scientific Micro Systems, Inc. (SMS) has announced the MDX-11, a Digital Equipment Corp. LSI-11-type microcomputer system. The MDX-11 reportedly features a 40M-byte Winchester disk drive with an average access time of 45 msec.

The system contains a DEC Q-bus backplane, designed to be configured with the LSI-11/23 or LSI-11/73 CPUs and memory and interface modules. The quad-size backplane reportedly can accommodate up to eight dual-height Q-bus cards to provide extra functions such as graphics, communications interfaces and additional memory.

The 35-lb desktop microcomputer includes an 8-in. floppy disk drive for backup and software updating that supports DEC and IBM formats and stores 1.2M byte per disk. The floppy and Winchester drives operate with the SMS FWD0106 disk controller, which operates in either a DEC-RX02-compatible mode or an extended mode that provides additional commands for read/write of the fixed disk and data transfer operations, the vendor said.

The MDX-11 is said to feature compatibility with existing SMS systems and DEC operating systems that include RT-11, RSX-11M and RSX-11M-Plus. According to the company, the S & H Computer, Inc. TSX-Plus operating system makes the MDX-11 particularly useful for small business applications.

Available now, the system is priced at $10,600.

Scientific Micro Systems, 777 E. Middlefield Road, Mountain View, Calif. 94043.

SAGE COMPUTERS, INC.
Unbundled software

Sage Computers, Inc. has lowered the price of its Model II and Model IV multiuser supermicrocomputers by unbundling three programs: Pascal, 68000 assembler language and Timberline Systems, Inc. spreadsheet.

Sage Models II and IV feature 256K bytes of random-access memory (expandable to 512K bytes); Motorola, Inc. 68000 microprocessors; the P-system operating system; Pascal; Word7, Inc.'s word processing software; and Teletalker, Inc. communications software, the vendor said. Sage II is equipped with one or two 640K-byte floppy disk drives. Sage IV has a 12M-byte hard disk and one 640K-byte floppy disk drive.

Prices for the two models range from $3,200 to $7,300.

Sage Computers, 4906 Energy Way, Reno, Nev. 89502.

AMERICAN COMPUTER GROUP, INC.
Quickplan

American Computer Group, Inc. has introduced a system designed for project management using the IBM Personal Computer XT.

Quickplan is a display and report writer that is said to permit a manager to customize specific data on specialized reports. The program's graphics provide the capability to draw network logic charts.

The vendor is offering the software as part of a package built around an IBM Personal Computer

Nearly Nine Million Computer-Involved People Around the World Rely on Our Publications For the News They Need.

We're CW Communications/Inc.; the world's largest publisher of computer-related newspapers and magazines. And wherever you go in the computer world, you'll find computer-involved professionals reading—and relying on—our publications. With highly trained and experienced editorial staffs all over the world, our publications give readers the best and most up-to-date information available in this rapidly changing industry.

Around the world:

We publish, co-publish or provide editorial services to the leading computer publications in the world, including publications in all of the following countries:
Scandinavia—Denmark, Sweden, Norway, Finland
Western Europe—West Germany, United Kingdom, France, Italy, Spain, Greece, the Netherlands.
The Mid-East—Kuwait, Saudi Arabia.
Asia/Africa—People's Republic of China, Korea, Japan, Singapore, Southeast Asia, South Africa, India.
The Southern Pacific—Australia.
Central and South America—Mexico, Brazil, Argentina, Chile.

In the United States:

In the world's largest computer market, we publish a whole series of publications that cover different aspects of the industry. Our largest publication, with more than half-a-million readers every week, is *Computerworld*, a weekly newspaper aimed primarily at larger computer users. Its companion publications include *Computerworld Office Automation*, *Computerworld on Communications* and a series of *Buyer's Guides* covering all major segments of the industry.

In addition, we publish *MICRO MARKETWORLD* for dealers, distributors, retailers and others involved in the microcomputer marketplace. For microcomputer users, we publish *Infoworld*, *Microcomputing*, *PC World*, *MacWorld*, *jr*, *80 Micro*, *inCider*, *Run*, and *Hot CoCo*.

No one in the world publishes more computer information for more people in more countries than we do. And we'd be happy to give you more information on any of our publications. Just send a telex to our U.S. offices, attention CW International Marketing Services, (telex #95-1152) or write us at the address below.

1-2-3 from Lotus. Maybe the best way to look out for number one is to go with number one.

But don't just take our word for it.

Take the word of the experts. *The New York Times* heralded 1-2-3 as "the wave of the future in business software." *Software News* said, "1-2-3 has more capabilities than any other program in its class." And in 1983, 1-2-3 from Lotus was named a "Product of the Year" by both *Fortune* and *Info-World*.

It's the difference between getting by and getting ahead.

What can 1-2-3 do for you? What it's already done for hundreds of thousands of PC users. Give you a proven business software that can dramatically increase productivity for you and everyone in your company.

After all, when it comes to looking out for number one, going with number one is the only way to go.

The best way to find out what 1-2-3 can do for you is to visit your local computer store. Or call 1-800-343-5414 (In Massachusetts call 617-492-7870).

Lotus
The hardest working software in the world.™

1-2-3 [illegible]

And it's been [illegible] almost from day [illegible] February of 1983, 1-2-3 [illegible] consistently been at [illegible] the software best sellers [illegible]

And it's the best selling [illegible] software in the world, for [illegible] good reason. It's the very best [illegible] PC software.

The PC software that [illegible] simply does more.

1-2-3 gives you the most powerful productivity software available today. An analytical tool that combines spreadsheet, graphics and information management into one incredibly fast, easy-to-use package.

With 1-2-3, you can analyze, interpret and report information in seconds with just the touch of a key.

And because it's all one program, you not only work faster and smoother, you work smarter.

And so does your PC.

1-2-3 and Lotus are trademarks of Lotus Development Corporation. *Based on Sales&, Software Best Selling Software Lists, issues covering the month of February 1983 and week of April 25, 1983, respectively.

UNIX™. An ideal has been realized.

Some say UNIX is the operating system of the future. We say, why wait till then? Because you can get it right now on a full range of HP computer systems.

Yes. It's running on our MC68000-based machines and our powerful 32-bit systems, so you can pick the right computer for the job.

And since our HP-UX operating system is an enhanced version of the industry-standard UNIX operating system, you can take advantage of the growing array of applications software available. You can also use the extra features of HP-UX, such as graphics and networking.

The UNIX operating system is only one of the high-powered operating systems we offer. And we put our full service organization behind all of them. We're ready to answer questions and to work with both end users and OEMs to find the best solution for any particular application.

There's never been a better time. Let HP help bring your computing ideal to reality. Sound interesting? Call your local HP sales office right now about the UNIX operating system. Or write to Hewlett-Packard, Attn. Pat Welch, Dept. 003194, 19447 Pruneridge Ave., Cupertino, CA 95014. In Europe, contact Henk van Lammeren, Hewlett-Packard, Nederlands B.V., Dept.003194, P.O. Box 529, 1180 AM Amstelveen, The Netherlands.

Productivity. Not promises.

HEWLETT PACKARD

UNIX is a trademark of AT&T Bell Laboratories.

MICROCOMPUTERS

Continued from page 118

XT. The basic package consists of an XT with a monochrome monitor, 512K bytes of memory, a 10M-byte hard disk, an asynchronous adapter, a 128K- to 260K-byte diskette, a graphics printer, IBM DOS 2.0 and Quickplan. Prices start at $7,727. Prices for a color version start at $8,061.

American Computer Group, P.O. Box 68, Kenmore Station, Boston, Mass. 02215.

STEP ENGINEERING
PC7

Step Engineering has announced PC7, a turnkey engineering workstation based on the IBM Personal Computer.

PC7 links the Step-7 firmware integration test system, an engineering firmware and software package, with the IBM Personal Computer. The workstation can define bit-slice designs, assemble programs, format object code and debug micro code.

PC7 is priced from $10,000.

Step Engineering, 757 Pastoria, Sunnyvale, Calif. 94068.

PRINTERS/PLOTTERS/PERIPHERALS

SWINTEC CORP.
Compumate 2100

Swintec Corp. has announced the Compumate 2100, described as a letter-quality daisywheel printer.

Compumate 2100 is said to feature both parallel and serial ports, interchangeable daisywheels, underscoring, bold and shadow printing, superscripts and subscripts. It is a logic-seeking printer with a typical speed of approximately 20 char./sec.

The printer is compatible with a variety of microcomputer systems, the vendor said.

The Compumate 2100 printer is priced at $649.

Swintec, P.O. Box 421, 23 Poplar St., East Rutherford, N.J. 07073.

Martec Associates, Inc.
CP80/1

Martec Associates, Inc. has introduced CP80/1, an 80-col. dot matrix printer.

CP80/1 features friction tractor and adjustable tractor, plus Ascii character, italic and alphanumeric fonts, the vendor said. A software package enables CP80/1 to emulate an IBM 5152002 graphics printer, according to the vendor.

CP80/1's interface is compatible with Apple Computer, Inc., IBM and Radio Shack personal computers.

The printer costs $330.

Martec Associates, PPP Division, 1510 Jarvis Ave., Elk Grove Village, Ill. 60007.

BOARD-LEVEL DEVICES

GVC, INC.
GVC-16

GVC, Inc. has introduced a demand-paged, virtual memory multiprocessor board that uses National Semiconductor Corp.'s 16032 32-bit microprocessor.

GVC-16 features 10-MHz speed, 512K bytes of dual-ported memory with byte parity (expandable to 2M bytes), 32K bytes of erasable programmable read-only memory and compatibility with Intel Corp.'s Multibus, the vendor said.

GVC-16 costs $3,295.

GVC, 222 Third St., Cambridge, Mass. 02142.

AUXILIARY EQUIPMENT

SYNETIX, INC.
PC-Handler

Synetix, Inc. has introduced the PC-Handler, a peripheral said to link up to four IBM Personal Computers in a shared-resources network.

The product enables users to cut costs by sharing a printer, modem, hard disk or other peripheral. It offers two serial ports, four IBM-compatible parallel ports, a clock and calendar, spooling capability and disk emulation, Synetix said.

The product is offered with 64K bytes of memory, expandable to 512K bytes.

The PC-Handler is priced at $795.

Synetix, 10635 N.E. 38th Place, Kirkland, Wash. 98033

BMH CO., INC.
Addtrace 1

BMH Co., Inc. has introduced Addtrace 1, a microprocessor machine language programming and troubleshooting aid.

Addtrace 1 monitors an address bus, enabling the user to trace the path of a program, the vendor said. The product allows observation of pulse duration and timing relationships with up to six control signals for each digit selected over full 64K-byte memory sections.

Addtrace 1 costs $199.50.

BMH, 224 Vassar St., Reno, Nev. 89502.

SOFTWARE

UNIFY CORP.
Unify

Unify Corp. has announced that Unify, its relational data base management system, is available for Apple Computer, Inc.'s Lisa 2.

The program features application development tools, such as Sequel 2,

If you're looking for a UPS system that will fit into small spaces, Exide Electronics has exactly what you need. The Exide Electronics Series 1000 UPS.

The fact is, many "small" UPS systems aren't really that small in size, especially when you consider the power they offer. And even if they could fit into available space they may not blend well with your environment.

Not the Series 1000 UPS. It packs a lot of power (3KVA) into a neat, space saving package. It's designed to fit *and* blend into the workplace. It's also designed to fit into your budget because in addition to its small size we gave it a small price (under $6,000).

Another nice thing about the Series 1000 UPS is its speedy delivery. If you need one right away you won't have to wait a month or even a week. It'll be on its way to you within 24 hours. And the Series 1000 will soon be available in 1.5KVA and 5KVA.

The Exide Electronics Series 1000 UPS. It's what small UPS systems should have been in the first place.

To: Exide Electronics, c/o Richard Weil,
PO Box 58189, Raleigh, NC 27658
☐ Please send us more information on the Series 1000 UPS.

EXIDE ELECTRONICS

P.O. Box 58189, Raleigh, NC 27658; 919/872-3020, TWX 510-928-0598
In Canada, 5200 Dixie Rd., Suite 20, Mississauga, Ontario L4W1E4

Weights listed are approximate and include smallest, standard battery (Slate, 15 min; Topaz, 20 min; Exide Electronics, 5 min) according to published literature of the manufacturer available at time of ad preparation. Battery size and weight may vary depending on system requirements. Illustrations show typical configurations and are scaled based on smallest, standard system configuration and battery dimensions according to published literature of manufacturer available at time of ad preparation. Battery housing of system may vary depending on system requirements.

MICROCOMPUTERS

C and RM Cobol interfaces; form generation capability; a query-by-form feature; and report generation and security features, the vendor said.

Unify requires 256K bytes of random-access memory, a 5M-byte hard disk and a version of Unix that works on the Lisa.

The package costs $1,995.

Unify, 9570 S.W. Barber Road, Portland, Ore. 97219.

ALLOY COMPUTER PRODUCTS, INC.
TIP-Six

Alloy Computer Products, Inc. has enhanced the software that operates its PC Backup tape cartridge backup system. The enhancement, called TIP-Six, will be bundled in with all new models of PC Backup.

According to the vendor, the 16-bit TIP-Six provides automatic subdirectory backup, date and time stamping of files and selective backup based on file names.

PC Backup runs under IBM's PC-DOS and Digital Research, Inc.'s CP/M 86 operating systems. TIP-Six will be available free of charge to TIP-Four-based PC Backup users who purchased their systems this year prior to the introduction of TIP-Six. Users of PC Backup models purchased over the last three to four years will be able to upgrade to TIP-Six at a cost of $50.

Alloy Computer Products, 100 Pennsylvania Ave., Framingham, Mass. 01701.

INTERNATIONAL ELECTRONIC MACHINERY, INC.
Fortran-77 compiler

International Electronic Machinery, Inc. has introduced a Fortran-77 compiler for Hewlett-Packard Co. Series 200 desktop computers.

According to the vendor, the product was developed for the HP 9816, 9826 and 9836 computers.

The compiler is priced at $1,200 in the U.S. and Canada and $1,500 elsewhere.

International Electronic Machinery, P.O. Box 1818, Fort Collins, Colo. 80522.

ASPECT
GL/M

Aspect has announced the Graphics Language for Microcomputers (GL/M) for the IBM Personal Computer.

With GL/M, users can create customized graphics on a variety of daisywheel and dot matrix printers.

GL/M comes in 5¼-in. or 8-in. formats for Digital Research, Inc. CP/M and CP/M 86 and IBM PC-DOS operating systems. Any Diablo Systems, Inc.-compatible daisywheel printer can be used.

GL/M is priced at $195, the vendor said.

Aspect, 167 Worcester St., Wellesley, Mass. 02181.

FUTURE COMPUTING, INC.
Software Perspectives 84

Future Computing, Inc. has announced Software Perspectives 84, a portfolio of reports, newsletters and industry forums focusing on the office personal computer software marketplace.

The portfolio includes five specialized monthly newsletters, including "Softwareviews," "Officeviews," "Homeviews," "Retailviews" and "Technologyviews." Each 16-page issue focuses on a key segment of the personal computer industry, the vendor said.

The package also includes access to Officebase, an inquiry service, and two reports, *Office Personal Computers: A Market Overview* and *Office Personal Computers: Software.*

Software Perspectives 84 is priced at $7,500 till June 1, after which the price increases to $9,000.

Future Computing, 800 Canyon Creek Center, Richardson, Texas. 75080.

SMOKE SIGNAL BROADCASTING, INC.
CCSM

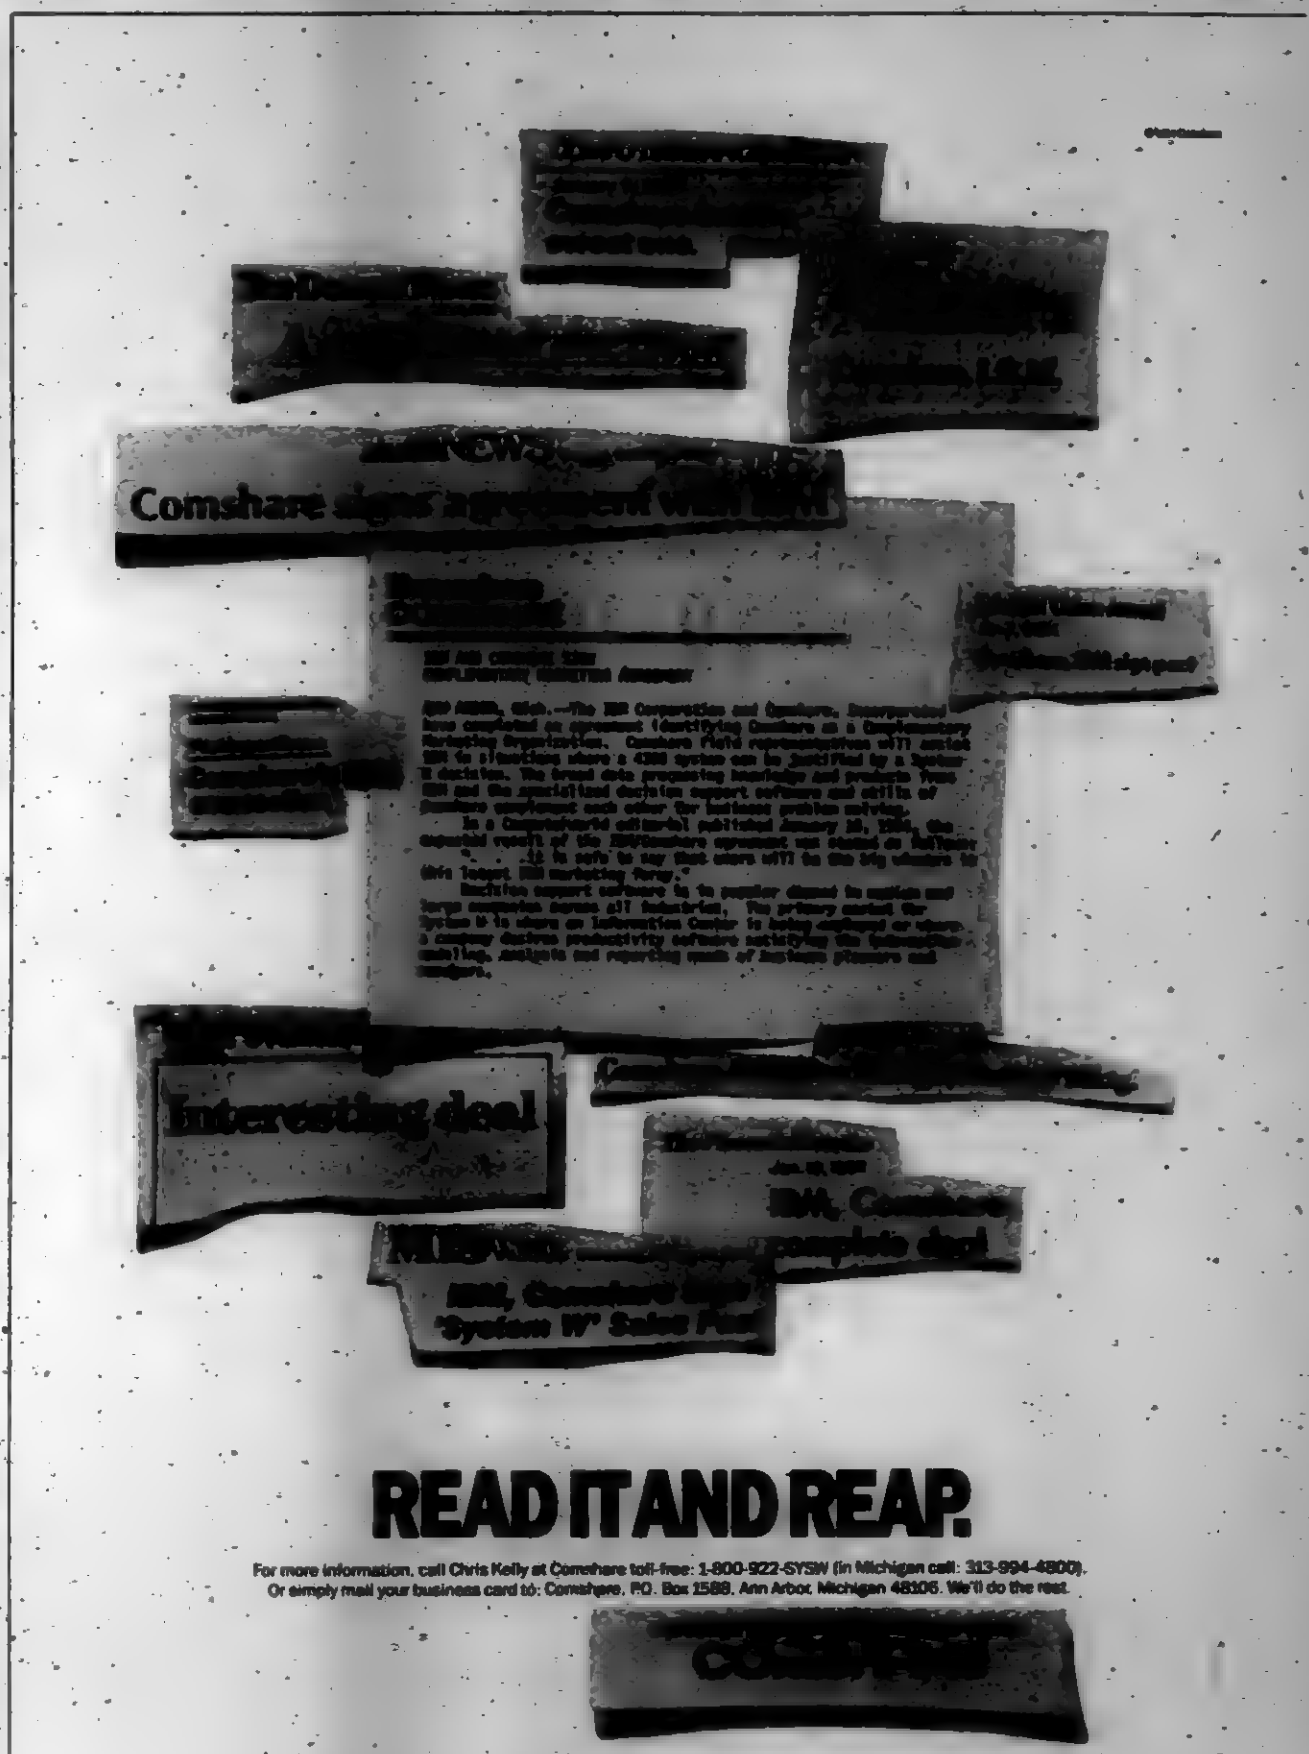
Smoke Signal Broadcasting, Inc. has announced that Comp Consultants Standard Mumps (CCSM) is available for its entire line of high-performance, multiuser, multitasking microcomputers.

The price for CCSM is $800, according to a vendor spokesman.

A complete system from Smoke Signal with one terminal, 16 I/O ports and 40M bytes of disk storage is priced under $13,500, according to the spokesman.

Smoke Signal, 31336 Via Colinas, Westlake Village, Calif. 91362.

See TRENDS page 124



MICROCOMPUTERS

MICRO SOFTWARE ASSOCIATES, INC.
Practicalc II

Micro Software Associates, Inc. has announced Practicalc II, a spreadsheet that runs on Apple Computer, Inc.'s Apple II+ and Apple IIe. Practicalc features word processing capabilities, advanced editing, variable column width and upper- and lowercase entry. The program features alphanumeric search and sorting, prompts for entry during calculation and printing of list formulas.

Practicalc II costs $69.95

Micro Software Associates, The Silk Mill, 44 Oak St., Newton Upper Falls, Mass. 02164.

DA-TECH CORP.
DA-6502B

Da-Tech Corp. has announced DA-6502B, a circuit emulator that facilitates software development for microcomputers using Moss Technology, Inc. 6502 microprocessors.

The system supports applications such as breadboard debugging, software debugging, production testing, training and field service, the vendor said. The emulator can perform read and write diagnostics on any preselected range of user random-access memory (RAM), provide a minimum check sum on user memory space and download diagnostic code from the emulator to user RAM.

DA-6502B costs $595.

Da-Tech, 92 Steamwhistle Drive, Ivyland, Pa. 18974.

WYSE TECHNOLOGY, INC.
Wyseword on WY-300

Wyse Technology, Inc. has announced that its firmware package Wyseword will now run on its WY-300 color display station.

It is said to simplify the keyboard operation of Micropro International Corp.'s Wordstar by reducing multiple keystroke commands, allowing the use of all editing keys.

The WY-300 display station features an 80-col., high-resolution, eight-color display and contains a soft character generator that allows up to 256 custom symbols to be loaded from the host computer. It also includes a predefined set of symbols that are stored permanently in read-only memory, which are loaded into the soft character generator automatically upon power-up, according to the vendor.

The WY-300 and Wyseword are priced at $1,295 and $100, respectively.

Wyse Technology, 3040 N. First St., San Jose, Calif. 95134.

MICRO ARCHITECT, INC.
IOAS-3

Micro Architect, Inc. has introduced an Integrated Office Automation System (IOAS) for the IBM Personal Computer, Personal Computer XT and compatibles.

According to the vendor, the IOAS-3 consists of a data base manager, a word processor and a spreadsheet. The system requires 128K bytes of memory and any version of the IBM PC-DOS. It is available in three versions: IBM Personal Computer XT, PCjr with monitors and PCjr with TV display. Both monochrome and color monitors are supported.

The IOAS-3 is priced at $199. A demonstration diskette is available at a cost of $15 for the Personal Computer XT version and $9 for the IBM PCjr monitor version.

Micro Architect, 6 Great Pine Ave., Burlington, Mass. 01803.

CENTERPOINT COMPUTER APPLICATIONS
Sign-Plot

Centerpoint Computer Applications has introduced a plotter program for the IBM Personal Computer that allows the user to produce six different letter font styles as well as custom fonts and symbols.

Called Sign-Plot, the program includes upper- and lowercase characters, punctuation and numbers in each font style as well as vertical and horizontal positioning of text.

Sign-Plot is designed to drive a variety of pen plotters, including models from Hewlett-Packard Co.; Houston Instruments; Enter Computer, Inc.; Amdek; Strobe, Inc.; Mannesman Tally Corp.; Apple Computer, Inc.; and California Computer Products, Inc. It requires 128K bytes of memory and two disk drives. Sign-Plot is priced at $149.

Centerpoint, 500 N. Michigan Ave., Chicago, Ill. 60611.

DATAPRO RESEARCH CORP.
Software directories

Datapro Research Corp. has introduced three new software directories.

The three directories are for Apple Computer, Inc.'s Apple II, II+, IIe and III; the IBM Personal Computer, Personal Computer XT and compatible systems; and a Digital Research, Inc. CP/M guide to software for more than 130 different microcomputer systems compatible with CP/M.

Each directory is priced at $19.95.

Datapro Research, 1805 Underwood Blvd., Delran, N.J. 08075.

LOGICAL SOFTWARE, INC.
Menulogic

Logical Software, Inc. has introduced Menulogic, a software product that allows users of the IBM Personal Computer to custom-design full screen menus.

According to the vendor, menus can be created using the full Ascii character set, including graphics characters with color, intensity and blinking.

If you sell large systems software — quick — what will all your prospects be doing on June 20, 1984?

They'll be looking through a great new reference guide to software vendors — the *Computerworld Buyer's Guide to Large System Software* being published on June 20. And you'll definitely want to be there.

Look at what the Buyer's Guide gives you:

You get a large audience with heavy purchasing responsibilities — more than 114,000 paid *Computerworld* subscribers in the U.S. These subscribers are concentrated in the large professional computer-using organizations that control 84% of DP/MIS spending in 1983 — $72.2 billion. And research shows these subscribers have a significant degree of purchase decision influence — ask your Buyer's Guide sales representative to show you the *Computerworld* reader profile for details.

Look at what the Buyer's Guide gives buyers:

They get a one-source, comprehensive listing of purchase information about applications, DBMS, and systems and utility software for use with mainstream data processing systems. They get two kinds of listings — vendor listings and product offerings. And, they get a whole range of feature articles and tutorials covering new technology, large system software trends and buying techniques.

Now that you know where software buyers are going to go next June, you can arrange to be there with an ad for your product or service — right when they're researching vendors! Ad deadline is May 4. To reserve space in this issue, call one of the sales offices listed below or call Ed Marecki, National Sales Director or Kevin McPherson, Product Manager.

DATA GENERAL CORP.
DBC to market Friday!, Dbase II

Data General Corp. has announced it will market two Ashton-Tate programs, Friday! and Dbase II, for use on its Desktop Generation computers.

Friday! is an electronic file management system said to provide integrated file capability. Dbase II is a relational data base management system.

Friday! is being offered by Data General for $295, in a Microsoft, Inc. MS-DOS version only. Dbase II is being offered in MS-DOS and Digital Research, Inc. CP/M 86 versions, both priced at $695.

DG, 4400 Computer Drive, Westboro, Mass. 01580.

ARTEMIS SYSTEMS, INC.
Metalogic

Artemis Systems, Inc. has announced Metalogic, a three-dimensional graphics program for users of the Apple Computer, Inc. Apple II+ and Apple IIe microcomputers.

A vendor spokeswoman said Metalogic is a set of ampersand commands that interface Basic programs to Sublogic Corp.'s A2-3D2 interpreter system to produce three-dimensional color graphics. By embedding "&" statements in a regular Basic program, individual objects or complex animated scenes can be generated.

The system requirements are the Sublogic A2-3D2 interpreter, Apple II+ with 16K-byte random-access memory card or Apple IIe and Apple DOS 3.3 operating system.

Metalogic is priced at $75 separately, or $180 for Metalogic plus the complete A2-3D2 graphics package.

Artemis Systems, 41 Parkview Drive, Millburn, N.J. 07041.

COMPUCORP
Level E Omega

Compucorp has announced Level E Omega, the latest version of its Omega office automation software for Compucorp's 600 and 700 series processors, in stand-alone or local-area network configurations.

The vendor said 14 improvements and 11 new features have been included with Level E Omega. The package includes word processing, mathematical calculations, forms creation, data entry, index access and data base management functions.

The enhancements and additions reportedly include an instant page format feature that can restructure an entire document even when only one page is format-changed, the ability to edit independent columns of text with right justification and proportional spacing and a phonetic speller feature that will search for a word after allowing the operator to spell the word phonetically, according to the vendor.

The standard Level E Omega package is priced at $650 for each stand-alone processor, according to a spokesman. Compucorp also charges a software license fee of $595 for each new retail customer.

Compucorp, 3211 Michigan Ave., Santa Monica, Calif. 90404.

SMC SOFTWARE SYSTEMS
Thoroughbred/OS

SMC Software Systems, a division of Science Management Corp., has announced the availability of Thoroughbred/OS on the IBM Personal Computer XT.

The vendor said the new software will allow users of the IBM computer, as well as other computers that support Microsoft, Inc.'s MS-DOS or PC-DOS, to run all business applications programs written in Basic Four Corp.'s Business Basic. The retail price of the software is $795.

SMC Software Systems, 1011 Rt. 22, Bridgewater, N.J. 08807.

SCHUHARDT SOFTWARE SYSTEMS, INC.
Intesoft series

Schuhardt Software Systems, Inc. has introduced the Intesoft series, a system for the IBM Personal Computer that allows office automation software packages to be used as independent modules or as an integrated system, according to the vendor.

The components of the Intesoft series are the Intenate, an integration and application management system, and Inteword, a word processing system. Intevate, an interactive applications generator, will be available by June. Intenate costs $249, Inteword is $295, and Intevate will be $249.

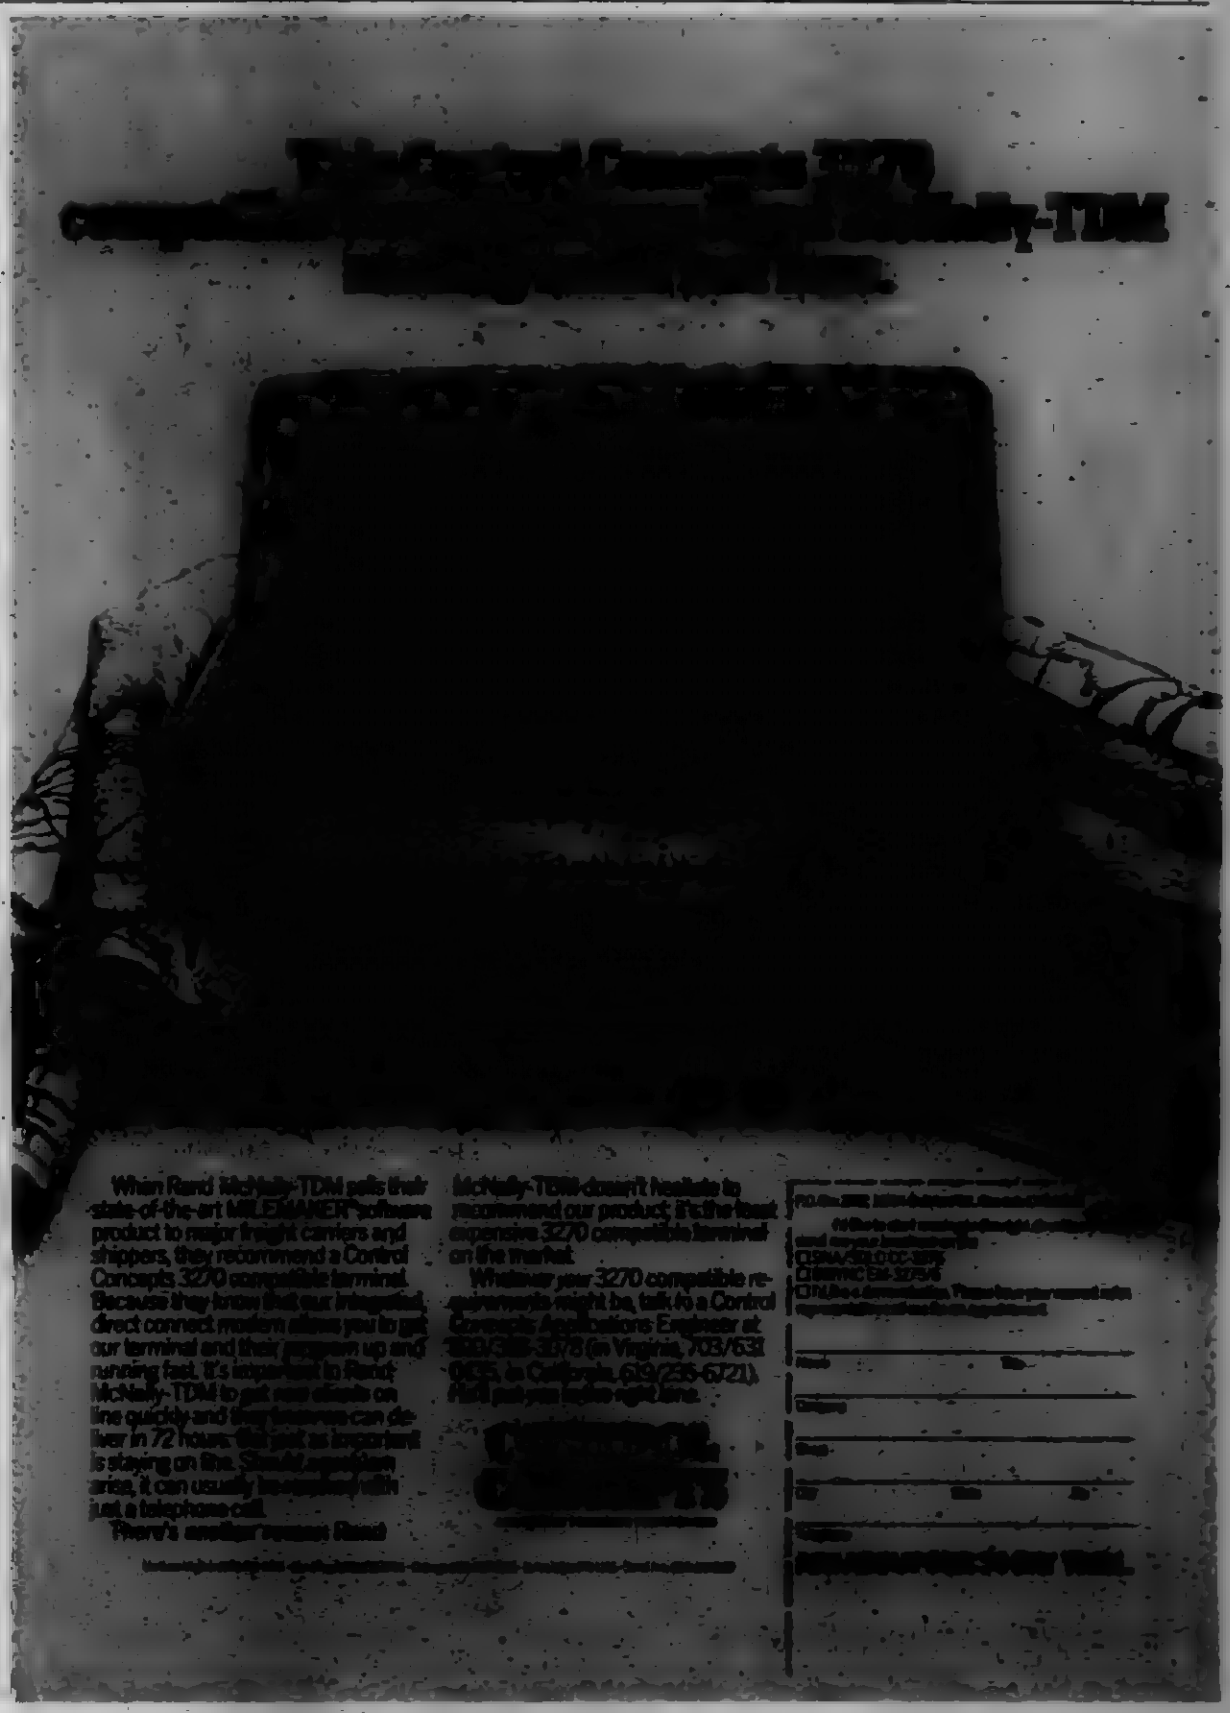
Schuhardt Software Systems, 515 Northgate Drive, San Rafael, Calif. 94903.

KRONOS, INC.
IBM PC Terminal Emulator, High Level Communications Interface, File Transfer, Host Emulator

Kronos, Inc. has introduced four software modules designed to facilitate the integration of the vendor's Timekeepers product, a stand-alone dedicated microcomputer for time accounting use.

One module, the IBM PC Terminal Emulator, provides emulation capabilities for users who prefer to use an IBM Personal Computer instead of a local video terminal with the Timekeepers unit. Use of a Personal Computer reportedly enables the user to write the time and attendance data in the Timekeepers' memory to diskette for permanent storage.

Continued on page 126



MICROCOMPUTERS

Continued from page 126

The High-Level Communications Interface module is said to provide programmers with a library of communications routines that implements the vendor's error-protected protocol.

The File Transfer package reportedly allows the user to transfer employee data from multiple remote Timekeepers to an IBM Personal Computer at a central location via telephone lines using the error-protected protocol.

The IBM PC Host Emulator module is a menu-driven program said to allow users to access reports available from Timekeepers. The software prompts users by asking them what function they would like to perform, then accesses its own programs automatically to perform the task.

IBM PC Terminal Emulator is priced at $180. High-Level Communications Interface costs $360. File Transfer, which includes the terminal emulator and communications interface modules, costs $540. The IBM PC Host Emulator, including the three other modules, costs $720.

Kronos, 62 Fourth Ave., Waltham, Mass. 02154.

ENERTRONICS RESEARCH, INC.
Energraphics version

Enertronics Research, Inc. has introduced a new version of Energraphics, a graphics software package that combines business graphics, statistical analysis, drawing functions, word processing, symbol and font generation, presentation and three-dimensional plotting of surfaces.

The vendor said the new version allows for rotation and movement of entire regions of the screen, providing 1,000-times zoom magnification.

Energraphics runs on the IBM Personal Computer and Personal Computer XT and compatibles. It requires 128K bytes of random-access memory and an adapter board. It costs $360 and is $450 with the plotter.

Enertronics Research, Suite 207, 150 N. Meramec St., St. Louis, Mo. 63105.

FORTE DATA SYSTEMS, INC.
Forte-Call

Forte Data Systems, Inc. has announced Forte-Call, a software package to tie remote personal computers and terminals into an organization's mainframe-based network.

The vendor said Forte-Call requires an IBM Personal Computer or Personal Computer XT equipped with either of Forte's 3270 emulation boards: Forte PJ or Forte PC78-2. The boards allow the computer to emulate an IBM 3278 or 3279 terminal when linked to an IBM mainframe.

Forte-Call is software-based and requires no additional hardware to operate. It is priced at $295.

Forte Data Systems, 1500 Norman Ave., Santa Clara, Calif. 95050.

STAFF COMPUTER TECHNOLOGY CORP.
The Key

Staff Computer Technology Corp. has introduced a computer security device that reportedly can be used with any computer with an RS-232 serial port.

The Key is a hardware module designed to prevent software piracy, a vendor spokesman said. The interactions of The Key and the software are used to form inquiry/response pairs. The use of many inquiry/response pairs reportedly enhances the security.

The Key sells for $210 each in quantities from one to 99 and for $195 in quantities of 100 or more, the spokesman said.

Staff Computer Technology, P.O. Drawer B, Del Mar, Calif. 92014.

MYCROFT LABS, INC.
Compat

Mycroft Labs, Inc. has introduced Compat, a utility that allows an Otrona Corp. Attache portable microcomputer to copy files to and from various manufacturers' 5¼-in. disk formats.

The utility allows the user to copy from Otrona to another implemented manufacturer's format, copy to Otrona format from another manufacturer's format and copy between two non-Otrona formats.

Compat reads the following implemented MS-DOS or PC-DOS 5¼-in. diskette formats: single-sided, 8-sector; single-sided, 9-sector; double-sided, 8-sector; double-sided, 9-sector.

The list price of Compat for the Otrona Attache is $195, which includes a program disk and a reference manual.

Mycroft Labs, P.O. Box 6045, Tallahassee, Fla. 32314.

AXELSOFT
Cross/file

Axelsoft, a software division of Axel Johnson Corp., has announced Cross/file, a combination file editor/reformatter.

Cross/file eliminates the need to retype information into standard personal computer application programs from external sources (such as mainframe computers, incompatible microcomputers and commercial data bases), according to the vendor.

Axelsoft said that with Cross/file, the user can pick up any information displayed on the screen. Type of file format becomes irrelevant, the company said, and any kind of communication protocol can be used as long as the communication program is able to store standard Ascii files on disk.

Cross/file was designed to allow the use of data from other computers as input to standard spreadsheet, data base, business graphics or word processing programs. It is available in Microsoft, Inc.'s MS-DOS and Digi-

MICROCOMPUTERS

tal Research, Inc.'s CP/M 80 and 86 versions. It is compatible with Visicorp's Visicalc, Lotus Development Corp.'s 1-2-3, Microsoft's Multiplan and several other application programs, according to Axxisoft.

The program can be used with the IBM Personal Computer and Personal Computer XT, the Digital Equipment Corp. Rainbow, the Wang Laboratories, Inc. Professional Computer, the Panasonic Co. Personal Computer or the Ericsson Step/one.

Cross/file is priced at $195, the vendor said.

Axxisoft, Axel Johnson, 666 Howard St., San Francisco, Calif. 94105.

JMI SOFTWARE CONSULTANTS, INC.
Bastoc 1.4

JMI Software Consultants, Inc. has introduced a new version of Bastoc, a software tool that provides Basic facilities on Unix and other systems supporting C compilers.

The vendor said Bastoc 1.4 translates programs written in one of several varieties of Basic to C language. It also now supports the complete Microsoft, Inc. Disk Basic dialect.

Binary versions are available for the IBM Personal Computer (PC-DOS, Co-Idris), the Radio Shack TRS-80/16 (Xenix), Idris on the Digital Equipment Corp. PDP-11 and Motorola, Inc. MC68000, Unix Versions 6 and 7 on the PDP-11 and the Apple Computer, Inc. Lisa (Uniplus). Any system supporting a standard C compiler is a potential host for Bastoc. Single-quantity price for Bastoc 1.4 is $350.

JMI Software Consultants, 1422 Easton Road, Roslyn, Pa. 19001.

THE SANTA CRUZ OPERATION, INC.
Xenix for Lisa 2

The Santa Cruz Operation, Inc. has announced that it will offer Microsoft, Inc.'s Xenix operating system for use on the Apple Computer, Inc. Lisa 2 microcomputer.

Other Xenix-compatible applications packages offered include the Multiplan Electronic Worksheet, the Uniplex word processing system, the Informix relational data base management system, Level II Cobol and the Forms 2 and Animator Cobol development tools, the vendor said.

The Xenix operating system is available for $795. The company also offers the Xenix Software Development System for $595, the Xenix Test Processing System for $495 or all three systems for $1,495.

The Santa Cruz Operation, P.O. Box 1900, 500 Chestnut St., Santa Cruz, Calif. 95061.

CLEAR SYSTEMS
Calendar/1

Clear Systems' Calendar/1, a program that prints or displays calendars of events in a standard, graphics monthly format, is now available for the IBM Personal Computer operating under PC-DOS or compatible systems.

Calendar/1 can be used as an appointment book and production schedule for one or many people and/or tasks. Multiple calendars are kept separate or can be merged into a master calendar. Files of annual events can be automatically merged with files of one-time-only events.

In addition, calendars can be tailored to the needs of the individual or organization by means of a parameter file that gives the user control over all options and defaults, including size, format and printer characteristics, the company added.

Calendar/1 is priced at $95.

Clear Systems, Suite 404, 309 Santa Monica Blvd., Santa Monica, Calif. 90401.

SYSTEM/Z, INC.
Basic/z enhancement

System/z, Inc. has announced a new version of its Basic/z compiler.

The enhanced compiler offers file locking, record locking and support for multiple devices, the vendor said. The compiler supports cursor positioning, screen attributes, input masking, screen editing of console input at run time, alphanumeric labels, user-defined functions and a program editor that tests syntax as the user types, according to the vendor.

It works with Digital Research, Inc.'s CP/M, MP/M II, CP/M 80 and CP/M 86 and Musys Corp.'s Turbodos operating systems and costs $345.

System/z, P.O. Box 11, Richton Park, Ill. 60471.

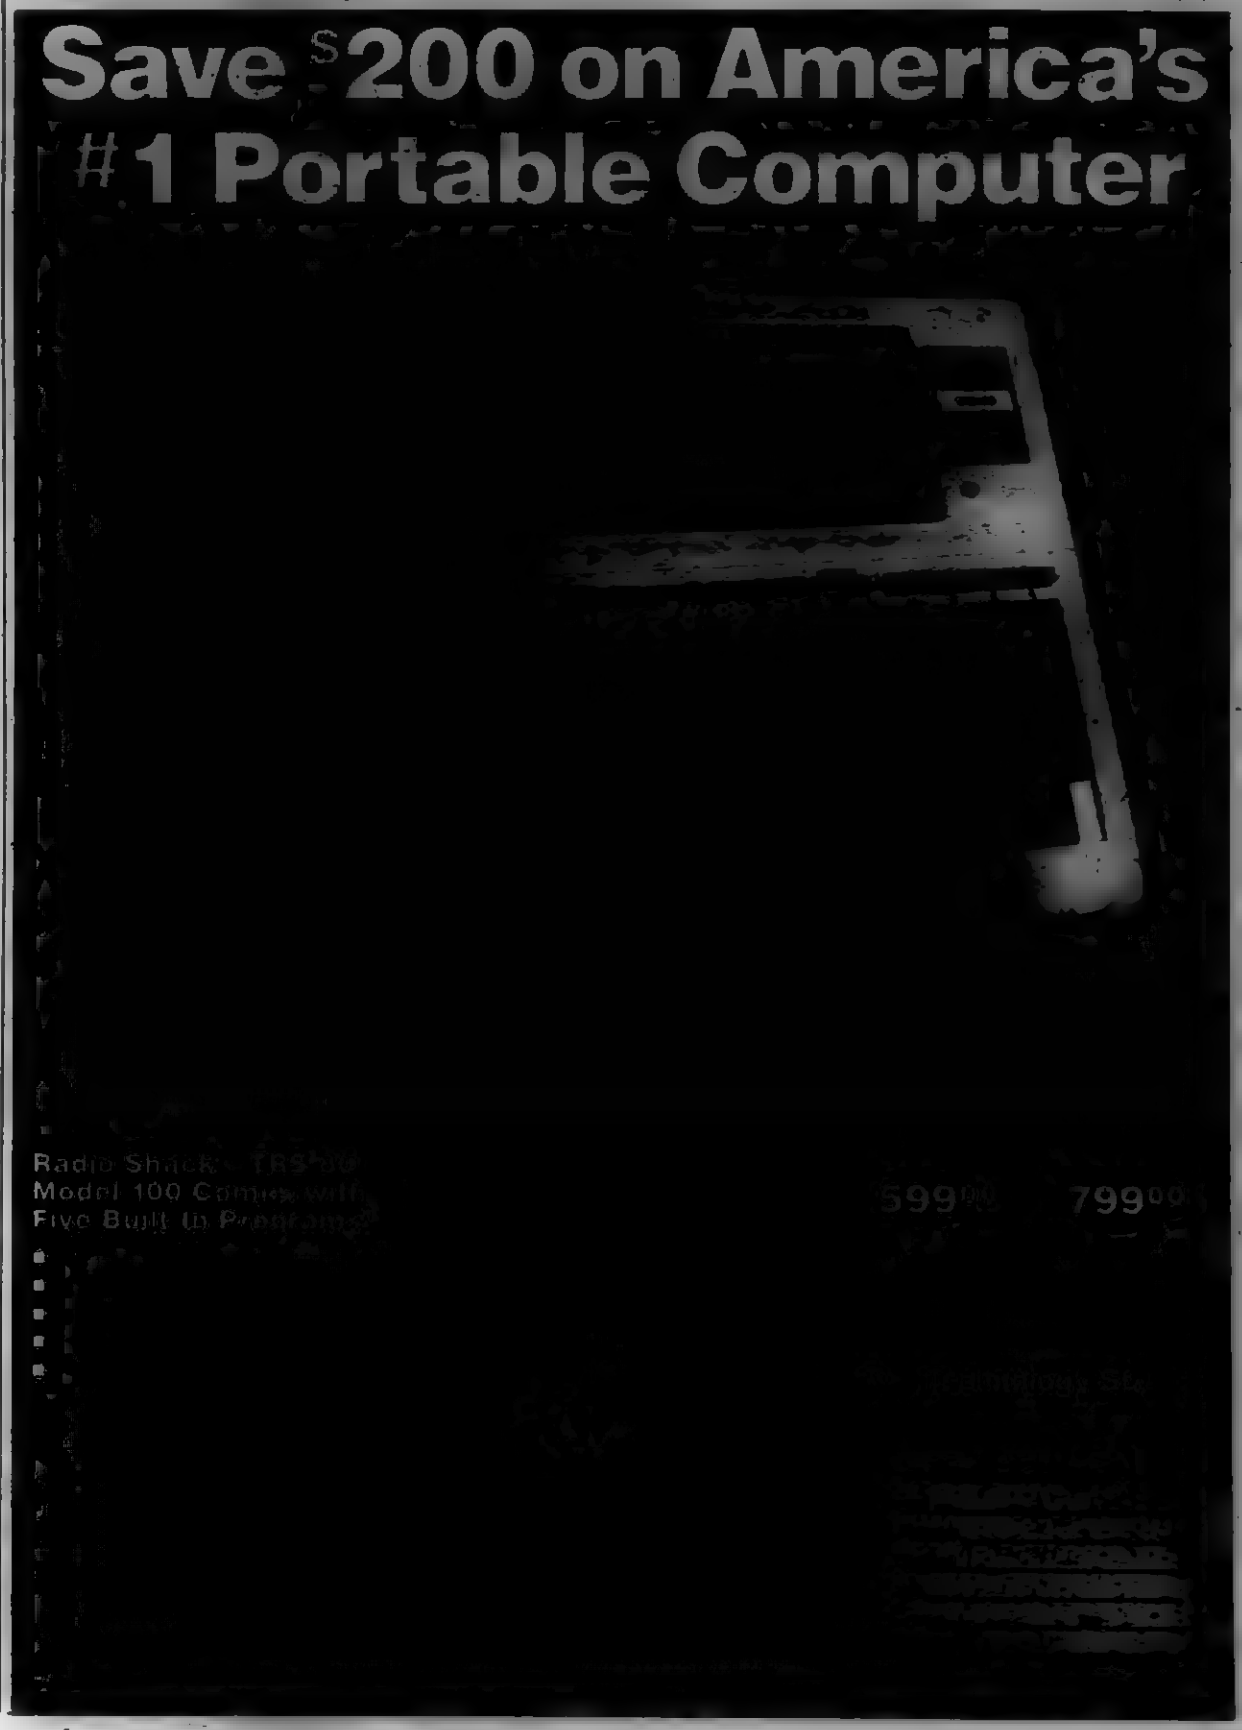
DIVERSIFIED DATA RESOURCES, INC.
Acom; Acomft; Acomhft

Diversified Data Resources, Inc. has announced the Acom program, which reportedly provides error-free data transfer from personal computer to personal computer or from personal computer to host mainframe. According to the vendor, Acom transmission is error-free, even if a line is dropped, a plug pulled or a modem jarred during file transfer. Three versions of Acom are available.

Acom, a terminal emulator with no file transfer capability, allows an IBM Personal Computer or Personal Computer XT to emulate IBM 3277, 3278 or 3279 terminals. No protocol converter is required to allow an IBM Personal Computer XT to emulate a Digital Equipment Corp. VT52 or VT100 terminal, the vendor said.

Acomft permits an IBM Personal Computer XT to transmit files to another IBM Personal Computer XT, according to a spokesman for Diversified Data Resources. Acomhft is said to be the mainframe software required for Acomft to transmit or receive Vsam, Isam or SAM files to or from an IBM or compatible

Continued on page 130



Shopping for intelligent terminals needn't be a compromise between price and performance. Consider the standards of the Ovation™ 1041 and 1051.

Both terminals feature low-profile, detached keyboards with soft set-up and non-volatile RAM. User-programmable function keys. 14-key numeric pads. User-selectable keyclick, capacitance switches and screen-saver features to name a few.

Naturally, the VDTs swivel and tilt at a finger's touch. 12-inch non-glare video displays are standard (15-inch displays are available too).

Add two industry standard communication ports, standard VT™-132/VT™-220, or custom emulations and 128 ASCII characters. Plus a broad range of graphics characters to cover the most demanding applications.

But the Ovation 1051 goes even further.

It also includes an 80 or 132 column display providing high resolution characters. Variable speed smooth scrolling. 16 user-programmable function keys (32 with shift). 256 graphics characters. Standard 32 Kbytes of RAM that can be upgraded to 64K.

There's more.

The Ovation Series™ features a broad range of custom options. Like custom functionality, firmware, keycaps, colors, even a private label option.

All things considered, you won't find better terminal values no matter where you shop.

To find out more about the Ovation 1041 and 1051, call your local Zentec sales office today.

host CPU. Acom, Acomft and Acomhft costs $120, $240 and $3,000, respectively.

Diversified Data, Suite 7, 35 Mitchell Blvd., San Rafael, Calif. 94903.

CHAMPS, INC.
Champs/A and Champs/E

Two programs designed to standardize information handling and print reports for athletic and activity office administrators have been introduced by Champs, Inc.

Champs/A categorizes information for scheduling, calendars and contracts. Champs/E provides a system for maintaining up to 25 items of student information. They are written for Apple Computer, Inc. and Radio Shack TRS-80 micros. Prices are $395 each; a 5% discount applies when buying both.

Champs, P.O. Box 24054, Apple Valley, Minn. 55124.

GRAPHIC COMMUNICATIONS, INC.
Graphwriter

Graphic Communications, Inc. has introduced Graphwriter, a graphics software package for creation of 35mm slides which supports Polaroid Corp.'s Palette 35mm slide producer.

According to the vendor, Graphwriter produces graphs and charts for business presentations and reports. The package includes 24 different format programs, capable of producing over 50 graphs.

The product is available for the IBM Personal Computer and the Digital Equipment Corp. Rainbow under the Softech Microsystems, Inc. P-system.

Graphics Communications is offering the Graphwriter combination set — normally $595 — and the Polaroid Palette Image Recorder — $1500 — for $1895.

Graphic Communications, 900 Fifth Ave., Waltham, Mass. 02154.

INNOVATIVE SOFTWARE
Total Information Management IV

Innovative Software has announced Total Information Management (TIM) IV, an enhanced version of its data base manager program for the IBM Personal Computer and compatibles.

The vendor said the major enhancements to TIM IV allow transfer of data among files while performing calculations and/or accumulating totals in a separate but related file.

TIM IV runs under PC-DOS on IBM Personal Computers and under Microsoft Inc.'s MD-DOS on compatibles, requiring 128K bytes of random-access memory (RAM) and two disk drives. It also runs under Digital Research, Inc.'s CP/M and MP/M with two disk drives and 64K bytes of RAM. It costs $495.

Innovative Software, No. 380, 9300 W. 110th St., Overland Park, Kan. 66210.

INNOVATIVE SOFTWARE
Fast Graphs Version 2.0

Innovative Software has announced Version 2.0 of Fast Graphs, a package for IBM's Personal Computer.

The vendor said Version 2.0 enhancements include smoother curves and a plotting speed five times faster than the earlier version.

Fast Graphs can plot four different charts on one sheet of paper, with the combined use of up to 16 patterns and eight colors, three character

THE PRINTER TO PICK WHEN THE PACE QUICKENS.

It's happening all over the PC and micro worlds.

You're getting hit with a ton of increased throughput requirements. Your applications are generating a deluge of paper. You need more printer speed. A lot more.

You're also looking for more professional-looking presentations so you need better print quality. A lot better.

Who's got the best of both worlds for you?

Okidata's Pacemark 2350 and 2410 dot matrix printers.

They'll not only help you *keep* pace with your world, they'll help you set new and exciting ones. In print speed. In print quality. And in vastly increased compatibility and capability.

Take throughput. The 2350 and 2410 can quickly get you out of the waiting game to where you're *really* cranking it out. And with flexibility, too: up to 5 pages per minute.

But wait. Cranking *what* out, you may ask? A single, restrictive printing mode? No way. The 2410 can give you DP, draft, and a correspondence quality that truly rivals the daisywheel.

And the 2350 and 2410 can both print at up to 350 cps. While producing 120 to 420 lines a minute for you. With bidirectional printing and short line seeking logic. And both high speed horizontal and vertical slew.

PC COMPATIBILITY.
SOFTWARE COMPATIBILITY.

The 2350 and 2410 use industry standard interfaces making them hardware compatible with most mini and microsystems on the market today. In addition, they are supported on the menus of most of the important software being offered to microsystem users like Visicalc, Lotus 1, 2, 3, DBASE 2, Peachtree 500 and General Ledger, MultiMate WP, Wordstar, etcetera, etcetera.

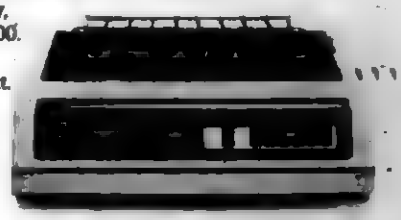
But wait, there's more. Like an outstanding all points addressable graphics capability with 144 x 144 dots per inch resolution.

Two color printing for highlighting. Down line loadable font sets for flexibility. Subscripts and superscripts so your scientific and technical usage won't bog down. Six-part forms handling. The capability to print 132 columns on eight-inch paper using 17.1 characters per inch to save paper costs and make output easier to handle.

And—so that you can depend on getting all that good stuff, all the time—a mean time between failure of 2200 hours. A mean time to repair of only 30 minutes. An average printhead life of 500,000,000 characters. And an industry low warranty claim rate of less than 2%.

No doubt about it, the quicker the pace at your place, the more you need Pacemark from our place. For more information, call toll free 1-800-OKIDATA.

In New Jersey, 609-235-2600.
Or write OKIDATA, Mt. Laurel, NJ 08054.



OKIDATA

their use. If any company buys 300 copies of a module, we will work with it to tailor the module to its needs."

Communications capability will be added when Lotus' Symphony is released.

The first 32 applications will be available in April; 20 additional applications will be ready by June, according to Boyd. "By the end of the year, there will be 200 functions available," he claimed.

Each Optionware module costs $300 from DSS Development, located at Corporate Place, 4 Barnard Lane, Bloomfield, Conn. 06002.

CORONA
from page 117

er for personal computers at Docutel Olivetti. Christianson estimated that Docutel Olivetti has sold 5,000 Corona IBM-compatible computers since the OEM agreement last November.

sizes for explanatory text and the use of footnotes.

Fast Graphs can be used with data from Visicorp's Visicalc;. Microsoft, Inc.'s Multiplan; Lotus Development Corp.'s Lotus 1-2-3; Sorcim Corp.'s Supercalc; or Innovative Software's Fast Facts and TIM IV. It is available for the IBM Personal Computer and compatibles, running under PC-DOS with two disk drives or hard disk, 128K bytes of random-access memory, a graphics interface card or monochrome card and monochrome monitor. Version 2.0 costs $350.

Innovative Software, No. 360, 9300 W. 110th St., Overland Park, Kan. 66210.

GENERAL ELECTRIC INFORMATION SERVICES CO.

Merlin application software

The General Electric Information Services Co. has announced that it will market over 40 microcomputer-based banking applications programs from Micro-Sharing, a new division of Merlin Information Systems, Inc.

The software will be sold on a subscription basis to large, regional banks, which will in turn remarket the software on a monthly subscription basis to smaller banks, according to the vendor. The arrangement would permit smaller banks to use the Merlin Information Systems banking software without paying the usual purchase price of more than $30,000 for the product.

The software will be downloaded to subscribing regional banks via the GE Mark III teleprocessing network and will run on IBM Personal Computers and Personal Computer-compatible machines.

Subscriptions are priced at $250 per month, with a minimum order of 20 per institution required.

GE Information Services, 401 N. Washington St., Rockville, Md. 20850.

DATANEX, INC.

Barr/Hasp

Datanex, Inc. has introduced Barr/Hasp, a communications package for the IBM Personal Computer.

The product, oriented to high-speed, bulk transfer of data, has remote job entry (RJE) capabilities. Barr/Hasp can move periodic transaction batches, RJE jobs, programs, messages, object files and executable files. An unattended mode allows the IBM micro to pick up or deliver information to a remote computer. Barr/Hasp costs $890 and includes a synchronous interface board.

Datanex, P.O. Box 1758, Eugene, Ore. 97440.

SOLUTIONS BY EXAMPLE, INC.

PC Speak enhancements

Solutions by Example, Inc. has enhanced PC Speak, a software package that allows blind users to work with the IBM Personal Computer.

The software works with a text-to-speech synthesizer. PC Speak will verbalize all data on a screen, or the user can select words or lines with a cursor. The software can be used with programming languages such as Basic or Pascal and software packages such as Lotus Development Corp.'s Lotus 1-2-3.

PC Speak runs under Microsoft Inc.'s MS-DOS and needs 64K bytes of random-access memory, a parallel or serial adapter and a text-to-speech synthesizer.

PC Speak costs $395.

Solutions by Example, Box 307, New Town Branch, Boston, Mass. 02258

ADVANCED DATA INSTITUTE, INC.

Genie

Advanced Data Institute, Inc. (ADI) has introduced Genie, a set of routines that allow programmers to develop applications that use ADI's Aladin data base.

Genie features initialization and holding of data base access paths, reading, updating and deleting of records and full or partial searches with wild cards, the vendor said. The utility reads or displays full or partial records, is menu-driven and includes data base interface operations and utility procedures, ADI said.

Genie costs $500 and works with Microsoft, Inc.'s MS-DOS or Softech Microsystems, Inc.'s P-system.

ADI, 1215 Howe Ave., Sacramento, Calif. 95825

APPLIED MICROSYSTEMS, INC.

PC-Profs Version 1.2

Applied Microsystems, Inc. has introduced PC-Profs Version 1.2, an IBM Personal Computer-based interface to the IBM mainframe Professional Office System (Profs).

The new system includes support of both the color graphics adapter and the monochrome monitor adapter and the ability to import and export Personal Computer text files into Profs notes and documents. All users of older versions of PC-Profs will be upgraded at no charge.

According to the vendor, PC-Profs provides an electronic office for user interaction. Pictures are selected on the screen to perform actions analogous to conventional office fixtures such as in/out trays, a file cabinet, a waste basket and a pad of paper.

The program requires 256K bytes of random-access memory and runs under VM with the mainframe and PC-DOS 1.0, 2.0 or 2.1 for the Personal Computer.

The product is available for $295 per copy. A demonstration diskette sells for $10.

Applied Microsystems, P.O. Box 832, Roswell, Ga. 30077.

LIFEBOAT ASSOCIATES, INC.

Enhanced version of Lattice C

Lifeboat Associates, Inc. has enhanced its Lattice C compiler to support Microsoft, Inc.'s MS-DOS 2.0 operating system.

The enhanced version enables pro-

grams to use MS-DOS' tree-structured directory to organize large numbers of files and provide file access to other directories, the vendor said. The compiler allows users to address 1M byte of storage with an Intel Corp. 8088 or 8086 microprocessor. Lattice C costs $500.

Lifeboat Associates, Dept. C, 1651 Third Ave., New York, N.Y. 10028.

MOTOROLA, INC.
System V/68

Motorola, Inc. has announced System V/68, a version of AT&T's Unix System Five operating system for Motorola's 68000 microprocessors.

System V/68 is the first Unix port that AT&T has developed jointly with an outside source, according to Motorola. Motorola plans to provide source code updates, maintenance and support of the operating system.

Source and object codes are available for $2,000 each, plus media charges.

Motorola, P.O. Box 20912, Phoenix, Ariz. 85036.

DATAVIZ, INC.
Oneshot

Dataviz, Inc. has introduced Oneshot, a productivity tool enhancer.

Oneshot takes data from mainframes, public access systems, other microcomputers and time-sharing systems and transfers it to an IBM Personal Computer or compatible machine. The data can be in the form of reports, queries, data files or any information arriving via communications products, Dataviz said.

Oneshot learns how to read/interpret data and recognizes headers, footers, separators, subtotals and other nondata, Dataviz said. It identifies data by the position of columns and format (text or numeric) and is priced under $200.

Dataviz, P.O. Box 1319, Norwalk, Conn. 06856.

CHAS-MOORE, INC.
XT-Driver

Chas-Moore, Inc. has introduced XT-Driver, a menu and security system that is designed for the IBM Personal Computer XT and IBM Personal Computer-compatible hard disk systems.

Users are assigned one password and a security code, Chas-Moore said. The information builds the user's menu and provides access to applications according to the user's security code level. The XT-Driver is said to provide menus containing popular applications and to allow users to build their own menus.

Other features include a log system for tracking user access, a programmable calculator, a directory manager, a message center and PC-DOS support menus that are said to aid users in the execution of certain commands, according to a spokesman for Chas-More.

The price of the basic menu and security system is $80, the spokesman said.

Chas-Moore, 3104 Jackie Center, Bakersfield, Calif. 93309.

PRENTICE-HALL, INC.
VCN Execuvision

Prentice-Hall, Inc. has introduced VCN Execuvision, a presentation graphics program for use with the IBM Personal Computer.

The product is menu-driven and makes it easy for novice computer users to make slides for presentation, according to the vendor.

The program was designed for use on the IBM Personal Computer with two disk drives, the IBM Color/Graphics Board and color monitor, Prentice-Hall said. VCN Execuvision is said to run under MS-DOS 1.1 and to require 128K bytes of memory.

Highlights of the program include a choice of 10 text fonts with rescaling and color options; foreground and background colors; "electronic scissors"; run-time options; speed variations for animation/motion techniques; and a variety of hard-copy printing styles, the firm said.

The program sells for $395.

Prentice-Hall, 200 Old Tappan Road, Old Tappan, N.J. 07675.

LOGSYS, INC.
Business Modeller

Logsys, Inc. has announced Business Modeller, an electronic spreadsheet that runs on Digital Equipment Corp.'s VAX-11 series superminicomputers, PDP-11 series minicomputers and the Professional 300 series microcomputers.

Users can track payrolls, sales bonuses, loan repayments, key account purchases and research data, according to the vendor. Features include maximum and minimum average of a list, sum and count of list items, table lookup and choice and logic expressions.

Prices range from $650 to $2,500, depending on the installation.

Logsys, Suite 1408, 116 John St., New York, N.Y. 10038.

ANALYSIS TECHNOLOGY, INC.
Data Analyst

Analysis Technology, Inc. has announced Data Analyst, a software encryption service for market research and survey companies using IBM Personal Computers.

Data Analyst encrypts floppy disks so that users can manipulate statistical data but not access personal information, the vendor said. Data Analyst consists of a software package that allows the user to define which fields should be protected and a service which encrypts diskettes mailed to the company, according to the vendor.

Diskettes are returned within 48 hours, the vendor said.

The software package costs $5,000. Each encoded diskette costs $75, Analysis said.

Analysis Technology, Suite F.P.O., Box 1070, 234 Pearl St., Boulder, Colo. 80306.

APPLIED SOFTWARE TECHNOLOGY, INC.
Enhanced Versaform

Applied Software Technology, Inc. has enhanced Versaform, a data base

$61/mo.*

*1 yr. lease.

Lease TI's new 855 dual-mode printer from MTI with on-site service for only $61 per month.

- 150 cps draft-quality mode, 35 cps letter-quality.
- Front-loading font modules act as electronic daisy-wheels for letter-quality printing.
- Change font styles at the touch of a button.
- Both serial and parallel interfaces are standard.
- Prints raster graphics.
- Small, lightweight and quiet for office environment.

MTI is an authorized distributor of Texas Instruments' full line of portable terminals, matrix printers and Professional Computers. Whether you lease, buy or rent our equipment, you'll find MTI is the one source for all the terminals, peripherals, systems, applications expertise and service you'll ever need. At great prices. Call us.

management system for Digital Equipment Corp.'s Rainbow microcomputers.

Versaform allows the user to design form-oriented records and includes data entry checking and automatic calculation capabilities, the vendor said. Preprinted forms may be filed from screen data with stored instructions, according to the vendor.

Versaform requires 256K bytes of random-access memory and costs $380.

Applied Software Technology, 170 Knowles Drive, Los Gatos, Calif. 95030.

MICROCOMPUTER SPECIALIST, INC.
Ontime Calendar Manager

Microcomputer Specialist, Inc. has introduced Ontime Calendar Manager, a calendar management and appointment scheduling package for the IBM Personal Computer.

Users can view calendars, print schedules, search for available times, enter activities, maintain facility log books, schedule activities for groups, create tickler files and leave messages for co-workers, according to the vendor. Ontime Calendar Manager integrates with Information Unlimited Software, Inc.'s Easybusiness software series, the vendor said.

The product runs under IBM PC-DOS or Microsoft, Inc.'s MS-DOS, according to Microcomputer Specialist.

Ontime Calendar Manager costs $199.

Microcomputer Specialist, 18 Lyman St., Westboro, Mass. 01591.

GUARDIAN AUTOMATED SYSTEMS, INC.
Legal Office Software

Guardian Automated Systems, Inc. has introduced a Legal Office Software package made up of four modules all written in C language for Unix-based operating systems.

The Legal Accounting module reportedly permits time and billing record keeping, trust accounting and accounts payable recording, Guardian said. The Case Management and the Scheduler modules, respectively, track litigation and automate the office's calendar, according to the vendor. The Unicorn/DB module reportedly is a data base management program for customized reporting.

The four modules run on the Fortune Systems Corp. Fortune 32/16 computer. They are priced as follows: Legal Acounting, $2,500; Case Management, $2,000; Scheduler, $150; and Unicorn/DB, $295.

Guardian Automated Systems, Suite 600, Liberty Bank Building, 420 Main St., Buffalo, N.Y. 14202.

INDEX TECHNOLOGY CORP.
Excelerator

Index Technology Corp. has announced a package designed to assist systems analysts in design, organization and documentation.

The Excelerator package is an integrated, menu-driven system that combines graphics, data dictionary and word processing capabilities for the IBM Personal Computer XT, according to the vendor.

Users can utilize Excelerator's document preparation facility to produce specification documents for review, Index said. The package's Excelerator Dictionary is said to store all objects, connections, text, data elements and records to assure consistency and accuracy in design. Up to 10 levels of graphs can be linked together in the dictionary for explosion and sequencing diagrams.

Prices for Excelerator begin at $9,500, which includes the software on 5¼-in. diskettes, documentation, keyboard template, 128K-byte memory expansion board, graphics board and Microsoft, Inc.'s Mouse and Word packages.

Index Technology, Five Cambridge Center, Cambridge, Mass. 02142.

LANGUAGE PROCESSORS, INC.
LPI-Cobol; LPI-RPG-II; LPI-Pascal; LPI-C; LPI-PL/I; LPI-Basic

Language Processors, Inc. (LPI) has announced a line of high-level language compilers that reportedly allow users to mix subprograms written in different languages into a single program.

The compilers — LPI-Cobol, LPI-RPG-II, LPI-Pascal, LPI-C, LPI-PL/I and LPI-Basic — are designed for computer manufacturers whose systems use the Motorola, Inc. MC68000 microprocessor and the Unix operating system, a vendor spokesman said. The Cobol, RPG-II, Pascal and C compilers are immediately available, according to Language Processors. The PL/I compiler reportedly will be available mid-1984, the Basic compiler in late 1984.

The compilers are priced at $50,000 each, according to the LPI spokesman.

LPI, 400-1 Totten Pond Road, Waltham, Mass. 02154.

AT&T from page 117

But whose personal computers? Is the giant firm planning to launch its own models?

"Of course they will, if they go into the office market, which we all think they will," said Everett Meserve, an analyst with Arthur D. Little, Inc. in Cambridge, Mass. "It's inevitable."

AT&T in 'a quandary'

The need for a personal computer product places AT&T in "a quandary, the same quandary that IBM has with endorsing Unix," Boyle commented. "They have to do it, but they'd like to postpone it as long as possible."

Robert Casale, president of marketing and sales for AT&T Information Systems, said last month's announcements "have no direct bearing on our agreements with Convergent Technologies, Inc." Casale later added that products from that deal are expected to ship this year.

AT&T and Convergent have released no details on those forthcoming products, but Convergent is widely expected by industry analysts to supply a version of its N-Gen workstation built around an Intel Corp. 80186 chip.

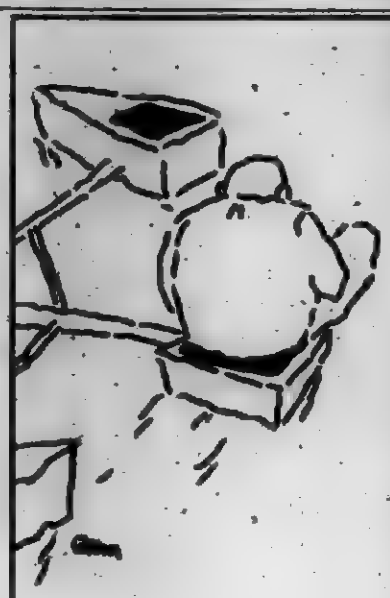
The Santa Clara, Calif.-based vendor began shipping N-Gens to other OEMs last year, but has acknowledged production delays.

Lower end misses to debut?

George Colony, president of Forrester Research, Inc. in Cambridge, Mass., predicted that AT&T also will introduce lower end microcomputers.

"These could be made by Japanese companies, Corona [Data Systems, Inc.], Eagle [Computer, Inc.] or Olivetti [Corp.]," Colony said. "I know AT&T has talked to all of these."

Of course, Colony admitted, AT&T has plenty of other potential suppliers for any machines it chooses to offer.



ANOTHER IBM 3274/76 USER AT THE HELM.

SORT OF.

The alternatives in printers for the IBM 3274/76 user could be categorized, basically, into two separate areas:

Take it, or leave it.

The AGILE 5287 Printer Protocol Converter allows you the intelligent alternative of a printer to suit your specific application. The flexibility to choose high speed printers, plotters, dot matrix, daisy wheel or even laser printers, provides you with the system control you intended. Pass the word; you're back in command.

Installation of the AGILE 5287 is simple. Its industry proven reliability, achieved through the 5287's built-in diagnostics, is backed by a full one-year warranty and a 30-day money back guarantee.

The AGILE 5287—call us for all the information necessary to make the choice.

After all, nobody likes to be taken for a ride.

MICRO BITS/THOMAS W. MADRON

Market still not geared toward organizations' different micro uses

Microcomputers have different uses in large and small organizations, and the market has not yet sorted itself out on the differing needs of the two kinds of organizations.

The most significant difference is that in large organizations micros are employed as personal productivity improvement tools for white-collar staff, while in small organizations the main objective is to meet the organization's operational goals. A person in a small business may also use a micro to improve personal productivity, but that may not be a sufficient reason for acquiring the machine.

In the late 1970s, micros were designed primarily for hobbyists and others interested in the micro qua micro. Very soon after it became clear that micros could be used for serious computing, machines and associated software were marketed to small businesses. By early 1982 it was becoming clear that the major market for micros in the mid-1980s would be large businesses, industries, government and education.

In small businesses, a microcomputer may be used for general data processing in the same way that a large organization would depend on its mainframe.

Hence, in the late 1970s the large microcomputer manufacturers almost always offered a general-purpose accounting package. But in a large organization, centralized business accounting will be run on a mainframe computer, and the micro probably will act as a terminal to that system.

With the newer 16-bit machines (which might be called the machines of the large corporations), software emphasis has been placed on word processing, spreadsheets and personal data management programs. The rationale behind this approach is that the micro in a large organization will be employed as a personal workstation rather than for general data processing.

Nowhere is the difference in uses of microcomputers more different for large and small organizations than in the need for communications.

Many applications in small businesses, for example, will probably not need to communicate with another computer. Indeed, there may be only one micro in-house. If communications are needed, the micro will often be used only occasionally, perhaps to contact a national information utility such as Dow Jones & Co.'s News/Retrieval Service or Source Telecomputing Corp.'s The Source.

But a large organization, which may buy hundreds or thousands of micros, will make a major mistake if its micros cannot communicate with its mainframe computer system.

As small blends into large, these scenarios may change, of course. If we have five or 10 micros in an office, in either a large or small organization, there may also be the need for a local-area network.

Local-area networks can support thousands of connections, but some are designed for smaller numbers of devices (up to 64 or 256, for example).

POS from page 117

checked, the form can be used several ways: as a sales ticket, a manager's key form, an inventory or a daily revenue report.

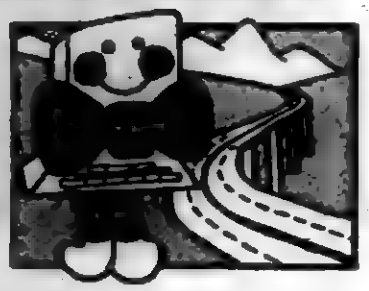
As the data is entered, the store's computer shows how it is reading the data via the Micropad's 40-character LED display screen. The screen also displays answers to the sales clerk's calculations on the form and flashes the name of each part being sold or ordered as its parts number is entered.

Should an error or misinterpreted symbol be displayed, the clerk can immediately correct it on the form, a feature that Welsh said has caused the accuracy of sales data to rise considerably.

Once the transaction is completed, the data is stored on a diskette, and managers can at any time access their store's system to gain up-to-the-minute sales information, such as total sales for the day and month, including commissions, for each of their sales clerks.

The sales clerks were given a half-hour training session on the Micropads. Although they must be careful about printing neatly — a slanted 1 can easily become a slash sign — the clerks are able to complete the forms in less time than when they were working without Micropads, Welsh said.

Advertise in the largest computer market in Europe — Germany — and reach well over 155,000 people.



The German computer market is the largest in Europe and the third largest in the world. It has over $11 billion in installed general purpose computers. The fastest growing segment of the German computer market is the microcomputer, with an installed value of $283 million. There were 10,000 IBM PC's sold in 1983 and another 30,000 units including IBM PCjr's are expected to be installed by the end of 1984.

You can reach the DP/MIS market, the PC market, the microcomputer market or the computer retailing market with our four German publications; *Computerwoche, PC Welt, Microcomputerwelt* and *Computer Business*.

Computerwoche is Computerworld's sister publication for the German EDP/MIS market. With a circulation of 30,000, *Computerwoche* reaches the important decision makers in medium to large computer-using organizations throughout the country.

We cover the microcomputer market with our microcomputer publication — *MicroComputerwelt*. Every month, *MicroComputerwelt* circulates to 65,000 German microcomputer professionals in the business, science and education fields.

PC Welt is our monthly publication specifically designed for IBM PC users. *PC Welt*'s total distribution is 50,000 and it is being sold at newsstands throughout Germany.

Computer Business, modeled after MICRO MARKETWORLD in the United States, covers all channels of distribution in the computer industry. *Computer Business*, circulates to 10,000 key decision makers with bulk-buying responsibility.

CW International Marketing Services makes it easy for you to advertise in countries all around the computer world. For more information on any or all of our four German publications just fill out and return the coupon below.

COMPUTER INDUSTRY

INDUSTRY INSIGHT
Peter Bartolik
CW Senior Editor

AT&T's shot at DP may end up a dud

AT&T fired off its shot heard round the world, but there remain many doubts about whether the communications giant can revolutionize the information processing industry.

Declining, at least temporarily, to enter the mainframe business, AT&T appears to have hitched its star to the success of its own Unix operating system.

Unix, it would seem, is the only product with the potential for bringing AT&T's hardware lineup to a position of dominance in the market.

To some people, the micro-to-supermini batting order unveiled recently by AT&T appears in many respects to be designed to battle with Digital Equipment Corp.'s cadre of machines. But DEC has a 10-year head start.

AT&T said its equipment will be available initially through value-added remarketers and to large-scale users who have the capabilities, time and resources to develop their own application packages. This, indeed, was the manner in which DEC cemented its market share; but, again, DEC has had several years during which third parties developed software that is now readily available.

Therefore, the key to hardware success for AT&T has to rest in the success of Unix. Unix in various releases has been available for years and has won a following in the academic market, and, reportedly, there are some 300 applications now available for Unix operating systems.

But while the operating system has generated much excitement in the computing community in recent months, the jury is still out as to whether it has the functionality and ease of use to stave off

Used computers seen safe bets

Big Blue security blanket covers buyers' risks

By F. Peter Model
Special to CW

First in a two-part series

Many businessmen avoid the used computer market because they suspect it's like the used car racket. They couldn't be more off base.

The used car market isn't dominated by one company; the used computer market is. No car maker would dream of providing open-ended maintenance to second-generation owners; IBM does.

Without that Big Blue security blanket, there wouldn't — couldn't — be a used computer market. An overwhelming 97% of the $7 billion business written by the 235 member firms of the Computer Dealers and Lessors Association (CDLA) is for IBM equipment.

Not only is there more IBM equipment than anything else, but IBM alone provides "cradle to grave" protection: As long as one of its computers performs according to published specs, IBM will maintain it.

Today, "fixing up" a computer is almost entirely cosmetic. Malfunctioning chips are replaced in seconds; circuit boards in minutes. Nor does internal machinery wear out because the computer's lower power generates little destructive heat, and most computers exist in climate-controlled environments.

The CDLA — comprised of third-party lessors, dealers and brokers — all of whom traffic in both new and used equipment — is aware of how many businessmen feel about entering the secondary market. Under Executive Director James F. Benton, it is starting to wage a low-key image campaign that stresses that the aftermarket is no different from the over-the-counter stock market.

Svend E. Hartmann, a New York dealer who also publishes one of the industry's price guides, said the aftermarket is a "risky business," but its members are "intrinsically decent fellows."

Dealers who can't depend on IBM's maintenance security blanket — remarketers specializing in Digital Equipment Corp., Data General Corp. and other makes

See MART page 156

Booming demand for semi parts causing headaches for small manufacturers

By Robert Batt
CW West Coast Bureau

MENLO PARK, Calif. — The booming demand for semiconductor components is causing massive headaches for many of the nation's medium and small computer manufacturers.

With chip manufacturers such as Intel Corp., Motorola Semiconductor Products, Inc. and National Semiconductor Corp. sold out completely on many of their products through 1984, even industry giants such as IBM reportedly are not able to get all the components they need.

At Convergent Technologies, Inc. of Santa Clara, Calif., production of the new N-Gen workstation has been hit by the shortage of Intel's latest 80186 chip, according to Nathan Teichholtz, director of marketing. Because of this, N-Gen is reported to be six months behind schedule.

N-Gen proving critical factor

The N-Gen system is a critical factor in Convergent's drive to replace its older line of desktop computer products, and so any delays can be serious for a company already suffering from a decline in earnings.

"The effect of the delays is that many of our larger customers who were winding down their previous generation of products in anticipation of new models from us are now going to have to wait longer than we would wish," Teichholtz said.

Chips in heavy demand include Intel's standard 8086 product and the 8048/8051 line of microcontroller chips; 64K-byte dynamic random-access memory (RAM) systems; transistor-to-transistor logic chips;

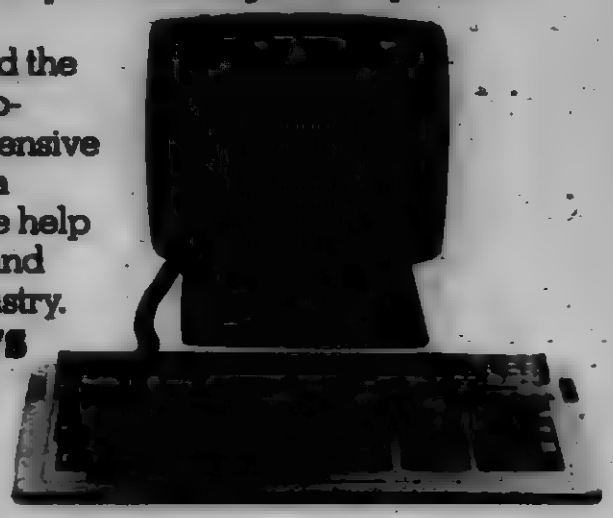
WITH DATA GENERAL YOUR COMPUTER WON'T BE ABANDONED AT YOUR DOORSTEP.

DATA GENERAL SERVICE—THERE WHEN YOU NEED IT

Some computer companies will sell you their bright new systems—and then disappear.

Not Data General. We understand the service and support needs of the automated business office. Our Comprehensive Electronic Office (CEO™) gives you a system that will run smoothly with the help of one of the most complete service and maintenance plans in the entire industry.



A SERVICE PROGRAM THAT'S RIGHT FOR YOU

Whatever the size of your office system, its locations, or hours of operation, there's a Data General service program designed to meet your needs.

With our "Enhanced Response Program," you'll have a service engineer on your site within 2 hours—24 hours a day, 7 days a week. Or choose our "On Call Service," in which a service engineer responds within 4 hours—Monday through Friday, between 8AM and 6PM.

With the 32-bit ECLIPSE® MV Family of computers, you can choose an uptime guarantee from 96% to 99%. Remote Assistance is also available to help you maintain high performance levels while saving time and money.

And, with our new DESKTOP GENERATION™, select from 16 service programs—the widest range of options for any desktop on the market. These programs will help increase productivity and keep maintenance convenient.

ALWAYS NEAR YOUR OFFICE

Data General has experience with large and small companies that have both local and distributed office environments. Whether you have one office, or a worldwide network, service is always nearby with Data General's 250 offices.

TOTAL SUPPORT FOR HARDWARE AND SOFTWARE

Data General's service organization will be your one source for handling both hardware and software problems. Our service engineers undergo extensive training every year. They'll know your system—no matter how new it is.

CALL NOW

To learn how Data General's Field Engineering Services can keep you a generation ahead, call **1-800-343-8842.** In Massachusetts, call **1-800-451-1014.** Or write Data General Service, 50 Maple Street, M.S. 05 G, Milford, MA 01757.

Magnuson files proposed plan of reorganization

SAN JOSE, Calif. — A little more than one year after filing for protection under Chapter 11 of the Federal Bankruptcy Act, Magnuson Computer Systems, Inc. recently filed a proposed plan of reorganization that would result in its assets being acquired by a subsidiary of Storage Technology Corp.

Under the proposed reorganization plan filed in Federal Bankruptcy Court here March 30, all assets other than approximately $2.2 million in cash will be acquired by Global-Ultimacc Systems, Inc., a private company formed in February and a 66%-owned subsidiary of Storage Technology.

Magnuson, a manufacturer of IBM 4300-compatible computers, declared itself bankrupt early last year [CW, March 14, 1983], blaming its woes partly on steep price cuts made by IBM for the 4300.

The reorganization plan calls for payment to general creditors of a total of slightly less than $1 million cash in settlement for all unsecured claims allowed by the bankruptcy court; holders of unsecured claims will have the option of receiving 50% of allowed claims or $500, whichever is less. The reorganization would also cancel all outstanding shares of Magnuson stock.

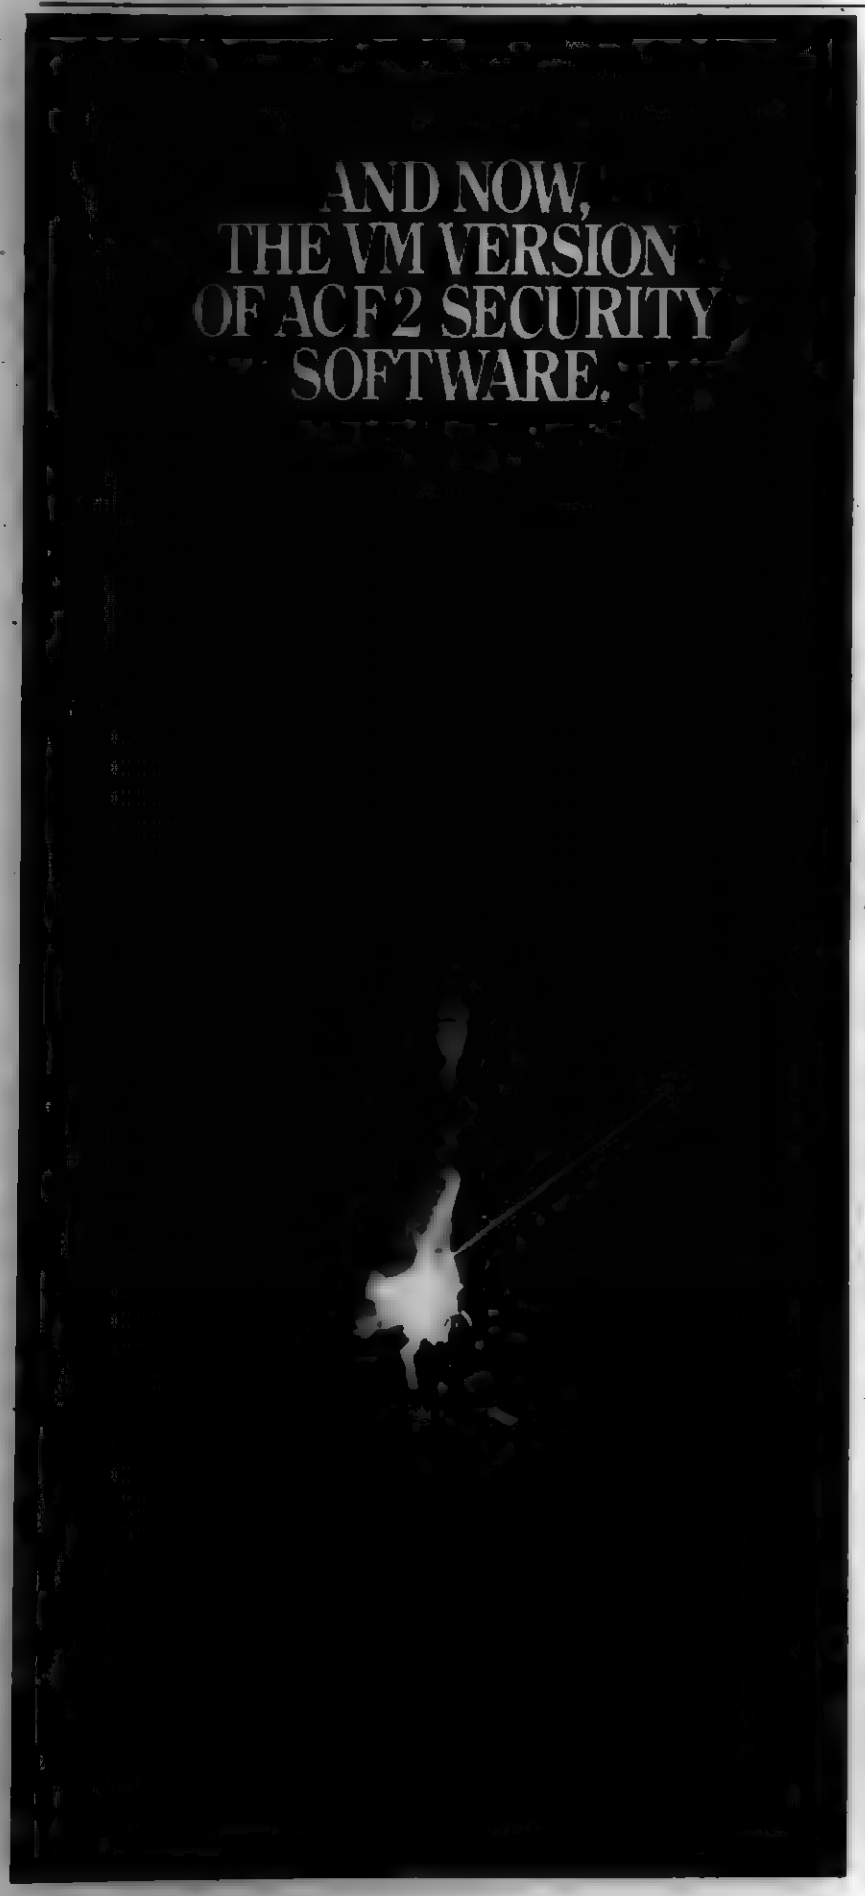
All of Magnuson's assets in excess of approximately $2.2 million cash for unsecured creditor claims and priority payments (such as payroll and taxes) would be acquired by Global-Ultimacc in exchange for shares of its stock. All of the Global-Ultimacc shares received in that transaction would be distributed to the private investor group, which holds substantially all of Magnuson's secured debt and a majority of its equity securities.

If the recently filed proposed disclosure statement is approved by the court, the plan will be submitted to creditors for their approval in approximately 30 days.

Market analysts attributed the slow demise of Magnuson over the last three years to a combination of factors. Those factors included both management shortcomings and intense competition in the IBM marketplace.

The company's search for a possible merger or acquisition partner began in 1982 as the computer manufacturer's assets continued to decline.

During the two years prior to seeking refuge in Chapter 11, Magnuson had lost approximately $57 million dollars.



With *innovative* and *non-traditional* Access Control Facility software, ACF2, VM users can sleep a lot better.

Because with ACF2/VM, all data is protected by default. We call this Implicit Security.

Implicit Security means you have unparalleled protection against unauthorized disclosure, modification and destruction of data.

It means you have control of the data residing in your system.

It means you have the ability to control access to other user-defined system resources.

It means you decide exactly what is to be made available and to whom, assuring you that liability and responsibility reside specifically with those in charge of data.

And there's more.

Combining ACF2/VM with ACF2/MVS or ACF2/VS1 provides the unique capability of one common access control discipline across VM, MVS, and VS1 systems.

We knew you'd like that.

You'll also like the initial controls: User Logon to both VM and CMS, user links to mini-disks, CP Attach and OS data set controls, and CMS file security controls over facilities which create, erase, read, write, rename and copy those files.

Naturally enough, there's more to the intelligence of ACF2/VM. So for further information, please write or telephone Mr. Shawn McLaren, direct: (415) 941-4558.

He'll be glad to tell you about a security software system that offers you a very bright future, indeed.

Tsongas: Tight export controls will harm U.S. high-tech trade

By David Glenn
CW Staff

BOSTON — U.S. Sen. Paul Tsongas (D-Mass.) recently criticized the Reagan administration's efforts to tighten export controls for high-technology companies, saying such restrictions will seriously damage the nation's ability to compete in the international marketplace.

Tsongas predicted that the free trade argument being sounded by the high-tech industry and others will eventually prevail in the U.S. Congress over the administration's concerns about national security.

The senator's remarks came at the Symposium on the Transfer of Technology in the International Marketplace, a two-day conference here sponsored by the Federal Bar Association. Tsongas is a member of the Senate Foreign Relations Committee, Small Business Committee and Natural Resources Committee.

Tsongas warned that the U.S. is experiencing a rapid decline in its competitive trade posture. "If we don't begin to view high technology as the kind of steel and auto industries of the future and address them the way [those industries] should have been addressed back in the '60s, then states like mine, which are now high-technology-dependent, will know the kind of decline we knew when I was growing up."

Tsongas questioned the administration's contention that tougher export controls are necessary to help halt the illegal flow to the Soviet Union of U.S. technology, some of which could be used for military purposes. He noted that the administration's main arguments for favoring export restrictions involve defense-related concerns.

He said it is interesting that the administration can argue, on the one hand, that the Soviets have achieved military superiority over the U.S. and claim, on the other hand, that access to U.S. technology will allow the Soviets to catch up militarily.

Tsongas contended, as have computer manufacturers, that many high-tech goods restricted by the U.S. are readily available elsewhere in the world. "It seems to me the U.S. is going to have to decide once and for all whether it wants to be a serious international competitor," he said.

The senator said he is pleased with the House version of the Export Administration Act and does not expect sharp differences between the House and Senate bills. He added, however, that the bill could fall prey to administration pressures or be lost in the shuffle of this election year.

Tsongas urged high-tech company officials to let Washington, D.C., legislators know about their concerns over export controls. "There's no constituency pushing for rationality. All the constituencies we hear from are basically those spooked by the Soviets."

IF YOU MISS CW ON COMMUNICATIONS, LOOK AT THE ISSUES YOU'LL BE MISSING.

JUNE.

Bypass. Bypassing the local loops provided by the Bell Operating Companies has become rampant with the availability of alternative technologies. See what this means to both big, regional operating conglomerates and smaller, non-Bell Operating Companies—all in the June issue.
Closes May 4.

JULY.

AT&T update.
Who are the winners and who are the losers after more than six months of deregulation?
Closes June 1.

AUGUST.

This issue will look at various teleconferencing technologies—including full motion video, freeze frame, electronic blackboards and computer conferencing. The cost-effectiveness of teleconferencing technology will be examined, plus information on private and public facilities—all in the August issue.
Closes June 29.

On Communications is ideal both for the advertiser and the reader. Because each one offers focused, in-depth information on areas of interest within communications.

Readers always want to catch up on what's hot and what's not in their particular specialty. And find out what the vendors have to offer.

As an advertiser, you won't want to miss the opportunity to tell them.

Maybe that's why our On Communications is becoming more popular every day.

Because everyone wins.

COMPUTER INDUSTRY

Directive to IBM's UK lessors seen as U.S. interference

By Ron Neff
Special to CW‡

LONDON — Leasing companies and their customers holding U.S.-made computer equipment must obtain the approval of U.S. officials before they can transfer that equipment to others within this country, IBM United Kingdom, Ltd. informed customers recently in a letter that has been interpreted as an attempt by the U.S. government to enforce its own rules in other countries.

The letter went on to remind IBM customers here, "As you are aware, transactions within the United Kingdom involving 'advanced systems' are also subject to the obtaining of U.S. export license approval. Such transactions include not only the initial installation of a new machine with a user, but also any subsequent dealings or transfers in such machines (at least while they remain an 'advanced system')."

Sent to the 30 major UK leasing companies dealing in IBM systems, the letter included as advanced systems: the 3033, 3042, 3062, 3081, 3083 and 3084, the 3838 and the 4381 Model Group 2.

The letter went on to say that transfers between users of any machines listed would require prior U.S. Commerce Department expert licensing and that applications could take three months to be processed.

Norman Tebbit, secretary of state for Trade & Industry, declared, "That is quite clearly an attempt by the U.S. government to impose its laws within the United Kingdom."

There is a belief within the UK leasing industry that the issue has come up at this time in part because the U.S. Export Administration Act is up for renewal, and there are considerable pressures in Washington, D.C., to make the rules stronger.

The list that IBM uses in the letter includes the 3033, which is now technologically obsolete. Whether or not they have ended up in the Eastern bloc, a number of such systems, and others on the list, are said to have been resold here without any notification.

Mike Dudley, a senior executive with Capital Leasing, said, "Once we have sold a system to a user, we cannot impose conditions and police them on its resale." He believes that few of the leasing industry's — or IBM's — customers in the UK bother about these so-called procedures or resale. He points out, however, that any exports would be covered by UK legislation, and applications would have to be made to the British government. The IBM letter noted all such exports "are also licensable" by a UK government agency.

Parry Mitchel, chairman of United Leasing, one of the larger UK leasing companies, said IBM would not issue such a letter without the prompting of Washington and called it "an attempt by the U.S. government to impose its laws within the United Kingdom. And that, of course, is contrary to international law."

Mitchel issued some pointed guidance to IBM UK, saying, "Unless this problem is resolved ... it's going to be extremely bad for their business."

Fake Apples barred from U.S.

WASHINGTON, D.C. — The International Trade Commission (ITC) recently barred the import of Apple Computer, Inc. Apple II and Apple IIe look-alikes, whether or not they contain an internal operating system, unless importers post a 200% duty tax on the value of the product.

President Reagan now has 60 days to accept or reject the findings of the commission.

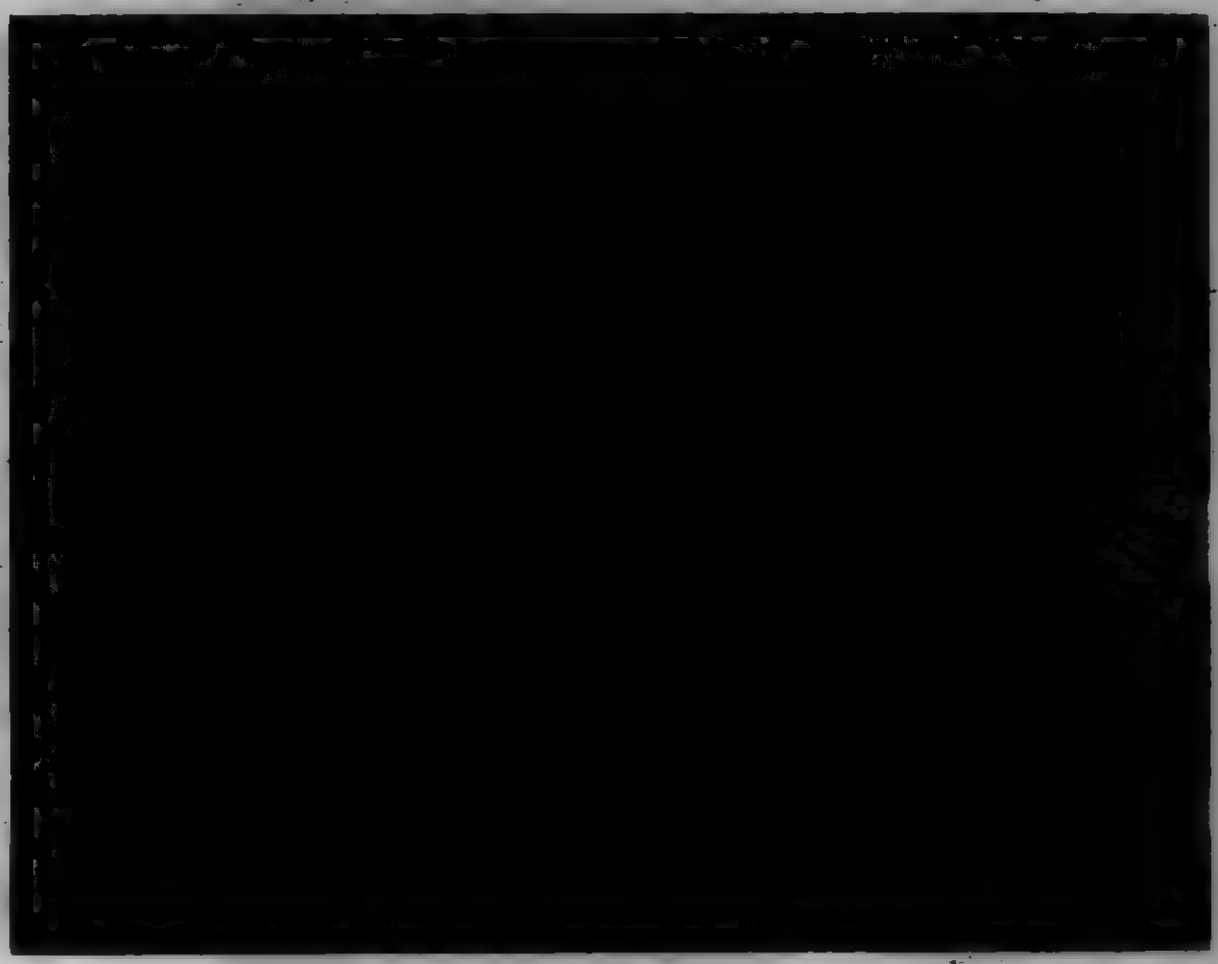
"We concur that the infringing imports have a tendency to substantially injure the domestic [computer] industry," the report said. "It is clear from the record that numerous [parties] are attempting to sell, and are selling, infringing computers in the U.S. under circumstances that indicate they are likely to be successful."

The ITC also noted that the Apple look-alikes are selling at prices much lower than Apple products, ranging from $300 to $400 per unit. U.S. Customs Service officials report that they have seized about 3,000 computers being sold as Apples.

The ITC determined that both Apple patents and software copyrights were being violated by the imports. The commission went further than expected when it expanded the order to bar imports "that have motherboards substantially similar to the Apple motherboards.

"To avoid evasion of our order, it excludes from entry computers and components [without read-only memory] which can be shown to be associated with imports," the ITC said.

Apple originally filed a complaint charging at least 15 foreign-based concerns, most of them located in Taiwan and Hong Kong, with manufacturing Apple look-alikes. Only two parties named by Apple appeared at the investigative hearing conducted by the ITC.



StorageMaster™
Media is Here!

Now you can buy flexible disks with a five year warranty from Control Data.

A lot of companies make diskettes. But Control Data also makes disk drives. In fact, we're the leading independent supplier of disk drives to computer manufacturers.

Now we've put our expertise into a truly superior line: StorageMaster diskettes from Control Data.

You can choose from a complete line of premium 8" and 5.25" diskettes in single or double densities, single or double-sided. And each diskette is 100% certified and backed by a 5 year warranty. So you can depend on them to perform for years to come.

Look for StorageMaster diskettes at your local computer store or ask for them from your computer supplies distributor.

Or give us a call toll-free at 1-800/328-6207 (in Minnesota call 612/835-8065) and we'll tell you where to find StorageMaster diskettes.

Nacha narrows EFT search to Geisco, McAuto

By David Simon
CW Staff

WASHINGTON, D.C. — A National Automated Clearing House Association (Nacha) task force has narrowed its search for a private processor of institutional electronic funds transfers (EFT) to two vendors — General Electric Information Services Co. (Geisco) and McDonnell Douglas Automation Co. (McAuto).

The task force is investigating how the nation's 31 regional automated clearing houses might switch from the Federal Reserve System to a private processor for financial institution payments.

The regional associations supervise the processing of corporate and consumer electronic fund transactions, which are sent through member banks and participating companies.

These transactions typically include preauthorized payments, such as automatic payroll deposits; interest, dividends, pensions and annuity payments; and payments of mortgages, installment loans, insurance premiums and utility bills.

The selection of Geisco and McAuto completed the first phase of Nacha's evaluation of proposals from eight companies, including IBM, Mastercard International, NCR Corp. and Visa U.S.A., Inc. A second phase of the selection process involves evaluating the Geisco and McAuto plans and deciding how they fit in with Nacha's overall objectives, according to Merrill Miller, Nacha vice-president and senior vice-president of California First Bank in San Diego.

Miller said the task force could recommend to the automated clearinghouses either a regional or national approach. Under a regional plan, it would be up to the individual associations to decide whether to replace the Federal Reserve with a private vendor. Automated clearinghouse groups in Arizona, Hawaii and New York have already taken such a step, Miller said.

A second approach would be to develop a single private vendor to provide EFT for the regional associations.

In seeking an alternative to the Federal Reserve, Nacha hopes to point the way toward lower costs and better service for the automated clearinghouses, according to Gary Singer, secretary/treasurer for Nacha. He said the group is particularly interested in moving toward an all-electronic delivery service, something the Federal Reserve is presently unable to provide. "We're trying to provide a flexible and efficient automated clearinghouse environment," he added.

"There is one national processor [the Fed] now," Miller said. "If you look at any other aspect of banking [such as check clearing], there are many service providers." A more competitive environment, he added, "is very healthful in terms of refining, developing and enhancing the service."

The Geisco and McAuto plans were outlined in March at the annual Nacha conference in New Orleans. Geisco proposed a nationwide automated clearinghouse service that would use its existing Mark 3000 IBM-based processing service and its Mark III network, company officials said.

McAuto also is proposing a national electronic payment delivery system called the Financial Users Nationwide Distribution and Settlement. The McAuto bid, part of a joint effort with the First National Bank of Chicago, is said to feature full electronic transfer and the capability to service both small and large financial institutions, a company spokesman said.

Both vendors agree that the Nacha recommendation is potentially very lucrative.

The task force will meet this month to evaluate further the two vendors' offers. The group hopes to make a recommendation by the end of June, Singer said.

Intel to build plant in Ariz.

SANTA CLARA, Calif. — Intel Corp. announced recently it will build its first major semiconductor component and assembly plant in the U.S. in Chandler, Ariz.

Construction of the 200,000-sq-ft plant will begin this year, and the facility will open in the second half of 1985, the company said.

Intel's other major assembly plants are located in Malaysia, the Philippines and Barbados.

The company also announced recently it will build its ninth wafer fabrication plant in Rio Rancho, N.M.

Gordon E. Moore, chairman and chief executive officer of Intel, said the Chandler plant will be a cost-effective component assembly plant "because the assembly process is becoming increasingly automated and, therefore, less labor intensive."

Intel said it expects to spend more than $200 million on new facilities and equipment this year.

Finally, the definitive for reaching today's data communications

It's called ANI™—Advanced Network Integration. From Infotron.

ANI is a definitive path for network growth and management that's reflected in a family of data communications products and services.

It gives you something you haven't had before—the means to plan and implement a data communications network based on long-term strategy.

ANI covers everything we make—from simple modems to stat muxes, to high-speed muxes, to network concentrators, to intelligent data switching systems.

ANI also includes everything we do. Systems engineering, from technical support to turnkey operations. Installation. Training. Telephone consultation and dialup online diagnostics. And worldwide field service.

Growth.
ANI products grow with you.

They're based on an architecture that's simple to expand and upgrade.

Because ANI products can be expanded both in size and function, they're easily integrated into larger, more complex networks. They grow with you instead of becoming obsolete.

Flexibility.
ANI products are versatile.

They can accommodate computers and terminals with almost any combination of protocols and speeds.

And because of their modular structure, ANI products will accommodate bridges to other networks, and gateways to public and private resources.

STC to remain silent on lawsuits, seek single hearing

By Peter Bartelik
CW Staff

SAN FRANCISCO — Storage Technology Corp. (STC) said recently it will not comment outside the courtroom on the mounting lawsuits filed by investors in its canceled mainframe project, but an attorney who filed one of the suits said STC will seek to have all the suits heard by one federal judge here.

Ronald B. Weinel, STC vice-president for investor relations, said recently the company will "just go on through the normal course of litigation, and we will just not make any public comment on them."

A total of six suits claiming misrepresentation and fraud by STC have reportedly been filed in various federal jurisdictions, although STC would not definitely confirm that. Weinel said he couldn't be sure of the exact number.

According to Chicago attorney Donald E. Egan, who filed the first suit [CW, Feb. 13], a class action suit brought by investor Michael Abelson, six suits are definitely pending in federal courts in San Francisco, Denver and Tampa, Fla.

The suits have been filed on behalf of Class A and Class B investors in Storage Technology Partners, a limited partnership through which STC raised in excess of $60 million to fund development of an IBM-compatible mainframe computer, which it subsequently canceled earlier this year [CW, Feb. 6]. All the suits reportedly charge to some degree that STC misrepresented the success it was having in developing the mainframe.

According to the suit filed by Egan, the partnership sold 5,000 units at $10,000 per share to 300 Class A investors for a total of $50 million between 1981 and 1983. In mid-1983, the partnership offered 2,000 units of Class B shares at $10,000 per share, and 180 investors paid approximately $10.6 million.

Egan said he is aware of — in addition to the class action suit filed by him regarding Class B investors — two individual suits filed by Class A investors in Denver, a class action suit for Class B investors filed in Tampa, an individual suit for Class A investors filed in San Francisco and, the most recent, a class action suit for Class A investors filed in San Francisco.

Egan said it is his understanding STC will file motions to bring all the cases under the jurisdiction of one judge in federal court in San Francisco. STC has not yet filed any answering brief to the charges, and "we've agreed to give them additional time," Egan said.

Commenting on his request that treble damages be awarded investors under terms of the federal Racketeer-Influenced and Corrupt Organizations Act (Rico), Egan said use of Rico is becoming "a very popular and vocal tool" in civil suits, although it was originally designed for use against organized crime figures.

Honeywell sets pact with NEC

MINNEAPOLIS — Honeywell, Inc. and NEC Corp. recently concluded definitive proceedings formalizing an agreement reached in principle last year to combine Honeywell's operating system with NEC's S1000 hardware system. It was also announced that CII-Honeywell Bull of France has signed a similar agreement in principle with NEC.

Honeywell and NEC announced last October [CW, Oct. 31] the decision to realign their business strategies. NEC essentially grew under Honeywell's wing and was granted Japanese rights to Honeywell technology in 1962, but the relationship began to erode in 1980.

Early last year [CW, Feb. 14, 1983] it appeared the two vendors were competing against each other when General Electric Information Services Co. (Geisco) announced that its network of Honeywell DPS 8 computers would be upgraded with NEC's S1000 mainframe, rather than with Honeywell's announced DPS 88/81 machine.

Still in contention

Kathy Tunnheim, spokeswoman for Honeywell, said Geisco has not yet announced final results of its "runoff" and that Honeywell remains in contention. Contrary to reports, she added, either vendor's machines selected by Geisco will run under Geisco's own Mark III operating system.

Honeywell said it would not dispute overseas reports that NEC will supply 150 of the S1000 machines to Honeywell.

Honeywell said the agreements provide for the three companies to work together to integrate NEC's S1000 large-scale processor with Honeywell's Gcos operating software, peripherals and communications system.

The S1000 system will be available to Honeywell late in 1985 and to CII-Honeywell Bull in 1986, Tunnheim said.

path
and tomorrow's —
objectives.

Management.
Management and control are vital to the operation of large, widely-dispersed networks.

ANI products give you the tools for monitoring activities, gathering statistics and keeping informed of events as they occur. From a central point, networks can be configured to meet changing requirements and provide diagnostics for solving problems.

Regardless of network size or complexity, ANI provides complete accountability for network operation.

The Bull Group to establish Bull Peripheral in Calif.

To spark developmental capability for Bull in U.S.

SUNNYVALE, Calif. — A subsidiary of CII-Honeywell Bull, Cynthia Peripheral Corp., announced recently The Bull Group will establish Bull Peripheral here to initiate a developmental capability for Bull in the U.S.

Bull Peripheral, composed of groups of senior technical staff from the France-based computer manufacturer, will concentrate on magnetic printers and rigid disk drives and will plan and develop leading-edge products for downstream marketing in the U.S. and Europe.

The French complement in the U.S. will number a half-dozen employees over the first year and will be housed in a new 10,000-sq-ft addition to the present Cynthia Peripheral located here.

Cynthia Peripheral said the new group will grow to a more comprehensive Bull presence in the U.S., leading to assembly and test operations. The Silicon Valley area reportedly was selected because of its reputation as one of the leading research and development areas in the world.

The Bull Group is said to be the leading French manufacturer of computers, with revenues last year of nearly $1.5 billion. Cynthia Peripheral is responsible for all Bull OEM peripheral sales, marketing and customer support activities throughout North America.

Videotex venture to target home user as future client

OUTSIDE LINES
Bohdan Szuprowicz

Videotex, sometimes called "the electronic library," has received a lot of publicity in recent weeks, topped by the announcement that CBS, Inc., IBM and Sears Roebuck & Co. have ganged up in a joint venture to take over the business. To some industry observers, this means that videotex has finally arrived, but others are not so sure.

The new venture is not in a hurry to offer any services for several years to come. What is significant, however, is the fact that it will be specifically targeting the home computer user as its future client, apparently at about half the cost of what current videotex suppliers are charging. Also, by providing access for any personal computer — whether from the IBM stable or not — the enterprise plans to eliminate the otherwise costly terminal that videotex users must buy or rent today to use the service. This will guarantee the group a multimillion subscriber base potential.

In its present form, videotex is basically an interactive information service using telephone lines or CATV distribution channels to connect a television set or a special terminal to a data base of general or specialized information. Subscribers must pay as much as $600 for the terminal or television set adapter, and they are facing user fees on the order of $15 per month plus telephone connect charges.

Videotex services of this type display mostly previously published material, while the interactive feature provides guidance through the data bases not unlike an index in a library. If the user wants to manipulate such data or perform transactions based on information acquired from various data bases, he must, more often than not, still revert to manual routines of filling out forms, signing checks, licking stamps and going to the bank.

There are at present over 5,000 data bases of all kinds available online, and individual videotex suppliers provide their subscribers with access to one or more such data bases.

Nevertheless, after several years of heavy promotion in over 20 countries, videotex has failed to capture the imagination of the masses, and most suppliers are still trying to discover how many customers are willing to pay for access to information that is otherwise available at a fraction of the cost. So far, no one seems to have discovered the magic formula that brings the price of home videotex services into balance with benefits to subscribers and costs of the operators.

Focus on business

As a result, videotex suppliers have been concentrating on business markets in recent years, peddling transaction-oriented information data bases containing specific facts such as prices, names, addresses and stock quotations that provide a competitive edge to the end user. This is not to say that the home consumer has been forgotten in the shuffle, but it is clear that until the content of videotex services is more appealing, the home videotex user will not embrace such a service on a massive scale.

What also keeps the videotex promoters searching for the magic content formula are the optimistic projections of huge videotex markets in the future, some of which envisage up to 30 million households in North America using videotex by the mid-1990s, when it will become a $30 billion industry.

Recent estimates by Predicasts, Inc. put videotex revenues at about $100 million in 1983, growing at over 100% per year and expected to reach $2 billion as early as 1987. Other forecasts are even more optimistic, predicting as much as $7 billion in revenues in 1987 and up to $10 billion by 1990. But others still do not see that market expanding anywhere near as fast and do not believe it will reach more than $500 million by 1992. These huge discrepancies only underscore the lack of real track record data in this emerging industry.

The entry of CBS, IBM and Sears in a joint venture, however, points to some new directions being taken in the battle to win the home videotex consumer. These are probably best understood when you analyze the operations of the three constituent companies; they offer valuable clues to present and future videotex competition.

Banks and mail-order shopping houses are among the most powerful supporters of videotex because they see it as a means to automate their "front office" activities in an increasingly competitive environment. Sears is, in fact, in both these businesses because it is the largest mail-order house and owns Allstate Insurance Co., Dean Witter Financial Services investment brokers

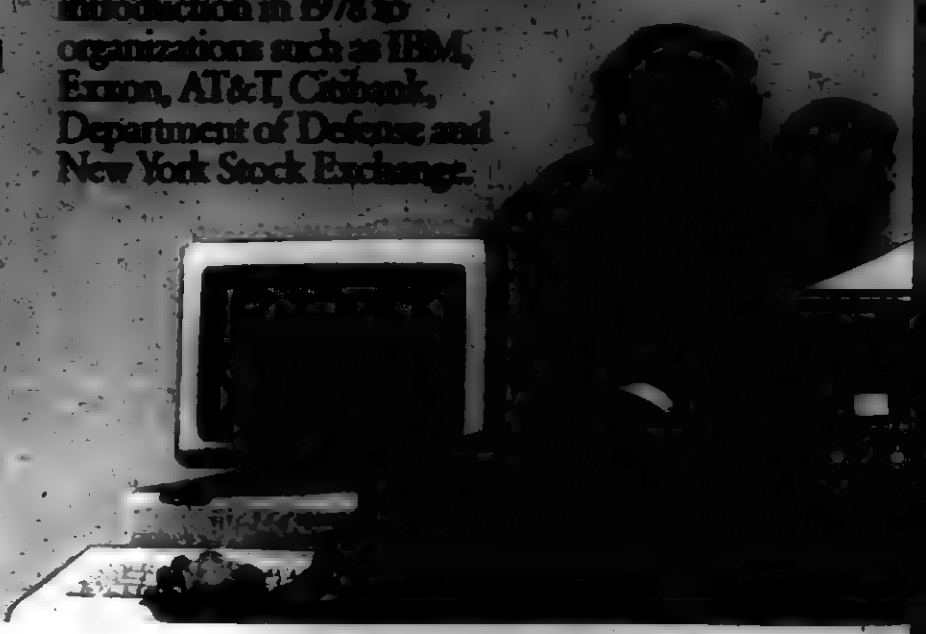
See VIDEOTEX page 152

Electrohome's EDP-57 is the proven and accepted way to project monochrome terminals for group presentations, training sessions and sales meetings.

No other projection system today can work with so many computer terminals!

- Fast, easy set-up by non-technical people.
- Adjustable for flat or curved, front or rear screen projection.
- Interfaces available for over 150 terminals.
- Lightweight and portable; easily moved from room to room.

Thousands of Electrohome EDP projectors have been sold since its introduction in 1978 to organizations such as IBM, Exxon, AT&T, Citibank, Department of Defense and New York Stock Exchange.



COMPUTER INDUSTRY

Former Xerox exec finds advantages to small firm

By Steve E. Owen
Special to CW‡

It's been almost a watchword to most of us growing up that the preferred course is to finish college and get hooked up with one of the big corporations. They offer stability, security and benefits that are often out of reach for employees of smaller firms.

Therefore, it came as something of a shock to my friends and associates, after years of working my way up corporate laddess with two of the largest and best known firms in the world, that I left all that behind to take a position with a small firm. A firm, by the way, that's in direct competition with IBM and Xerox Corp., my former employers.

Granted, the move took me from a mere vice-presidency at Xerox to the positions of president, chief executive officer and member of the board of directors at Western Data Systems, Inc. (WDS). It was not a desire for titles or some personal ambition, however, that helped me decide to make the change. After all, in a business as volatile as computer software and hardware, there is a certain amount of risk involved in such a career switch.

The truth is, there are major advantages that a smaller company has over a larger company. Not the least of the advantages is the opportunity to once again serve customers and not just the stockholders.

That doesn't mean that corporate officers at large companies don't care about their customers — just that priorities are different. When a company has huge capital investments in a particular line of hardware, for instance, its officers have to be constantly cognizant of that fact.

In a small company, the ability — even the necessity — of being responsive to the needs of customers is more highly developed. Customers and products are direct, tangible items with which every person is involved.

Employees are there to see the company grow, to satisfy a market need, not simply to collect a paycheck. There is an excitement, a sense of urgency about the business that is often lacking in larger organizations. There is a flexibility for innovation and change, with no bureaucracy to buck.

In a small company, you can provide 10 improvements to the customer in the time it takes just to get one change approved by an industry giant. A case that speaks to all of the above ideas is that of Western Data Systems itself.

WDS has built its reputation in the field of software development and marketing with an integrated manufacturing and financial system. It's an excellent job shop and manufacturing system, but it had lacked features that one client, heavily involved in government contract work, absolutely had to have.

The upshot was that the company was able to develop a system to meet that client's specific needs. It was able to devote the manpower to bring the whole of the company's resources to bear on the solution of one client's problem.

As a result, a new product was developed that speaks to the specific needs of a hitherto untapped market in the manufacturing industry.

With only two or three layers of top-to-bottom management with which to consult, the decision could be made quickly to take the risk involved in tackling a project like the one outlined. Picture, if you will, trying to get approval of this type of undertaking through the 15 or so layers that exist in huge organizations. You're looking at decisions made in millenia, not hours.

True, the small company makes mistakes sometimes, but progress comes from action, not discussion.

This brings us to another point. In bigger companies, markets are examined and targeted, and products are devised to fit them. The process is backwards, and the solutions devised often fail to anticipate needs that become apparent only by direct customer experience.

Smaller companies tend to reinvest earnings to products and services, not overhead resulting from a massive support structure.

The case of Texas Instruments, Inc.'s sudden pullout from the home computer market illustrates this point. According to news reports at the time, a multimillion dollar advertising campaign was already under way and couldn't be stopped, despite the fact that the computers were going for a song at every discount house and computer store in the country. Possibly the decision was made to continue the campaign just to deplete the warehouse stock, but it's hard to believe it was cost-effective on that basis.

Granted, TI will survive, while a setback like that might have destroyed a company with more limited resources. On the other hand, the smaller outfit would probably have been unable to make such an overcommitment.

In summation, it must be granted that giving up the security and the resources available in a large company is no easy thing. I'm not saying that big is bad, at all. There are disadvantages to being with a small firm that some may feel I've glossed over.

Small isn't for everyone, it's true, but the feeling of excitement, of being able to respond to customer needs in a tremendous industry, is right for me.

Owen is president, chief executive officer and member of the board of Western Data Systems, headquartered in Calabasas, Calif. Previously he was vice-president of planning, development and product marketing for Xerox Computer Services.

RCA Service realigns its communications business

CHERRY HILL, N.J. — RCA Service Co. announced recently a reorganization of its commercial communications businesses in a move designed to offer a new level of service to business customers.

The reorganization combines the company's existing data services business with a new automated business communications organization in a single division under the direction of Earle A. Malm II, formerly the division vice-president of telephone systems and data services.

The telephone systems business will now report to Raymond J. Sokolowski, division vice-president of consumer and commercial services, according to a spokesman for RCA Services, a division of RCA.

Malm said the company's "new thrust focuses on developing systems for businesses that have complex data and voice communications requirements. We are investing in the future while building on [RCA] Service Co.'s extensive distribution and service network.

"With our planned investments in automated business communications, we intend to offer systems designed to solve specific customer-application problems. And we will support those systems with high-quality user training, documentation and service," he said.

The reorganization will not affect RCA's telephone systems customers, Sokolowski said.

But the company reportedly plans a more regional structure in managing the sales force and intends to transfer the majority of sales and support personnel into regional offices and existing branches.

ONE OF THE BEST BRAND NAME PRINTERS HAS A BRAND NEW NAME.

GENICOM

The General Electric 3000 family of printers has become an industry leading product. But now, this popular printer series has a new name, because the Data Communication Products Department of GE is now an independently owned company called Genicom.

At Genicom today, we offer the same complete line of printers we offered while a part of General Electric. We have the same facilities, the same nationwide service network, and the same corps of experienced employees...only the name has changed.

Above all, Genicom offers you the same reliable product quality you've come to expect from us over the years. Our Genicom 3000 printers feature outstanding performance for end-users as well as superior flexibility for many OEM's, distributors, retailers and dealers. There are 3000 models with speeds from 40 to over 400 cps. Single or dual mode printing. Type quality from EDP to NLQ. Multi-color printing. Graphics. Selectable type fonts, American craftsmanship and more. There are even 3000 family printers for personal computers...ideal for business needs.

We're proud of the excellent brand reputation we established under General Electric. But now we're going to make a new name for ourselves by bringing you more innovations, and more of the reliable quality you've always found in each of our products.

Genicom Corporation, One General Electric Drive, Dept. M331, Waynesboro, VA 22980. In Virginia, call 1-703-949-1170.

Comsat mulls SBS pullout

WASHINGTON, D.C. — Satellite Business Systems (SBS), the joint satellite network venture, may be in the process of losing one of its founding partners.

Communications Satellite Corp. (Comsat) recently confirmed rumors that it is thinking of cutting its losses in the business that was formed with IBM and Aetna Life & Casualty Co. as partners by reducing or selling its interest in the venture.

SBS has reported losses of more than $120 million in each of its three years since it was founded.

In a related development, American Information Technology, one of the seven regional telephone companies, said it had signed a five-year agreement with an SBS subsidiary, SBS Real Estate Communications Corp., to provide communications equipment and services worth a reported $130 million.

Nata to get gear orders

WASHINGTON, D.C. — The Bell Atlantic telephone companies have agreed to process all equipment service orders through the North American Telecommunications Association (Nata).

Nata is the trade association of the competitive telecommunications equipment industry, representing more than 600 non-Bell manufacturers, suppliers and vendors.

According to Nata, the agreement was designed to help the divested Bell operating companies facilitate the installation of business telephone equipment while ensuring that customers of competitive equipment vendors are not discriminated against in receiving those services.

Now you don't have to be rich to be powerful.

Riches and power don't always go together. Take Plexus, for instance. The world's most powerful UNIX*-based supermicros.

Powerful because multiple processors share the UNIX load. So processing power is distributed to where it does the most good.

Terminal I/O. Disk I/O. Data communications. And, of course, data processing.

Our unique architecture also lets us bring you the world's first UNIX Network Operating System (NOS). So you can combine Plexus systems in an Ethernet network for even more power.

NOS gives you real time, continuous access to files. From anywhere in the network.

Files are also updated on the same basis. So everyone in the network works with up-to-the-minute data. Automatically.

No waiting for file transfers. And that's a decided improvement over everything else that's out there.

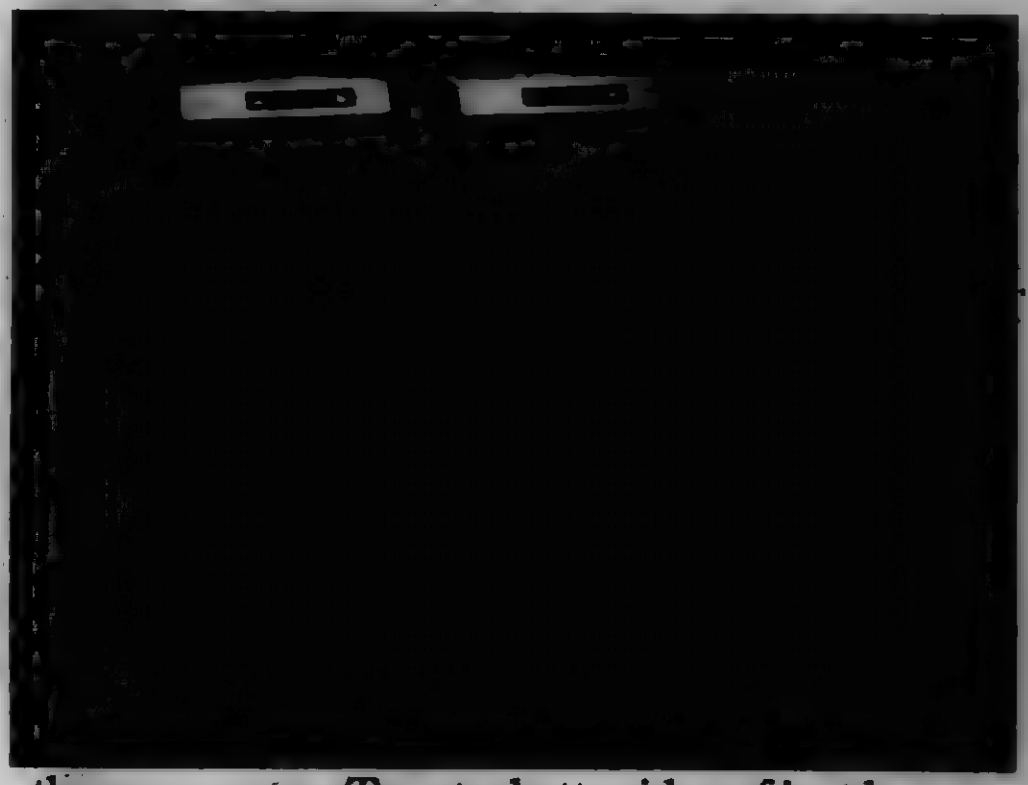
You also get to save money on powerful UNIX-based software, including COBOL, FORTRAN, Pascal, BASIC, and C. Database management and word processing, too. As well as hundreds of third party UNIX packages.

Plus our own software and maintenance support. And even a software referral service for your OEM programs.

Does all this make us expensive?

Absolutely not.

In fact, Plexus systems cost thousands of dollars less than the minicomputers we outperform.



To get a better idea of just how good that performance is, come get a demonstration. Call *800-528-6050*, ext. *1444*. In Arizona, *800-352-0458*, ext. *1444*. Or write Ralph Mele at Plexus Computers, Inc., 2230 Martin Avenue, Santa Clara, CA 95050.

You see? You don't have to be rich to be powerful. Just smart.

PLEXUS

Built for speed.

EXECUTIVE CORNER

C.M. Chung has been elected president and chief operating officer of General Instrument Corp.

■

Mitsubishi Electronics America has named four new executive vice-presidents. They are **Ric Fechtman**, administrative and operations group; **Yoshiro Kitada**, electronics and communications group; **Hiro Taniguchi**, semiconductor division; and **Rempei Tsuchiya**, assistant to the president.

■

Daniel A. Hesse has been appointed chief executive officer at Devox Communications Corp.

■

Russell J. Hit has been appointed vice-president of operations at Sun Microsystems, Inc.

■

Richard H. Lassier has resigned as executive vice-president and a director of Raster Systems Corp.

■

Angelo V. Cappuccio has joined California Devices, Inc. as chief financial officer.

■

Informatics General Corp. has announced the following appointments in the Financial and Insurance Systems Group: **M.L. Bradley**, group vice-president; **Terry D. Jung**, vice-president, finance and administration; and **William L. Altes**, vice-president of sales. **Stanley A. Alekna** has been promoted to vice-president/general manager of the company's Life Insurance Systems Division.

■

James G. Warner has been named vice-president of Cortex Corp.

■

Arthur J. Schneider has been named vice-president, advanced technology, in the computer systems operations of Sperry Corp.

■

John Molitor has been named president and chief operating officer of BKW, Inc.

■

David C. Fries has been appointed president and elected a director of Ibis Systems, Inc.

■

Robert A. Halab has been appointed chief financial officer of Tymshare, Inc.

■

Carole Morton has been named president of Dylakor, Inc.

■

Roger Gower has been named president of Qume Corp., succeeding **David Sen-Lin Lee**, founder of Qume, who has been named a vice-president of ITT and head of ITT's Business Information Systems Group.

■

Peter A. Davis has been elected president of Open Systems, Inc., the microcomputer division of University Computing Co.

■

Stephen G. Jerritts, president of Lee Data Corp., has been elected to the additional office of chief executive officer, succeeding company founder **John M. Lee**. Lee will remain chairman of the board of directors. **Wayne A. Zachike** has been elected vice-president, corporate controller and treasurer of the company.

■

Jim M. Smaha has been promoted to vice-president and general manager of the semiconductor division of National Semiconductor Corp.

■

Robert W. Casey has been named vice-president, international, at The Ultimate Corp.

■

John J. Christman has been named corporate vice-president and general manager of the data products division of Facit, Inc.

■

Ronald W. Braniff has been appointed president of ASK Computer Systems, Inc. **Sandra Kurtzig**, founder and former president of ASK, continues as chief executive officer and chairman of the board.

■

Scott McNealy has been appointed president and chief operating officer of Sun Microsystems, Inc.

■

Terry D. Cardor, president of Reynolds & Reynolds Co., has been named chief executive officer following the resignation of **E.F. Strasser**. Strasser will remain chairman of the board. **Budd L. Tipple** has been named senior vice-president and chief operating officer.

■

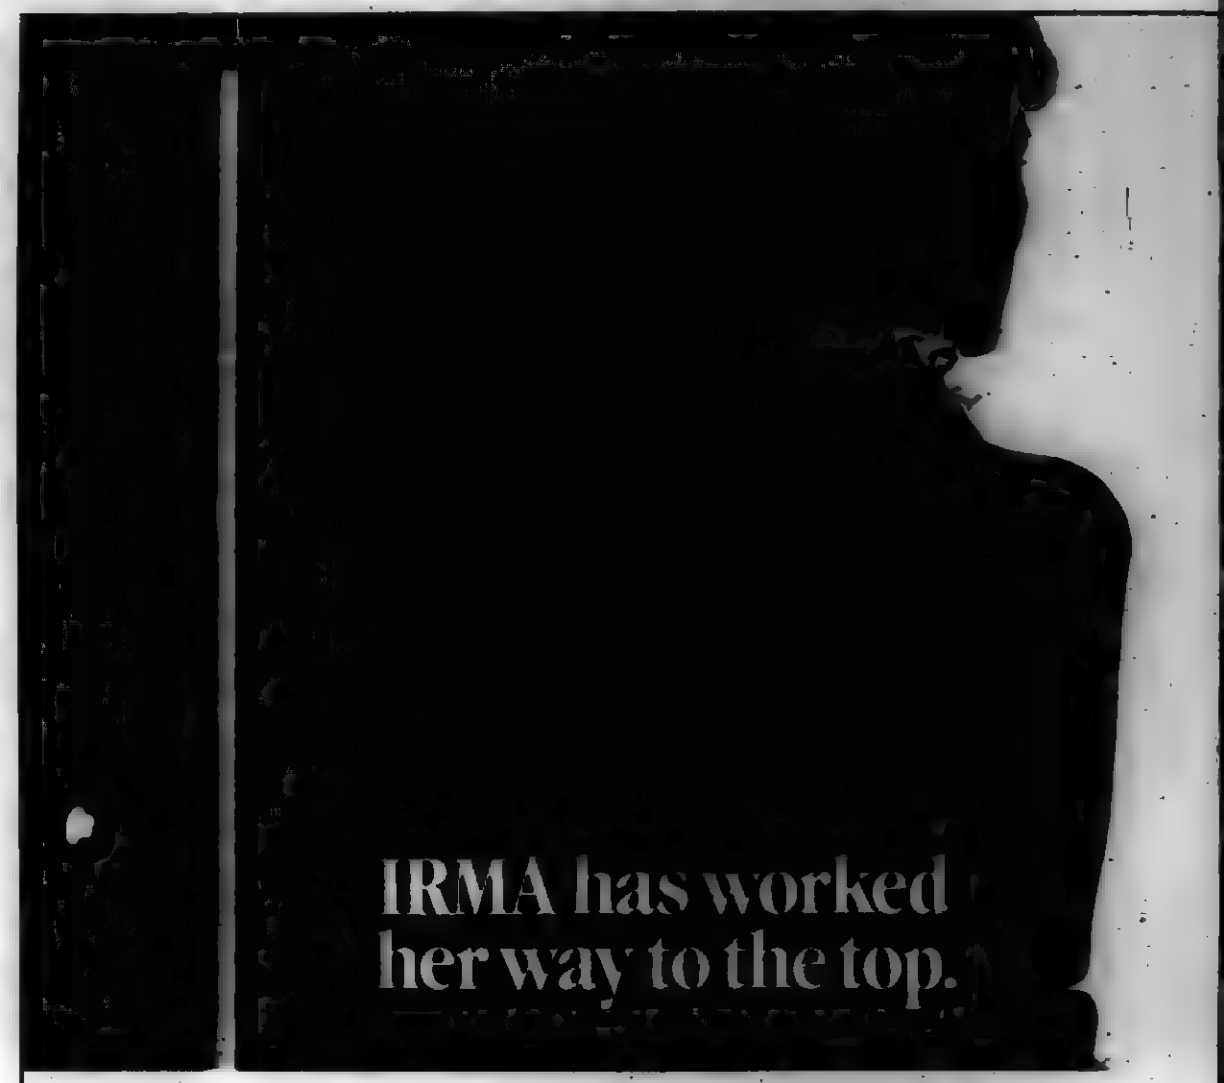
Richard Kemp has been appointed chief operating officer and general manager of Wordplex Corp.

Amdahl income seen down in '84

SUNNYVALE, Calif. — Amdahl Corp. announced recently it expects first-quarter 1984 income to be less than experienced during the comparable period one year ago.

According to John C. Lewis, Amdahl president, "The results of our European operations will be below expectation for the first quarter. This is mainly caused by 580 processor installation deferrals in favor of models and features which will commence volume shipment in the third quarter and by the negative effect on earnings of foreign exchange rates as compared to a year ago."

In the first quarter of 1983, Amdahl earned $7.4 million, or 12 cents per share, on revenues of $171.6 million. Analysts generally expected some increase for the first quarter of this year.



She's Director of Decision Support, the leader in IBM 3270 mainframe/PC networks.

IRMA is taking charge! Her performance in over 25,000 IBM 3270 mainframe/PC installations has made her the industry's leading Decision Support Interface.™ Why? Because IRMA works. Easily and economically, IRMA's on the job giving PC users mainframe data access, selection, storage and communication back to the mainframe.

She's more capable than ever.

IRMA is a printed circuit board that slips into any available IBM PC/PC XT slot and attaches via coaxial cable to a 3270 controller. She's as easy to work with as the PC itself and provides standard text file transfer software

HP exec reveals Personal Productivity Center concept

By Robert Bolt
CW West Coast Bureau

LOS ANGELES — "The office will be the backbone of all our computer activities over the next four to five years," a Hewlett-Packard Co. executive said here recently while announcing a strategy to market integrated office automation systems based around microcomputer networking.

Edward McCracken, general manager of HP's Business Development Group, announced the company's Personal Productivity Center concept at a press conference during the 1984 Office Automation Conference, sponsored by the American Federation of Information Processing Societies, Inc.

McCracken said HP will center its office automation marketing efforts on systems integrating the HP 3000 distributed processing system, interactive office software and the HP 150 touch-screen personal computer.

HP officials said the concept will provide office professionals, support people and clerical staff with word processing, personal file, graphics, spreadsheet analysis and data processing capabilities.

McCracken said the Personal Productivity Center is HP's response to swiftly merging markets for data processing, personal computing, office automation, word processing and networking capabilities.

The integrated market, he said, will create a need for a departmental work-group computer that will effectively manage a network of personal computers and office workstations handling both data processing and office applications, such as word processing and electronic mail.

"By tightly integrating the functions of personal computers, secretarial workstations, departmental computers and office software, we believe we can serve a market which is expected to reach $23 billion by 1988," McCracken asserted.

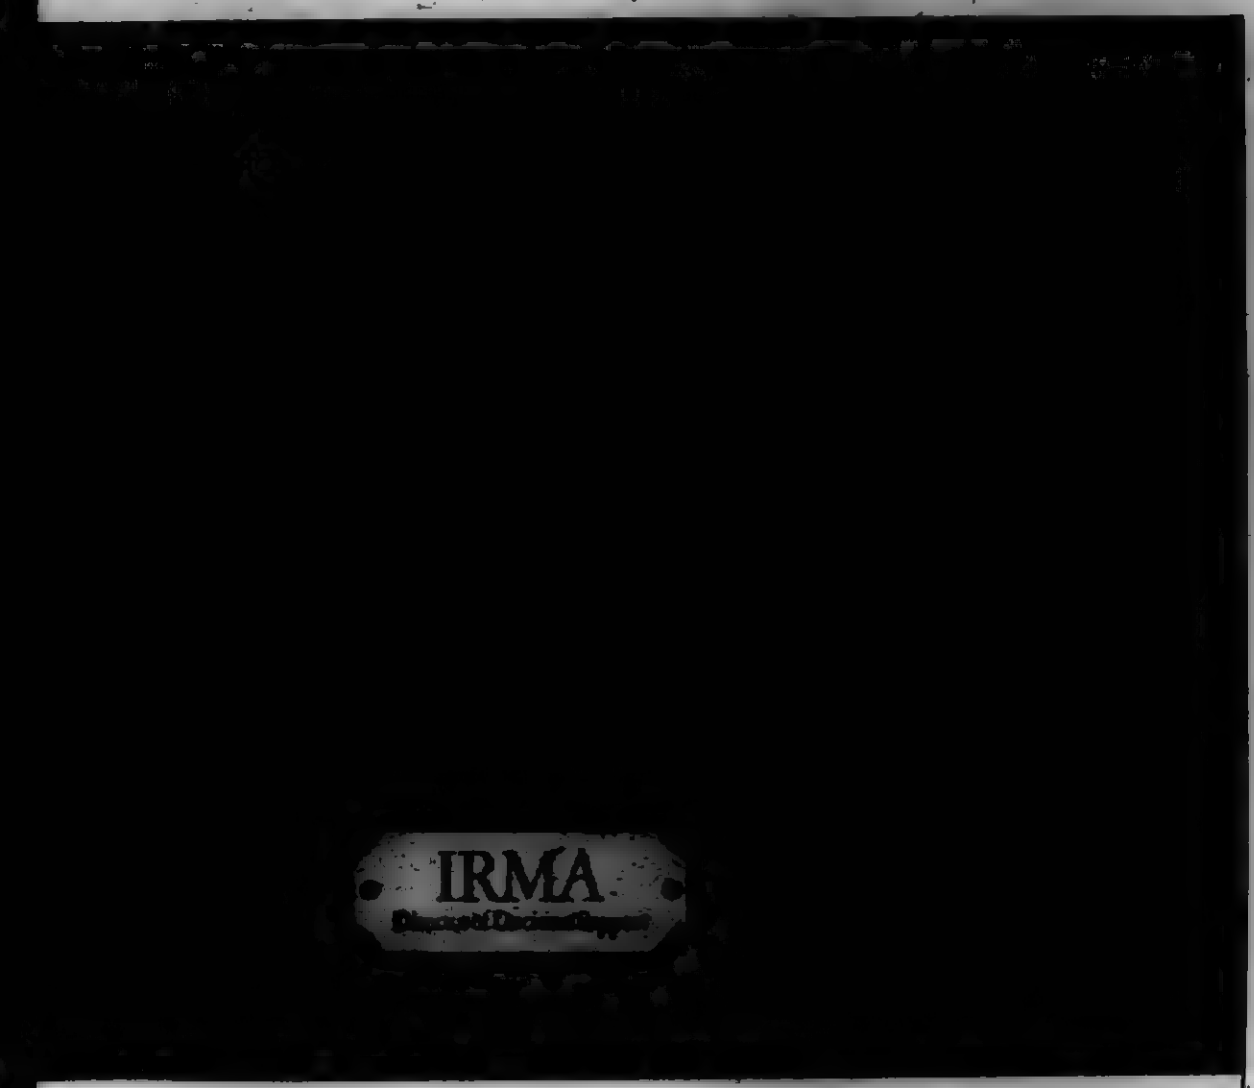
The company intends to provide applications access, data access, resource sharing, communications services and information management to users of both personal computers and MIS.

"The concept of the Personal Productivity Center lets personal computer users, who have developed individual applications on their personal computers, also take advantage of the more powerful data bases or office software on larger computers," McCracken explained.

HP officials said a small Personal Productivity Center might consist of several HP 150 touch-screen personal computers used as managerial workstations, HP 2626 secretarial workstations, an HP 3000 business computer and various office software.

Larger Personal Productivity Centers could link more than 100 personal computers or workstations in a single HP 3000-based network.

Embracing the concept of open architecture, company officials announced that in the future conversion capabilities between HP's word processing software and other key WP products will be provided. One example, they noted, is the current development of an interchange facility between HP Word and Wang Laboratories, Inc. products.



for VM/CMS and MVS/TSO mainframe environments, in addition to optional APL Terminal Emulation.

She's got more to offer.

Other IRMA products give you more ways to build cost-effective IBM 3270 and IBM PC-based decision support networks.

IRMALINE™ is the first coaxial link between 3270 networks and remote personal computers, including the IBM PC/PC XT, the Apple Lisa, the DEC Rainbow and others.

IRMALETTE,™ the Asynchronous Interface, lets you run the same IRMA software in your remote personal computer that you run in the office.

So connect with success. With IRMA products from DCA. Call 1-800-241-IRMA.

Connect with success.

5¢ NICKELS AND DIMES

Analogic Corp.'s reported sales for the second quarter ended Jan. 31 were $36.5 million. Net income increased 39% to $4.9 million, or 27 cents per share, from $3.5 million, or 21 cents per share, in 1982.

■

Lanier, Inc.'s reported revenues for the year were $54.2 million, down 13% from 1982. Earnings per share of 37 cents were up 19% from the fourth quarter of 1982.

■

American Software, Inc. reported revenues for the third quarter of fiscal 1984 were $6.2 million, up 37% from 1983. Net earnings increased $1.3 million, or 33 cents per share, up 41% from $960,000, or 23 cents per share.

■

Applied Data Research, Inc.'s reported revenues for 1983 were $89 million, an increase of 30% over 1982. Income was $12 million compared with $8.3 million, a 43% increase. Net earnings for 1983 were $6.9 million, or $1.45 per share, compared with $4.7 million, or $1.16 per share, in 1982.

■

Schnucks Software Systems, Inc. approved a 2,000-for-one split of the company's common stock, increasing the company's authorized shares to 2,400,000. The split will be effective to shareholders March 30, and shares will be distributed April 16.

■

Scarborough Systems, Inc. has obtained private equity financing of $6 million from an investment group. The financing group was assembled and coordinated by Alex Brown & Sons and by Morgens, Waterfall & Vintiadis.

SHORTSHEETS

Educom Computer Literacy Project has been awarded a $50,000 Exxon Education Foundation grant to support activities during 1984.

■

Cobe Laboratories, Inc. has entered negotiations with IBM for the possible purchase of a portion of assets of IBM's Biomedical Systems.

■

Data General Corp. has expanded its software development environment marketing program by appointing Redm Corp. as the marketing representative for Ada Work Environment.

VIDEOTEX from page 146

and Coldwell Banker Commercial Group, a nationwide commercial real estate broker firm. All of these operations could vastly improve their sales and productivity through transactional videotex services because they deal mostly in transmitting information.

IBM is also eminently suited to provide the hardware and software linking the ubiquitous IBM Personal Computer and other personal computers into sophisticated data bases that will also provide priceless real-time consumption and demand patterns to product and service suppliers that will cooperate with such a conglomerate.

CBS, on the other hand, can provide the customized entertainment content for such networks to take some of the boredom out of the more mundane videotex applications. There have been suggestions of interactive soap operas, for example, where subscribers get an opportunity to influence the unfolding story by voting to kill a particularly nasty character or to play the latest video games delivered electronically to their homes for a tryout.

For the individual investor, however, videotex does not appear to offer any unusual investment opportunities. Videotex services require huge resources, and other such ventures as Dow Jones & Co.'s News/Retrieval Service, Times Mirror Co.'s Videotex America, AT&T and Knight-Ridder, Inc.'s Viewdate and others are being introduced by large corporations or even larger joint consortia.

SEMI from page 135

erasable programmable read-only memory device; and the F245 microprocessor from Fairchild Camera & Instrument Corp.

Most computer manufacturers have adopted a multisupplier strategy in order to secure the parts they need. Altos Computer Systems, Inc., for instance, uses five U.S. vendors and three overseas manufacturers to supply itself with the 750,000 chips a month, including 100,000 dynamic RAMs, used in the production of its range of 8-bit and 16-bit small business computers.

"We have seen a definite lengthening of lead times, and over the last two months, we have been forced to obtain an increasing number of devices from distributors — up to 15% of our total supply — which means we are paying premium prices on those parts," Gary Strewter, vice-president of manufacturing at Altos, commented.

David Cochran, vice-president of quality, reliability and technology at Xebec Corp., a San Jose, Calif.-based manufacturer of hard disk drives and controllers, said prices are rising dramatically. "The spot market has increased tremendously, with a several dollar premium paid for those hard-to-get parts that have to be procured now to fill system deliveries," he claimed.

Exorbitant prices

Cochran said prices have already become exorbitant, with contracts made six months ago being ignored by semiconductor vendors in favor of renegotiated or more lucrative contracts.

According to Dick Rathman, vice-president of engineering at Durango Systems, Inc., a Silicon Valley-based small systems manufacturer, the rise in prices for large-scale integrated processor parts (from approximately 15 cents a piece in 1982 to over $1.40 a piece today) is typical of what is happening in the marketplace.

"Because of the shortages, we are having to carry excess inventory and pay premium prices to ensure we get what we need. With the larger semiconductor vendors, most of the chips are already allocated, which means we cannot ramp up production even if we wanted to," he said.

William Strauss, vice-president at Integrated Circuit Engineering Corp., a Scottsdale, Ariz.-based market research firm, predicted bankruptcies, particularly in the personal computer market: "There will be companies that cannot ship their computer products because of the lack of chips. The question is how long can they hold up without sufficient supplies? Those who survive may well be those who can afford to pay the expensive prices demanded and who can afford to ship their products at a loss for a while."

TIME
Your Most Precious Resource

In any business, time is money! This is especially true when dealing with Data Communication Networks where system performance and RESPONSE TIME is critical to the user.

Degradation of system performance (responsiveness) is inevitable as customer work loads increase. Installing faster, more sophisticated hardware is a popular but temporary solution. It is only a matter of time until the problem reappears.

Questronics offers a solution through statistical performance analysis of your system. Over seventy-five categories of line utilization and response time information can be generated in eleven different reports (hard copy and/or data based).

Questronics model CPA/7 is setting the standard in the industry by providing vital performance statistics in the areas of:

- •User/System Response Time
- •Network Transmission Time
- •Line Utilization
- •Polling Counts
- •Character Transmission Counts
- •Poll List Wrap Time
- •Transmission Errors
- •Histograms
- •Host Resident Time
- •Alarm Conditions

Utilizing this information, DataCom managers can then make the crucial decisions necessary to fine tune and balance the network. Each line may also be further refined to greater efficiency, enabling planning and projection for new growth.

Call Questronics and discuss your situation. We'll give you straight answers.

"IDMS/R represents a major advance in database technology."

Dave Litwack*

Because IDMS/R is the first relational DBMS designed for both the DP professional and the end user.

IDMS/R is not only a relational database management system, but a particularly powerful one. IDMS was made relational by removing all pointers and allowing the user to define data as tables and providing the traditional relational operators such as selects, projects and joins. The major benefit of a relational DBMS is the capacity to develop applications faster because the developer does not have to be concerned with the database design. IDMS/R provides this and much more.

For example, the Automatic System Facility (ASF) of IDMS/R is a major advance over fourth generation languages. The ASF is so comprehensive and easy to use that all a user need do, to develop an application, is define a relational record. The Automatic System Facility dynamically generates all necessary supporting structures including data definitions, screen formats, application processing logic, and documentation. So, the developer can witness the application being produced, literally, in seconds. This capability makes IDMS/R the perfect system for the end user.

Data processing professionals can use the ASF to help develop production applications. The ASF can be used to build a prototype that can be enhanced, using Cullinet's fourth generation language, ADS/OnLine, into a complex production application. But, when they build a complex high volume application using IDMS/R, DP professionals require outstanding performance. Typically, 5% of the data relationships (joins) in any application are accessed 95% of the time. With IDMS/R, they can simply change these relationships to predefined joins and benefit from a dramatic boost in performance. We call it Relational Fastpath. Relational Fastpath makes IDMS/R a unique DBMS and a perfect system for DP professionals' system development needs.

In addition, IDMS/R has the most sophisticated back-up and recovery capability of any DBMS, full integration with personal computers and is also integrated with Cullinet's complete line of financial and manufacturing applications.

In summary, IDMS/R was designed to satisfy the requirements of those who want to develop applications faster and those who have the responsibility of processing them.

For further information, attend a Cullinet Seminar. Mail the attached coupon or call Cullinet at 1-800-225-9930 (in Massachusetts, 617-329-7700).

*David Litwack is Cullinet's Vice President of Product Development. Mr. Litwack has contributed significantly to the many technical advances Cullinet has achieved in database software products, including IDMS/R. Mr. Litwack joined Cullinet in 1976. He is a Cum Laude graduate of Brandeis University and holds a Masters in Computer Science from Boston University.

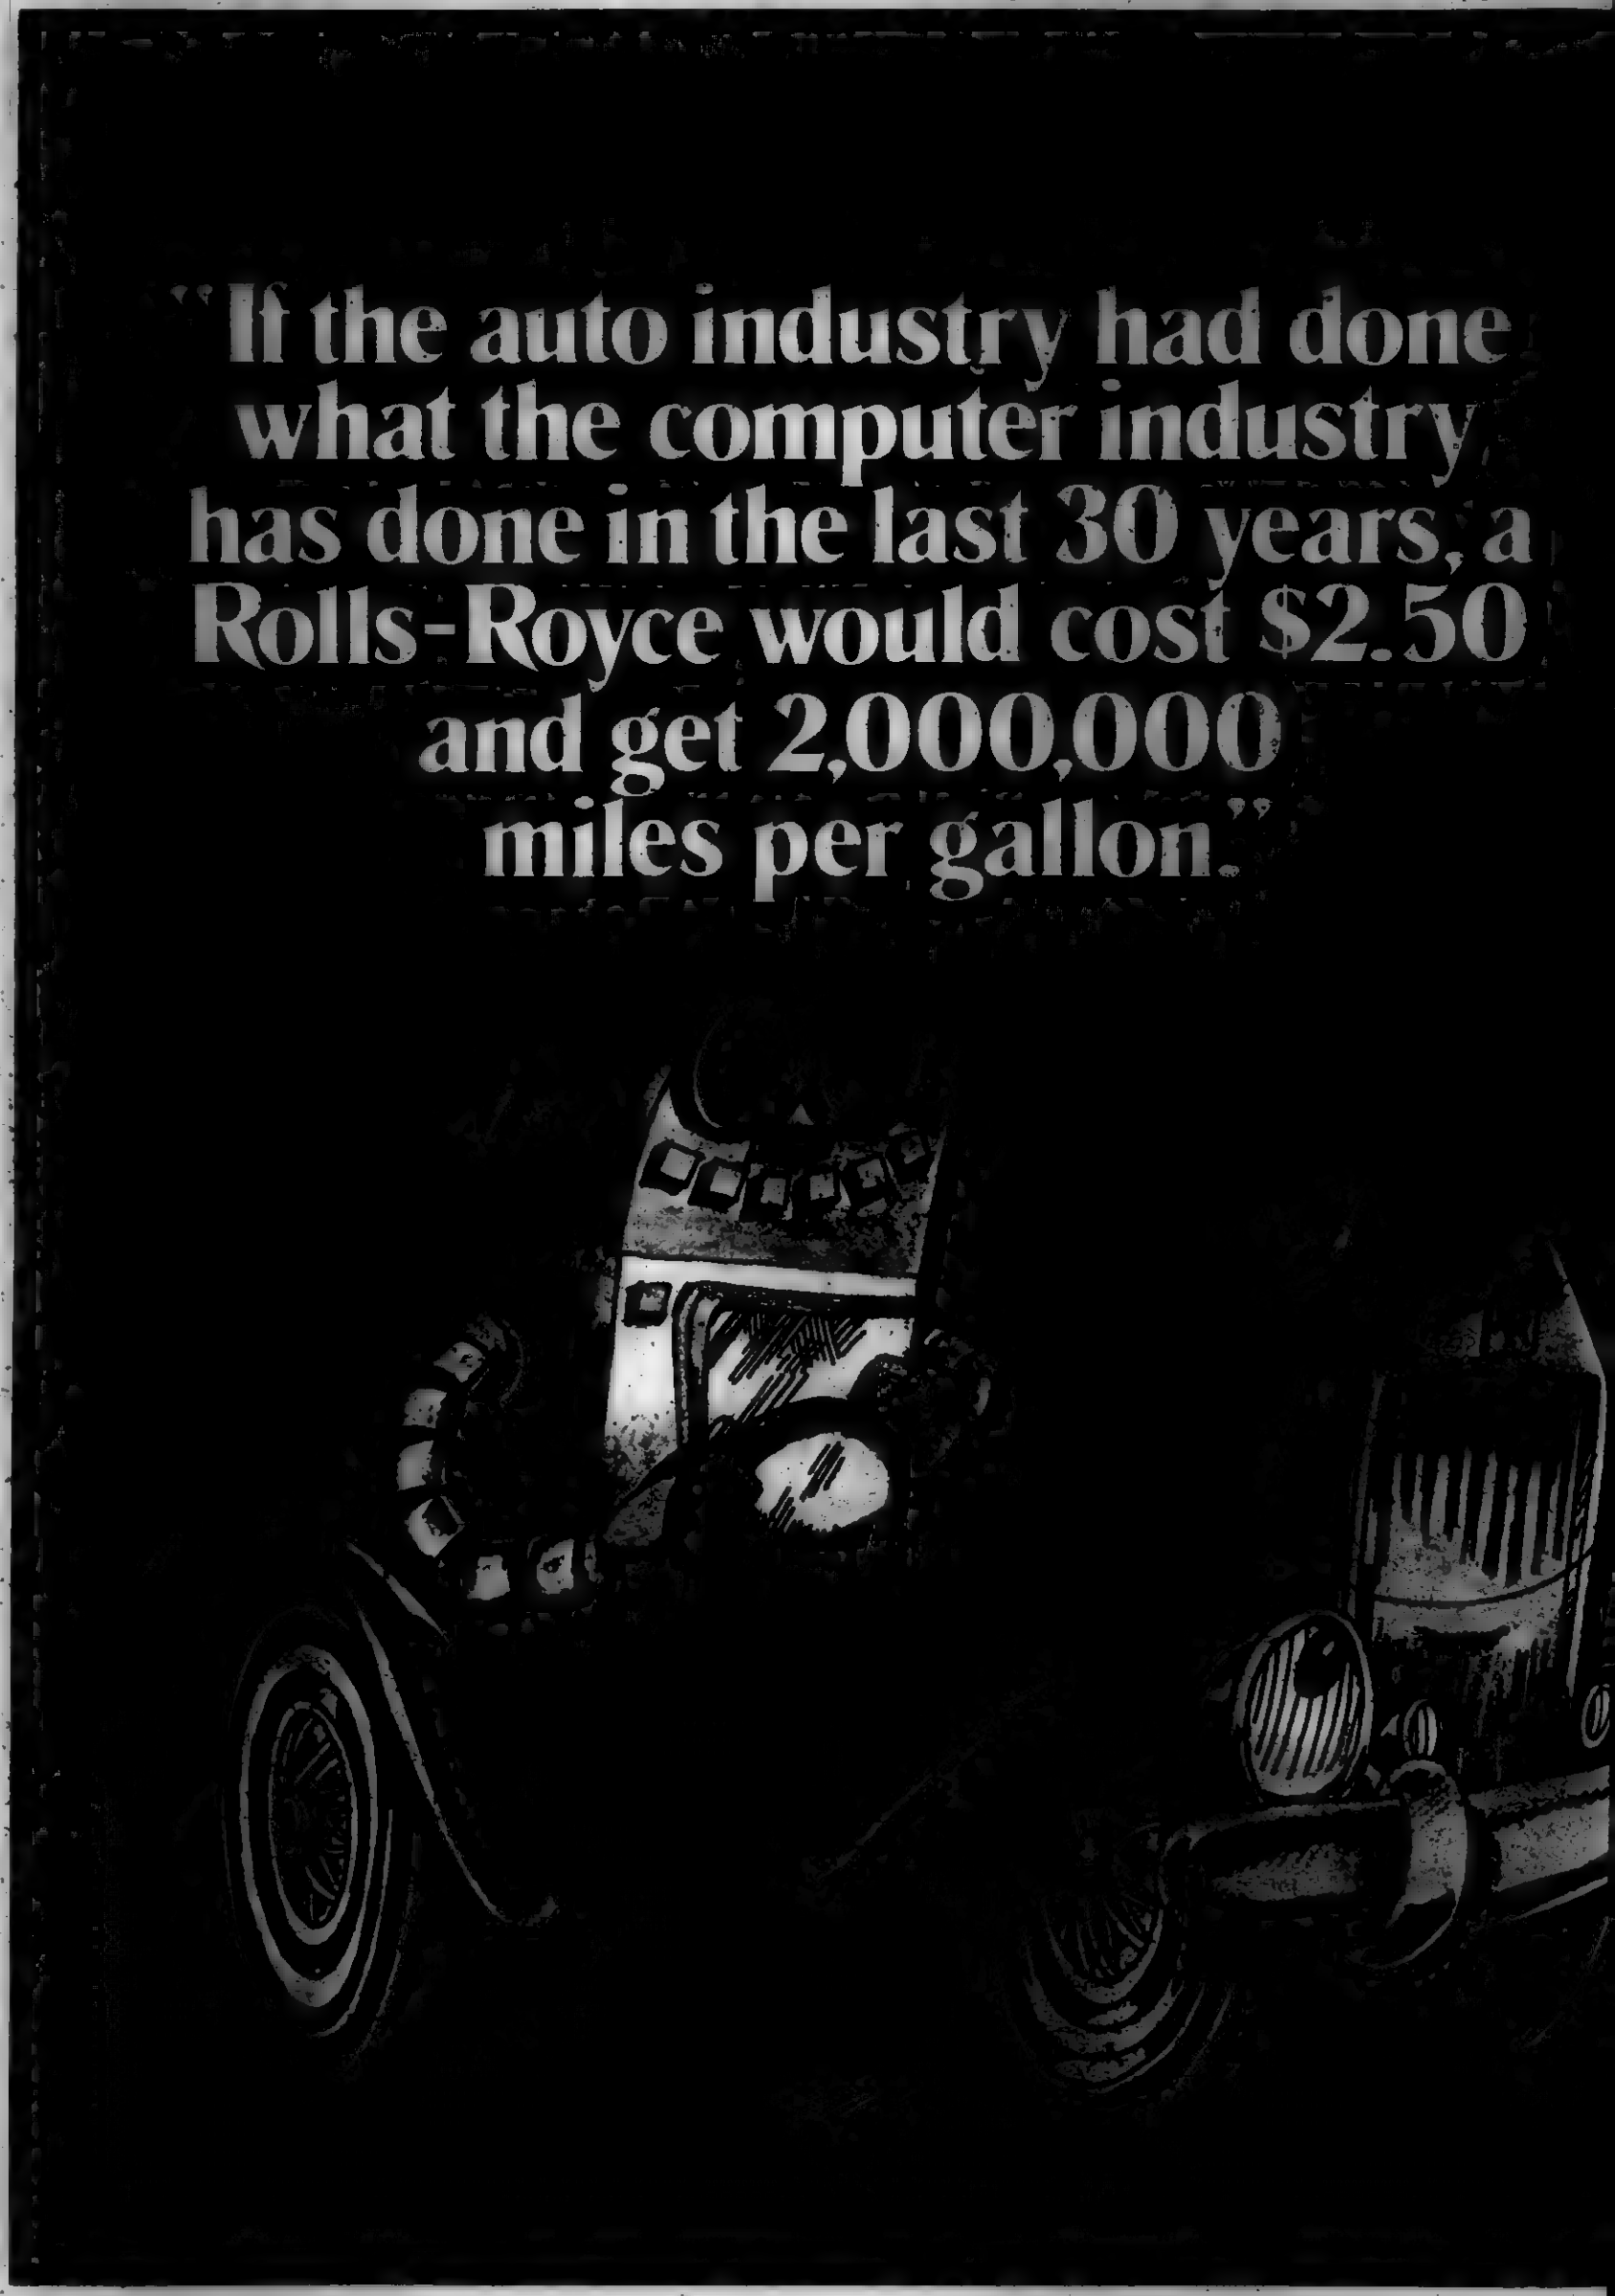
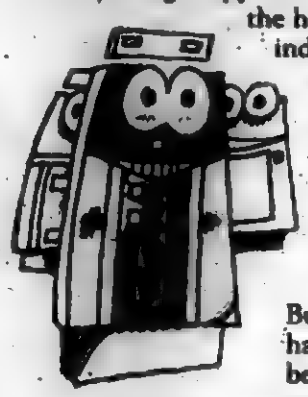
"If the auto industry had done what the computer industry has done in the last 30 years, a Rolls-Royce would cost $2.50 and get 2,000,000 miles per gallon."



Computers aren't just an industry, they're a revolution in the way mankind operates. And no one covers this revolution better than we do!

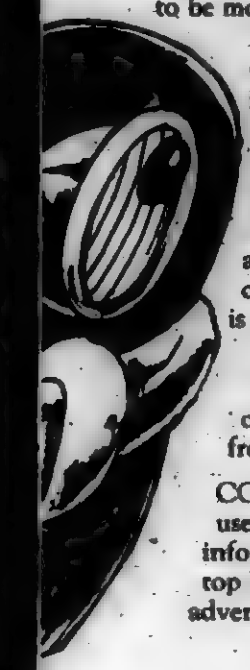
We are CW Communications/Inc. and despite our youth (only 15 years) we're the world's largest publisher of newspapers and magazines for computer people all over the world.

Most of our publications are weekly newspapers, because so many things happen so rapidly in the computer business (as the headline quote from a prominent industry executive makes so clear). In only thirty years the industry has gone from the development of the giant Eniac system, through the tube-powered, water-cooled Univac I (the world's first business computer), to the incredibly cheap, battery-powered microprocessor.



But as unbelievable as the last 30 years have been, the next 30 will probably be even more incredible. In the next two years alone, the installed power of general purpose computer systems will grow almost as much as it did in the previous 16 years. And the supercomputers of the 90's will transfer data at a rate several hundred times faster than even today's speedy computers! It's hard to remember this is real science, not fiction.

This extraordinary increase in efficiency has led to a rapid expansion in computer use, as human ingenuity finds more and more applications for these powerful tools. So the market for computer products and services has turned out to be more elastic than most observers had thought.



Worldwide expenditures are currently at $90 Billion, and growing by 20% a year.

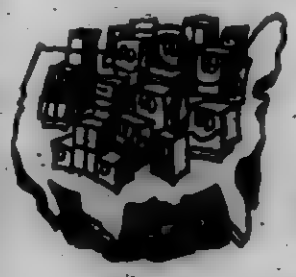
A constant flow of new products; rapid changes in technology; more and more new applications; and large and growing expenditures. It's an industry with a strong need for current, complete and accurate information. Which is where we come in.

Our oldest publication is COMPUTERWORLD, a weekly newspaper with a growing all-paid circulation in excess of 120,000 (quite an increase from our modest 7,500 in 1967).

COMPUTERWORLD serves America's computer users with the consumer-oriented, objective information they need. And it has become America's top business/professional publication, measured by advertising revenue.

ISO WORLD is our semi-monthly publication for retailers, dealers, distributors and other independent sales organizations (ISOs) in the resellers marketplace. This is a relatively new marketplace which has grown up around the minicomputer and microcomputer, and which shows every sign of very rapid growth for at least the next decade.

The latest phenomenon of the computer industry is personal and desk-top computers and we're covering it with our newest publication, INFOWORLD and PC WORLD. INFOWORLD is a weekly newspaper for all micro users and it features complete software and hardware reviews, while PC WORLD is a monthly magazine devoted to users of the IBM PC and compatibles.



The United States alone accounts for nearly half of the worldwide computer market, but billions of dollars are spent by foreign computer people for American-made computers and computer products. And our publications penetrate those marketplaces, too.

We are publishers of newspapers and magazines in the following markets: Australasia, West Germany, United Kingdom, The People's Republic of China, Japan, Brazil, Mexico, France, Spain and Denmark.

And we provide U.S. advertising representation and editorial services to publications in the following countries: Italy, Greece, The Netherlands, Sweden, Argentina, Chile, Southeast Asia and Kuwait.

Our International Marketing Services Department can give you one-stop advertising service for any or all of these publications — including translation and production services. We'll even bill you in U.S. dollars, so it's easy as advertising in U.S. publications.

Computing is an exciting industry, with a unique need for information. And the publications we produce provide that information to nearly two million computer-involved people around the world. They are excellent vehicles for reaching these people with your advertising message, and we'd be happy to give you more information on any of them. Just call or write, Don Fagan, Vice President, Sales.

COMPUTER INDUSTRY

MART from page 135

— have a harder row to hoe in winning consumer confidence. "We have to be a little more giving, more flexible, in extending our 'consumer protection' coverage," according to Chuck Newman of Newman Computer Exchange, Inc., a DEC aftermarketer based in Ann Arbor, Mich.

What has helped legitimize the business even more, Newman said recently, is the emergence of a slew of price-trend reporting services.

Since most of the blue book publishers also happen to be used computer dealers, a caveat emptor seems to be in order: Charlie C. Greco, director of Financial Information Planning with International Data Corp., an industry analysis firm in Framingham, Mass., said, "I would suggest deducting at least seven points going in, and on top of that, question the availability of the product."

Forearmed with price information, the careful shopper should know precisely what he wants, according to Ken Bosomworth of International Resource Development, Inc. of Norwalk, Conn., another industry analyst. "Virgins should stay clear of the used market, but then most do," he added. "First-time users need the support systems that only the manufacturer can provide."

Dealers shy away from giving advice. "We don't want customers to buy on our say-so and then discover it doesn't meet their needs," Newman pointed out. Added CDLA President Rick Forsythe, "I think of us as soybean traders who've never seen the farm."

IBM still an influence

While IBM may no longer own the equipment, it still influences the asking price. "The secondary market lives permanently in the shadow of IBM," Forsythe admitted.

Steve Deixler of Princeton Computer recalled when IBM, a few years ago, announced price cuts for its 3350 disk drive in anticipation of introducing the more advanced Model 3380. The aftermarket became glutted with the earlier model, and prices plunged precipitously. Then IBM encountered some production problems, and the 3380 debut was delayed, so 3350 prices shot up. Then the 3380 began coming on stream, and prices plunged once more, now down to 20% of what IBM had discounted it to. "It's a yo-yo that can drive you bananas," Deixler complained.

It also troubles some dealers that IBM will refurbish turned-in equipment and reintroduce it to its primary market as brand new.

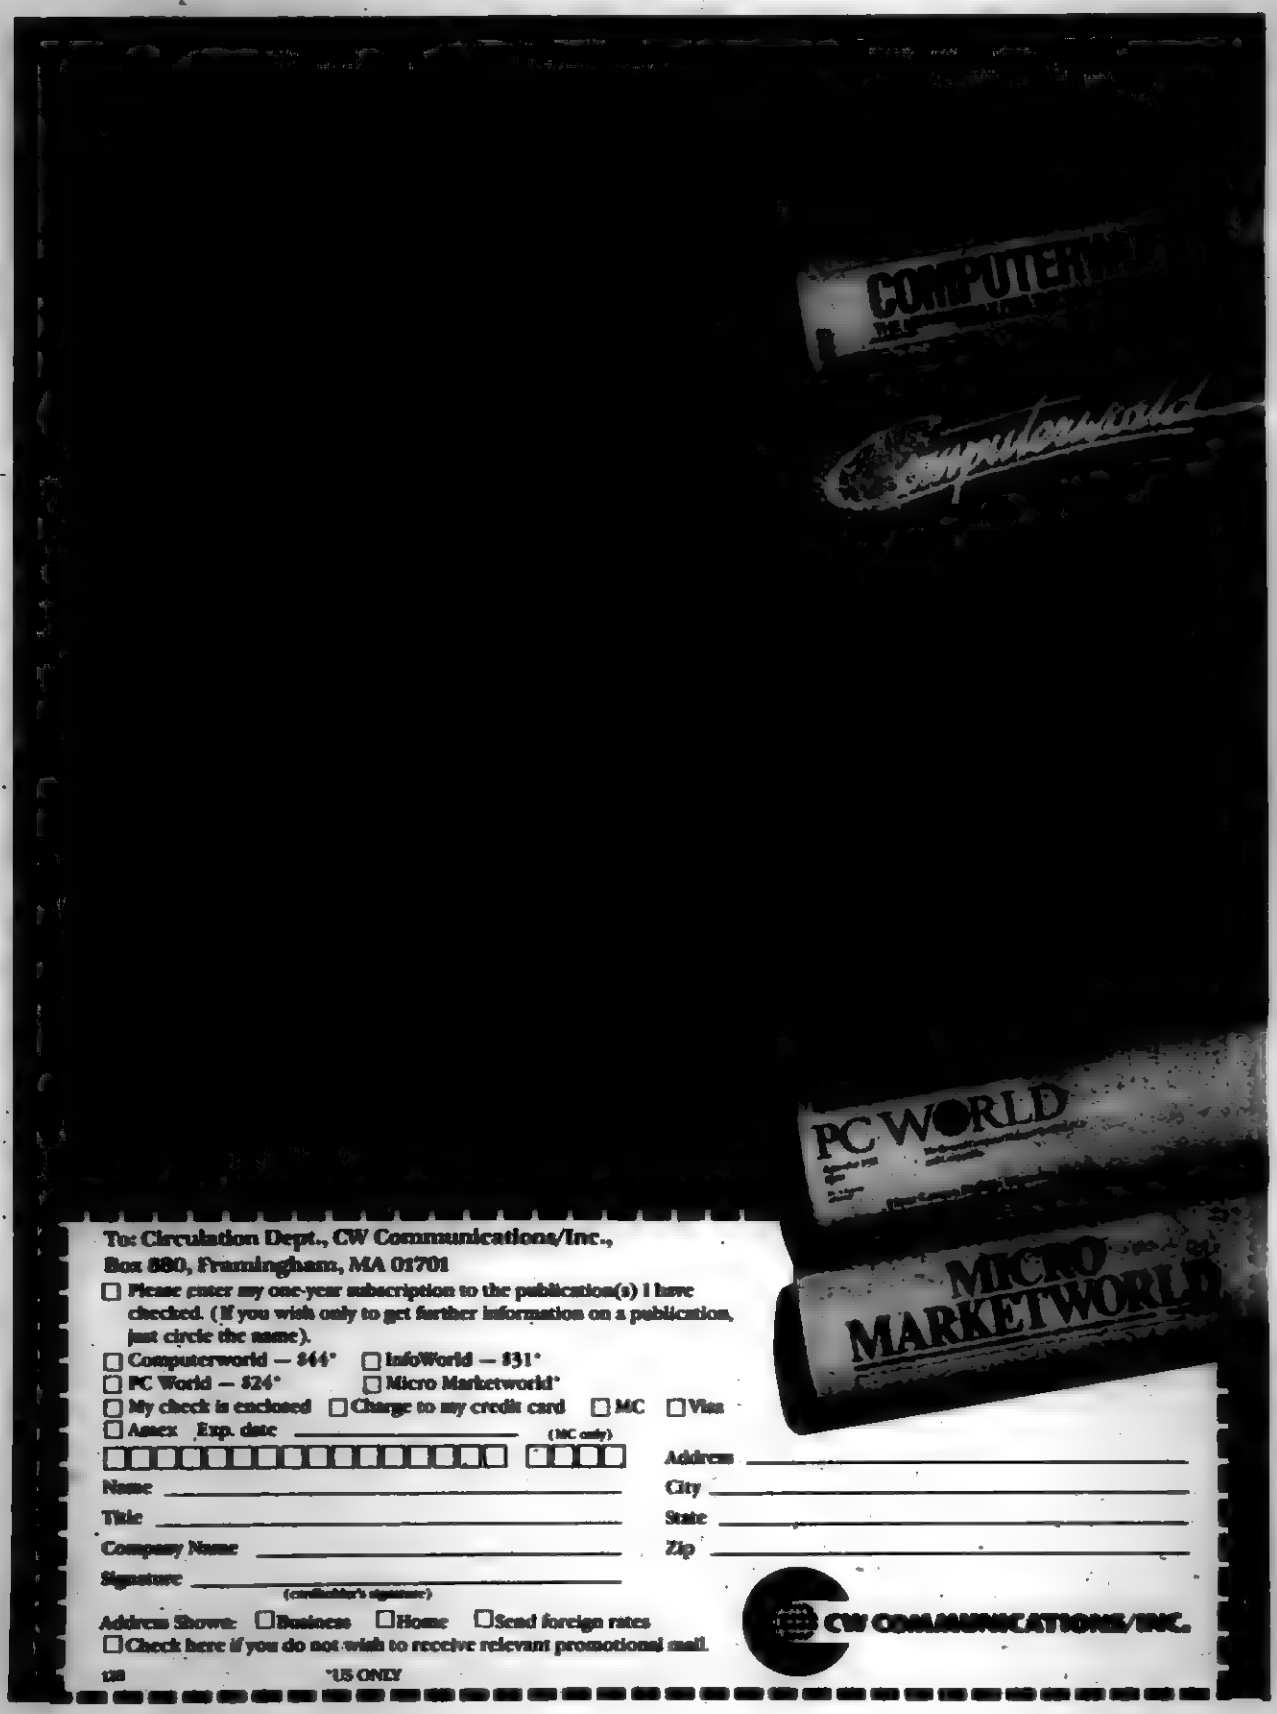
If there is such a thing as an "average" savings to be realized by tapping the secondary market, the consensus seems to be anywhere from 15% to 20%. It makes no difference whether the equipment is actually used or still fresh in the box.

On an individual basis, of course, savings can be enormous. It's still possible to pick up an IBM 3031 or 3033 disk drive for as much as 98% off — or two points short of a giveaway.

And that's really the biggest reason for going to the aftermarket; not just to pick up a bargain, but to get immediate delivery when the manufacturer smiles patronizingly and tells you it can't be done.

Next week: Big Blue's Credit Corp. has aftermarket dealers nervous.

Model is a former editor and contributor to several publications and is a public relations consultant to government and industry.



UNIX from page 135

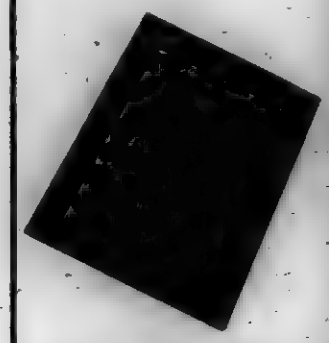
future operating systems from other vendors. Consequently, the jury will remain out for a while as to whether AT&T can become a key player in the information processing marketplace.

■

Storage Technology Corp. (STC) said recently it is studying IBM's recent announcement of the 3480 tape subsystem. STC said it has developed the technology "needed to move in several directions"; move it must, and rapidly, in a focused direction.

For STC to leapfrog IBM, the obvious direction would be rapid development of its optical storage subsystem technology. Pure archive application is one thing, but what is really needed to leap ahead is a cost-effective means of reusing optical storage disks.

POSITION ANNOUNCEMENTS



Yes, our track record is far better than most in the industry. No, we're not perfect; but our guarantee is:

"If, for whatever reasons within a specified time frame, you are not satisfied with a ROMAC® placement, we will honor our written guarantee."

We're that sure we can make the kind of placement for you that stays placed.

ROMAC®, the placement firm with a proven record of placement success in the data processing profession.

Meet with Success.

Network Integration

At The Gateway To America's Technology Highway.

Codex Corporation, a division of Motorola's Information System's Group, has been at the gateway of America's networking and communications technologies for over two decades.

And as the need for fast, efficient, reliable transfer of information becomes increasingly critical, more and more companies worldwide are turning to Codex today for both proven and innovative solutions.

From modems, LANs, network processors, resource sharing and integrated network management and control systems, Codex has the technologies and opportunities for engineers and technical managers to transform their energy and expertise into outstanding products...and careers.

Codex will also put you at the Gateway to America's Technology Highway. Our suburban Boston facilities are located only minutes from Route 128, America's most exciting technological center. And convenient to the area's famous educational, cultural and 4-seasons recreational resources.

Make Codex your gateway to a better career. Please direct your resume and a letter outlining your career interests to Bob Lippman, CODEX CORPORATION, Dept. 200-409, P.O. Box 507, Canton, MA 02021.

Kodak

Software engineers. The time is now.

Computers play a vital and ever-increasing role in every step of production at Kodak. And we need skilled professionals who want to share in the challenges and rewards of technological leadership.

We're looking for talented software and computer engineers with a BS or MS and technical experience in minicomputer and microprocessor systems used in the development of software for real-time equipment control. Assignments may involve design of software systems for products or manufacturing control; programming mini- and/or microcomputers; integrating computer software and hardware into complex electromechanical systems; and quality assurance of computer programs.

Kodak also has opportunities for electrical engineers in the areas of design and development, video, test, systems and optical engineering.

We offer competitive salaries, liberal benefits, and opportunities for individual contribution and growth. Positions are available now. If you have the necessary skills and drive to meet the challenge of working for a corporation in the forefront of technology, send your resume today.

OPPORTUNITY IS WAITING FOR YOU

We are a respected services organization that provides a wide variety of professional services in the fields of engineering and data processing. We are expanding our "Computer Services" group significantly, and are looking for qualified personnel to develop and run our business operations.

We have targeted 6 growth areas in the United States as start up situations and need capable individuals that are prepared to deal with the challenges associated with being new at the local level yet seasoned on a national basis.

Staff Requirements Include:

- Branch & Sales Manager Will be responsible for developing client service engagements, market research and planning, branch administration, training, and supervision of staff with full P & L reporting responsibility.
- Staff Sales Specialist Will be responsible for all sales activities on a day to day basis to include pre and post sales support functions. Will work with Branch Manager on development of local market penetration sales plan.
- Staff Recruiting Specialist Will have direct responsibility for identification, interviewing and hiring of professional services support staff.

Successful candidates will not only have the necessary expertise we seek, but the ability and creativity to apply their backgrounds to a start up environment.

For the right people we are offering competitive salaries and MBO oriented bonuses. Please write us today and include your resume with relevant credentials and salary history.

TRICAL ENGINEER MECHANICAL ENGINEER

GROWTH CAREERS IN OPTICAL STORAGE

3M has a major commitment to development and production of optical recording media. This growth area has created immediate openings for experienced engineers or recent graduates with advanced degrees.

SOFTWARE ENGINEER/ COMPUTER SCIENTIST

Will be responsible for design, coding and testing software for real-time process control and data acquisition in a distributed processing environment. Initial assignment will be as lead person for the automation of a large thin film deposition system. This system includes data base management of test results for use by non-programmers. We will require a degree (BS-PhD EE, Physics, Computer Science) plus experience and/or knowledge of PDP-11 and/or VAX/VMS.

ELECTRICAL ENGINEER

Will design and implement high-speed digital systems for optical media testing. Projects will include a high throughput production test system to test optical disks with hundreds of megabites capacity. Analog design is also included. We require a BS-PhD EE with broad experience which includes magnetic recording and/or communications.

MECHANICAL ENGINEER

Will design and build components and subsystems for large scale vacuum deposition systems, process development systems, and robotics for clean-room material handling. We require a BSME with knowledge of robotics and experience in vacuum systems technology.

All positions are located at our research center in St. Paul, MN. Compensation and benefits plan are highly competitive.

COME GROW WITH US IN ORLANDO

At our huge IBM data center (2 3084's, 3 3033's, 1 4341, and 1 4361) in beautiful Orlando, Florida, over 900 talented people provide commercial data processing services to users across the country. We have a number of immediate position openings, including:

TELECOMMUNICATIONS ANALYST
with solid experience using ACF, VTAM or TCAM, NCP, and 3705 or 3725. MSNF would be a plus.

TELECOMMUNICATIONS ANALYST
with strong background in COMTEN network communications.

SR. SYSTEMS PROGRAMMER - PROGRAM PRODUCTS
with significant experience in MVS operating systems internals and in performing modifications to MVS. Must know SMP, assembler, maintenance and documentation procedures.

IMS SYSTEMS PROGRAMMER
able to read and debug IMS software problems and apply maintenance to the IMS system. Must know assembler, SMP and data base recovery.

DATA COMMUNICATIONS CONSULTANT
with solid experience in fiber optics, network models, local area networks.

GRAPHICS APPLICATIONS PROGRAMMER
with experience in FORTRAN on 3D graphic systems preferably in architectural engineering environment.

NC PROGRAMMER
who has a good background using APT in an IBM support environment.

CAD/CAM APPLICATIONS SPECIALIST
using FORTRAN on VAX equipment. Will have heavy customer interface.

If you believe you are qualified for and are interested in any of these positions, we want to hear from you. We can offer you an excellent salary, superb benefits, complete relocation, and an outstanding future. Please mail your resume, in confidence, or call (305) 896-7417 (collect).

Programming

SOFTWARE ENGINEER
"C" S/370

Candle Corporation, a multinational high technology company and developer of OMEGAMON®, is seeking a key individual to assume a lead role in the development of advanced software using the C language in an IBM mainframe, mini, and micro environment.

The ideal candidate will have in-depth C language programming skills (in any environment), as well as significant systems programming and software development experience on IBM mainframes using IBM 370 Assembly Language, preferably in an MVS, CICS, and/or VM environment.

You must have had significant programming experience in both C and IBM 370 Assembly Language to qualify. Experience with other structured languages such as PL/1 or Pascal is a plus. Strong preference will be given to candidates having in-depth knowledge (internals) of MVS, CICS or VM.

This is an opportunity to be a key contributor to the development of innovative software products in a dynamic and rapidly growing software firm.

Candle offers an excellent compensation and benefits portfolio. For consideration, please send your resume with salary history to:

We want

SEs EXPERIENCING ORIGINALITY!

We want to hire systems engineers. Ones who don't seem to think like everyone else. Or anyone else. At Storage Technology, we encourage this kind of originality. That's one way we've become a leader in data storage systems and technology. If you've been experiencing some originality lately, and enjoying it, perhaps you should consider enjoying these other experiences you can have with us.

Experience freedom.

Freedom to be a self starter. To be responsible. The freedom that lets you call your accounts "yours." At Storage Technology, you can experience as much freedom as you can handle.

Experience listening.

The kind of listening that takes your ideas, suggestions and problems seriously. We're experienced listeners. We'll listen to anything you have to say about our business. We're also good at applying what we've heard.

Experience trust.

Trust in your knowledge and experience, your decisions, your dedication. We take great pride in trusting our systems engineers. That's because the difference between a good operating system and a great operating system can be a simple matter of trust. And we like great operating systems.

Experience participation.

Participation in major marketing decisions, customer account decisions and decisions about where this data processing industry should head next. Our systems engineers continually help us make these kinds of decisions. They're involved. Why? Because we need their experience.

Experience creativity.

The kind of creativity that makes your job extra worthwhile. The kind that puts your mind to work. We think all systems engineers should be creative. And imaginative when solving problems or enhancing systems. We accept creativity as an everyday part of your job.

Experience at Storage Technology don't end here. We are a Fortune 500 company. The world's leading independent supplier of high performance data storage systems and technology. Storage Technology provides exceptional benefits packages which include health, dental and life insurance, stock purchase, profit sharing and more.

We currently have openings for systems engineers experiencing originality in the following cities:

Milwaukee, Manhattan, East Meadow, L.I., Boston, Philadelphia, Hartford, Detroit, Cincinnati, Pittsburgh, Chicago, Washington D.C., St. Louis, Little Rock, Memphis, Kansas City, Austin, Los Angeles, San Francisco, Seattle and Summit, N.J.

To experience more information about these or future openings send your resume to Fred Moore, MD 3K, Storage Technology Corporation, 2270 South 88th Street, Louisville, Colorado 80028.

Storage Technology is an Equal Opportunity Employer.

Every Day, Engineers at E-Systems Garland Division Are Taking Technology Where It Has Never Been Before... Turning SCIENCEFICTION into SCIENCEFACT.

E-SYSTEMS

The Company.

E-Systems Garland Division is renowned for its products' and systems' technical excellence and quality.

E-Systems Garland Division provides an atmosphere that promotes talent and personal growth. We attract the highest caliber of talent and our employees demand an environment that expands expertise into excellence.

Our people know that every day there are new technical challenges to meet and to solve.

The Benefit.

We promote a Program of Human Resources of advanced thinking that includes... Flexible Employee Benefits (FLEXCOMP) and an Employee Stock Ownership Plan.

If joining E-Systems in Dallas means a move, our unique Relocation Center will help you. Our personalized relocation program even includes dual career assistance.

As Dallas offers a quality lifestyle, so E-Systems offers a quality working environment – *warm and open* – where career pathing is taken seriously.

Our Needs. Software Specialists.

With a BS or MS in Computer Science, Math or Electrical Engineering using IBM ALC, FORTRAN/VS, FORTRAN 77, or GOULD SEL assembly languages, you can qualify for an opportunity with a long term project involving

- mainframe and configurations using the latest hardware/software technology
- combining complex algorithm development
- extensive equipment interfaces in support of real-time processing

ScienceFact.

ScienceFact means variety, enormous technical challenge, and responsibility.

If you have the talent, we will give you everything you *really* want in a career. You are invited to help us turn ScienceFiction into ScienceFact by contacting **Ann Olson**, E-Systems, Inc., Garland Division, P.O. Box 660023, Dept. 41, Dallas, Texas 75266-9983.

New 1984 Salary Data

No doubt, during 1983, you knew that many firms took a hard line on awarding salary increases—or, in some cases, even enacted across-the-board cuts.

Yet, on the other hand, did you know that salaries for *some* computer professionals *soared* right on through the uncertain business outlook?

Computer salaries are up.

The new, *1984 Computer Salary Survey and Career Planning Guide* is based on contacts with more than 44,000 computer professionals and 35,000 organizations. Not only are salary averages for fifty-eight positions reviewed (including ten new ones), but high and low compensation ranges are also provided.

Included are positions in programming, software, systems design, data base/data communications, Edp auditing, operations, computer sales, marketing, marketing support and management.

In addition, the new Survey details seven ways to maximize your chances of getting ahead through a proven, seven-step system that has helped thousands of computer professionals advance their careers.

Free to computer professionals.

The new 32-page Survey is available to you without charge. Since 1966, this annual report has helped approximately a quarter of a million computer professionals understand current trends in technology and compensation, realize how and where they fit in and what they need to do to reach their full potential.

You owe it to yourself—especially if most of your career lies ahead—to call or write today.

Call today for your complimentary copy.

Call the Source Edp office nearest you for a free copy of our new 32-page report. We'll mail a copy to you in strict confidence, without obligation.

If unable to call, write:

SYSTEMS PROGRAMMERS
PROGRAMMERS - ANALYSTS

The positions below reflect a portion of the active openings for which we are recruiting. They are with Fortune 500 and large regional firms across the country, with many openings in the Southeast.

TECH. SUPPORT
Systems Programmer OS/MVS-GENS $30-45K
Systems Programmer - VM GURU $30-44K

BANKING
Sr. Systems Analyst - Hogan-Cash Mgmt. $25-36K
Programmer/Analyst CICS (COMMAND & MACRO) $22-36K

INSURANCE -
Systems Analyst 5/7 yrs COBOL-IMS/VS, CICS/VS $28-40K
Programmer/Analyst 3/5 yrs COBOL-CICS/VS-LIFE 70 $22-32K

MANUFACTURING
Senior Analyst OS/MVS COBOL - Mfg apps. $30-40K
Programmer/Analyst OS/MVS IMS/VS - Mfg apps $26-34K

Client companies assume all fees - including interviewing and relocation costs. Installations are "State of the Art" and offer excellent career path progression. Forward your resume now or call collect for additional information.

POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS

UNIX* Operating System Software Specialist

An advisory role—with a mountain view

You're the expert.

You eat, sleep and dream UNIX.

And, what's more, knowing it 'cold' means you can lead others to better software solutions based on its unique qualities.

Digital invites you to join them in Colorado, where your special talents will make you an immediate key contributor.

Yes, Colorado.

You can enjoy not only an advisory role — but wide open spaces, unraveled mountain paths, fast snow and good fishing.

We're looking for UNIX operating systems specialist to head up a new consulting effort. You step in and provide problem solving help and technical guidance to Digital Software Specialists.

And we want you to get involved with the client directly — see them if necessary to resolve problems.

The requirements are stringent. You must have 3+ years experience using the UNIX operating systems and its associated tools — and a substantial background as a UNIX operating system manager or exposure to UNIX operating system internals, preferably Berkeley UNIX operating system. 3+ years experience using "C" language is also required.

Of course, strong customer relations skills are critical as are good written and verbal communications skills.

If you want to see the 'great outdoors' one more time, contact S. Chamberlain, Digital Equipment Corporation, Dept. 0401 3804, 4405 N. Chestnut Street, Colorado Springs, Colorado 80907.

We are an affirmative action employer.

*UNIX is a trademark of AT&T Bell Laboratories.

People and Technology. PERFECT INTERACTION

digital

If you are looking for a high visibility opportunity with respect technology, a quality working environment and recognition for your relatively autonomous work, plus a competitive compensation package and benefits that may surprise you, CONSIDER:

RADIOLOGY AT HUP

Since its founding as the nation's first teaching hospital, The Hospital of the University of Pennsylvania has given birth to new technologies and treatment modalities which have become the cornerstone of established practice for subsequent generations of health care professionals. Our Radiology Department figured prominently in dynamic innovative technological applications.

MANAGER, ADMINISTRATIVE AND CLINICAL COMPUTER SYSTEMS

The Department of Radiology is seeking a computer professional experienced in organizational information management to direct, control and plan for the Management and Clinical Computer Systems in Radiology. Demonstrated supervisory skills, systems and applications programming experience in a state-of-the-art DEC environment required. VMS, MUMPS and networking experience strongly preferred. MS Engineering, Computer Science, Math or equivalent will be a real plus, though your BS and heavy pertinent experience may qualify.

SYSTEMS PROGRAMMER

BS Computer Science, two years systems and applications programming on DEC, one year data base management required. Your RSTS/E, BASIC-PLUS and MUMPS experience, particularly with health care applications will be a super plus.

Forward your resume with salary history and requirements to Laurent G. Hahn, HUP Recruitment, 3400 Spruce Street, Philadelphia, PA 19104. An equal opportunity employer, M/F/H.

HUP HOSPITAL OF THE UNIVERSITY OF PENNSYLVANIA

We are expanding the staff of our computer systems department which has created three immediate openings.

Application Manager

You will oversee the development and installation of software modifications to our Atex system which is used for text processing, advertising tracking and billing. Your responsibilities will include working with user departments in developing personal computer applications, especially financial data collection. You should have programmer/analyst experience with a PDP-11 or VAX installation using Macro-11 or Pascal. Atex experience preferred; accounting/billing system experience a big plus.

Atex Advertising System Specialist

You will be an advertising system support person for our systems group. Your responsibilities will include assisting users of our Atex advertising/billing system with reports, format writing and training. Atex experience preferred, familiarity with advertising procedures a must.

Personal Computer Support Specialist

You will work with our growing number of in-house personal computer users who are using mostly DEC Rainbows. Your full-time responsibility will be to assist these users with spreadsheets, word processing, answer questions and training. Experience with PC's required and a willingness to work with a variety of user requests.

To apply for any of the above, send your resume or a detailed letter, including salary requirement, to Tom Pike, Corporate Systems Manager, CW Communications, Box 880, Framingham, MA 01701. No phone calls, please.

We are the world's largest publisher of computer-related newspapers and magazines, including *Computerworld* and more than three dozen other publications around the world. We offer pleasant working conditions in modern offices adjacent to the Mass Pike, excellent benefits including dental and optical and profit-sharing. We are an equal opportunity employer.

CW COMMUNICATIONS/INC.

LEAD PROGRAMMER/ANALYST - CICS

McCormick & Company, a Fortune 500 company and a world leader in the manufacturing and marketing of seasonings, flavorings and specialty food products has an opportunity on its Systems Development Staff for a Lead CICS Programmer/Analyst. This position is responsible for leading development projects, providing training and technical direction to the staff, and designing and writing on-line application programs.

The individual we are seeking should possess eight years of progressively responsible experience as a programmer/analyst of which at least the last four years have been spent programming under Command Level CICS. A thorough knowledge of OS/JCL is required. Familiarity with VSAM, IMS, structured COBOL, TSO/SPF and SDF would be a real plus. A college degree or working toward one is desirable.

We have two IBM mainframes running under MVS/SP 1 with a nationwide communications network operating under CICS supporting over 200 terminals plus several remote minicomputers and RJE stations.

We offer an excellent compensation and benefits package including relocation assistance. If you are looking for a company which encourages technical career growth, send your resume with salary history in confidence to:

Michael Trustey
Manager, Human Relations
Management Services Division
McCormick & Company Incorporated
414 Light Street

AN EQUAL OPPORTUNITY EMPLOYER M/F/H

FACULTY POSITION

Albright College is continuing to invite applications for a new faculty position in Computer Science. Candidates must be qualified in two or more of the following areas: assembly and machine language, operating systems, data base theory, computer organization, theory of programming languages. Doctorate in computer science or a closely related area preferred, but masters degree will be considered; relevant professional or industrial experience desirable. Strong commitment to undergraduate teaching in a liberal arts college and excellent communication skills are mandatory.

Computer Science at Albright is an established major field of study based on ACM Curriculum '78 recommendations. The college curriculum includes a broad general studies program and emphasizes critical thinking and communicative skills.

Position available September 1984. Send resume by April 30 to: Mrs. Donna McClelland, Department of Mathematics and Computer Science, Albright College, P.O. Box 516, Reading, PA 19603.

Albright College is an Equal Opportunity/ Affirmative Action Employer

DATABASE APPLICATIONS PROGRAMMER

Staff position for development and support of statistical database applications in collaborative efforts of the Department of Statistical Consulting and Computer Science. Duties will include design and coding of new applications; maintenance and enhancement of existing management information systems; documentation of applications packages; advising and assisting users. Provides opportunity to work in an academic environment, to help develop management tools, and to gain experience in analyzing nonstandard requirements and developing workable solutions. Interest in working closely with users essential. Professional programming experience required. Database and PL/I experience especially helpful. Bachelor's degree preferred. Multiple application helpful.

Applicants should send resume, statement of professional goals, and names of references to the address below. No agencies.

Our Way Is Working

Stimulating challenges in one of the world's most exciting industries can be yours with Northwest Orient airlines.

Major new applications and systems development efforts offer a broad range of applications for our sophisticated and multi-processor Univac 1100/80 site. New systems are being developed in such areas as general ledger, human resources, flight crew management, aircraft forecasting, passenger and cargo revenue accounting, automated check-in, and flight planning. If you have 2 or more years of experience in one of the following areas we are interested in talking with you:

APPLICATIONS PROGRAMMERS

Candidates should hold a degree in computer science, management information systems or quantitative methods, plus expertise in COBOL, FORTRAN and/or MAPPER. Experience in a Univac 1100 environment and DMS 1100 or similar data base management system is a plus.

SYSTEMS PROGRAMMERS

Openings now available for experienced personnel at various levels including: performance analysis, data communications, interrupts, and operations.

If you are seeking to put your knowledge to practical use in a demanding industry, Northwest offers an atmosphere of close interaction between user departments and management, and a team approach to development. Our competitive salaries and fully paid company benefits — including free travel — are backed by 35 years of continuous profitability.

The World is Going Our Way. To learn more call (612) 726-2226 for an application. Or send your resume in confidence to M.V. Johnson.

Engineering Beyond Reality

Over 50 years ago LINK was born when a young visionary, Ed Link, designed a system to teach pilots to fly without leaving the ground. His pioneering discovery was the brainchild of what has become the billion dollar flight simulation industry. Today, LINK remains in first place; designing and developing custom, computer-controlled flight simulation equipment for NASA and the military that goes beyond state-of-the-art.

At our facilities we can duplicate every aspect of the aerospace scenario in detail so realistic it goes beyond reality; all through the technological "magic" of microprocessors, lasers and G-seat motion systems. Our VISUAL Laser Image Generator, the first laser beam training simulation system, scans a model board that dramatically alters the aerospace environment while simultaneously recreating the sights of full-scale reality in miniature.

Link's history of "firsts" has resulted in many on-going contracts which means long-term, secure careers for talented engineering professionals.

TELEMETRY EXPERTS

RESPONSIBILITIES: Will perform system engineering trade-offs for telemetry and network systems. Produce design specifications and requirements documentation. Integrate design into a total simulator product.

REQUIREMENTS: Bachelor's Degree in related discipline. Strong background in telemetry and network systems in simulation. Requires exposure to TDRS, NASCOM and Air Force RTS systems and hardware. Knowledge of simulation techniques and programming in hardware solutions. Capable of integrating hardware/software and document design and requirements to applicable military standards. Must have 2 to 10 years related experience.

COMPUTER SYSTEMS ENGINEERS

RESPONSIBILITIES: Perform systems engineering to satisfy simulation performance requirements for computational system.

REQUIREMENTS: Decomposition, analysis, allocation • Interface review • Preliminary design • Integration and verification planning • Process walk throughs, design reviews, code and test audits • Overall responsibility for the technical performance of simulators. Experience: • BSCS plus 6 or more years experience. • FORTRAN and Assembly language proficiency • Real time, multi-tasking operating system experience • Flight hardware integration experience is a plus. • Ability to travel.

As the industry innovators in flight simulation, we can offer excellent salaries, comprehensive benefits and a promise of another 50 years of technical "firsts." To start your career with LINK, please send a detailed resume including salary history in confidence to: Patricia Records, Department 653-9426. Link Flight Simulation Division, 2224 Bay Area Blvd., Houston, Texas 77058. An Equal Opportunity Employer M/F/H/V.

U.S. CITIZENSHIP REQUIRED

Software Engineers

We are Structural Dynamics Research Corporation, SDRC, an international engineering consulting and computer software firm.

Openings exist for dynamic individuals to assume roles of technical leadership in the design and implementation of User Interface Development Systems and User Interface Management Systems. The successful candidates will design and implement these software systems on in-house DEC and IBM mini and mainframe computers using the C programming language.

This development process requires significant skills in computer science disciplines relating to software tools and operating system design and interfacing. Openings exist for:

- Software tools designer. Design and implement a screen manager and text editor concentrating on Human Engineering and Graphics.
- Operating Systems Specialist. Design and implement machine independent operating system interfaces concentrating on concurrency issues and device independence.

These positions are best filled by people with these qualifications:

- Experience in operating systems, real time programming, compiler development, or forms interfaces
- Experience in the development of large interactive applications
- Experience in or interest in computer graphics
- Familiarity with relational database concepts
- Graduate work in Computer Science or equivalent experience

SDRC offers a stimulating and challenging career opportunity, professional growth and excellent company paid employee benefits.

COMPUTER PROFESSIONALS

With Current Experience In Applications Software, OS/SW, Communications Networks, Compilers, DBMS and Development Tools.

We are now assuming our responsibilities as the Shuttle Processing Contractor for NASA at the Kennedy Space Center, Florida and the U.S. Air Force at Vandenburg Air Force Base, California. This six year contract (with options to fifteen years) will provide you with a secure opportunity to join the team of professionals like yourself who are making a significant contribution in the manned space program.

If you are an experienced computer professional whose goal is more challenging and rewarding work in a state-of-the-art environment, look to Lockheed Space Operations Company. We are hiring a number of professionals, like you, to fill opportunities involving the development and enhancement of: Applications Software (Real-time and Interactive), Operating Systems Software, Communications Networks, Compilers, Data Base Management Systems and Development Tools. You will be working on the Space Shuttle Launch Processing Systems (LPS), which is a highly distributed network of over 300 MODCOMP Super Mini Computers and a large number of Honeywell 6000's with over 3.5 billion bytes of mass storage. Some of these opportunities will involve a three month program to become familiar with the entire LPS and the space system unique OS/SW.

We also have opportunities available for MIS Applications professionals to develop a wide variety of on line Data Base Management Systems.

For immediate consideration call or send your resume to: Donald C. Quirk, Lockheed Space Operations Company, 1832 Garden Street, Titusville, Florida 32592. CALL COLLECT (305) 268-4070. Candidates who wish to pursue opportunities located at Vandenburg Air Force Base, California should send their resume to: Lockheed Space Operations Company, Employment Office, 1100 West Laurel Avenue, Lompoc, CA, 93436.

CLEVELAND
THE NORTH COAST OF AMERICA

Cleveland is the nation's best kept secret. Anyone who has lived here knows it is a city with much to offer. Four beautiful seasons, parks and bountiful recreation facilities, plus cultural activities including the symphony, ballet, opera and live theatre. Our midwestern lifestyle offers friendly neighborhoods at affordable prices.

Leaseway Transportation has been headquartered in Cleveland since it was founded, over 80 years ago. With revenues of over $1.3 billion, Leaseway stands out as a major employer with outstanding career opportunities, especially for systems professionals.

Our new data center is equipped with an IBM 3083EX/4341 complex running under OS/MVS and a dual processor Sperry 1100/72 system. Distributed systems include Prime, HP and Four-Phase. Extensive use is made of database architecture in systems design with development work performed on-line and supported by a fourth generation language.

If you are degreed and have broad business and systems project experience, Leaseway wants to hear from you. IBM and transportation industry knowledge are preferred. Expansion of our corporate capabilities has created the need for:

- **SR. PROGRAMMER/ANALYSTS**
- **SR. SYSTEMS ANALYSTS**

Please send your resume and salary requirements to Debra Miller at:

Product Manager

A future to be optimistic about.

You'll have much to be optimistic about in this senior level opportunity at NCR's Scripps Ranch facility.

There's our strong marketing, evidenced by our introduction last year of more data processing products than any high tech company with a major international organization. We have an atmosphere that inspires and encourages personal achievements. Plus, you'll have the opportunity to achieve and be rewarded well with a good salary, numerous benefits, and chances for further career advancement.

Your duties and responsibilities will be comprehensive, too.

Concentrating on day-to-day interfacing and support of marketing and sales groups, you'll be strongly involved in all product management tasks. From sales training support to direct sales support. Product and marketing strategies along with forecasting, pricing and financial planning. Plus, participation in all product presentations as well as development and release of corporate and consumer materials.

To successfully handle these accountabilities, you must have 10 years product management experience with a minimum of 3 years direct sales experience in computer systems and products. You'll need outstanding analytical and communication skills. And, we require a BS or BA degree in Business, Marketing or Computer Science.

Join us in time to celebrate the optimism of our Centennial. For immediate, confidential consideration, send your resume and salary history to: **Systems Engineering — Scripps Ranch, 9900 Old Grove Road, San Diego, CA 92131. Attn: Sharon Jordan.**

These are key positions and provide excellent opportunities that will lead to further promotion in a fast growing company. Excellent compensation and good fringe benefits for experienced individuals. Your potential for personal advancement with a $100 million plus company is the greatest right now as we expand.

INDIANAPOLIS, IN - Field Engineers. Immediate openings for people with experience on IBM 3653 Point of Sale Terminals.

JACKSONVILLE, FLA - Field Engineer. Immediate opening for experienced Field Engineer for support of IBM 3200 Terminal Equipment.

OMAHA, NB - Field Engineer. Immediate opening for an experienced Field Engineer to service and maintain IBM large mainframe equipment, terminals and peripherals.

Dataserv will soon have additional opportunities for field engineers and technical specialists in several other major cities throughout the United States. If you are considering a change in employment, contact Dataserv for a review of what we have to offer.

For immediate consideration and more information call Toll Free - 800-328-6729 or send your resume to: Bev Walters, Dataserv Computer Maintenance, Inc., P.O. Box 3003, Hopkins, MN 55343. We are an equal opportunity employer and all inquiries are considered confidential.

dataserv

Direct Marketing Data Services, Inc.
Manhattan

We are one of the fastest growing companies in today's $14 billion direct mail industry...and have done it through our network of capabilities. Serving the largest mailers and information users, our services primarily match, select or eliminate names in a structured, high production environment. To do this, we have a versatile (three tier) powerful computer line-up: IBM 3083 through WANG VS. Achieving this state-of-the-art precision and personalization at low operating cost is our everyday standard. Yet sustaining such growth and professionalism requires high caliber individuals, as these three opportunities indicate:

Director - Data Processing Vice Presidential potential - compensation OPEN. Take charge immediately of facilities, operations and programming. Close there are to hand, plan the consolidation of multiple sites into one integrated location. Direct the addition of a new medium-sized mainframe that you and your team will install, staff and operate. This top position requires at least five years of operative DP experience, with 2-3 years at a management level. Must be able to direct all programming and demonstrate the skills necessary to evaluate, acquire and integrate new hardware. Position reports to the President.

BAL Programmer/Analyst $30K range This lead position requires Assembler language for new system programming (60% of effort) and maintenance of present programs (40%). There is great satisfaction in successfully programming in our fastest, high output system, dealing with the largest files in all direct mail. This position will develop program specifications, code and test programs, then document and implement. Two years of applicable experience needed with the opportunity provided for future training and supervisory experience.

Executive Sales Vice Presidential Potential. Generous immediate compensation with unlimited earnings potential. Start by taking over house accounts then add your own contacts for your greatest earnings potential ever, in this highly professional environment. Must understand and communicate in proposals, the marketing and pricing of database services, duplication information and elimination, demographic and geographic information services and delivery improvement systems. To be considered, your present compensation must already exceed $25K and still be growing. Send your resume and current earnings, in full confidence, to: President, Direct Marketing Data Services, Inc., 225 Hudson Street, New York, N.Y. 10013. Besides a challenging environment and upward opportunities, our firm offers a wide range of benefits, including life, hospital, major medical and dental insurances, along with paid vacation, medical leave and holidays. We are an Equal Opportunity Employer.

Technical Support Manager

Technical Support Manager required to direct the systems programming section in a COMTEN to UNIVAC connection and provide technical leadership and coordination for the data center and applications development section.

MVS Systems Programmer

MVS Systems Programmer required with experience in installing SMP/E along with TSO/E, VTAM and CICS.

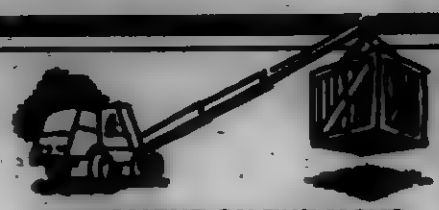
RANDOLPH'S APPROACH TO COMPUTER LEASING... AND WHY IT WORKS.

Started in 1964, Randolph has been saving its customers 30% to 70% of their DP hardware dollars . . .

And we *know* leasing is still the most financially attractive method of acquiring computer equipment at low cost without draining working capital.

But we learned early that the dollar-and-cents approach to computer leasing is only part of a company's concern. Equally important are: prompt installation . . . dependable servicing . . . flexible upgrade capabilities . . . and full support services. Our commitment to *this* approach is the key to satisfied customers . . . and our success.



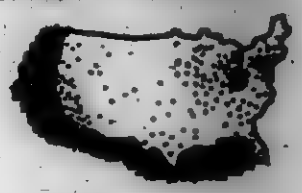
EQUIPMENT ON THE MOVE
We have under management IBM computers with an original cost of over one-half billion dollars . . . and we're adding to this investment to meet the changing needs of our customers. Whether it's an IBM 3081 or 4300 system, additional tape drives, disk storage, printers or other peripherals, our equipment inventory is available to meet your company's requirements. Even hard-to-get machines are sought out and acquired for Randolph customers.

BUT . . . SERVICE MAKES THE DIFFERENCE
The real story behind Randolph's success is our approach to customer support services. To keep computer operations running smoothly and efficiently, these support services have proven to be valuable assets to our customers' D.P. operations.

Continuous IBM Maintenance Program
Manufacturer's service is available day or night, seven days a week, to insure optimal use of your system.

On-Going Technical Support
Randolph's technical staff is on call to help you reconfigure your system to meet changing data processing requirements.

Active Remarketing Division
We assure maximum return on your investment in computer equipment which you no longer use.



RANDOLPH . . . COAST TO COAST
We presently serve customers in over 300 cities and towns from Maine to Hawaii.

MEMBER OF THE FIRST NATIONAL BOSTON FAMILY
In 1972, The First National Bank of Boston purchased our S/360 leasing business, and we became a wholly-owned subsidiary.

With the Bank's financial capabilities behind us, Randolph customers benefit even more from the combined efforts of the best computer leasing and financing people in the United States.

HOW ABOUT YOU?
If your company is not presently leasing computer equipment from Randolph, you'll be interested in our new brochure outlining our special customer support services, and important facts on how we can reduce your computer costs. Call Joseph B. Kelly, Jr., Executive Vice President, 800-243-5307.

BIDS & PROPOSALS

Department of Housing Preservation and Development Request For Proposals

The Department of Housing Preservation and Development is seeking proposals for a capacity and management review of its batch data processing operation.

Request for proposals may be picked up between 9 am and 5 pm at HPD/Office of Operations, 100 Gold Street, Room 9082, New York, NY 10038.

Requirements for the bidders conference to be held on Wednesday, April 25, 1984 at 3 pm are set forth in the request for proposals and must be honored. The deadline for submission is 5 pm, May 11, 1984 and must be accompanied by a refundable check or money order payable to the Commissioner of HPD in the amount of $1,000. For further information call, (212) 566-6841.

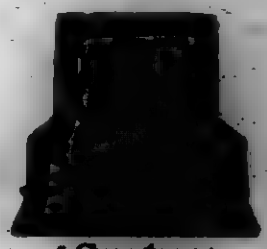
Only MSA software makes your mainframe work 100 times better

1. Now MSA's Executive Peachpak™ II software links personal computers to the mainframe. So you can...

2. Use your PC to access all your MSA mainframe systems, from General Ledger to Manufacturing.

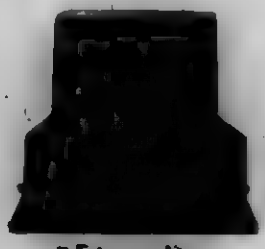
3. Access entire mainframe files, so you can work with large amounts of information at one time.

4. Get HELP if you need it, with a built-in feature that guides you through the system.



5. Choose the exact mainframe information you need, as much as you need, in the form you need.

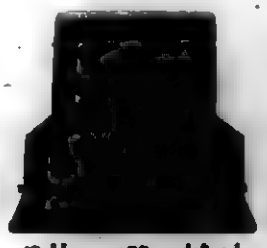
6. Use it with Peachtree Software, 1-2-3™ from Lotus, DIF,™ VisiCalc™ or other micro software.



7. Enjoy a real-time environment, no waiting for processing.

8. Allow only authorized personnel access to the mainframe, due to built-in security.

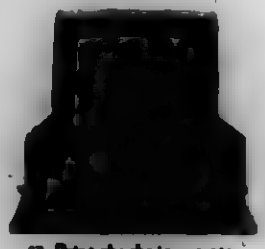
9. Get database-to-database transfer with Database Sharing.



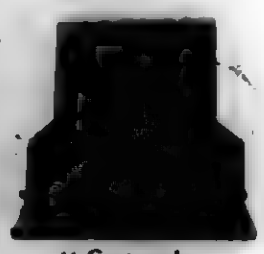
10. Use over 20 predefined applications from MSA. For example...

11. Use PeachLink™ to download information from both MSA and non-MSA online mainframe systems.

12. Download vendor history from MSA's Accounts Payable System and use PeachCalc™ to do comparative analysis.

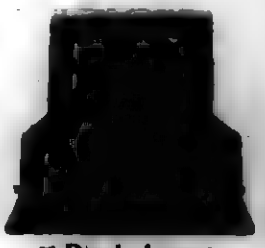


13. Print checks in remote locations from mainframe Accounts Payable data.

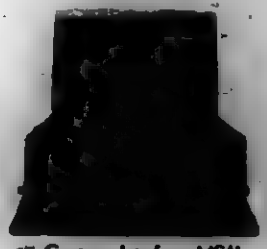


14. Create a salary administration worksheet on a PC using MSA's Payroll/ Personnel System.

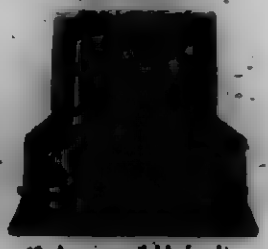
15. Make a purchase order adjustment without leaving your workstation.



16. Download current balances from General Ledger to graph actual vs. planned.

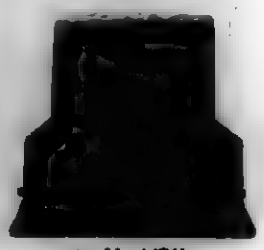


17. Capture data from MSA's Fixed Assets System, use PeachCalc™ to create a lease amortization model.

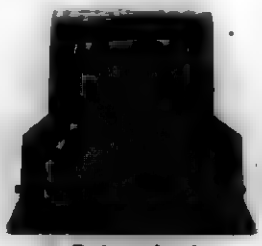


18. Access available funds data in MSA's Budgetary Control System...

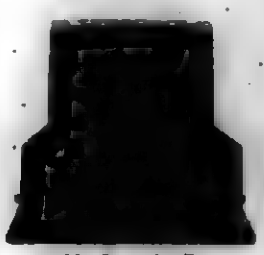
19. Use PeachCalc™ to project expenditures through year-end.



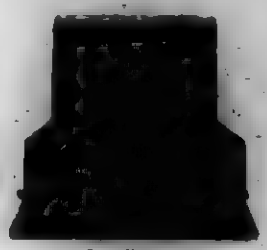
20. Use MSA's Manufacturing System data to produce cost/margin analysis with PeachCalc™



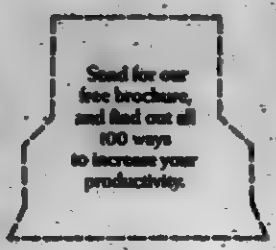
21. Dial up subscriber databases to access current credit information for customers...



22. Use PeachCalc™ to analyze information, set credit and update your mainframe Accounts Receivable data.



23. Install it in less than one hour.



24. -100.

Backlogs? Rush requests? Now they're a thing of the past.

MSA's new Executive Peachpak II links your company's personal computers directly to your mainframe. So executives can get to vital information without waiting for print-outs.

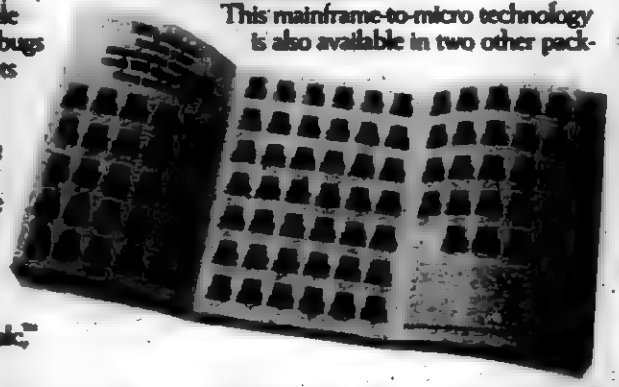
Best of all, this hot new technology is available from MSA *right now.* (In fact, it's already installed and working for companies across the country.)

MSA is the mainframe-to-micro leader. While other companies are still trying to work the bugs out of their initial offerings, MSA already has its second successful mainframe-to-micro product: Executive Peachpak II.

It offers such advanced features as Database Sharing, MSA's database-to-database transfer technology that lets you get all the mainframe information you need instantly.

And a Universal Interface with most microsoftware packages including Peachtree Software, 1-2-3™ from Lotus, and VisiCalc.™

Executive Peachpak II also includes PeachCalc,™ an electronic spreadsheet. A Business Graphics System for color charts and other graphics. Telecommunications that let personal computers talk to each other—or link to resources such as Dow Jones News/Retrieval.® PeachText,™ complete report production system that lets executives edit and footnote reports. A List Manager for organization. And PeachLink,™ the software that links your PCs to the mainframe.



This mainframe-to-micro technology is also available in two other packages: Administrative Peachpak, which includes comprehensive word processing functions. And Graphics Peachpak, for color graphs and charts.

All include PeachLink.™ And all are backed by the service and support MSA is so famous for.

This revolutionary new link means you can now deal with one software company that supplies all the advanced mainframe systems your company needs. All the software for your personal computers through our Peachtree Software Company. And the software that links them together.

Talk to MSA about new Executive Peachpak II. And see how much more you could be getting from your mainframe. Call Robert Carpenter at (404) 239-2000, or write to Management Science America, Inc., 3445 Peachtree Road, N.E., Atlanta, Georgia 30326.

1893. Architects discover up is better than out.

The proposition is easy enough to grasp. When space is at a premium, build skyward.

That's why Wright Line designed its PC WorkCenter to take up more vertical space and less horizontal. Let's face it, few offices embracing personal computers today were designed to accommodate an additional piece of substantial furniture.

Designed particularly for IBM Personal Computer Systems, our PC WorkCenter takes as little as 18″ × 24″ of floor space. Believe it or not, that's less space than your average office chair takes.

Our vertical ergonomic design provides for more efficient and convenient access to all computer components. The unit's storage capacity accommodates software manuals, diskettes and supplies, so every thing you need is all in one place. There's virtually no disruption to your normal work habitat.

As for security, just roll down the locking tambour door for overnight protection against theft and unauthorized use.

1984. IBM PC users discover up is better than out.

An internal cable management system protects against wire damage while leaving nothing underfoot. The master switch with circuit breaker allows you to activate the whole system with just the flick of a switch. And locking casters are ready to roll in seconds for shared use in other offices.

The PC WorkCenter is available in 50″ and 63″ heights, both well within acceptable height limits of contemporary office environments.

Wright Line has been supporting IBM for 50 years. First in the computer room, now throughout the office. And the way things are going, the sky's the limit.

For more information on our PC WorkCenter or for a complete catalog of PC support products, contact Wright Line, 160 Gold Star Blvd., Worcester, MA 01606.

35
LOCAL-AREA NETWORKS
By David L. Terrie
Almost every business has a wiring problem. Read about what's happening as technology helps users ease that tangled web.

39
STRATEGIC PLANNING
By Dixon R. Doll
Strong telecommunications planning is needed to support the office automation environment in any organization. The postdivestiture confusion is leaving many OA planners in a dilemma.

43
PC NETWORKS
By Amy D. Wohl
The current driving force in OA is microcomputers, many of which are being bought to act as workstations. Is this really helping users? If so, what should they know to let micros work best for them?

49
PBX TECHNOLOGIES
By Angela MacRae
The most difficult problem of managing information systems is integrating and connecting installed and future systems and technologies. PBX may be the answer for many users. Find out if it's right for you.

52
THE PERFECT SPREADSHEET
By Thomas Zappia And Thomas O'Flaherty
Micro spreadsheets abound in the market, but their capabilities are still limited. Find out what's available now.

55
THE QUEST FOR COMPATIBILITY
By Glenn Rifkin
"IBM PC-compatible" means many things to many people; users are getting caught in the middle.

59
PICKING A WINNER
By Linda L. Winningham And Patricia Carrell
As data bases proliferate rapidly, choosing the right one can be a game of luck.

A NEW GENERATION OF SOFTWARE
By David A. Boucher
A new generation of software is being developed for the emerging 32-bit workstations. What is its current status and how will it help you?

EDITORIAL

The battle over CRT safety is heating up again. No matter how many times we're assured there is no radiation danger from these terminals, users and user groups remain unconvinced.

Bills pertaining to CRT safety have already been introduced in nine state legislatures this year, and two more will reportedly be introduced shortly. Lobbying on both sides of the issue should be intense, with union groups pitted against vendors and big business organizations. In addition to action on the state levels, the U.S. Congress's House Education and Labor Subcommittee on Health and Safety is studying CRT safety.

Although no study has produced scientific evidence that CRTs pose a serious health threat, individual complaints and a number of miscarriages or birth defects continue to be attributed to CRT use.

All parties seem able to agree that some physical ailments — backaches, eyestrain and stress — can be caused by terminal design or work area factors. A recent issue of the Harvard Medical School Health Letter estimated that more than half of all CRT operators suffer from eye irritations, focusing problems and fatigue. Job stress is compounded as operators try to keep pace with a constantly alert computer and to cope with the fact that often their performance is monitored by that same system.

The question of how dangerous CRTs can be will probably go unanswered for some years to come. Continued scientific evidence is needed before we can put the problem to rest one way or another. But we need to address some aspects of the issue now.

Some of the problems can be dealt with on a management level. Management should give more attention to employee needs and fears before computers are brought in. An unhappy, rebellious or physically uncomfortable employee is less productive than one who is satisfied with the working environment. Managers should also encourage better training and more employee involvement in the selection and application of computers. Adjusting the work area to the new needs of employees in an automated environment should be high on employers' priority lists.

Technology itself will help users as interfaces become more sophisticated and screen usage decreases. Voice interfaces may become a normal means of machine communication, thus eliminating many present-day ergonomic problems. Until that time, however, the emotional issues and questions of health and safety of CRT terminals need our attention.

LETTERS

WHERE'S OA?

Yes, I like *Computerworld OA* very much!

My division is currently engaged in a companywide implementation plan for office automation, and your publication provides valuable information to aid in this process.

In the past, I particularly looked forward to each week to the "Office Automation" section of *Computerworld*.

However, although CW OA is an excellent resource, its sporadic publication [six times yearly] would serve your readers best, as it has in the past, if it were an addendum to weekly OA news in CW.

Why, when the integration of data processing and office automation is becoming so critically important, have the editors of CW chosen to eliminate weekly coverage? I hope that either the weekly section will be reinstated or that your publisher will offer a weekly OA publication.

OA HIRING

I have just read "Hiring the Right People" [*Computerworld OA*, Feb. 15], which deals with the problem of finding the right people for office systems positions.

I very much agree with the comments of those quoted regarding the qualifications. However, although the thought of the article very much reflects the needs of the marketplace, it is not indicative of hiring practices on a wide basis.

I have first-hand knowledge of this because the ideal person, as described in the article, could have been me.

I have been seeking a new position for some time now and have found that the great majority of office automation positions do not go to those who possess the attributes mentioned. Instead, specifications for these include large mainframe experience, programming languages, systems development and perhaps data base experience.

After reading the article, I am wondering if I am looking in the wrong places. If that is the case, where might the "right place" be?

James F. Chiodo
Buffalo, N.Y.

TREASURE TROVE

The project team leader of our integrated office study, an outside consultant, was kind enough to give me a copy of your Feb. 15, 1984 issue. I found the magazine to be a treasure trove of information, much of which couldn't be more timely.

I would find it very interesting, however, to hear how you can possibly justify a $71 difference between domestic and Canadian subscription rates for your weekly publication, *Computerworld*.

HERO BREAKS DOWN OFFICE WALLS.

MDS HERO TRANSFORMS ISOLATED WORKSTATIONS INTO NETWORKSTATIONS.

The personal computer is not all pluses. This modern miracle of speed and precision has created a kind of cubbyhole mentality. Isolated, self-protective pockets of valuable information, inaccessible to other computers or the rest of the organization.

How will your company move forward when its best thinking can't even move from office to office? Your company needs HEROS.

IN THE OFFICE, HERO UNITES AND CONQUERS.

HERO™ is the intelligent, desktop Networked Personal Computer from MDS. It does everything an ordinary personal computer can do. And lots that it can't. HERO can form interactive alliances with mainframes, trade information with other computers, make peace between departments and convert diversified knowledge into decision-making power.

HEROS LOOK GREAT IN BLUE.

HERO and IBM. Together, they're unbeatable. Mated with MDS SUPER 21™ Communications Processor, HERO slips comfortably into IBM SNA networks. It looks like Big Blue's 3270 SNA and 3776 remote-job-entry systems. And our MDS SUPER SNA™ option gets both on one communications link. Additionally, HERO runs MS-DOS software, as well as a fast-growing library of MDS software programs.

HEROS PLAY "SHOW AND TELL," NOT "HIDE AND SEEK."

HERO and SUPER 21 give you the power to liberate data from personal, departmental and corporate databases that used to play hard-to-get.

With INTELLIGENT 3270™ (an intelligence only MDS offers), your people can write their own programs and integrate them with data in the mainframe. HERO lets you access the database, extract information, process it, display it, update it and utilize it. Then return it or store it right at the workstation.

MDS HERO WILL MAKE A HERO OUT OF YOU.

With HERO and SUPER 21, what's been out of control will soon be under control. Yours. And your current investments in data processing will pay off even more handsomely. Instead of your system not working, it will be networking. Efficiently, effectively and economically.

Not just in the office, but throughout your entire organization.

Furthermore, MDS systems are planned for non-obsolescence. They're modular in design to accommodate future growth. So, like a hero, every MDS system is immortal.

TOGETHER, WE'LL MAKE HEROIC STRIDES.

MDS is a multidivisional, multinational corporation. We've grown by helping our customers to grow. We'd like to do the same for you. Not just in IBM country, but beyond.

Wherever you are, or want to be, we are. MDS offers service and support capability around the world. Around the clock.

Ask our customers about us. And give us a call. Dial **800-MDS-HERO.** Together, there's no barrier we can't break through.

MDS MOHAWK DATA SCIENCES

OA FORUM

HAMMERING IT OUT

By Michael Hammer

"Hammering It Out" will be a regular feature in Computerworld OA *and will attempt to give readers a look at the lighter side of the developing world of OA.*

Mythology and ritual are mankinds's natural responses to forces that we do not understand. For example, primitive man's understanding of the awesome spectacles of volcanoes, earthquakes and the like was modest. He responded with intricate theories of angry gods with intestinal distress. Among the rituals intended to soothe the divine tummies were the sacrifice of maidens and the dismemberment of chickens.

Today, of course, we understand geological phenomena much better, and hardly anyone dismembers chickens any more. However, superstition still reigns in many areas of human endeavor, and the ritual response continues to operate. In particular, office automation is rife with this less-than-rational form of behavior.

I was reminded of this recently when a company asked me to review the corporate office survey it had just completed as part of its OA strategic planning process. (Also sometimes known as activity profiles or time distribution studies.) The company was most proud of this document and of the exhaustive data collection effort that led up to it.

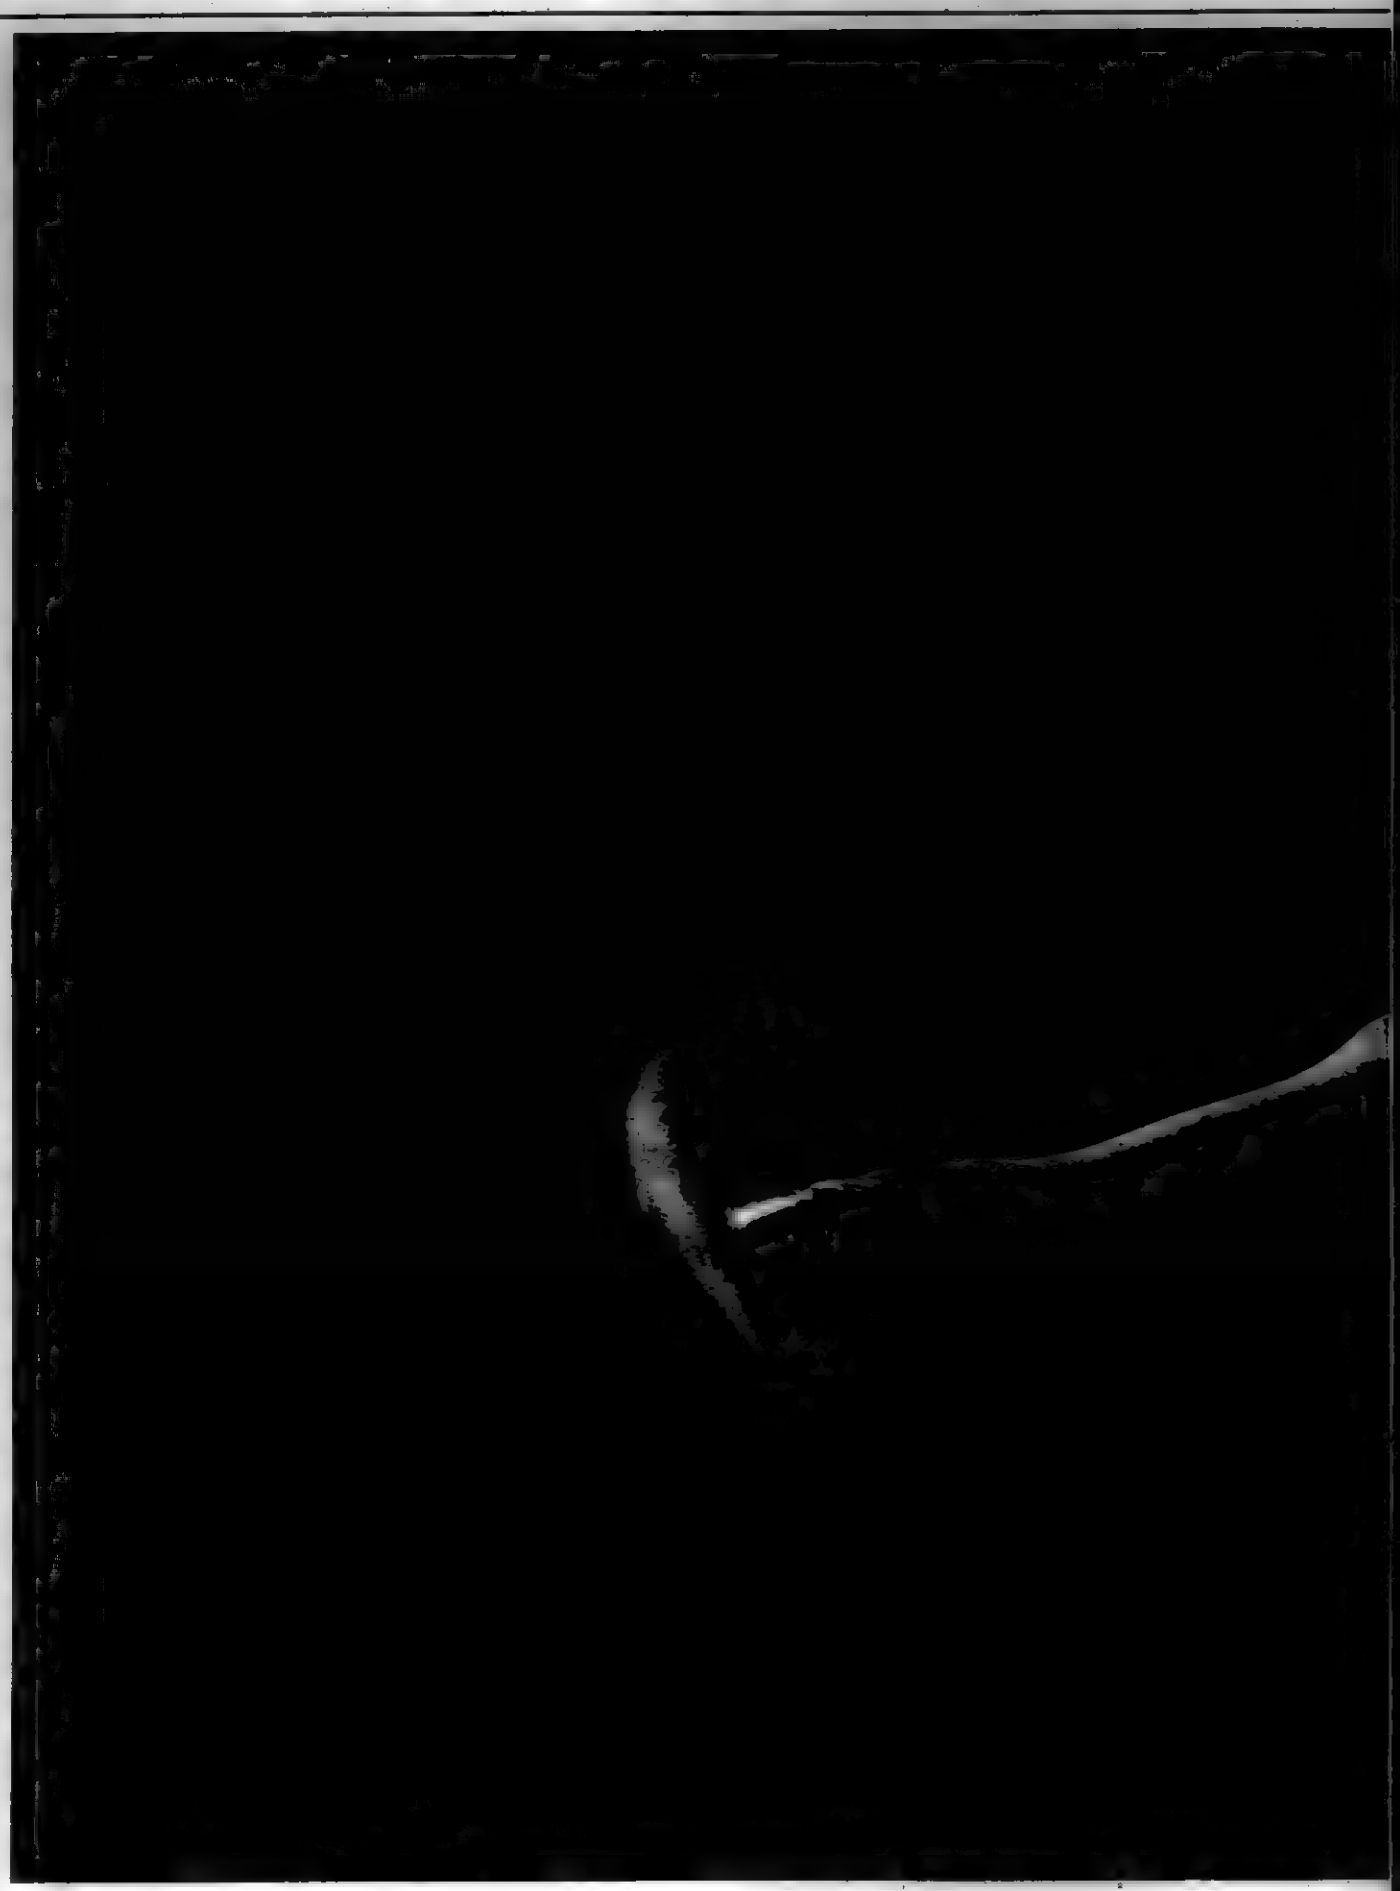
The survey was extremely thorough. It contained detailed analyses of how different classes of office workers spent their time, expressed in terms of a dozen or so activity classes — typing, filing, calculating and so on. They had even broken it down by location and organizational unit and had employed the latest in graphics technology to produce bar charts and other forms of supporting illustration.

The company was so pleased with the product that it would have been in bad taste to ask what the conclusions of the survey actually meant and what the company would do as a result of it. In reality, of course, the results of these surveys are almost entirely devoid of meaning.

If we determine that a typical manager spends 46% of his time in meetings, 22% producing documents, 18% in communication and so on, what have we really learned? Nothing at all. Is 46% too high or too low?

In truth, the office survey as currently practiced is largely an empty ritual, which many organizations perform in response to their confusion about OA. "When in doubt, count," is the order of the day.

Do the statistics tell us why the manager was in a meeting, what it was about and whether or not it was successful? They do not. Let us even suppose that we install an electronic office system that reduces the amount of time spent in meetings. Unless the laws of arithmetic have



OA FORUM

been repealed, the total time distribution must still equal 100%; on what basis do we say the new distribution is better than the old one?

The view of the office on which such surveys are based is obsolete and bankrupt. It is a child's-eye view of the office. When asked what daddy does in his office, my four-year old will describe my day in terms of typing, filing and talking on the phone. Nothing is literally wrong with her answer, but somehow it fails to capture the nuances of my work.

Hammer's Office Survey Form

Name of respondent.....

Percentage of time spent standing up .....

Percentage of time spent sitting down .....

I have recently developed my own abbreviated office survey form, which can be easily administered to any collection of office workers. It has the advantages of both completeness and brevity. Based on an exhaustive analysis of the results of this kind of survey, I have concluded that the typical office worker requires better shoes and chairs. I submit that my analysis is quite as useful as the more popular forms; neither gets at the real substance and content of an individual's work.

In truth, the office survey as currently practiced is largely an empty ritual, which many organizations perform in response to their confusion about OA. "When in doubt, count" is the order of the day. The office survey has all the appurtenances of ritual: an arcane vocabulary, obscure rites conducted with elaborate forms, lofty debates on theological minutiae (the relative efficacies of assorted questionnaires) and a cult of witch doctors blessing the entire enterprise. (These of course are the consulting firms, for whom office surveys are manna from heaven.) Alas, like most such rituals, this one is conducted more for its own sake than as a reasonable means to a worthwhile end. It makes us feel virtuous, efficient and productive, but it leads nowhere.

This is not to say that data collection has no place in the processes of office systems analysis or corporate OA planning. Of course it does. But data is meaningful only after one has an appreciation of an organization's business mission and business activities. Statistics about volumes of office activities need to be interpreted in the context of what an office is really all about. Ritual can never be substituted for insight and understanding.

Meanwhile, rumor has it that the San Andreas fault is about to let go. If you can spare a couple of chickens, let me know. OA

EDUCATING THE EXECUTIVE

By Judith Wadness

The people in the corner offices need to understand the powers of microcomputers. They realize it; you realize it. Now how do you accomplish this goal?

Executive education is a sensitive and difficult task. It must confront the problem of helping the person in the corner office become knowledgeable about micros without making him look foolish and lose face. Without understanding the uses and benefits of micros, however, executives cannot be expect to approve the purchase of these machines.

The training must therefore be concise, present usable information quickly and also be cost-effective. Throughout the session, the executive will probably be analyzing the costs and benefits of the time spent, determining whether the training is worthwhile or wasteful in terms of executive time, trainer time and machine cost. Executives should leave each training session with an immediate understanding of the benefits to be attained.

Training sessions must be independent. Although we know real learning builds incrementally on previous sessions, executives cannot be depended upon to attend additional sessions. As a result, each session's objective must be clearly defined and the information presented must be independent of other training.

The following techniques have been successful in training executives:

• **One-on-one tutoring:** Many companies use this approach because they think executives expect (and need) individual attention. Given the right tutor for the executive's personality and style, this method can be effective.

Unfortunately, this type of training often turns into a demonstration rather than a hands-on learning experience. As a result, the executive doesn't become proficient or even comfortable with the machine.

• **Independent study packages:** Independent study packages are getting better, but they are limited to a handful of popular software packages or company-specific applications. If these packages are to be part of the training program, executives need only know how to insert the disk and turn on the machine to be able to train at their own pace and convenience.

• **Saturday sessions:** These sessions have proven to be among the most effective methods for training senior executives, who place a different value on their weekend time. The hook here is to invite the executives to bring their children or grandchildren and to gear the presentation to the kids. Introductory material can then be presented without insulting the executives.

The inexpensive games bought especially for the kids are used to get everyone familiar with the keyboard and comfortable with the machine. The executives forget their discomfort and unease when assisting their children. The older children even end up teaching the parents, and the two or four hours become a success for everyone.

• **Use of consultants:** Consultants can be used effectively to overcome superior-subordinate roles that are often obstacles to executive education. The knowledge that an outsider will be doing the training is often enough to encourage the executives and to ensure their attendance at the training sessions. The material can be presented in a nonthreatening manner and each session can be customized to the executive's needs and level.

• **External seminars.** The plethora of seminars geared to executive education is indicative of the widespread use of this approach. Similar to outside consultants, external seminars provide a safe environment for learning. However, they usually require at least a half-day commitment off site, a luxury many executives cannot afford.

The techniques discussed here can also be applied to other areas of executive training, such as the use of decision support systems or the electronic mail system. The important thing is to make sure the benefits are readily apparent to the executive being trained.

Wadness is office automation specialist at Computer Partners, Inc., in Wellesley Hills, Mass.

ADDRESSING TOMORROW TODAY.

Imagine.

A remarkable new ZIP Code system for business mailers. So precise it can actually pinpoint specific streets, specific buildings. Even specific building floors.

That's the ZIP + 4 code.

Now imagine a computerized sorting system so advanced that it automatically reads the last line of the address off your envelope. Reducing sorting time while increasing sorting efficiency.

That's the Optical Character Reader (OCR).

EFFICIENCY.

Perhaps most amazing is the fact that both the ZIP + 4 program and our OCR's are already in place. Ready to bring technological efficiency to the mountainous task of moving 100 billion pieces of business mail per year.

But to deliver the future, we need your help.

Begin by being sure that the entire address on all your business mail is totally visible, legible and located properly. Your local post office can give you all the information you need.

ECONOMY.

Use of ZIP + 4 codes is voluntary. But by adopting them, you'll be rewarded in the form of more stable postal rates. In fact, when you meet the eligibility requirements, you can start saving postage right away.

If you're a First-Class mailer of 500 pieces or more who already presorts, you can save a half-cent per piece when you use ZIP + 4 codes. And that's on top of the three-cent discount for presorting.

If you're a First-Class mailer who doesn't presort but mails 250 pieces at a time, you can save nine-tenths of a cent per letter.

And no matter how many, or how few, pieces you mail, using ZIP + 4 codes can give you a cleaner, more efficient mailing list. Plus more consistent delivery.

COOPERATION.

Let us show you how you can put more zip in your mail service. Contact your local Postmaster or Customer Service Representative. And send yourself into the future.

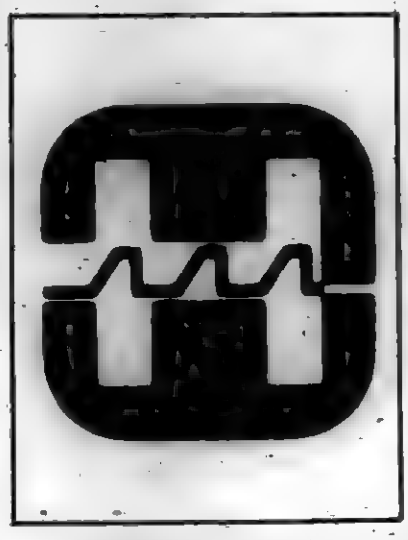
NEWS



Which Way Did They Go?

MELBOURNE, Fla. — Harris Corp. recently found itself in a dilemma. Still in the final stages of development on its Series 9000 office systems offering, the company late last year acquired Lanier Business Products, Inc., the well-known office products manufacturer. Because Lanier had its own successful word processing product, the One-Step software package, and several new products on the way, Harris had to make a quick decision about what to do with the Series 9000.

Clearly, Harris couldn't bring out a product that would compete with Lanier's, so last month, despite more than three years' work and a reported $60 million in development costs, the Series 9000 was gone. According to Jack C. Davis, senior vice-president of Harris' Information Systems Division, the decision was very logical. "We simply didn't want two systems to work against each other."

In fact, the Series 9000 will not disappear completely. Harris announced plans to integrate the "best" features of the 9000 with Lanier's family of products, including the One-Step, the Lanier Business Processor 1000 and the Lanier Business System 5000.

Of the five pieces that made up the 9000 — the 9000 controller; the CRT; the operating system; the text processing software; and Harrisnet, the local-area network hardware and software — only the CRT and the text processing software were officially killed. Harrisnet, Davis said, would be established as a standard for all Harris/Lanier products.

Davis pointed out that the 9000 controller and operating system will form the nucleus of a new distributed data processing system for Harris. The ergonomic design of the 9000 will also be incorporated into other Harris products.

Although consultants agreed Harris had to make this move, the payoff is not so certain. According to Thomas Billadeau, it is doubtful the 9000 ever got into the beta-test stage; therefore, it would be difficult to determine what the "best" features of the 9000 are. "I've used the system and I wouldn't have any idea," he said.

Billadeau added that depending on Lanier for its entrance into office automation was unlikely to succeed for Harris. Lanier has been in turmoil since before the merger, and many of its key managers have left the company. "Harris is going to have to step in and get involved a lot sooner then they had thought. Any end user who commits to Lanier is just begging for trouble." In addition, he said, Harris has also not enhanced its own credibility, because this is the third time it has promised a system and not delivered.

Davis admitted that Harris wouldn't have made certain strategic moves had it known the merger was coming. He said the essential components of the 9000 are not being scrapped, and it was an "excellent opportunity" for a company to be able to choose between two good products (the 9000 and Lanier's System 5000) to offer its customers.

In This Corner . . .

WELLESLEY, Mass. — When Software Arts, Inc. and Visicorp signed a 1979 agreement to market Visicalc, the future for both companies was rosy. Daniel Bricklin and Robert Frankston, creators of the unique and innovative Visicalc, had founded Software Arts and wanted to be responsible for the development and enhancement of the product. They turned to Daniel Fylstra, president of Personal Software, Inc. to handle the marketing of the product.

Needless to say, Visicalc was at the forefront of the personal computer revolution. To date, it is reportedly the best-selling computer program in history.

Unfortunately, this Horatio Alger tale has taken an unhappy turn. With tough competition like Lotus 1-2-3 honing in on its market, Visicalc sales have dipped dramatically — from a high of nearly 40,000 units per month to just 5,700 per month in December. Now the two companies have locked horns in a law suit in which Visicorp sued Software Arts for $60 million in damages and Software Arts countersued.

Visicorp claimed Software Arts was more than a year late in delivering advanced versions of Visicalc and was spending its time developing another product called TK!Solver. Software Arts, in its countersuit, claimed Visicorp had failed to use its best efforts to maximize sales of Visicalc. Software Arts also asserted that it had terminated the agreement, that it is entitled to the return of all Visicalc trademark rights and that it intends to market Visicalc itself.

Last month, Software Arts began to market a $100 advanced version of Visicalc for the IBM PC. Visicorp also continues to sell the product. As usual, the end user gets to figure out what's going on.

Chapter 11, No. 3

SAN JOSE, Calif. — It might be the early signs of the long-awaited shakeout or just poorly managed companies ending up with the expected results. Whatever the reason, Victor Technologies, Inc. in February joined Osborne Computer Corp. and Computer Devices, Inc. as the third micro maker in six months to file Chapter 11 of the U.S Bankruptcy Code.

It was a long way down for Victor, whose president, Charles Peddle, was hoping to make his company the Number Three computer maker in the world by marketing the Victor 9000 desktop. The 9000 was reportedly a best-seller in Europe, but couldn't crack the market at home.

In filing Chapter 11, Victor claimed an estimated $70 million in unsecured debt. Three other units of Victor also filed Chapter 11 — Victor United, Inc.; the U.S. distribution subsidiary; and Victor Technologies International Sales Corp.

As part of the court-supervised restructuring, Victor terminated 300 employees in the U.S., leaving approximately 570 employees worldwide. Victor reached an agreement with its largest secured creditor, Security Pacific National Bank, under which the bank will finance "near-term manufacturing and distribution needs," a Victor spokeswoman said. Victor reportedly has suits pending from several other creditors.

CRT Controversy Continues . . .

Despite the consensus among vendors that CRT terminals are safe to use, the issue is far from settled. Congress and a number of state legislatures are gearing up for debate on CRT health hazards, while studies continue to emerge from many different venues supporting both sides of the issue.

In February, 9 to 5, the National Association of Working Women, released a study implicating CRT use with widespread health effects such as miscarriages, eyestrain, muscle pain and exhaustion. At the same time, The Koffler Group, a consulting group in Santa Monica, Calif., in its published review of CRT health research concluded that all prior research correlating CRT use and adverse health was either poorly conducted or biased.

While six to eight states are considering CRT legislation, the House Education and Labor Subcommittee on Health and Safety heard testimony in late February from a Syracuse, N.Y., insurance company clerical worker who linked her child's birth defects to CRT use. Her company, she said, "enslaved us to the new machinery and subjected us to health and safety hazards." The 9 to 5 study reported that a voluntary survey of 6,000 CRT operators (871 of whom responded) showed more than half experience eyestrain or muscle strain, and 45% reported pregnancies ending in miscarriage, stillbirth, early death of infant or birth defects.

In response to the report, Karen Nussbaum, executive director of 9 to 5, stepped up a national campaign that calls on concerned parties to take action on CRT health and safety issues.

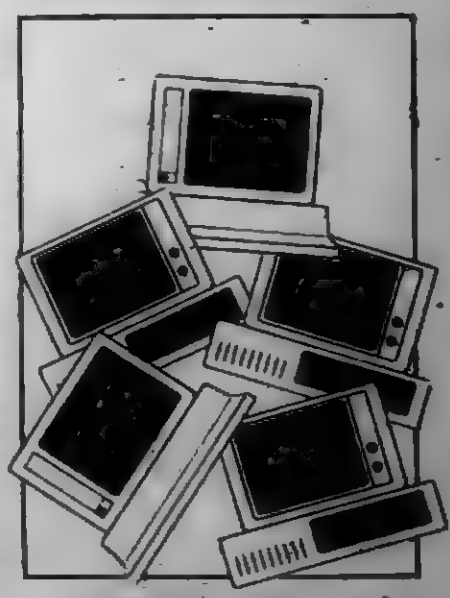
Not everyone agreed with 9 to 5, however. Karen Kessel, editor of the Koffler Group's "Office Systems Ergonomics Report," said any proposed CRT legislation was premature because of the lack of scientific data on the subject. Kessel, referring to much of the negative CRT research, said, "There's a lot of garbage out there." The research Kessel cites as the best in terms of scientific method, concludes that CRTs do not pose a health or safety threat to users.

As solid pieces of research, Kessel referred to a 1981 study by the National Institute for Occupational Safety and Health (Niosh) — which reported no evidence for CRT-caused eye problems — and a 1983 Bell Laboratories report in which no difference was found between the complaints of telephone operators using CRTs and those relying solely on hard copy.

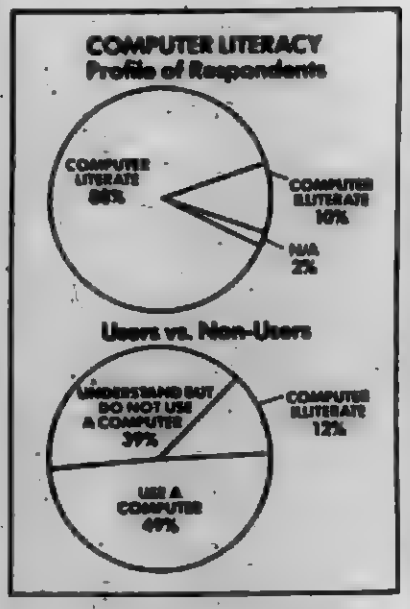
Kessel said publicity about recent reports of CRT health hazards have been unfortunate in that they are diverting attention from "real ergonomic issues." She called for more research on how CRTs are used and better-designed software so that tasks are made less monotonous.

Nussbaum said the most important part of her organization's recent study was finding 15 clusters of abnormally high incidences of health problems. She said that instances such as United Airlines' San Francisco reservation desk are being investigated.

"The problem won't be solved by the industry alone," Nussbaum said, and called for legislation to regulate the uses of CRTs "so that worker safety is protected."



OA NEWS



88% LITERATE

Computer literacy among white-collar office workers is already here and it isn't reserved for the young. According to a study sponsored by Exxon Office Systems Co. (and conducted by the Omni Group, Ltd., a New York consulting firm), 88% of white-collar workers are already computer literate. The study defined computer-literate people as those who either use and understand computers or who have a general understanding of how computers operate and what they can do.

The finding, the report stated, is in sharp contrast to the notion that managers and executives are computer illiterate. Of those polled, 49% use a computer and another 39% have either had "some training or are comfortable with their comprehension of a computer and its applications." The Exxon study also found identical percentages of computer users in the 31-to-40 and 41-to-50 age groups. A majority — 54% — of both groups use computers.

The study said 78% of those who use computers have a daily need for the machine. Among the more widely used OA applications were data base management, word processing, information services, statistical analysis and multiple address mailings.

Perhaps most enlightening was the study's finding that corporate representatives responsible for OA training "significantly underestimated the actual level of computer literacy among office workers and overestimated the degree of fear or other negative factors." The figures showed that representatives thought only 10% of managers knew how to operate a computer when, in fact, 67% of managers said they have this skill. The survey focused on both end users and corporate policy makers. For the end-user survey, 5,000 middle managers were contacted by mail, and 464 reportedly returned questionnaires. The corporate policy survey was conducted by phone with representatives from 100 Fortune 500 service companies. More information is available from Exxon Office Systems, 777 Long Ridge Road, Stamford, Conn. 06902.

PCs And Fortune 1000

CAMBRIDGE, Mass.— The Professional Automation Report from Forrester Research, Inc., a Cambridge, Mass., consulting and research firm, has taken an in-depth look at the IBM PC and its impact on corporate America — specifically, the Fortune 1000 companies. Forrester has concluded that the IBM PC dominates that market already with an estimated 45% of the installed base. By year-end 1986, it predicted, IBM could have well over two million PCs installed in the Fortune 1000.

Fortune 1000 will lead in professional computer networks, integration with existing mainframe/distributed processing equipment and bridging between different workstation types. In addition, the research firm said this community of users will become primary innovators in the use of next-generation software. The five imperatives that will govern professional computer acquisition in Fortune 1000 industries, according to Forrester, are:

- Compatibility with industry-standard software.
- Concordance with embedded systems.
- Ease of use.
- Organizational support: The professional computer must square with the "corporate information culture."
- Ability to fit with long-term strategy.

The Forrester report divided the professional computer market into three groups: IBM; systems challengers/potentials — Digital Equipment Corp., Hewlett-Packard Co., Wang Laboratories and so on; and stand-alone vendors.

According to the report, IBM will have 2.6 million PCs installed in the 1000 companies by 1988, with AT&T Information Services taking second place, DEC third place and Apple Computer, Inc., fourth. For more information contact Forrester Research, P.O. Box 1091, Cambridge, Mass. 02238.

Videotex Deal . . .

NEW YORK — The entry of IBM into a joint videotex venture with CBS and Sears, Roebuck & Co., may bring instant credibility to the videotex market, but not without some drawbacks, according to industry analysts. Although the deal will not produce tangible results for several years, IBM's entry is expected to exert an immediate influence on videotex producers already in the game.

Martin Lane, a consultant for Link Resources Corp. of New York, expects the videotex market to slow to a crawl until it becomes clear what IBM will do. The wait-and-see attitude may have a negative effect on IBM's major competitors, Knight-Ridder Newspapers and AT&T, whose collaborative venture, Viewtron in South Florida, is the only commercial videotex service in the U.S.

The IBM-Sears-CBS venture intends to send data to home computers instead of the dumb video-screen terminal Viewtron employs. IBM is hoping to cash in on its already widespread base of Personal Computers; Viewtron subscribers must buy AT&T's terminal, which costs $600 and can be used only for videotex.

This agreement marks a change in allegiance for CBS, which had hooked up with AT&T two years ago on a similar project. Sears is hoping to market its vast merchandise catalog and financial services products electronically; IBM hopes to use videotex to sell more home computers.

The videotex business projects tend to be a losing proposition initially, according to Lane. IBM, CBS and Sears have the financial capabilities to survive in the market, he said, but the history of joint ventures between corporate heavyweights does not contain many success stories. Whether the three giants, will succeed in the long haul remains to be seen.

BRIEFS

MAYNARD, Mass. — Digital Equipment Corp. and 3M Co. announced a joint program to develop a new worldwide standard for data interchange in the form of a compact half-inch storage tape cartridge.

Compactape is intended to serve as a secondary storage medium for disk drives in the 20M-byte to 200M-byte capacity range.

For more information, contact DEC, 125 Main St., Maynard, Mass. 01754.

SAN JOSE, Calif. — Visicorp, in a move calculated to expand its position in the windowing environment software market, has lowered the price of the Visi On Applications Manager from $495 to $95. The pricing move was made to "bring the performance and productivity gains offered by the Visi On to a broader base of end users," Visicorp said from 2895 Zanker Road, San Jose, Calif.

OMAHA, Neb. — A comprehensive directory of all 22,368 U.S. computer dealers is now available from American Business Directories, Inc. The spiral-bound book fits into a briefcase and is available for $369, from American Business Directories, Inc., 5639 S. 86th Circle, P.O. Box 27347, Omaha, Neb., 68127.

MENLO PARK, Calif. — The personal computer market for business establishments will peak during the next two years and then grow at a far slower rate than previously expected, according to a study by SRI International, Inc.

SRI also estimated that average annual growth from 1986-1990 will be only 5.4% and that by 1986, more than half the personal computer shipments to U.S. businesses will be replacements for older 8-bit and 16-bit gear.

The findings are part of a $400,000 research program on office automation applications done by SRI.

The entire study is available for $24,000 from SRI International, 333 Ravenswood Ave., Menlo Park, Calif., 94025.

TROY, Mich. — The American secretary loves office automation.

That was the finding of a recent survey, "People in the Electronic Office," which looked at the impact of OA on people in the office. The Kelly Services report indicated that 93% of secretaries surveyed are not only satisfied with being secretaries, but are also satisfied with their current positions.

Word processors and other electronic equipment are seen by 87% as opening up new opportunities for advancement.

The report is available at no charge from Kelly Services, 999 W. Big Beaver Road, Troy, Mich. 48084. OA

It Takes All Kinds...

BUT NOT ALL MANAGERS' STYLES ARE EQUALLY EFFECTIVE.

BY ROBERT L. WILLIAMS

Success is measured in many ways in today's world of business. Nevertheless, most office automation managers would agree that having solid support from top management, along with adequate staff and budget to allow the development and execution of aggressive plans, would constitute a strong start. This article examines some attributes that help a manager achieve these ends.

Any discussion of OA implementation typically involves several topics:

Technology, of course, leads the pack and probably always will; other factors like user training, cost-benefit analysis and start-up strategies also often enjoy the spotlight.

However, the issue of assuming the appropriate management style is usually kept relatively obscure — even though it, perhaps more than any other issue, determines the ultimate success in establishing and expanding OA in the organization.

Many OA managers encounter two kinds of delays while implementing their programs. The first is the basic failure of top management to understand and be committed to OA as a means to achieve business objectives. The second involves day-to-day operational

(Continued on Page 13)

THE MUSEUM OF MODERN ART/FILM STILLS ARCHIVE

Roadblocks to OA Implementation

Roadblocks to OA implementation occur in two significant areas: lack of commitment from top management and day-to-day operational difficulties. The manager who can recognize the issues involved in these two areas and who can respond to their challenges will find his job a lot easier.

Three common symptoms identify an inadequate commitment to OA by top management:

☐ No formal charter exists. There are no clear definitions of the goals and responsibilities of the OA resource group or its relationship with the DP and telecommunications functional areas. The latter point is particularly crucial because OA, DP and telecommunications together comprise the backbone of the information network; various degrees of paralysis result when their efforts do not completely complement each other.

☐ OA staffing decisions are inadequate. The assignment of personnel to the OA area is often opportunistic, if not haphazard. This tends to compromise both the size and talent of the OA resource group. As a result, the manager is spread too thin and cannot effectively apply his skills.

☐ Perceptions of cost-benefit are distorted. Many well-conceived OA programs are based upon intangible or soft-dollar savings. (Hard-dollar savings can be identified only when significant amounts are presently being spent on office support systems and services.) If key decision makers are reluctant to move forward without tangible cost-justification, exceptional opportunities may be lost.

The second reason for slow progress, day-to-day operational difficulties, has six distinct challenges associated with it:

- ***Obtaining cooperation from the user community.*** Without the proper input and support from the people being affected by OA, no recommendation has a chance.
- ***Projecting realistic benefits.*** With no standard method available, the most appropriate approach to justification is often unknown.
- ***Selling the concept of OA.*** The acceptance of proposed solutions depends largely on how the message is delivered. This is apparently more difficult for managers who come from a technical rather than a functional background.
- ***Establishing organizationwide policies.*** Due to the divergence of viewpoints and the frequent development of expertise within user groups, many OA managers are frustrated with their track records in setting uniform guidelines for the acquisition and use of OA systems.
- ***Dealing with vendors.*** Many OA managers feel that a great deal of pressure is exerted on them to observe preferences for certain vendors. This obviously is a delicate issue and requires continuous attention. The inability to stay abreast of developments in the rapidly changing marketplace is another source of deep concern.
- ***Dealing with change.*** Perhaps the most common on-going challenge is finding time to monitor and react to continually evolving technology, organization and reporting relationships as well as to changing user needs and expectations. The OA manager must frequently negotiate with new users on everything from revised job descriptions to hardware configurations. OA

WHY MORE BIG SYSTEM IBM® OWNERS ARE KEEPING UP, WITH SORBUS.

After all, like IBM, Sorbus provides on-site field engineers 7 days a week, 24 hours a day; a full preventive maintenance program and genuine IBM parts.

But unlike IBM, Sorbus will service virtually every peripheral in your system, IBM or not. For small equipment such as PCs, Sorbus offers the same high quality service, with turn-around so swift you'll be pleasantly surprised. And, Sorbus Service costs less.

No wonder Sorbus services more IBM systems than any other independent; maintains more than 150,000 machines for over 35,000 clients; has one of the fastest response times in the industry, and carries a parts inventory so large, we usually can fix your equipment right then and there.

So, if your operation includes one or more IBM PC, System/3, 34, 36, 38, 360, 370, 303X, or 4300 series, keep up with Sorbus: rated the #1 independent service company by computer professionals nine years in a row.

difficulty (see "Roadblocks to OA," Page 12).

Roles available to the OA manager who seeks to overcome these roadblocks to success generally fall into one of four categories, which are are plotted on the Professional Personality Map shown in Figure 1 on Page 14.

The two dimensions represent motivating needs. The first is the need for control of the environment; the second, the need for interaction with people. Any pair of coordinates on the grid formed by the two axes falls into one of four quadrants, each of which represents a unique professional personality:

- ***The Doer*** has a high need for control of the environment and a low need for interaction with people. This person wants something to happen and wants it to occur according to his plans. However, the Doer is not overly concerned with whether other people are sold on the project.
- ***The Thinker*** has a low need for control of the environment and a low need for interaction with people. This person is satisfied with personal knowledge and preoccupied with designing the ideal system. The fact that no one appreciates the system and that it does not come to life puzzles the Thinker.
- ***The Adviser,*** with a low need for control of the environment and a high need for interaction with people, is rather passive and enjoys being asked for help. This person places great emphasis on how well his work is perceived, but very little emphasis on actual results.
- ***The Promoter*** has a high need for control of the environment and also has a high need for interaction with people. The Promoter actively seeks out new opportunities and is satisfied only when his ideas receive favorable acceptance and are fully implemented. This person devotes great effort to addressing all aspects of a project to ensure its success.

Every OA manager fits into one of the categories of the Professional Personality Map. More specific labels may be used to describe each role in the context of OA. The empiricist is a Doer. He likes the experimental approach, installing pilot project after pilot project and slowly growing a sophisticated and well-tested automation capability for the organization. The result is a slow but steady growth in the use of OA.

The technologist is a Thinker, concerned with OA hardware and software and the combination that will produce the ideal system. This quest typically ignores specific needs and desires of users.

The technologist is a Thinker. This person is concerned with OA hardware and software and the combination that will produce the ideal system. This quest typically ignores specific needs and desires of prospective users. The result is certain frustration, disappointment and resentment.

The consultant is an Adviser. Line managers are served only when they request assistance. The analysis is usually on tar-

Polaroid cuts the glare and cuts the price!

Introducing new Polaroid CP-50 Filters.
Some video-display filters improve contrast. Others reduce glare. The new Polaroid CP-50 does both. For under $50.

The CP-50 is a durable, lightweight, circular-polarizing filter that virtually eliminates glare. And is far more effective than non-polarizing filters for improving contrast.

The glaring problem.
Bright light from windows or overhead lamps reflects off your computer screen. So you squint, strain and shuffle in your seat to read the data.

Your eyes must constantly refocus between the reflections and the data. The result? Sore eyes, dizziness and headaches. You slow down. And you're not as productive as you could be.

The low-cost solution.
One way to cut glare is to change the lights, drapes and office furniture. But that's expensive. What's more, it does little to improve contrast. And most other filters simply reduce glare without really improving contrast.

Polaroid's CP-50 reduces glare and improves contrast. For less than $50.

There's a CP-50 for your color or monochrome display.
Polaroid CP-50 Filters come in sizes to fit most video displays. And you can mount the filter yourself in a couple of minutes. There are no holes to drill, no tools required.

*Suggested retail price.

Polaroid

Polaroid CP-50 Filters. The low-cost answer to a glaring problem.

get, but serious inconsistencies develop during the installation process. The result is slow progress toward automation and difficulty in getting departments to become standardized.

The entrepreneur is a Promoter. This person takes a marketing approach to the problem of spreading OA throughout the organization. He concentrates on actual user requirements while also focusing on the applications that promise the best return to the organization. The result is rapid movement and the maximum possible results from the resources allocated to OA.

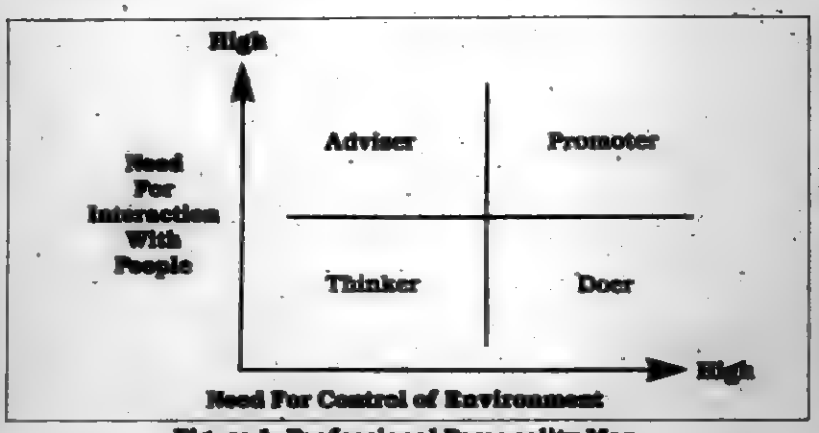

Figure 1. Professional Personality Map

The role of entrepreneur best positions the OA manager to remove those obstacles to success (described in "Roadblocks to OA Implementation" on Page 12) by recognizing the importance of people and their needs, as well as the organization's requirement for optimal cost-performance.

An entrepreneurial OA manager style has some key advantages.

First, it sells the concept of OA. Many people are still resistant to automation and have difficulty understanding how it can help them. The entrepreneurial OA manager puts substantial energy into educating top management and potential users, identifying underlying concerns and meeting objections with persuasive arguments and favorable facts.

Second, it facilitates organizationwide standards. The entrepreneurial OA manager takes an active role in promoting systems. This provides an excellent opportunity for large-scale planning and for installing compatible systems and procedures wherever automation goes.

The third key advantage of the entrepreneurial style is that it fosters innovative, results-oriented attitudes. An entrepreneurial OA manager will push his program forward at a good speed while keeping everything aligned with underlying business purposes.

Most OA managers would like to have top management's solid support and an adequate staff and budget to allow the development and execution of aggressive plans. The OA manager who wants to achieve that enviable position should demonstrate that the following descriptive statements apply to him:

- Able to handle conflict.
- Not afraid to make decisions.
- Cannot wait for the perfect solution.
- Sensitive to the human factor.
- Accepts limitations.
- Surfaces needs and develops practical transition strategies to meet them.
- Solves business problems.
- Develops trust and confidence.
- Stresses teamwork.
- Understands the change process.
- Attracts and retains competent staff.
- Knows when not to get involved.
- Expands knowledge of technology through effective delegation and vendor relationships.

Each of these attributes is associated with the entrepreneurial style. Given the typical roadblocks to success, they underscore the need to let that style pervade every aspect of the job. When this is done, the OA manager can feel sure he is contributing as much as possible to improve information management, enhance productivity and contain office support costs within the organization. OA

Williams is a manager in the Philadelphia office of Arthur Andersen & Co. and a member of the firm's core group of OA consultants.

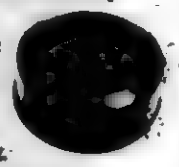
There's nothing special about this file.

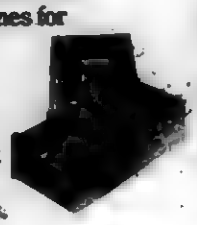
"The Anything File."

Why invest in a special file for card trays? And another for disk cartridges? And still another one for Mag tapes?

If your company is like most, the practical answer for you is Supreme's "Anything File"... Conserv-a-media.™ An ingeniously designed 36" cabinet for multi-media storage and retrieval, Conserv-a-media (The "Anything File") comes in heights of 59", 72" and 85" with adjustable interior components for total versatility.

In these handsome, quality-constructed easy-access units you can have your choice of almost any storage configuration. With hanger bars for tape-seal belts. With wire racks for disk cartridges. With roll-out shelves for disk packs or card trays. With roll-out shelves and rail dividers for cassettes and microforms. With stationary shelves for binders and manuals. With hanger bars for center hook filing of EDP printouts. With hanging frames for drop filing of all legal/letter size material. With pullout work surface shelves. And more.





It's the inventiveness you expect from the people who invented lateral filing in the first place.

Conserv-a-media by Supreme. What's special about it is that it's the best non-special file you can buy.

We understand how important it is to listen.

Windows Come To The Workstation

By Molly Upton

A mad rush toward modeless, multipurpose software for personal computers is now under way. When the dust settles, the real winners will be users who don't want to switch floppies constantly or dicker with operating system commands and different structures for different applications.

In the meantime, those making major buying decisions about software packages face a difficult process. A look at specific features follows; first, let's look at some global level trends — including windows and integrated packages. Everyone aspiring to be anyone in the packaged software business is touting an integrated system. "Integrated software" means a lot of things to a lot of people, but three hierarchical levels seem to stand out. In general, each level contains the characteristics of the previous levels:

- Data integration — data from one application can be transferred to another application.
- Command structure — the majority of the commands are constant throughout the range of applications.
- Modeless (or seamless) — functions previously done under different applications can be performed in one application. Integration of data and command structure are achieved as well. A central data base, from which all applications are structured, is generally required.

Environment software, which is divided into two types, provides hooks between the operating system below it and the applications software above it. The first type — Visi On, for example — requires new software to be written to its specifications; the second type — Quarterdeck's Desq falls into this category — accommodates existing software.

Multitasking or concurrency is one important trend which, although not yet pervasive, probably soon will be as the demand for background communications increases. Another strong trend is toward hot switches, as they are sometimes called, which make it easy for the user to suspend operations in one task, implement another and return to where he left off. Quarterdeck's Desq, Digital Research's Concurrent CP/M and Structured Systems Group's Windowmaster seem to be the principal providers of multitasking environments.

One word of caution must be raised about concurrent systems: Some of them seem to have a difficult time handling communications as an uninterrupted background task. Ouch!

Digital Research has indicated it will announce a product that lets MS-DOS run on top of Concurrent CP/M. Whoever thought the battle of the operating systems was over?

Open systems is really quite a

loose term. According to one meaning, it is an integrated package that accepts other packages' files (also known as import/export capability) via such means as the DIF format.

DIF is a file format standard, developed by Software Arts, to enable the transfer of data. All DIF files have two basic parts, one of which contains information about the file, the other the data itself.

In another meaning of open systems, the vendor of the environment — Visicorp, for example — makes available its specifications to other vendors to write programs that use the same user interface and also integrate data.

Artificial intelligence work being done in the Lisp language can be expected to be applied to mundane applications. The user will simply see easier to use applications that appear to function more or less the way he thinks they should.

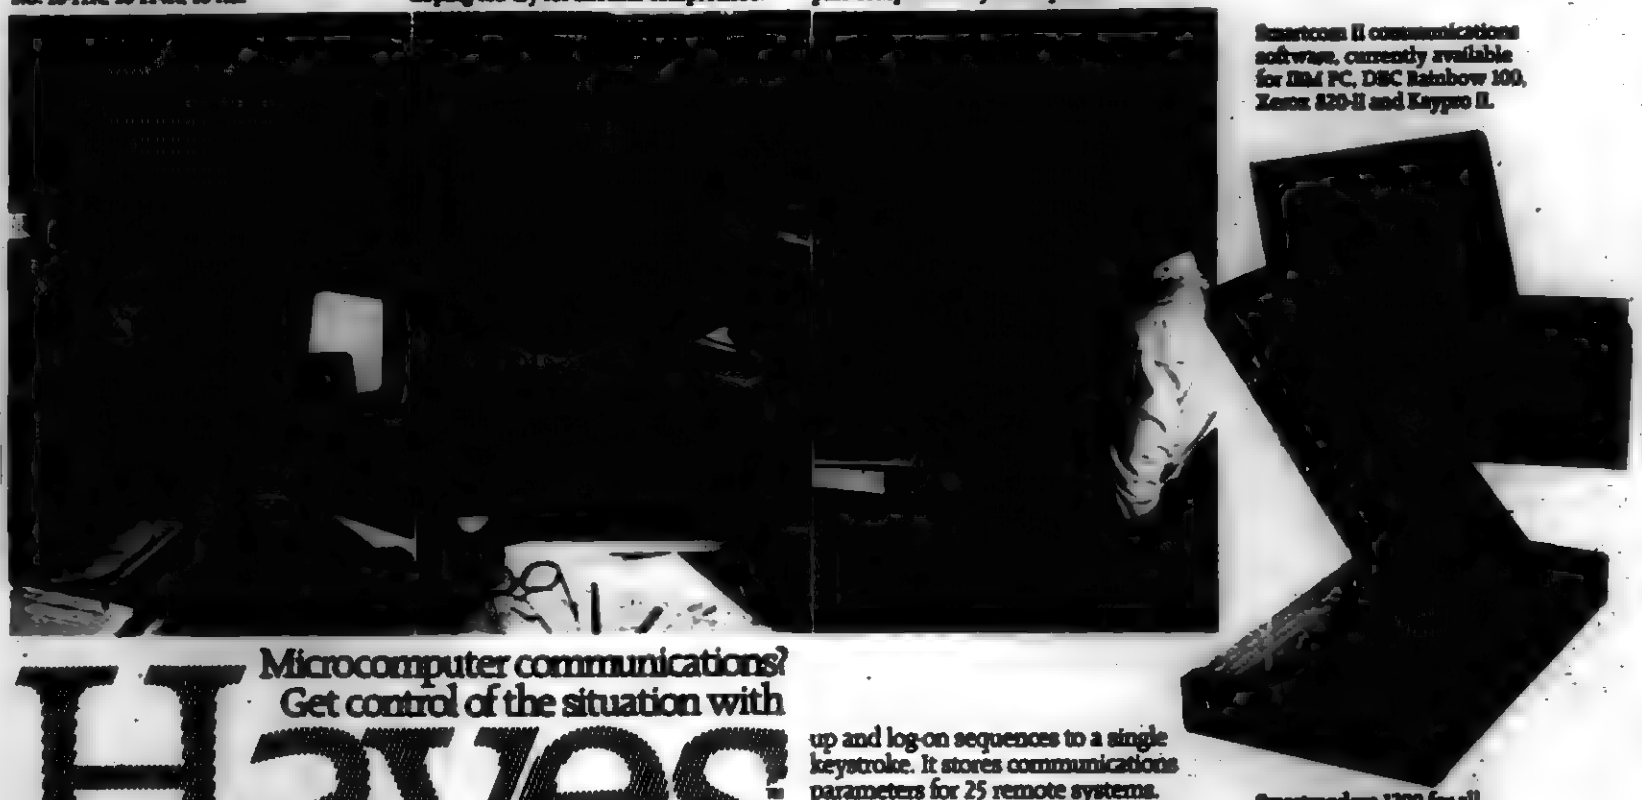
Intuitive systems are also creating a lot of discussion. Artificial intelligence work being done in the Lisp language can be expected to be applied to mundane applications. The user will simply see easier to use applications that appear to function more or less the way he thinks they should.

Goal seeking or the how-to-get (as well as what-if) spreadsheet is a feature being implemented.

To all reps: Price changes on following items effective immediately: No. 10-11A, 10-114A, 10-AL.

Chris: The latest offer looks better, although it's still not what we were hoping for. Try for another compromise.

Just got the word from Gary. Increased our share by 6%. If trend holds, we'll pass competition by third quarter!



Smartcom II communications software, currently available for IBM PC, DEC Rainbow 100, Xerox 820-II and Kaypro II.

Smartmodem 1200 for all computers with an RS-232C interface. Smartmodem 1200B plug-in board for the IBM PC.

Microcomputer communications? Get control of the situation with Hayes™

Microcomputer communications can present the DP/MIS staff with a tangle of mis-matched hardware, user-hostile software, and a situation that can quickly get out of hand.

Hayes can help you avert that chaos, with a telecomputing system designed expressly for microcomputers.

A system so advanced, it's downright simple. Economical. And requires no handholding from you.

Hayes. The computer's telephone. Our Smartmodem 300™ and Smartmodem 1200™ connect to any desktop computer with an RS-232C port. They operate with rotary dial, Touch-Tone® and key-set telephone systems. At full or half duplex. And both feature self-test capabilities, as well as indicator lights and built-in speakers for monitoring calls.

The lower-priced Smartmodem 300 is ideal for local data swaps and communicates at 300 bps. A built-in speed selector on Smartmodem 1200 automatically detects transmission speeds (110, 300 or 1200 bps).

Smartmodem 1200B™ is also available as a plug-in board for IBM® Personal Computers. And Hayes manufactures the Micromodem IIe® for Apple® II, III, IIe and Apple Plus computers, as well. It comes packaged with Smartcom I™ communications software.

Speaking of software, more programs are written for Hayes modems than for any other. And that impressive list includes our own incomparable communications software.

Smartcom II.™ Complete, menu-driven software for the IBM PC, DEC Rainbow 100,™ Xerox 820-II™ and Kaypro II.™ Even first-time communicators will find success with Smartcom II. Screen prompts guide users in the simple steps it takes to create, send, receive, list, edit, name and re-name files.

Tasks like simultaneously receiving, printing and storing data—completely unattended—are easily managed with Smartcom II, because it takes full advantage of Smartmodem's capabilities.

The program reduces lengthy dial-up and log-on sequences to a single keystroke. It stores communications parameters for 25 remote systems.

Plus, there's an on-line help feature that explains prompts, messages and parameters.

Our reputation speaks for itself. Hayes has five years of solid leadership in the microcomputer industry. Nationwide availability through retail computer stores. Trouble-free factory service and call-in assistance. A limited two-year warranty on all hardware. And the most efficient telecomputing system available. Anywhere.

If you're involved in linking micros or setting standards for configurations, remember this. Everything your people need to know about communications can be summed up in one word: Hayes.

Hayes®

Hayes Microcomputer Products, Inc., 5923 Peachtree Industrial Blvd., Norcross, GA 30092. 404/441-1617.

Smartmodem Specifications
Low Speed Data Formats (Smartmodem 1200 and Smartmodem 300) Serial, binary, asynchronous: 7 or 8 data bits; 1 or 2 stop bits; odd, even or no parity (0-300 bps).
High Speed Data Formats (Smartmodem 1200) Serial, binary, asynchronous: 7 data bits; 1 or 2 stop bits; odd, even, or fixed parity or 8 data bits; 1 or 2 stop bits; no parity (1200 bps).
Dialing Capability: Touch-Tone® and rotary-dial pulse dialing.
Command Buffer: 40 characters.
Commands (unnecessary with Smartcom II software): A: Immediate answer. A/: Repeat last command. C: Transmitter Carrier. D: Dial command, including simple dialing, waiting for second dial tone, auto-dialing and other features. E: Local echo. F: Full/half duplex. H: Switch hook. M: Audio monitor. O: On-Line. P: Pulse dialing. Q: Quiet mode. R: Reverse originate/answer mode. S: 17 "Set" commands speed, escape code character, number of rings to answer on, etc. Z: Clear operational parameters above. T: Touch-Tone dialing. V: Verbal result codes.
Result Codes: (can be suppressed with Q) OK; Command line ok. 1/Connect: Carrier detected. 2/Ring: Phone is ringing. 3/No Carrier: Carrier lost or never heard. 4/Error: Error in command line. 5/Connect 1200: Carrier detected at 1200 bps. (Smartmodem 1200 only.)
Audio Monitor: Two-inch speaker with volume control.
Rear Panel: On-off switch, power jack, RS-232C connector, modular phone jack connector, volume control.
Operation: Full or half duplex.
Data Rates: 0-300 bps and 1200 bps for Smartmodem 1200; 0-300 bps for Smartmodem 300.
Interface: RS-232C.
Intelligence: Z-80™ microprocessor with 4K byte control program for Smartmodem 1200; Z8 microprocessor with 2K byte control program for Smartmodem 300.
Telephone Capability: Bell System 103 or 212A compatible originate or answer mode for Smartmodem 1200; Bell System 103 compatible originate or answer mode for Smartmodem 300.
Receive Sensitivity: -9dBm for Smartmodem 1200; -6dBm for Smartmodem 300.
Transmit Level: -10dBm.
Registration: FCC registered for direct connect to the nationwide phone system. Connects with modular jacks RJ11W, RJ12C, RJ21W, RJ22C.
Power Needs: 11.5 Vdc @ 1.5 Amp. 117 Vac, 60Hz, 15.5 Vac output.
Size: 1.5" x 5.5" x 9.0"

ARE YOU EXPECTING MIRACLES FROM YOUR COMPUTER?

Computers have solved a lot of problems around the office.

But because of their usefulness, sometimes it's easy to expect more from computers than they can possibly deliver.

For example, computers are good for storing data. But they can't store the documents you must keep for evidentiary purposes. And they can't make your old paper files more efficient.

But computers along with micrographics can. Micrographics is 3M's concept of file management that uses microfilm instead of paper to store and retrieve your important documents.

With one of our computer-assisted retrieval systems, for example, you can dramatically improve file retrieval time and virtually eliminate the problem of lost files. All in less space than you now devote to record storage.

The result is a system that not only improves the efficiency of workers, but saves your company time, space and money.

Find out how micrographics can fit into your office automation plans and give you more control of your files. Call 1-800-328-1684 (1-800-792-1072 in Minnesota or 1-800-268-9055, Operator 13 in Canada) or return the coupon for our free booklet. Because good as they are, computers can't do it alone.

GET CONTROL. GET FILE MANAGEMENT.

WINDOWS

Windowing is an extension of the operating system. With windowing, levels of capabilities differ according to vendor. Windowing may occur within an application, such as word processing, or among different applications. It may be single tasking, with one application actually running, or multitasking, with more than one application functioning simultaneously.

Some packages, like Microsoft Corp.'s Windows, offer the windowing capability alone; others, like Quarterdeck Software's DesqView, use windowing as a vehicle for other capabilities — in this case, data integration.

Windowing packages can be categorized according to two types of windows. In either case, the user selects the size of the window and calls up another application. Microsoft's Windows uses tiling, the approach used by Xerox Parc's Bravo editor. The software keeps the user's screen neat. In the second approach, windows overlap, as in Xerox Corp.'s Star, Visicorp's Visi On and Apple Computer, Inc.'s Macintosh.

In light of the trend toward modeless software, windowing is neither the last word nor a required facility for all software. However, it will always be necessary to look at two sources of text simultaneously, especially within an application such as WP, and this is best done with windows. Windows will be needed in systems that switch easily between local and remote programs.

Windows may not be necessary in the many cases where the sole function of windows is to help a user transfer data from one application to another in order to perform a different function — for example, spreadsheet data into a graph, or a graph into WP. With a modeless package, a user can start out in WP, do some spreadsheet work in the document and graph it without leaving the original document.

In an attempt to describe differences between his firm's environment software and other vendors' (read Microsoft) windowing managers, Dan Fylstra, Visicorp's chairman, maintained the following: Windows in and of themselves are not a panacea. They are a good vehicle for building better applications, but have little virtue in and of themselves. They do not automatically solve integration problems or make an application easier to use, he said.

Nevertheless, a number of windowing packages were announced recently and the rumor mill reports that IBM is expected to announce its own window manager shortly. If true, that could explain why Microsoft failed to sign up IBM as an OEM for its window manager. Such an IBM package is expected to be the advance guard of a move to make PC-DOS more proprietary — just when lots of vendors thought there was a market for MS-DOS hardware.

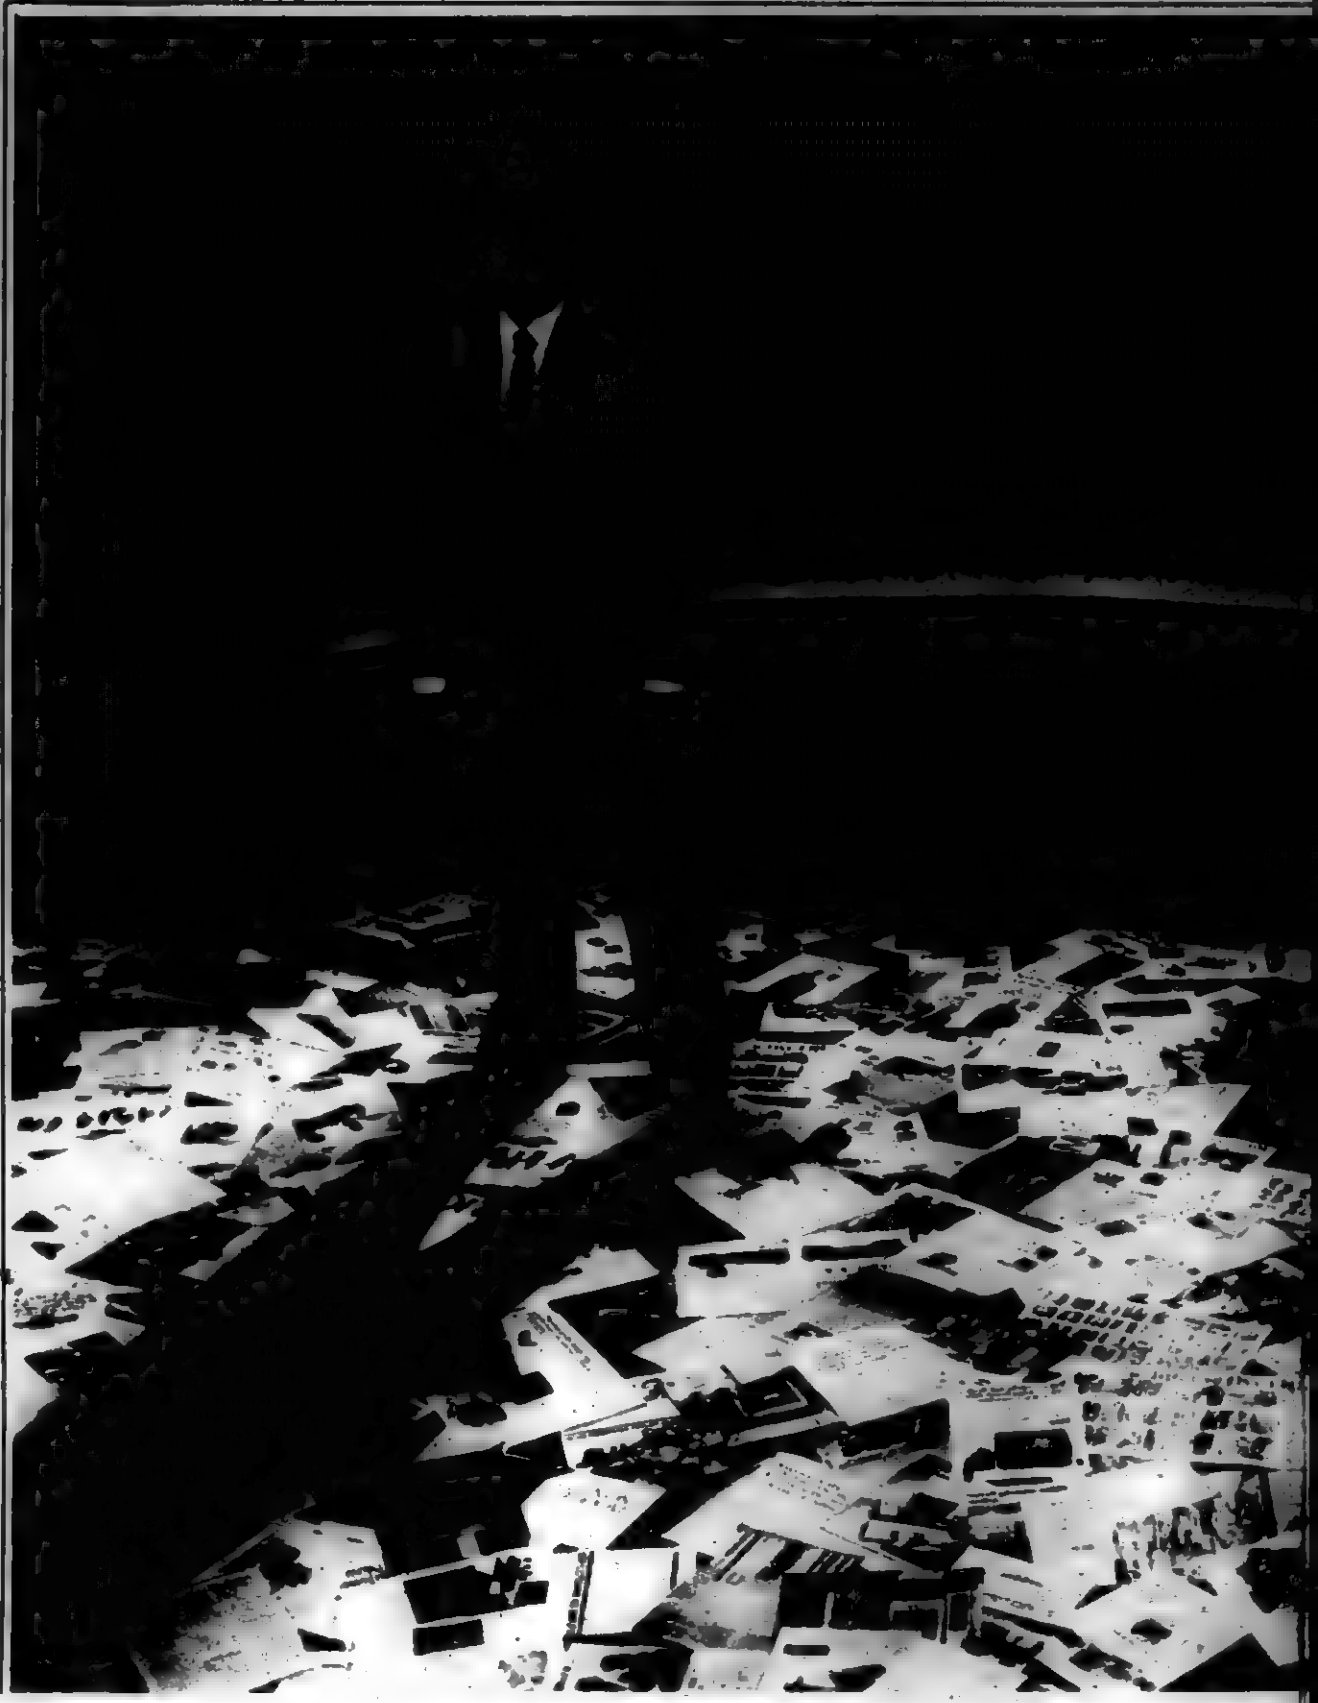
on newer packages. With goal seeking, a user inserts parameters — such as revenue over six months — and the program gives an example of the numbers needed to arrive at the target. Software Products International plans to ship this feature as part of its Open Access.

Linking can be either optional or fixed, depending on the package. With some integrated packages, the user has no choice: Figures in the spreadsheet are linked with the graph and so on. Some folks want a choice — Software Products International's Open Access, Ovation Technology's Ovation and Visicorp's Visi On offer it.

Macro capability, which is also known as stored user instructions, is similar in concept to the stored keystroke command facility on WP gear. It ranges in sophis-



tication from capturing steps to do a function within one application to programming the interaction of a number of applications. As Macros become easier to do, the user will not be aware he is programming.

In the investigation of integrated packages and environments, one key question users should ask is whether the product accommodates the transfer of existing data files into its applications (see Figure 2 on Page 22).

Visi On from Visicorp and *Windows* from Microsoft are both examples of software being written today for the hardware of tomorrow. Both companies like to demonstrate their products on Wang's Professional Computer because it has an 8086 instead of an 8088, and they are eagerly awaiting the widespread availability of the speedier Intel 186 and 286 processors.

Both products also offer applications developers an environment that will provide portability of software to other hardware running the same environment. In addition, Visicorp provides applications for its system; Microsoft does not. (See Figure 1.)

The interfaces are quite different. The Visi On screen features overlapping windows; across the bottom of the screen is a common list of commands including Help, Open, Close, Full, Frame, Options, Transfer and Stop. In addition, each application's window also carries its own line of its commands.

Unfortunately, when a window occupies less than a whole screen, all the commands are not visible and must be scrolled horizontally via the mouse. As they pass, they are highlighted in reverse (white on black), which is a bit strong visually. Pull-down windows, if not also icons, might provide a cleaner interface, and the screen is not as clean as that of a Lisa or Mac.

A relatively little-known fact about the first release of Visi On is that it does not allow transfer of graphs into a document. Also, Visicorp, which is offering applications to go with its Visi On environment, gets 10 lashes: Although it is now putting the DIF file transfer into Visi On, that wasn't originally among the specs.

That from a company that pioneered what has become a de facto standard!

The Visi On system shown in November had a few tender spots, which may have been cleaned up by now. Among its OEMs Visicorp has signed IBM, which will market Visi On and its applications under Visicorp's name.

Microsoft Windows is described as an extension to MS-DOS 2.0. It provides a window manager and graphics device interface and thus offers applications developers a virtual interface to bit-mapped screens and the use of a mouse. In addition, the package offers window capabilities, data exchange and user interface features, such as menus, icons and scroll bars.

Data transfer is done if participating programs find a common format and agree on a protocol. Initial data types include uninterpreted binary, Ascii text and Sylk files. Any MS-DOS application that doesn't address specific hardware will run, appearing through the windows. Other software that goes to the hardware level also runs, but without benefit of any capabilities of windows.

Applications available for Visi On include, in addition to the Visi On applications manager (environment), Visi On Calc, Visi On Word and Visi On Graph. Visi On Query, a relational data base manager, will be available in the first quarter. Current files from existing Visicorp applications can be transferred into the Visi On environment, and there is a full trade-in financial incentive to upgrade to the new applications.

About a month after shipping the product, Visicorp dropped the price of the applications manager from $495 to $95. Perhaps users can understand paying for applications, but think the ability to trade information among applications should not cost so much. Visicorp insists that the move was preplanned and that it intends to use this timeframe for aggressive penetration of the market before MS Windows hits the streets.

Visi On Graph costs $250 for line, pie, bar and area charts; Visi On Word is $375 and shows underlining, bold, italics, subscripts and justification and Visi On Query tables hold up to 65,000 records and can join up to five files. The interface to the data base is meant to resemble a spreadsheet and will sell for $375. Visi On Calc costs $395, and the mouse is priced at $250.

Visicorp doesn't really intend to be in the mouse business, and it is providing the RS-232 mouse

specifications to the peripheral industry. For output, the firm said it is working on a virtual device standard which will be printer independent with the addition of device drivers. It is shipping a library of 11 device drivers and has plans for more.

Visicorp has reported a backlog of about 30,000 Visi On products. The company has shipped over 1 million Visicorp products, with Visicalc accounting for more than 700,000 of these.

Desq from Quarterdeck, in contrast with Visi On and Windows, is a package for today's applications. Desq provides a portable computer user with an environment that allows files to be swapped from one application to another, stores user instructions, has a hot switch between applications and uses a mouse.

Desq does not offer common commands on the application level and thus is best for users addicted to various programs. The recommended memory is 512K bytes and a hard disk. Desq, like Microsoft's Windows, will accept Lotus files. The price is $399 for the multiple window product. Quarterdeck has signed contracts with NCR to market Desq on its Decisionmate and with Digital Equipment Corp. on its Rainbow.

Bill Gates, chairman of Microsoft, and Gary Pope, Quarterdeck's executive vice-president of software development took part in a happenstance thrust and parry session in the aisle at a recent conference. Gates seemed impressed and according to the rumor mill, he may be thinking of doing something in conjunction with Quarterdeck.

Lotus' 1-2-3 is probably the most popular integrated package, and ***Lotus ' Symphony*** package adds WP, communications and a beefed-up data base with forms and mail merge capabilities to the Lotus 1-2-3 features of business graphics and spreadsheet. Windows can be either tiled or overlapping, and there is a facility to exit to MS-DOS and then return to the same spot in Symphony. Lotus claims Symphony will support MS Windows and Desq and the 3270 PC environments and is thus able to swap information between Symphony and programs running under these environments. Symphony will be available in mid-1984 for $695.

Open Access from Software Products International (SPI) is a good example of an integrated package with common commands, and it may be a winner. The folks at SPI come from the University California San Diego (also embryo for UCSD Pascal), and SPI has been licensing software to manufacturers since 1979. Open Access is very quick and includes nice features like three-dimension graphics, multiple graphics on the screen simultaneously, goal seeking or how-to-get spreadsheet and optional linking.

All six modules can stand alone or be integrated. For example, the relational DBMS can join five files simultaneously; retrieve records based on 64 search conditions and then sort on 15 fields; and perform mail merge, among other tasks. The spreadsheet has virtual memory. In addition to the graphics, mentioned above, its other features are WP, communications and time management.

Handy pop-up special function windows such as help, search (list of files) and pocket calculator are easily invoked. The entire package, which costs $595 from SPI, San Diego, Calif., can run on either floppies or a hard-disk IBM PC system. It accepts DIF files and also Lotus files.

Other integrated packages exist in varying stages, but before buying them, users should ask the following questions:

- Is the level of function sufficient in the applications you plan to use? Many are not strong in one area or lack it altogether.
- Can you transfer your old files into it?
- Are the commands as well as the data integrated?
- If you need to use this package in conjunction with a mainframe, will that be possible?

Upton is editor of the "Office Automation Reporting Service" newsletter published by International Data Corp. (IDC), an information processing market research firm in Framingham, Mass. OA

MODELESS PACKAGES

Integrated packages aren't the last word. Modeless packages actually seem to be arriving.

Jack 2 from Business Solutions, Inc. of Kings Park, N.Y., runs on a 128K-byte IBM PC (or look-alike) with two floppies or an IBM XT with a supplemental installation package. It features automatic linking among four applications: WP, spreadsheet, data base manager and business graphics. All functions can be done on the same screen, which means a user doesn't need to exit from WP to do spreadsheet calculations and so on.

Jack 2 word processing can handle multiple columns of text on the same page and hide scratchpad or confidential information in the middle of the text. In the spreadsheet, users can call the cells by name. Currently, because it was designed to be printed by daisy wheel printers, the graph function is limited to bar charts. Icon-driven commands are displayed at the top of the screen. The price is $495.

Other packages include a report generator, at $250, which can calculate and count, and Utility, at $125, which transfers files between Jack 2, DIF and PC-DOS files.

Dayflo is another offering and comes from Dayflo, Inc. of Irvine, Calif. Dayflo runs on a hard-disk IBM (or look-alike) and performs functions such as WP and data base management. It is reportedly designed to work the way a manager does and accommodates "impulsive input" filing and retrieving information in a variety of ways. Future plans call for graphics, spreadsheet, project manager and other applications. Its price is $495.

Ovation from Ovation Technologies of Canton, Mass., is one of the first products touting a wide range of application functions performed within a universal environment. The company claims Ovation eliminates data swapping. It looks modeless to the user, who can perform spreadsheet functions and graphs while looking at his text screen. The package uses 30 common commands throughout all functions; new users should find it easier to get up and running than almost anything else on the market.

The proof of the pudding lies in the range of functionality within the five applications: WP, spreadsheet, graphics, information management and communications. Log graphs are reportedly possible, which may make this a first on multifunction system.

Ovation claims the system recognizes the form of data it is working on and acts appropriately. A macro capability exists, and the program also uses virtual memory. Ovation will be marketed with Tandy's newest product and seems to run very fast on an ordinary PC XT.

Ovation needs 256K bytes of memory and DOS 2.0 on either floppies or hard disk, but the latter is strongly recommended. The price is $795.

Aura from Softrend is yet another entry in the modeless arena. Based on menus, the package does include command bypass facilities, and its strong point is its macro instructions. A user can create his own main and sub menus and can also store instructions within an application to perform such tasks as select, sort and create a report. Aura looks as though it would be handy for the person who has to do repetitive tasks on different data.

Although Aura does not have goal seeking, it does zoom from a spreadsheet back to the source of a particular number. Its elements include information management, spreadsheet, business graphics and WP. The business graphics involves switching to bit-mapped mode and comes with prestored boxes, circles and so on. In addition, text can be different sizes.

Aura is priced at $495 from Softrend in Salem, N.H.

Whatever Happened To Xerox?

By Glenn Rifkin

It could simply be a matter of perception. Xerox Corp. views itself as a strong contender in the integrated office marketplace, but industry analysts are scratching their heads and wondering whether the giant corporation intends to stay in the business at all.

It could also be a case of great expectations. Yes, Xerox has a strong office presence with its copier/duplicators, laser printers and electronic typewriters. But why hasn't Xerox — the nation's 38th largest corporation, with $8.5 billion in revenues, more than 100,000 employees and a name so engrained in the office that it has become a verb (as in "to photocopy") — managed to parlay that power into becoming a dominant force in OA?

Three years ago, Xerox seemed poised to do just that. With its Ethernet local-area network as the first solid contender available in that market, the company made a flurry of announcements in 1981 for add-ons to the network, including its innovative 8010 Star workstation; the 820 personal computer; the Memorywriter family of electronic typewriters and a series of enhancements to Ethernet. The company also offered its 860 word processor for the network.

The Xerox strategy was to offer an integrated office solution based

on the Ethernet network, with the Star as the flagship product.

With its user-friendly mouse interface, icons, powerful integrated software, windows and high-resolution screen, the Star was the talk of the industry that year. Unfortunately, the talk didn't translate into dollars. With a $16,000 price tag, the Star faded quickly.

Since then, Xerox' quest for the office market has been quiet and unspectacular, to say the least. More than 5,000 Ethernet networks are installed and the specifications have been adopted as standards by the IEEE and in Europe. But of those 5,000 Ethernets, only 500 were installed by Xerox. The company made public its specifications when the product was introduced and many other vendors are selling Ethernet-like products. As Tom Elliott of the International Data Corp. (IDC) put it, "Reflected glory doesn't necessarily do anything for the bottom line."

The company hasn't introduced any innovative technology since 1981 (except enhancements to existing products). Although Xerox officials have expressed commitment to a strong personal computer offering for its customers, Robert Adams, president of Xerox Systems Group, admitted that no new product in that arena would be introduced in 1984.

Xerox has also seen several of its key office division leaders leave the company. It has reorganized the structure of these divisions several times in the last few years, culminating in the formation of the Xerox Systems Group under Adams in June 1983. Adams is now responsible for the three divisions, Printing Systems, Office Systems and Office Products, and for the Versatec and Kurzweil groups, two acquisitions which supply electrostatic plotters and data entry systems respectively.

Despite the apparent loss of momentum over the past three years, Xerox is sticking to its guns and its strategy. David T. Kearns, the company's president and chief executive officer, said, "We are committed to office automation. We have a broad line of products. We are doing well in some areas and not as well as we'd like in others. But we're proceeding."

Kearns pointed out that Xerox has been a pioneer with both Ethernet and the Star. He admitted that in 1981 "we may have made more of a flurry (of announcements) than we should have. We have not met the expectations of the numbers of installations we would have liked if you look at the objectives we had at the time. But we have a large number of networks installed worldwide of which we're very proud. They are with sophisticated users who know and understand systems and feel we are providing them with good service.

The Ethernet specifications have been adopted as standards by the IEEE and in Europe. But of the 5,000 Ethernets in place, Xerox installed only 500.

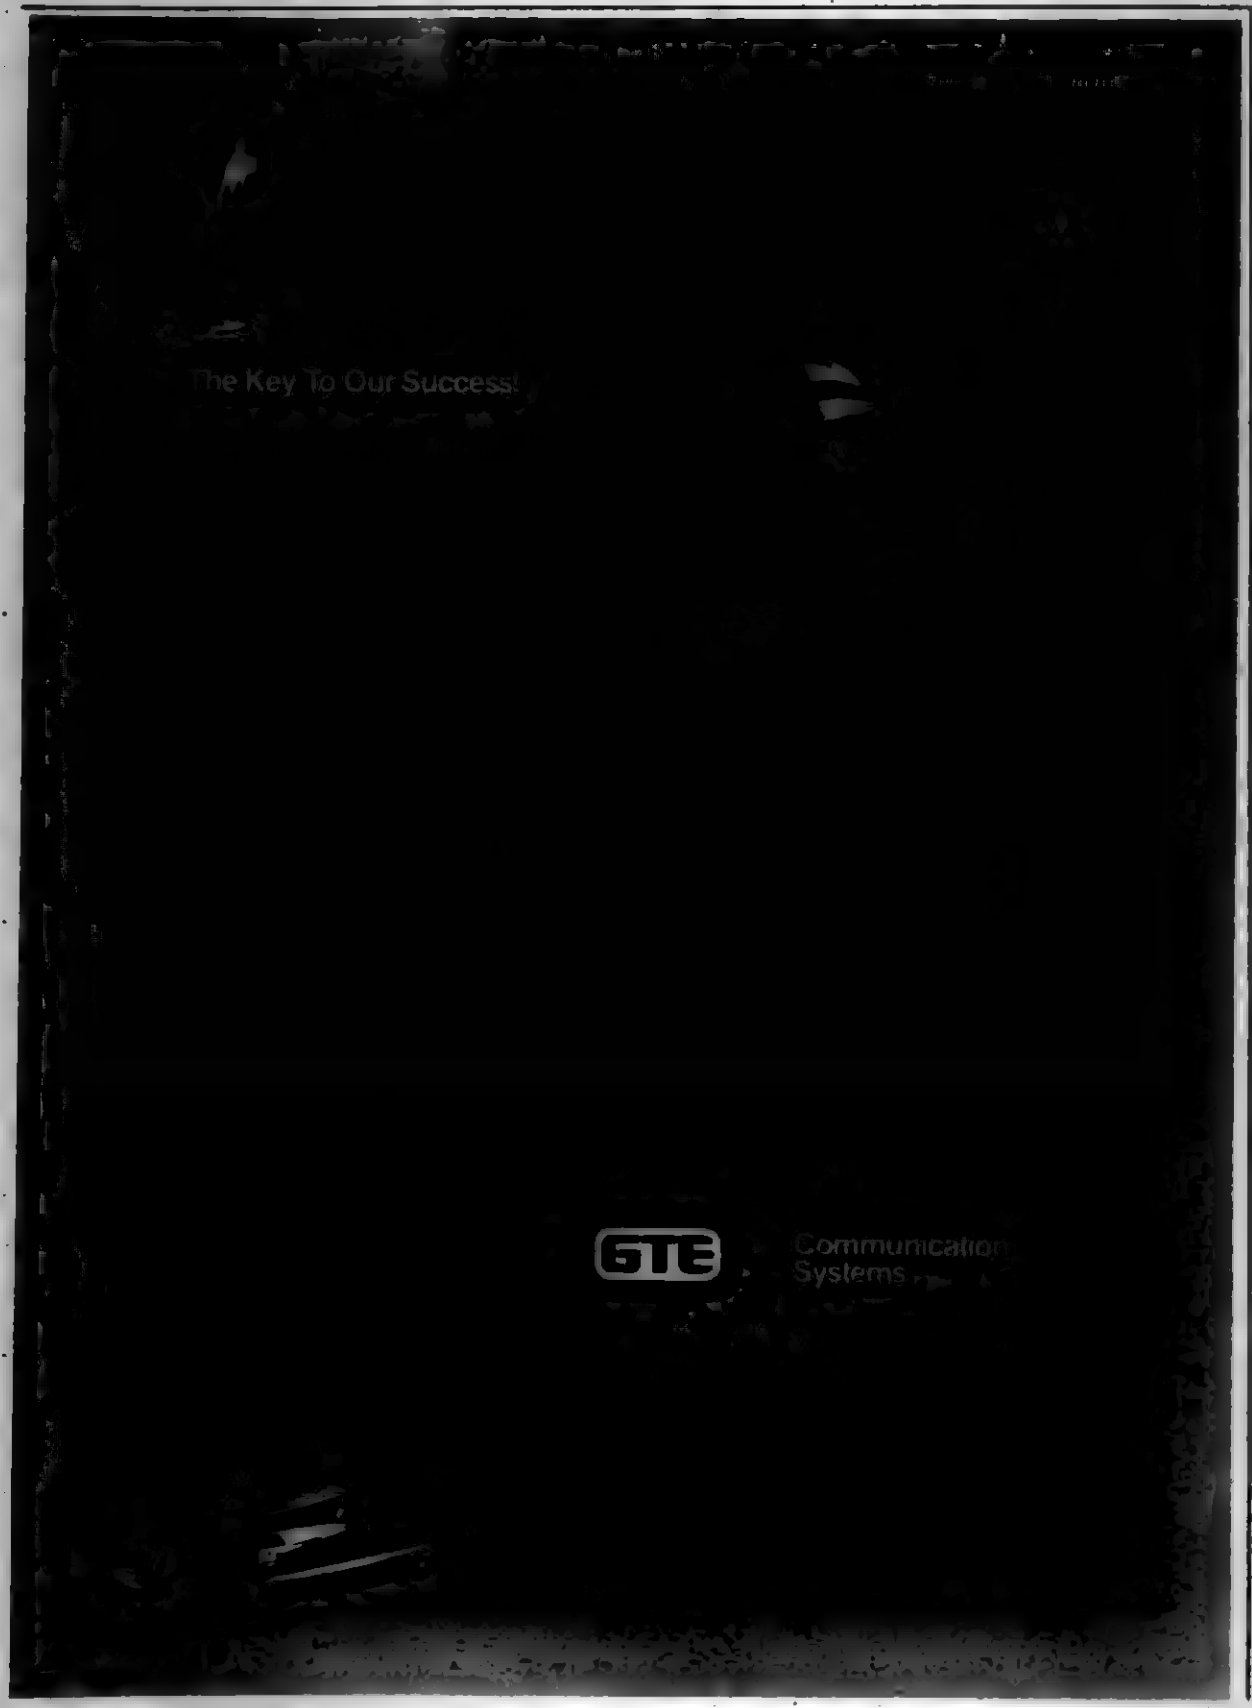
I wish we had twice as many as we currently have, but we're on the uptake in that area."

John Shoch, president of the Office Systems Division, believes that much of the negative attention Xerox has been getting lately can be credited to "people in the industry who help to perpetuate an incorrect impression based on old information."

Since 1981 the company has tended to take a "lower profile" as it built away at its system, according to Shoch, who said some Xerox customers are getting up to 500% improvement in productivity with these systems. "What we've been doing since the announcements is delivering the goods. When we work with a customer, we're trying to understand their complete work flow and have an office systems solution that has dramatic improvement in the way they run their business. We now have about 20 products on the workstation and server side, and a bunch more coming. We have pulled together more products working to solve office systems problems than anybody else in the business," he said.

Industry analysts, however, don't share Shoch's enthusiasm. Elliot of IDC pointed out that in 1983 Xerox had "an unusually nondescript year. It does not seem to be nearly the force to be reckoned with that it did even 18 months ago."

Cliff Lindsey, vice-president of office automation service for Dataquest, Inc. and a longtime Xerox watcher, added, "I'm disappointed that they haven't moved faster and taken advantage of the pioneering technology they in-



At last, a system with a head for numbers, an eye for pictures, and a mind of its own.

Introducing the Kodak KAR-4000 information system. Take the processing power of a stand-alone computer. Add a "photographic memory" to access original document images. Top it off with comprehensive, one-source software and service.

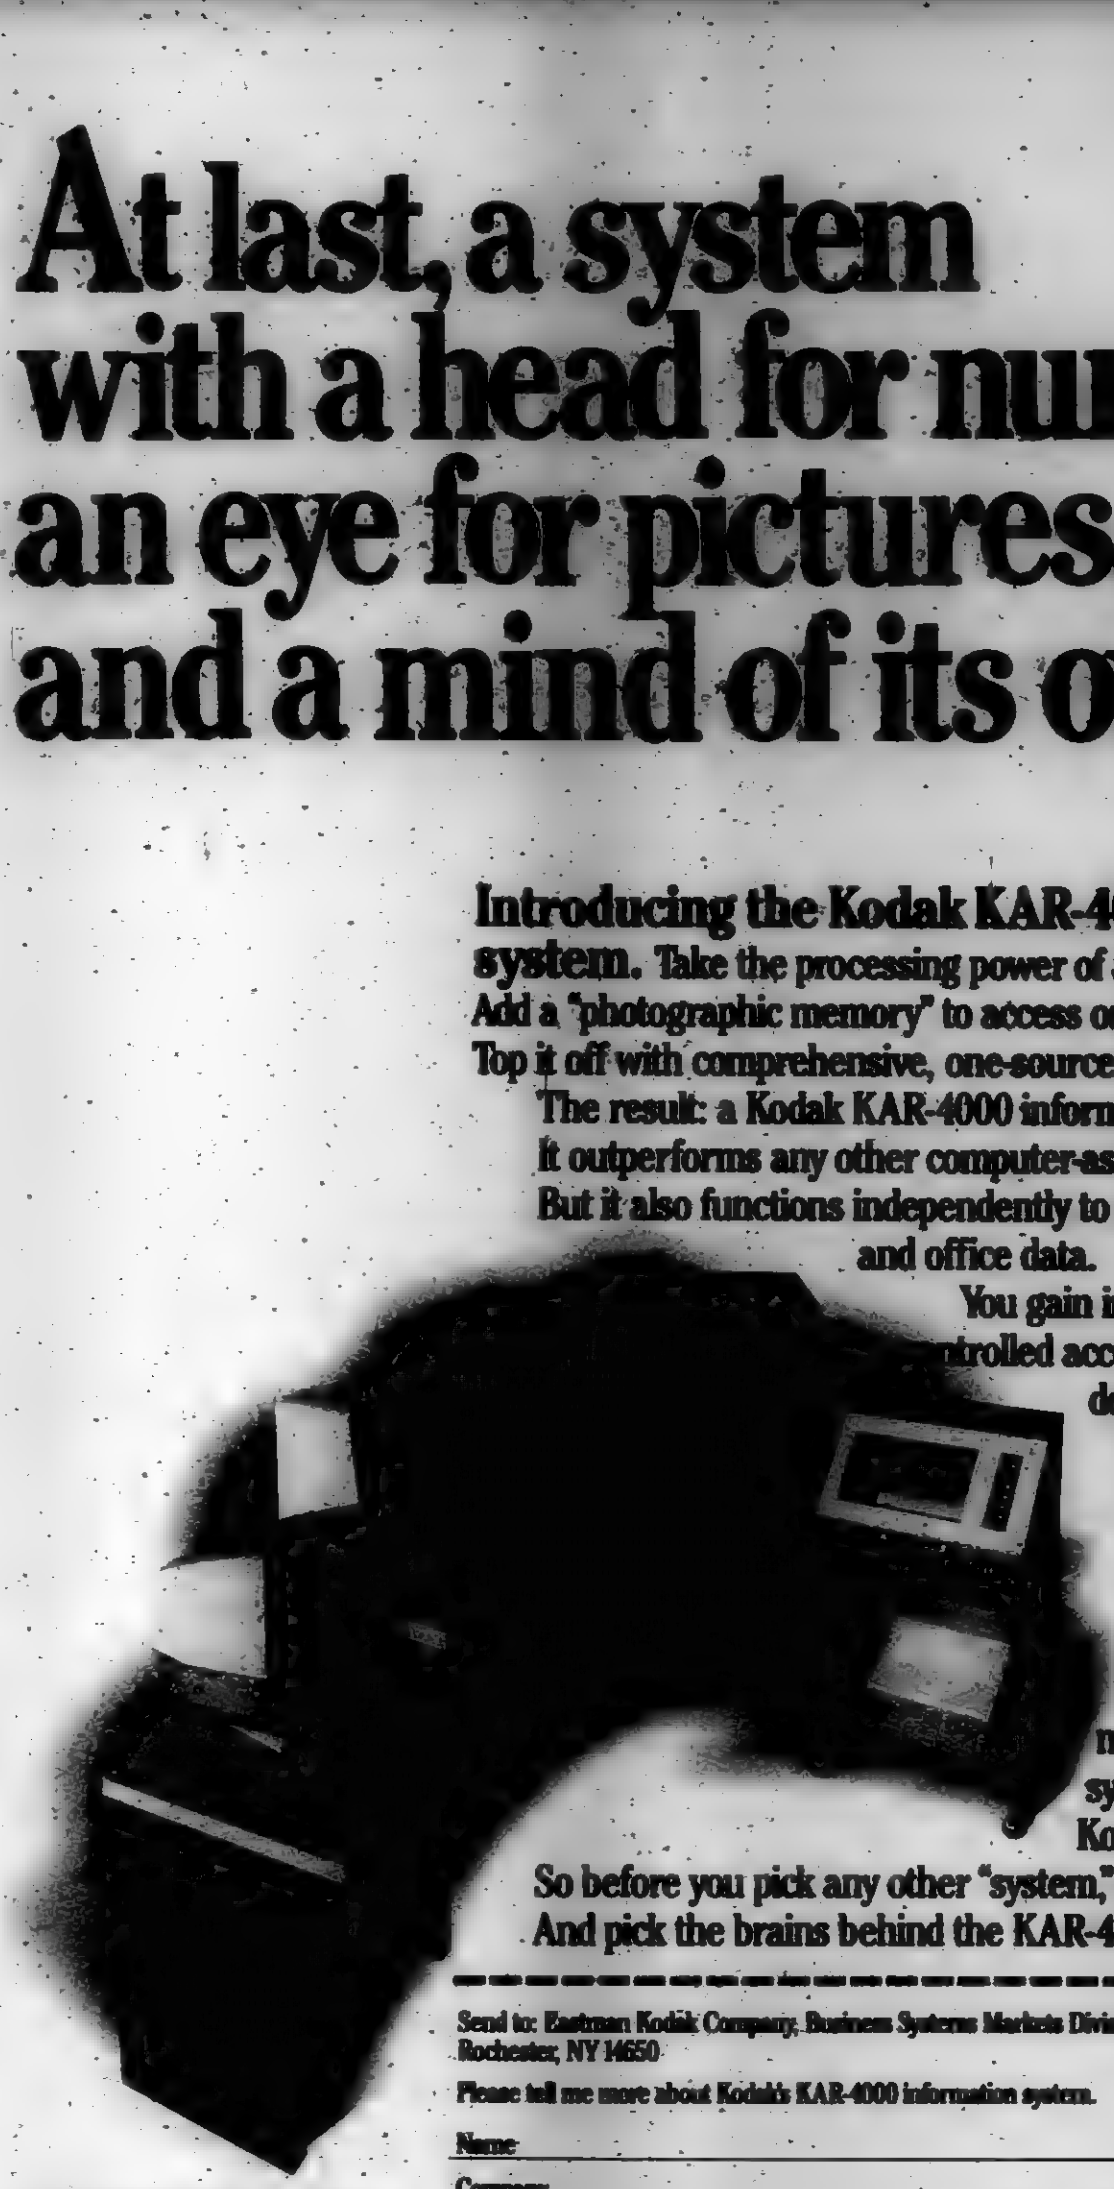
The result: a Kodak KAR-4000 information system.

It outperforms any other computer-assisted retrieval system. But it also functions independently to process both documents and office data.

You gain independent computer-controlled access to on-line data and documents. Without the staggering expense of on-line computer storage.

You even gain independence from service—all components in the KAR-4000 system are serviced by Kodak.

So before you pick any other "system," send in the coupon. And pick the brains behind the KAR-4000 information system.



The Kodak KAR-4000 information system. It gives the computer a photographic memory.

Kodak

vented. I've been waiting for the past three years for them to capture a major market share and they simply haven't done it. The next 12 months will be extremely critical for them."

Although Xerox has been on schedule with its announced products since 1976, the marketing hasn't been on course, according to Lindsey. The industry thought Xerox would dominate the workstation market, but it hasn't lived up to expectations. The price/performance range of the Star was too steep for the mass market and represented a radical change for the office. "It required a lot of system analysis in the office to make it fit," he said, "and I didn't see Xerox doing a lot of that."

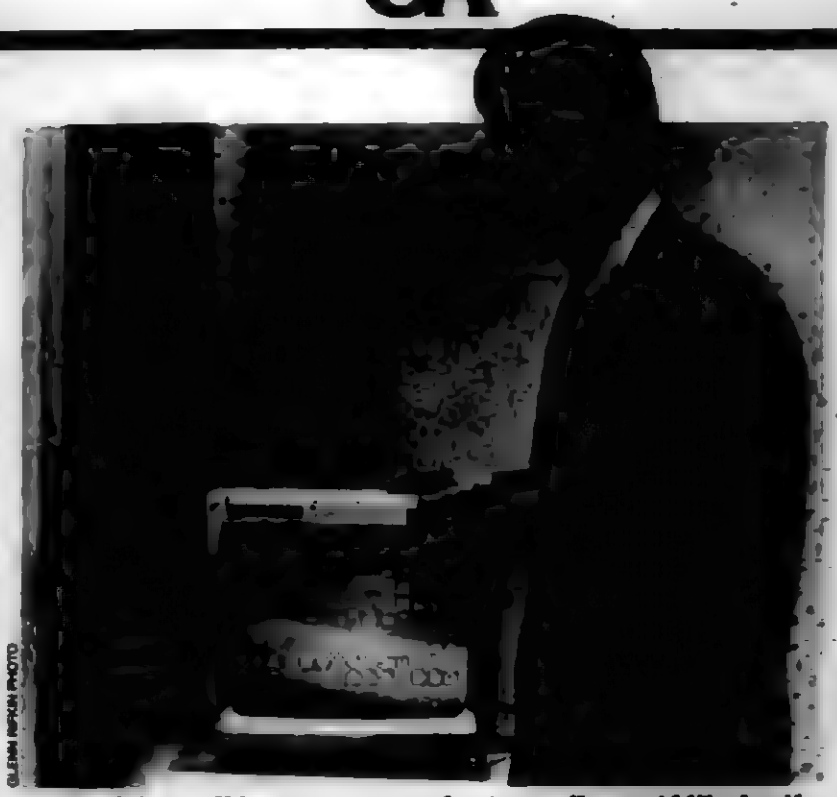
Xerox recently cut the price of the Star to $9,995 from its previous price tag and introduced a stand-alone version and remote version of the product. But according to Andria Rossi, a consultant with the Seybold Consulting Group, Inc., that may be "too little, too late." Apple Computer, Inc. now offers similar technology for significantly less money on both its Lisa and Macintosh microcomputers, and the Star is not innovative anymore. "The Star may have a chance if an organization has let Lisa in the door and then wants to move up to a more sophisticated system. But that isn't all that likely. Xerox just took too much time."

To Xerox, the Star has not been the failure that others have dubbed it. "We're selling Stars," Adams stated. "We may not be selling as many as we thought when we announced it, but we're selling them. They're going to people who are very heavy in the composition area; who need a very good screen and rapid response on a variety of functions. The processor on the Star is much faster than the Motorola 68000."

Xerox has admitted, though, that its workstation strategy needs attention, and the company claims to be addressing that issue. According to Adams, the company erred by introducing an eight-bit system (the 820) at the same time the industry was turning to the 16-bit PC. "We've been behind the power curve ever since," he said. Xerox tried to address that issue last May by introducing its 16/8 micro with both a Z80 and 8086 chip. The 16/8, not IBM-compatible, does little more than "keep them in the business," according to Lindsey.

Kearns stated firmly that Xerox must have a viable PC offering for its customers, but added that it will not take on Apple or IBM in the broad retail marketplace. "Our main focus is to have an attractive product for our customers to tie into their networks," he said.

Adams acknowledged that Xerox is at work on a new line of workstations, but would not say what to expect or when. But he did explain that in Xerox' opinion, OA is much more than just workstations. "It depends on where you are standing to look at the universe," Adams said.



"We're doing well in some areas and not as well as we'd like in others. But we're proceeding." — David T. Kearns, Xerox' president.

While IBM has led the way in data management and AT&T in voice management, Xerox has blazed a trail of its own in document management, according to Adams. He believes that document management is the third major subset of OA and it is in this baileywick that Xerox is dominant. With its impressive line of copier/duplicators, laser printers and Memorywriter typewriters, the Stamford, Conn.-based corporation will always have document management and composition "in its heartland."

"I think a good solid printer, electronic typewriter or facsimile device is as important to a good office automation system as a workstation," Adams said.

Indeed, Xerox remains dominant in the $11.5 billion copier/duplicator business and has placed more electronic laser printers worldwide than all of its competitors combined. Perhaps its major success story to date is the Memorywriter, which in just two years on the market has tied IBM for the lead in the electronic typewriter arena.

Analysts believe the Memorywriter, perhaps with screen/memory add-on and even PC software, could well be an entry point into offices for Xerox. "But it is hard to imagine an electronic typewriter being the entry point for selling an entire office system," stated Elliott.

The analysts are also concerned about Xerox' word processing offering, the 860, which was considered innovative when introduced in 1979, but is now considered out of step. "The 860 was pretty good when it came out, but it is due for the next generation," Lindsey said. "If they are after the word processing market, the 860 isn't enough," added Rossi.

In addition, there is the issue of IBM compatibility. Shoch pointed out that Xerox offers a number of ways to interoperate with the mainframe environment, specifically related to applications.

"We will have a series of announcements over the course of this year that expand our terminal capabilities and our RJE capabilities in the IBM world," he stated. "Our current product line supports the 3270 interfaces and asynchronous terminal interfaces. It has also not escaped our attention that the [Digital Equipment Corp.] VT100 would be a particularly valuable market."

Xerox is also committed to introducing the IBM PC onto the Ethernet network; reportedly working jointly with 3Com Corp. and Visicorp on that project. "We will integrate [the IBM PC] into our environment better than it gets integrated into its native environment," Shoch projected.

With its strength in networking and its niche markets, Xerox remains a force to be reckoned with. Adams' Systems Group generated $2 billion in revenues last year and, despite the argument over what is and is not OA, it provides significant financial support to a prolonged effort in the market.

Along with its financial soundness, Xerox has other resources at its disposal, according to Steven Abraham, an analyst with Price Waterhouse & Co. in Los Angeles. Abraham pointed to the Palo Alto Research Center (Parc), which was responsible for much of the trendsetting technology introduced by Xerox over the years and which continues to provide state-of-the-art research for Xerox.

Abraham acknowledged that Xerox has experienced internal marketing difficulties, but said that under Adams, those problems could well be solved. "Now that all the divisions are reporting to Adams, there should be a much clearer sense of marketing strategy. There's a tremendous internal commitment to solving these problems. People haven't seen a quick response at Xerox to the market changes, and that has justifiably brought about a negative view. But I'm optimistic. There's a lot of talent there."

Optimism, of course, does not guarantee success. Xerox has some serious catching up to do with major competitors like IBM and Wang Laboratories, Inc.; industry watchers, after years of disappointment, tend to be skeptical.

The company needs a lower priced, high-performance workstation — somewhere in the $5,000 price range — tied into Ethernet, both Lindsey and Rossi agreed. It also needs a state-of-art personal computer, and that machine must not get caught in the six- to nine-month time lag other Xerox products have found themselves in, according to Lindsey.

"We predicted in 1980 that if a vendor wanted to be a winner in the second half of the decade, it would have to infiltrate a large part of the market in the first half. That seems to be coming true. And for Xerox, that puts them in a critical time window. They don't have a large installed base out there and don't have a lot of time to get it," Lindsey said.

"I'd been holding out hope for them for a long time, but now I'm pessimistic. It's going to be slim pickings out there in the next five years. I'm just amazed at how little they've capitalized on some great technology," he noted.

Elliott of IDC added that Xerox' best strategy might be to focus on its strength in the imaging area and to produce high-quality, hard-copy output incorporating text and data. "This might mean that Xerox would find itself at the downstream end of the office information flow, formatting and printing information stored and manipulated by equipment from other vendors. This is not the most glamorous niche in the office of the future, but it is likely to be a profitable one," he said.

Xerox, however, has no intention of settling for a niche market. With a sales and service organization numbering 40,000 and a restructured marketing plan, the company has its sights set on the total office market.

Chairman Kearns admitted Xerox may have had too much of a "Xerox alone" strategy five or six years ago, but said that the company is on the right track now. He acknowledged that there is much training and restructuring to be done, but despite the cost and difficulty, "When you look at the basic organization we have versus anyone else except IBM, for us to take a back seat in this is absolutely not necessary."

Adams echoed those sentiments: "I believe we're in a long-distance race here and we're going to start looking at who will be the winner in 1990, not 1984. You don't want to get too far behind the leaders, but you also don't quit the race just because you find someone ahead of you." OA

Rifkin is senior writer at Computerworld OA.

Nothing Could Be Finer Than OA in Carolina

BY DAROLD R. KLAUK

No matter how much planning goes into an office automation project, it pays to prepare — if not for a disaster, at least for a changing environment.

Like many public and private organizations, the state of South Carolina found itself juggling a fluctuating economy and rising operating costs at the same time that it experienced a growth in demand for services. It became increasingly evident that the state needed a strategy to reduce operating costs and increase office worker productivity.

An OA pilot project was initiated to determine how much automated office technology could help us to achieve these objectives. One of the first steps in the pilot was a preimplementation study, which looked at the current work load of various offices, identified potential productivity areas and selected individuals to participate in the project.

Next, an ergonomics, or human factors, task force was formed, consisting of individuals with interdisciplinary skills needed to focus on users and their needs. They represented the areas of personnel, legal, management information systems (MIS), planning, training and human factors.

The group's first task was to issue a request for proposals (RFP) specifying the perceived functional needs of the selected office work force. The evaluation method did not use cost as the sole guideline. Several weighted criteria included functionality, support, cost, ergonomics, compatibility, expandability, reliability and documentation and training. Before a contract was awarded, a full-function demonstration was required, and all proposed software and hardware products had to be in current production.

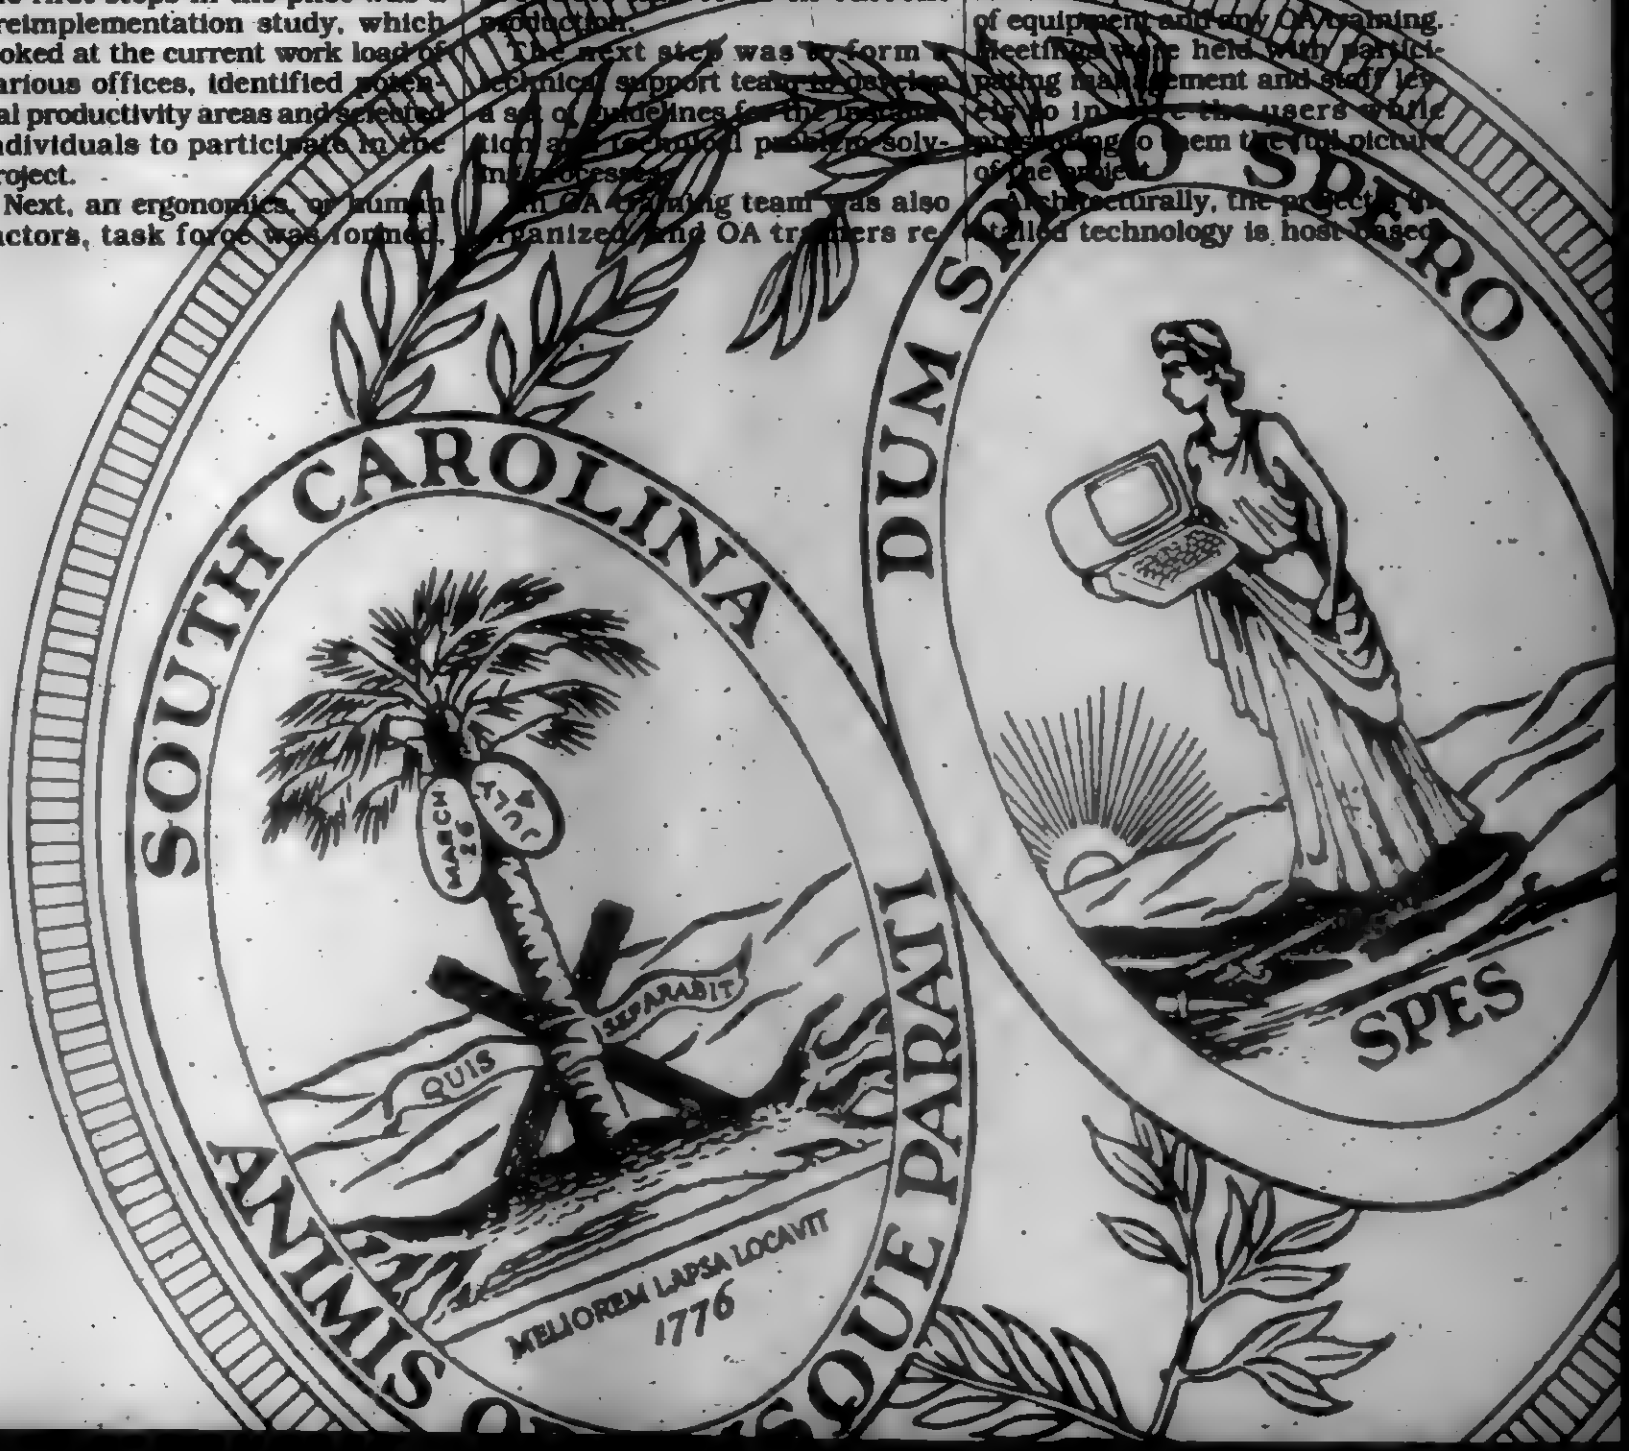
The next step was to form a technical support team to develop a set of guidelines for the [illegible] tion and technical problem-solving processes.

An OA training team was also organized, and OA trainers received in-depth training in each function that would eventually be taught to the end users. A self-paced training program was developed and a training center was specifically designed for and dedicated to the trainees.

The installation of the equipment and the institution of OA training were done in phases. A test group functioned as "guinea pigs" in all phases of training. This group represented various job skills from the clerical, technical and management office worker levels.

From the start, the OA program adopted a strong "people, not technology" philosophy. One result of this approach was the development of OA orientation seminars for users prior to the installation of equipment and any OA training. Meetings were held with participating management and staff levels to inform the users while [illegible] them the full picture of the project.

Architecturally, the project's [illegible] technology is host-based.



Hewlett-Packa surge in office

Introducing the Person

The principle is simple. Boost the productivity of individual PCs. Your people, your department, even your entire company will follow suit.

The first boost occurred when we introduced the touchscreen HP 150 as an office and managerial workstation. This made personal computing so much easier and faster that individual productivity soared.

Now the Personal Productivity Center combines the flexibility of the HP 150 with the power of our HP 3000 family of distributed computer systems.

You can shape each Productivity Center just the way you want it by adding other office and computing products from our extensive range.

You can link managerial and secretarial work stations. Create impressive presentations, merging business graphics and word processing. Store them on large disc files. And print them out on laser printers and color plotters.

Your PCs also grow more productive by increasing the range of software they can run. In addition to leading PC programs like 1-2-3™ from Lotus™ and popular word processing packages, they can use HP 3000 business software like our exclusive DeskManager. This combines electronic mail, quick memo

rd touches off a productivity.

al Productivity Center.

writing, personal filing and calendar functions. And each PC can access data processing systems and large corporate data bases.

Personal Productivity Centers can communicate with similar networks in other parts of your company, as well as your mainframes. Each system can expand to handle more than 100 workstations. And you can grow without involving your programmers in any software conversion.

So if PCs alone are making your people more productive, just wait till you see them all working together. And you can see them right now by calling your local HP sales office listed in the white pages. Or write for complete information to: Hewlett-Packard, Dept. 03191, 19447 Pruneridge Avenue, Cupertino, CA 95014. In Europe, contact Henk van Lammeren, Hewlett-Packard, P.O. Box 529, 1180 AM Amstelveen, The Netherlands.

It could turn your whole company into a productivity center.

Productivity. Not promises.

Now Wang gives you office automation on a platter.

Introducing Wang Office.

It's the kind of comprehensive office software and communications package only Wang could put together.

Because only Wang can bring you the most advanced electronic mail. Only Wang can bring you the newest in time and task management. Only Wang can bring you the industry's best word processing.

And only Wang can put all of this together with the world's most advanced communications in one flexible package—easy to put in place and virtually transparent to the user.

With Wang Office you can not only process information, you can send it to, or retrieve it from, any office, anywhere in the world.

Instantly. Wang Office.

Thirty years of commitment, innovation and technology.

Yours.

On a platter.

For more information on Wang Office, call 1-800-225-9264. Or write to: Wang Laboratories, Inc., Business Executive Center, One Industrial Avenue, Lowell, MA 01851.

minicomputers are located at three sites, with each processor attached, directly or remotely, to the host. For office functions, the host provides services for central storage, retrieval and distribution of documents and messages. Local processors provide text and records processing capabilities, office administrative functionality and access to a host computer using multifunction workstations.

The functions implemented and evaluated include electronic messaging, calendaring, document distribution, word processing and records processing as well as access to DP applications and resources at the host in the batch and interactive modes. Additional OA implementations have occurred in other offices using equipment compatible with that of the pilot project forming an OA network.

The project was not without problems and unknowns. Most notable was the state of constant change that occurs in most organizations and that in turn has an impact on the staff.

Because of the excellent planning effort, the implementation of the project progressed with a high degree of confidence that all elements were in place. Nevertheless, the project was not without its share of problems and unknowns. Most notable among these was the state of constant change that occurs in most organizations; these changes in turn have an impact on the work force. Reorganizations affect office workers' physical locations, job roles and tasks. Also, people retire, new workers are added and others move on to other employment. These factors directly affect the implementation of the project: installation schedules change as a result of equipment relocations; training schedules must be altered to accommodate new users. Users, project implementors and management should recognize that these changes are inevitable and they cause delays in a project's scheduled implementation. They also affect any preimplementation, baseline productivity measurements that were taken.

Another area in which problems can occur is in the installation of the equipment and cables. This installation should be done by experienced individuals, or at least under their guidance. In this stage of the implementation process, many unpredictable and frustrating problems may surface in such areas as fire code compliance, adequate power sources and proper electrical grounding, particularly in older buildings. Unless allowance is made for these problems, the impact on budgeting and scheduling could be substantial.

The other area in which problems arose was training. Planning efforts defined a strict requirement to meet end-user needs; the emphasis was on user training and support. Based upon experimentation with the test group, a set of courseware was assembled and optimized. The training process was changed to accommodate users in the following areas:

- Length of the course.
- Number and type of functions taught.
- Duration and timing of classroom sessions.
- Availability of equipment.
- Nonattendance at classroom sessions.

Each of these changes had a ripple effect on the total training program as schedules were juggled, causing delays in completing training.

Trained and back at their work places, users placed added demands on the OA team for handholding support. This additional support was necessary to assist users as they became more proficient in using the technology and applied it to automating existing manual office applications. At this stage, an office applications support group with adequate resources is required. Without it, the users' attitudes suffer, which affects their support of the project's goals.

In spite of the implementation difficulties, however, the pilot did have demonstrated successes. Recent probes into the affected offices indicate the installed OA technology has been well received. Productivity gains have been achieved, and cost-avoidance has been realized. In addition, the quality of both work product and work life has improved.

The project has provided the staff with learning experiences — both good and bad — as a pilot project should. One objective of the pilot was to test the OA waters and to use the lessons learned for future OA implementations. The progress to date seems to indicate that OA is indeed the means to do more work for less cost.

The very implementation of OA technology should be beneficial unless a major mistake is made in selection, installation, training or support. The degree of the project's success can be measured, for example, in terms of the number of user requests for more devices. Through word of mouth, the project will develop a reputation — good or bad.

Most certainly, the sophisticated word and records processing features have made it possible to produce documents and correspondence of better quality, faster and easier. Also, a few managers are now effectively generating their own correspondence, replacing paper and pencil with on-line electronic document creation.

Users' diversified application needs reinforced the original assumption that they should be provided with a single type of device — a multifunction workstation. This device provides access to automated office functions and DP applications. Cost-avoidance is achieved as the number, type and support of workstations are reduced.

Another of the successes was the move from a dedicated WP center environment to a local distribution of the text processing capabilities. Localizing the author/text-creator relationship has been extremely productive.

An intangible but real productivity benefit has been the improvement in office workers attitudes and motivation as a re-

Teach your IBM or Wang to read.

China Computerworld 电脑

The only specialized computer publication written exclusively for the People's Republic of China (PRC).

The PRC is a huge country which now has a rapidly growing installed base of computers. And the future looks very bright for the Chinese EDP market.

Government plans call for extensive use of computers in the PRC's technological modernization, and annual EDP expenditures are expected to grow into the billions of dollars in the 80's.

A good deal of this money will be spent on foreign computer equipment and the purchase decision-makers for this equipment will be using *China Computerworld* to help them choose the products and the companies they need.

China Computerworld is a joint venture of the Fourth Ministry of Machine Building and CW Communications/Inc. Its 50,000 subscribers include the key government officials and computer managers who have EDP purchase decision authority.

China Computerworld is published on the fifth and twentieth of each month. Its tabloid newspaper format gives you a unique opportunity to introduce your products and services to this awakening giant of a marketplace.

CW International Marketing Services Department gives you one-stop advertising service in countries around the world. For more information about *China Computerworld* or any of our other foreign publications, just fill out the coupon below.

sult of being able to perform tasks more quickly, easily and effectively.

The following guidelines should be relevant and useful to those considering OA implementation:

Planning Phase:

- Initiate OA on a small scale. This not only minimizes risks, such as cost and disruption, but also provides options to explore multiple vendor capabilities without substantial investment and commitment to any one vendor.
- Consider leasing the equipment instead of purchasing it outright. This can help eliminate a locked-in committed feeling if a change in technology becomes necessary.
- Check existing office procedures for redundancies and bottlenecks. Procedural changes could bring about surprising results.

Place reasonable goals and expectations on the people and the project itself. Establish what you mean by a "successful" effort so you will know when it has (or has not) happened.

- Look carefully at each user's needs. One type of workstation will probably not fit all needs.
- Place reasonable goals and expectations on the people and the project itself. Establish what you mean by a "successful" effort so you will know when it has (or has not) happened.
- Don't lose sight of human factor issues — for example, proper placement of equipment in individual offices, CRT-type tables and proper chairs.
- Involve users early and give them decision-making tasks. Their attitudes will significantly affect the project's progress. Establish an OA steering committee.
- Don't allow the techies to run the show. Get a mix of users involved, each with voting power. Establish a users group.

Implementation Phase:

- Remain flexible as the implementation activities progress. Many factors will arise and have an impact on predefined planning and scheduling activities.
- Support end users' DP needs as well as their OA needs. Don't oversell OA functions; DP applications are still part of the office environment.
- Be cautious about introducing new technologies. Give end users ample time to adapt to new devices before you ask them to switch devices.
- Listen to the users' suggestions. They are the real-world users and your best source of knowledge on their jobs and needs.
- Continue giving office applications support to users. Over time, however, they will become quite self-sufficient.

Evaluation Phase:

- Establish standards wherever feasible. Examine the issues of functionality, connectivity, compatibility and control.
- Be prepared to present quantitative gains to management. Intangible benefits alone probably won't justify expansion of the current project or start-up of future ones.
- Document what you learn — both the successes and the problems — for future implementations and other implementors.

In summary, one of the original precepts about OA technology was that it would allow more work to be done for less cost. Indeed, more work can now be done and more information is now available than before the introduction of the OA technology. Initially, however, this comes at an additional cost. The return on investment cannot and should not be measured in the short term. Over time and with consideration for intangible as well as tangible benefits, the OA system will prove not only beneficial but also essential. OA

Klauk is an information resource manager for the office automation activities within the state government of South Carolina.

They offer PROFS under VM.

LOCAL-AREA NETWORKS

By David L. Terrie

Interest in cable-based local-area networks stems from the simple fact that business has a wiring problem.

After the dense fog of bandwidths, access methods, topologies and media has been cleared away, cable-based local-area nets remain; potentially, they can provide flexible low-overhead networks, peripheral sharing and information sharing.

Desktop computers have advanced far beyond network supply lines of traditional distributed processing. Each user maintains his own data base, takes responsibility for his applications software disks, for backup and security and for archives when his hard disk is too full.

Furthermore, resource sharing (storage, peripherals, higher level processing and applications and communications facilities) has not existed.

Prices are falling fast for printers, mass storage and communications facilities, but the need for more sophisticated (and expensive) facilities is rising even faster.

Increasingly, users will want such facilities as laser printers, image scanners, presentation-quality color graphics output, mass storage, shared files and data bases, improved network management and sophisticated Systems Network Architecture links. Sharing these facilities will reduce their costs to the individual user, but it will still result in a significant net rise in the cost of computing for desktop computer users.

Local-area nets will not only facilitate access to sophisticated shared resources, they will enable increased architectural flexibility.

Along with facilitating access to sophisticated shared resources, local-area networks will enable increased architectural flexibility with respect to both processing and storage.

Of significant importance among these opportunities is the concept of the virtual desk. Wang Laboratories, Inc., for example, gives its Professional Computer users this capability on its VS systems, allowing the use of the VS hard disk as if it were resident in the workstations. This will soon be a standard feature for all system vendors' desktop computers. Storage will move back to center, including better back-up facilities, better data security, better data consistency and easier software updates.

The diskless desktop computer is what would have evolved had networks proliferated simultaneously with desktop computers. Processing power — but not necessarily storage — would have continued along its outward path to the workstation. (Datapoint Corp.'s Arcnet architecture is a singular example of this development). As it is, with desktop computing having first proliferated independently of the office systems architecture, desktop computers have not until recently been designed to be a compatible element (running proprietary software) of office systems.

Four basic workstation options will emerge:

- An intelligent terminal typified by IBM's 3270 family or Digital Equipment Corp.'s VT 100/200 family (that may take the form of a terminal phone like Rolm Corp.'s Cypruss or Northern Telecom, Inc.'s Displayphone).
- A diskless desktop computer utilizing a virtual disk at the file server and/or the utility processor level.
- A desktop computer with a local hard disk for added redundancy (in case of network failure) end performance.
- A full desktop computer with dual floppies or a floppy and a hard disk to allow full network independence and archiving capability.

A key proviso to make diskless desktop computer architecture feasible is a shared repository where the operating system and applications software reside. The best approach in the design of this facility may be to download the operating system when the workstation is turned on and for applications to be downloaded subsequently according to the user's stored profile.

If multiple standard and proprietary operating systems are available to the user, at power-up a standard menu can be downloaded that would ask for the user's ID and then provide a choice of profiles. Where possible, however,

SIEMENS

What separates our least cost routing from all the others?

Unlike other PABX manufacturers, Siemens gives you genuine cost-cutting control with Dynamic Multigroup Queuing, an exclusive, standard function of the least cost routing feature of our SATURN™ digital PABX systems.

Dynamic Multigroup Queuing automatically assures that calls will always be placed at the lowest possible costs. True "look back" capabilities enable our systems to expand the queue and seize the least expensive route (FX, SCC, WATS, DDD) available, improving trunking performance while lowering long distance costs by as much as 30 percent. No other company offers this money-saving advantage. But Siemens offers even more.

More capability...
For maximum cost efficiency.

There's quite a big difference in today's least cost routing systems. Some offer more capability than others. Siemens provides the most comprehensive LCR feature in the industry as a cost-saving standard function of SATURN systems. Our complete LCR package includes:

- 128,000 central office area code combinations with direct access to 3 SCC networks.
- Rotary dial area customers can now access SCCs through SATURN's ability to flip-flop from dial pulse to DTMF.
- Full digit number analysis—Lowers network costs, increases efficiency through analysis of entire digit number, as opposed to 3- or 6- digit analysis offered by other systems.
- Programmable search timer-controlled advance—Improves network efficiency by ensuring that optimal queuing time is attained before advancing to next trunk group.
- Day of week/Time of day control—Lowers network costs, improves service, and maximizes non-usage sensitive routes.
- Wide Band Tone Detection—Provides a wider range of frequencies to detect SCC dial tones. Insures digits will be accepted by the SCC. Simplifies complicated routing procedures. Improves speed and performance in network applications.
- Special service code routing—Removes service traffic from all but DDD routes. Prevents clogging of expensive routes with "no cost" calls, increasing network efficiency and lowering overall network costs.
- Digit Translation—Adds or deletes digits as necessary to complete calls via the selected route element.

Applied technology...
For improved communications management.

By applying field-proven technology to its digital telephone systems, Siemens automatically saves you money by controlling your telephone costs. Our advanced LCR is just one of the many standard features specifically engineered to make day-to-day business communications easier, more flexible, and more affordable.

For further information, or the name of the SATURN Gold Seal Dealer in your area, call 1-800-327-0638. (In Florida, Alaska, and Hawaii, (305) 994-8100 ext. 5330).

Siemens.
Innovations in telecommunications for over a century.

the required operating system should be transparent to the user, who is primarily concerned with the application.

Though cost per connection will play an important role in the overall shape of the cable-based local-area network market, network software will play an equally significant role in the fortunes of individual vendors. At this stage in this very young market, hardware has been the name of the game. This stage is similar to that of the desktop computer market prior to the advent of the IBM PC and MS/DOS' dominance as the operating system for PC software developers.

However, when the bulk of the market settles down and adopts the IEEE 802 and other de facto standards, the differences between networks will largely be defined by software. Network software provides the functions above the physical and data link layers. Systems vendors, such as IBM, Wang and DEC, already provide network applications such as electronic mail and data access and security functions as parts of their systems software environment. But PC nets linking formerly single-user systems must provide these functions themselves.

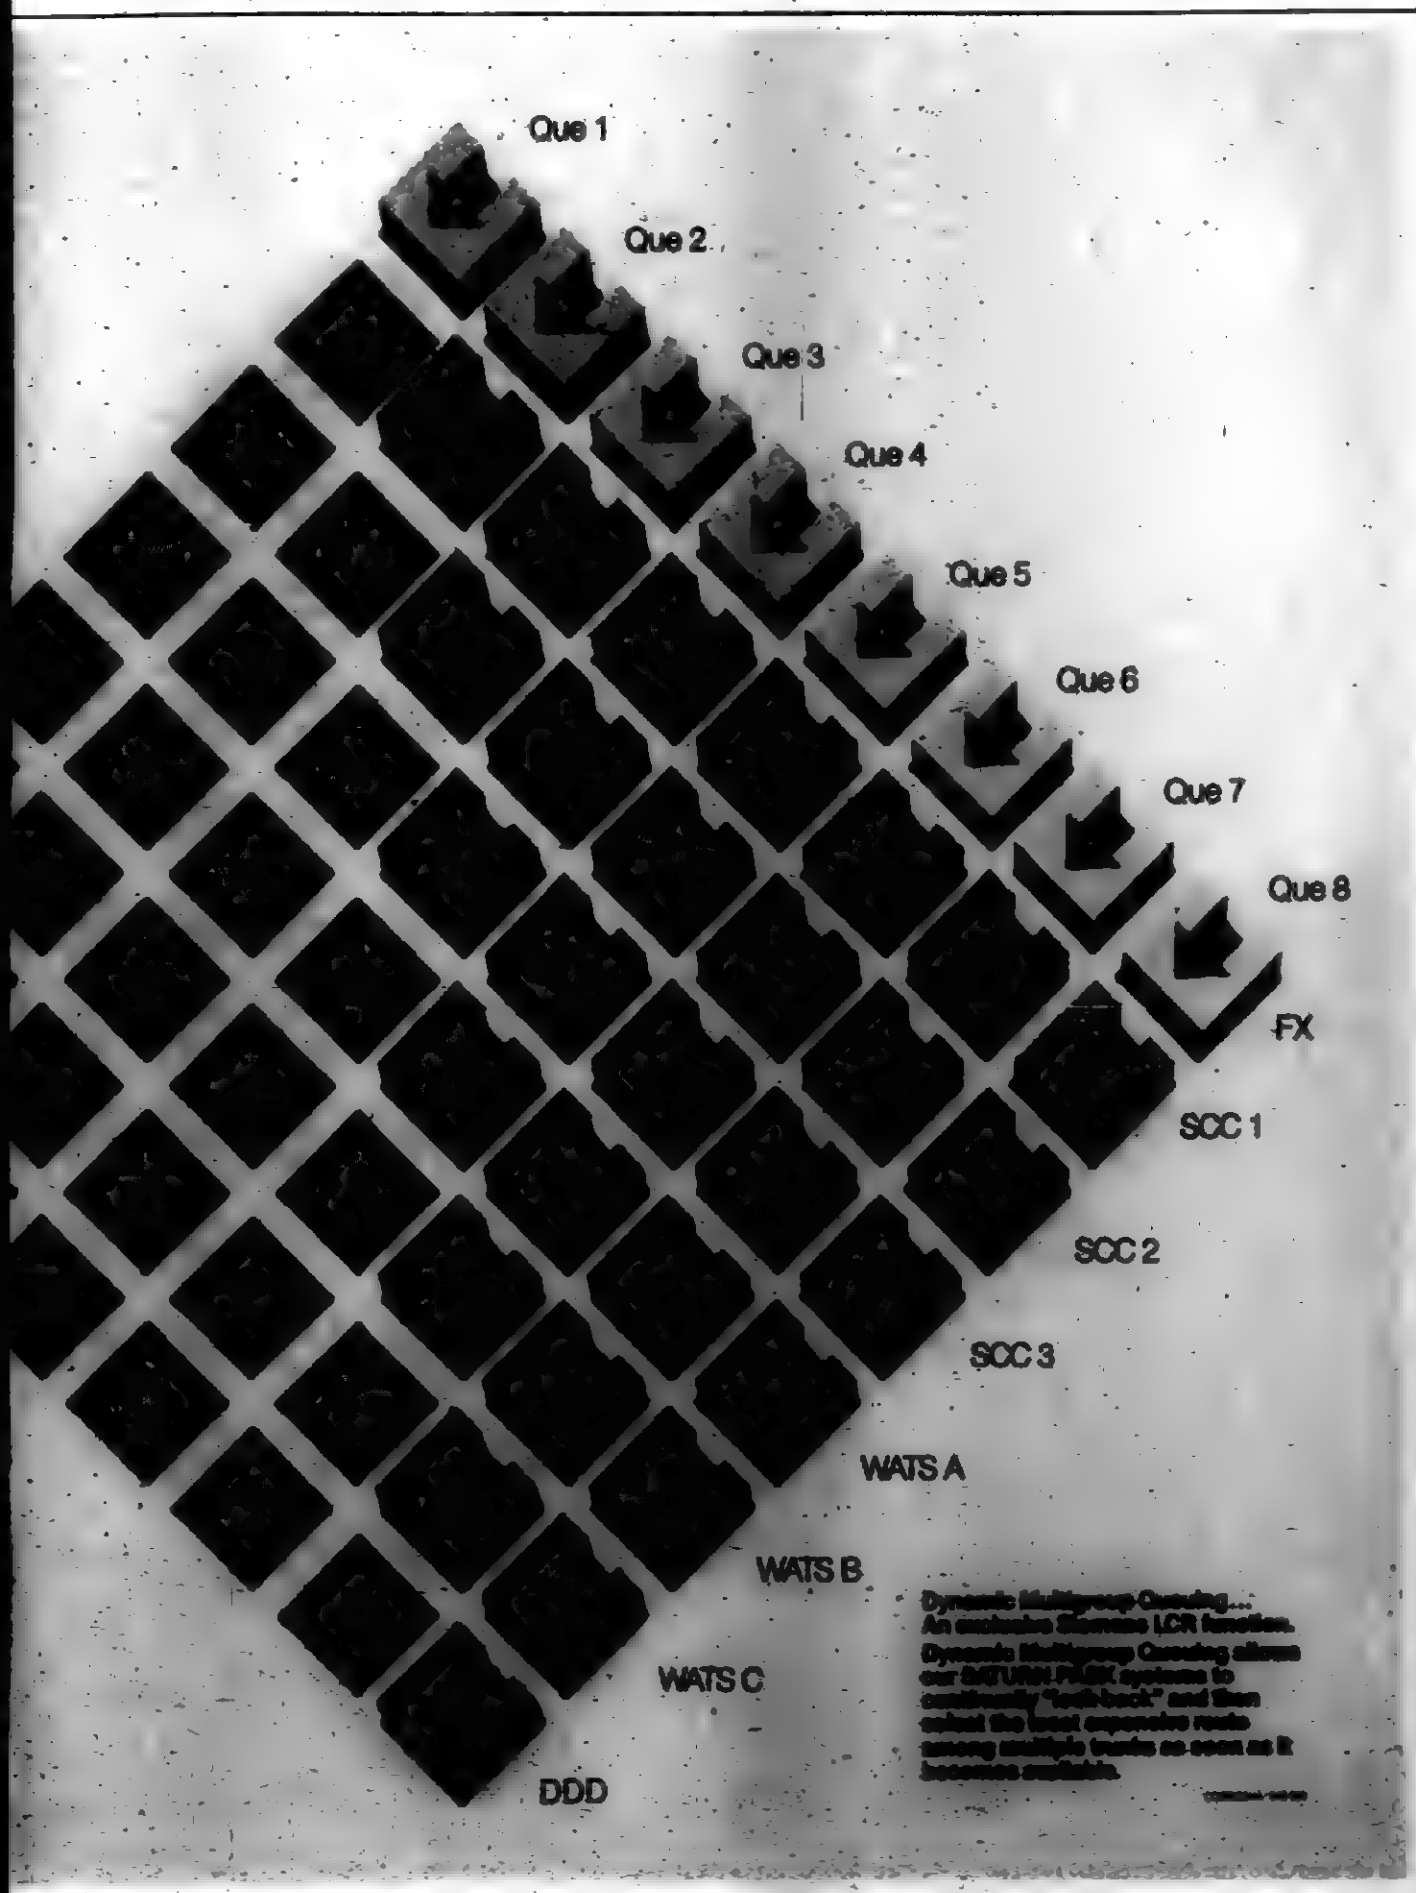
Here, as in the desktop computer market, ease of use and functionality are defined more by software than hardware, especially in the workstation environment. A local-area network should have at least the following software-based facilities:

- The file server allowing concurrent updates (or at least concurrent access), record locking and multiple levels of security.
- Print server software to spool print requests, so that print jobs can be queued on the print server. Further, multiple printers should be supported for letter quality, graphics (matrix and/or laser) and draft printing.
- Electronic mail software that stores a pointer in a file server. Any file should be sendable to individuals or broadcast lists. Users should be able to append comments and so on.
- Strong gateway and bridge facilities for internetwork communications.

One key benefit of incorporating a local-area network at the systems level is that systems no longer have to process routing and transport functions (as is the case in a point-to-point network). In the absence of a local-area network, these chores can be off-loaded with a communications processor. This, of course, is an expensive solution, especially since each node would require a front end. If a communications processor is not utilized, a portion of the nodes' processing resources must be partitioned to handle these chores, which leaves less processing power for running applications.

These facts say two things: No vendor will be able to provide cost-competitive solutions without using a local-area network in its systems architecture, and the market for communications processors will be dampened considerably (since only one node on a local-area network needs to attend to these chores).

On Page 38, some common user questions are answered.



Cost per connection will be important in the overall shape of the cable-based local net mart, but network software will be equally significant for individual vendor fortunes.

Some Common User Questions

Why consider a local-area network in the first place if a private branch exchange (PBX) can switch data with installed wiring?

For two reasons: First, the overhead efficiencies at the systems (mini and mainframe) level in a network architecture will be cut considerably by implementing a local-area network to replace a point-to-point network. Second, the 56K bit/sec maximum data rate for digital PBXs is not adequate for heavy file-transfer-oriented communications.

Users of transaction-oriented terminals and desktop computers with light file transfer requirements will be adequately served by a PBX. But many desktop computers and high-performance engineering workstations will be much better served by local-area networks offering 20 to 100 times the throughput. (A 1M-byte file would take less than a second on an Ethernet local-area network vs. a minimum of 20 seconds on a PBX.)

For these reasons, users should lean strongly toward implementing local-area nets for departments or work groups using desktop computers. Although not many users are communicating today, better software links to corporate data and growing user sophistication will result in a dramatic increase in users downloading files to their desktop computers.

I'm working out a corporate policy on local-area network implementation. What do you suggest?

There are two key elements here. First, should the policy attempt to control growth and implementation from the top (for example, the management information systems shop/systems environment) down, or should growth be monitored at the department level?

There are two separate (but not conflicting) goals to strive toward. The first is to solve end-user problems as cost-effectively as possible. One or two PC nets or departmental nets should be standardized on, and growth allowed to proceed as islands. In large sites where the host or satellite processor vendor offers a cost-effective solution, users should take advantage of it. However, third-party solutions will not create significant compatibility problems given strong bridge and gateway facilities.

The second goal should be to improve the efficiency of the systems network via a backbone. Implementing a local-area net to replace a point-to-point net may reduce overhead enough to make the freed-up applications processing pay for the implementation in a short period.

These two environments should then be merged as user requirements dictate. In the meantime, users will get the benefits of resource sharing (while still accessing corporate data via modems if necessary), and the network overhead will have been reduced considerably. Both steps will provide short-term benefits without creating long-term havoc.

How can a user be protected against having to rewire a building, given the difficulties in accurately predicting network capacity needs five or 10 years from now?

A tiered or hierarchical approach to networking may be the soundest strategy. It allows users to pull broadband or fiber-optic cable for the backbone, while opting for more cost-effective twisted pairs or baseband cabling in the workstation environment. This is, in fact, what IBM, Intel Corp. and several other vendors are pursuing.

The tiered approach has the following advantages:

- It simplifies network management and diagnostics by isolating performance and fault measurement to a small number of nodes.
- It limits the effects of network failure to a small group of users.
- It allows network administrators to design cost-effective solutions based on appropriate classes of service for departmental or application needs (a basically direct relationship exists between bandwidth and cost-per-connect).
- It allows users to implement local-area nets on an as-needed basis without jeopardizing the corporate networking plan's viability. Small, low-cost departmental local-area nets can be implemented individually and then strung together via a bridge to a backbone.
- The tiered approach will permit users to upgrade subnets or the backbone independently to enable use of the best available technology that may not be available from the systems vendor.

(Care should be taken in the design of the network that the majority of packets do not have to cross a bridge; these lines usually fall quite naturally along work group or departmental lines.)

What is the best approach to the issue of network topology?

Don't be enticed by the pretty pictures often seen in local-area network vendors' brochures. Notice that those buildings are empty. Yours won't be (unless you're constructing a new building). In an existing building, the conduits from a mini or other host to work areas are going to reflect the current star topology used. Because local-area networks offer both physical and logical configurations, many sites will find it best to use a physical star to segment a floor into quarters, fifths or whatever the layout dictates.

After this backbone has been laid, physical buses (or stars, in IBM's case) can be used to hook up the workstations in the area. Cable mass will have been reduced and connectivity increased.

Will it be possible to reuse existing cable plant?

Yes. Vendors (notably IBM) will use a "baluns" to adjust the impedence of installed cable for terminals to that of their local-area networks.

Are fiber-optic networks usable today? If not, should a user consider pulling fiber-optic cable anyway?

Vendors still haven't solved the problems associated with tapping optical fiber. Nevertheless, two things are certain: These problems will be solved in the next three to four years; second, fiber-optic networks will dominate the backbone market by the end of the decade.

For large networks requiring multiple channels, broadband is still the best choice. The primary exceptions to this rule will be at data centers requiring very high (over 20M bit/sec) data rates; campus environments; and in government, military or other applications requiring the security inherent in a light wave system.

Vendors such as Siecor and Ungermann-Bass, Inc. are using a physical star configuration for the backbone that allows fiber to be used as a backbone with connections at the ends only.

IBM's token ring backbone will probably also utilize a physical star topology for this reason. OA

Terrie is director of office systems research at The Yankee Group, a Boston-based market research and consulting firm.

"Before Soft-Switch," that is."

"I used to be difficult to share information at our company because our office equipment comes from different vendors. Consequently, when we needed a finished document, all of the information had to be re-keyed for the word processors.

"Not any more. Soft-Switch lets us exchange all of that information intact, with no document clean-up.

"Soft-Switch is a Document Control System from ITI, and it runs on our IBM mainframe. It permits documents created on one type of equipment to be used by other devices, regardless of the vendor (word processors, personal computers, printers, etc.).

"Soft-Switch gives us extensive edit level translation capabilities. It stores documents in libraries on the mainframe—no more hunting for diskettes for last year's reports. And routing is simple and efficient. Whether the document goes to storage at the mainframe, or to a device across the hall, or to 25 branch offices around the country, Soft-Switch requires just one command. Conveniently, the recipient gets the document directly from the mainframe. This is especially useful when you route across time zones.

"It's simple to install and doesn't need much maintenance. The staff likes it because it's easy to use, requires very little training, and just about eliminates document back-up.

"Soft-Switch supports both MVS and VM/CMS operating systems, and it's the first Document Control System that's fully compatible with IBM's DIA/DCA.

"Soft-Switch is available for most major OA equipment. And if you don't have a mainframe, you can still use Soft-Switch by time-sharing through CBInetwork Corporation.

"For years you've been hearing about 'integrated' offices. Well, now you really can integrate what you want, when you want—with Soft-Switch. Check it out. Call ITI."

STRATEGIC PLANNING

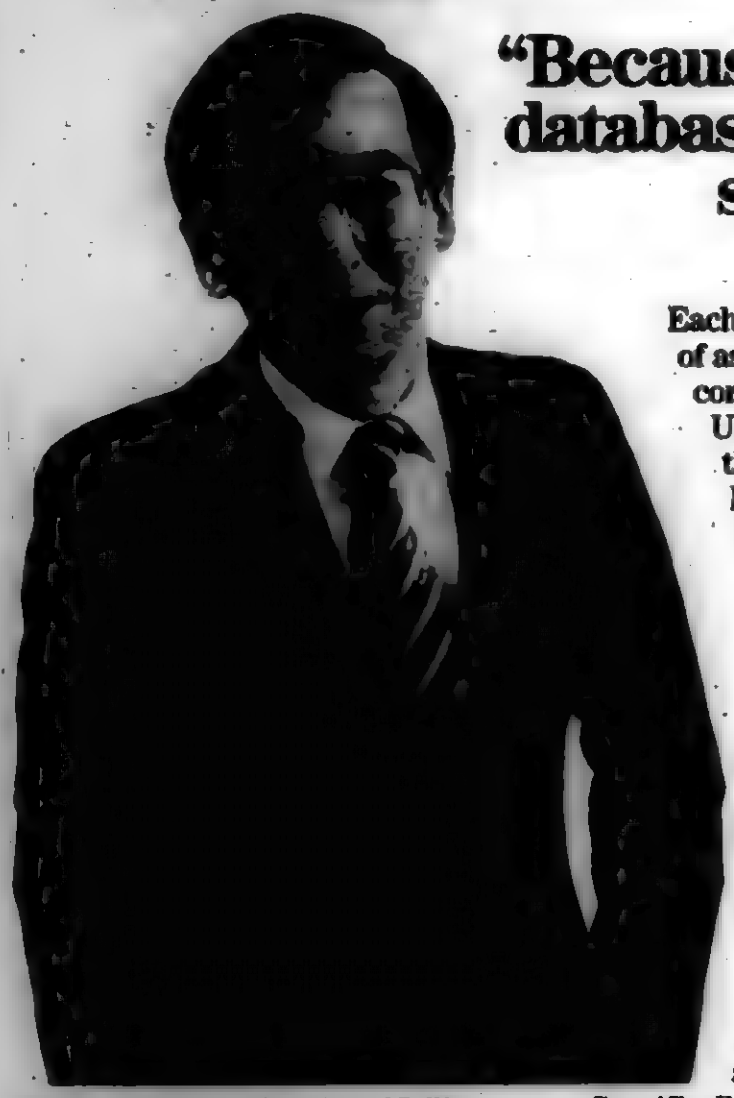
By Dixon R. Doll

The past two years of fast-changing technology and industry restructuring that have resulted from the AT&T divestiture have had quite a significant impact on most U.S. organizations.

Most companies now recognize that the time has come to apply formal planning methodologies.

These methodologies are based on the fundamental notion that business strategic planning is the principal process that feeds information systems planning, office automation and telecommunications strategic planning. Figure 1 on Page 41 portrays a common set of steps in developing prioritized actions or programs on which user organizations spend time, money and personnel resources. The output of the planning process can be simplistically viewed as a prioritized set of actions or programs that best meets the business needs of the user organization. It is clear from Figure 1 that telecommunica-

Why is Cullinet's information systems strategy creating so much interest?



"Because the strategy of integrating database, applications and decision support makes sense."

*Bob Goldman**

Each day, representatives of as many as eight major corporations from the United States and around the world visit Cullinet's headquarters. They are coming in increasing numbers because they've heard what Cullinet is doing in information systems technology. After the meetings, they are convinced that Cullinet's direction in information systems makes sense for their organizations. It is, in their opinion, the only coherent and intelligent approach available.

Specifically, this means the full integration of Cullinet's IDMS/R database management system, applications, including Manufacturing and Financial Software, and Decision Support Systems that link personal computers to the corporate mainframe.

In other words, a single source of software as opposed to the fragmented approach which has plagued the computer user in the past.

Often, these visitors return to our headquarters with the senior officers of their organization for an Executive Program. Senior management is interested to learn that there has been more progress made to deliver on the promise of computers for top managers during the past year than during the previous twenty. This promise of computing for top management is "knowing that they have a problem in time to take corrective action."

In order to fulfill that promise, the full integration of Database, Applications and Decision Support Systems is required. When management understands the importance of the integrated software solution, the result is a renewed enthusiasm by them for support of the information systems activities of their companies. They realize that their respective companies must put in place new information systems in order to compete or even survive in the future.

That, in the final analysis, is what Cullinet is about: providing a complete and integrated software solution for the 80's and 90's.

Call or write us for more information or attend a very informative seminar explaining this unparalleled software solution. To participate in one of the 700 Cullinet seminars scheduled internationally, send in the coupon or call 1-800-225-9930. In MA, 617-329-7700.

Robert N. Goldman is President of Cullinet Software, Inc. Starting with the Company over ten years ago, Mr. Goldman has been intimately involved with the evolution of Cullinet's software architecture. In various roles, including Director of Software Development to Executive Vice President and in his current position as Chief Operating Officer, Mr. Goldman has been a key contributor to the product and strategic directions of the Company. He holds a Bachelor of Science Degree in Computer Science from Purdue University.

tions requirements exist as a direct result of two sets of needs. The first is the need to support other technology plans, including DP and OA. The second consists of specific business needs to increase productivity and profitability in ways that may not depend on information systems and OA per se.

The last 15 years has seen a rapidly exploding set of new applications for telecommunications coupled with industry deregulation and rapid technological change. This combination has dramatically increased top management and end-user awareness of innovative ways of using telecommunications services. Telecommunications organizations have moved through several distinct stages of sophistication in most customer organizations. In the late '60s and early '70s, they were generally relatively low-level organizations that did little or no planning and were mostly concerned with operational activities.

Now, however, the charter of the typical telecommunications organization has changed. It is normally charged with:

- Providing internal users services that are cheaper than the services publicly offered in the marketplace.
- Packaging technologies to provide new services that are important to the success of the business but unavailable in the public marketplace.

If the internal organization is unable to do either or both of these things, the telecommunications organization has little or no reason to exist. Many enterprises are fast recognizing the important opportunities associated with selling spare capacity noninternal networks, and with becoming, in effect, resellers or brokers of advanced telecommunications services. Numerous Fortune 500 companies have already entered the commercial market, reselling excess capacity in their networks to business users whose requirements overlap their own.

The successful telecommunications organization will recognize that it must, first and foremost, be a responsive service-providing organization. It must keep closely in synchrony with the business needs of the internal users, fast changing technology and various external factors. These external factors will include not only changing tariffs, political developments and standards, but other nontechnological factors — for example, the cost of business travel and jet fuel — that influence the costs of alternative ways of solving the business' problems.

Organizations are becoming increasingly aware of the need for broad thinking about different ways of solving business problems, especially in areas that involve new uses or expanded uses of telecommunications. Businesses are concerned about the flood of paper. They would like to move information around inside the enterprise and across enterprise boundaries. They would like selected access to information known to be stored in various files and data bases. They recognize that information movement can indeed take place in numerous ways, some of which don't involve the use of telecommunications services as we know them.

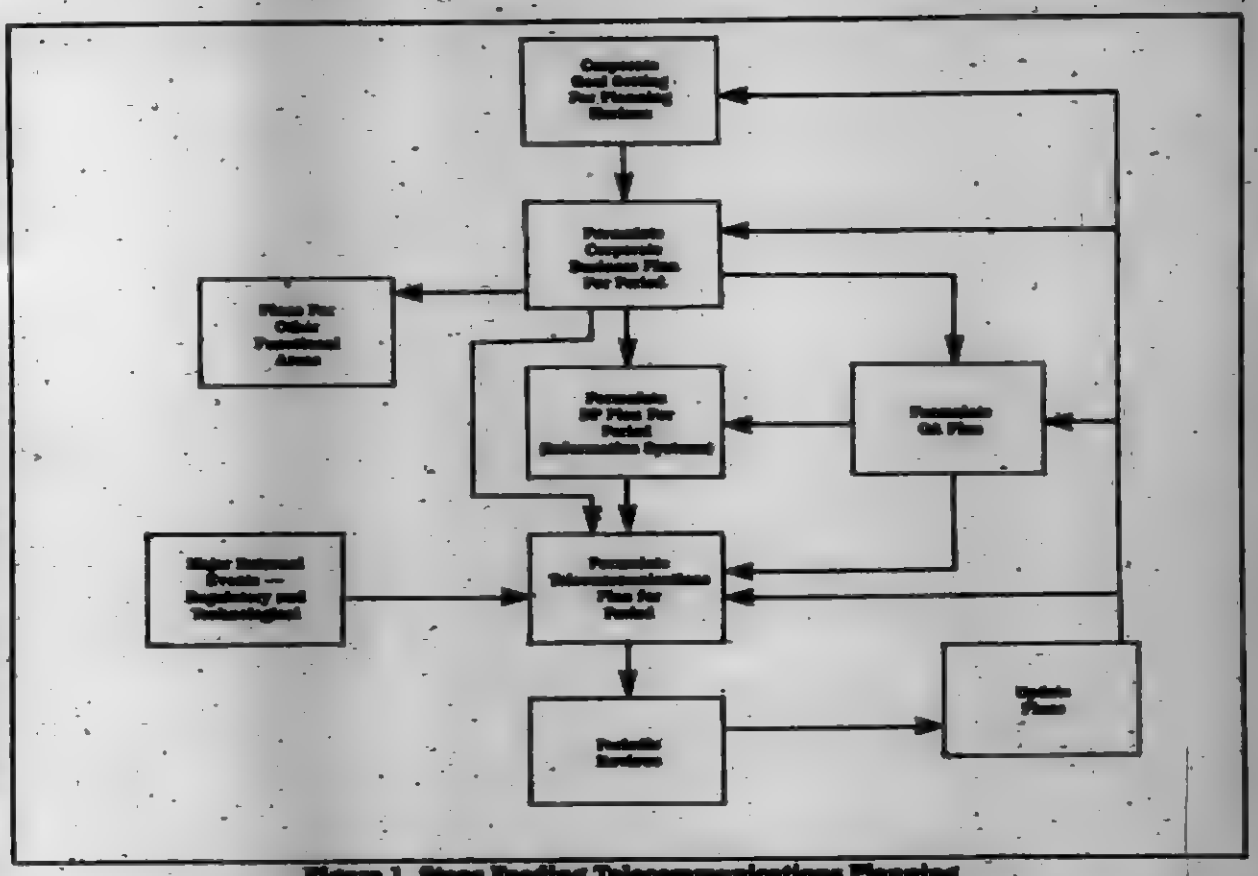

Figure 1. Steps Feeding Telecommunications Planning

They carefully investigate a variety of telecommunications-based and alternative methods for solving business problems. Among those methods are courier services, document distribution services and business travel, the soaring cost of which is a growing concern. For example, at a recent American Express seminar, John Reiner, senior vice-president, presented statistics indicating that American business travel costs soared from $35 billion per year in 1972 to $75 billion per year in 1982. His forecasts predict total business travel expenditures climbing to $124 billion by 1985 and $250 billion by 1990!

Growing concerns over productivity, soaring travel costs and the pressing need for better ways of solving problems have spawned considerable interest in teleconferencing as a principal ingredient in the strategic plan.

One way to determine the business needs to be supported is through a multifaceted program of interviews and questionnaires of executives, DP/information systems users and line managers. In all cases, the objective should be to identify areas in which better ways of using telecommunications technology could benefit the

HOT BUTTONS

- Excessive phone tag.
- Soaring travel costs and wear and tear on people.
- Obtaining access to necessary information.
- Inadequate document composition and distribution capability.
- Multiple independent wide-area networks.
- Excessive cabling costs for in-house networks.
- Multiple terminals required for accessing different applications.
- Restrictions of dedicated computer vendor network architectures.
- Inadequate support for dial-up terminals.
- Organizational structures (corporate vs. divisional).
- Networking extensions to customers and distributors.
- Electronic mail (text and voice) opportunities.
- Teleconferencing.
- Blocking vs. nonblocking switch.
- Use of satellites.
- Multivendor coordination — a nightmare.
- Network troubleshooting tools, techniques.
- Local-area networks.
- Centrex replacement plan.
- Phone system upgrade.
- Cost and performance optimization — existing and planned networks.
- Cost-allocation systems and procedures.
- Service-level goal setting (availability and response time).
- Service-level tracking and reporting.
- Network management and administration.
- Transborder data flow.
- Network support for PCs.
- Presentation-level protocol conversion.
- Private microwave and fiber-optic systems.
- Voice data integration (all levels).
- Synchronous data transmission through computerized branch exchange.
- Noncoded information device support.
- Public data network: economics; international accessibility; device support; bulk data transfer security; above-transport services.
- Vendor relationships: AT&T Information Systems vs. Bell Operating Cos.; end-to-end providers; other vendors.
- Resale carrier opportunities.
- Exploiting forthcoming T1 services.
- Multipoint data networks — what happens?
- Enhanced gateways and bridges: local-area net-to wide-area; inter-local-area net, inter-wide-area net.
- Opportunities for portable terminals, personal computers.
- Speech recognition opportunities.
- Lease vs. purchase telephone equipment.
- Other bypass technology opportunities.

enterprise. The interviews have several functions. They:

- Identify problems (real and perceived).
- Articulate changes in strategic business directions which must be supported by the telecommunications plan.
- Produce principal documents on which the plan itself must be based, namely, the prioritized list of key issues and supporting business requirements for the planning horizon.

Normally, the planning horizon consists of a five- to 10-year window. Actions, projects and programs slated for the next year are usually considered tactical. Complementary actions and directions scheduled for the remainder of the planning horizon can be viewed as the strategic piece of the directional plan.

Every organization will articulate its principal business needs differently, but several dozen typical key issues seem to show up in most companies as the principal areas of concern (see "Hot Buttons" on Page 41).

After these areas of concern have been defined, business requirements are summarized and presented to top management for their review. When the accuracy of these requirements has been established and a priority assigned to them, the next move can be taken. This consists of the all-important steps of identifying alternative solutions, evaluating them and ultimately selecting the preferred direction.

The best way to get from here to there (the objective of the strategic planning exercise) depends on the organization. It must clearly have a sense of vision about where it thinks it wants to be in office communications at the end of the planning horizon. Although enterprises vary in their descriptions of exactly where they wish to be in the future, most tend to agree that the general level of functionality and capability shown in Figure 2 is one they would like to work toward.

The plan must involve laying out a time-phased set of actions that can be taken to specifically bring about the general levels of functionality implied in Figure 2. This step will specify in detail the physical interconnections, services from common carriers, wide area networks, local-area networks, external network gateways and other levels of functionality required in a specific network plan for a particular user.

Now comes the most challenging and interesting activity in the entire strategic planning process. After the needs have been established, they can be laid out on a time line to establish a point of reference, based on existing network configurations. The planning exercise must define a series of paths for moving the enterprise from where it is today to where it wants to be in the future. The steps in the plan identify specific building block procurements and interconnections to be made across the plan's timeframe.

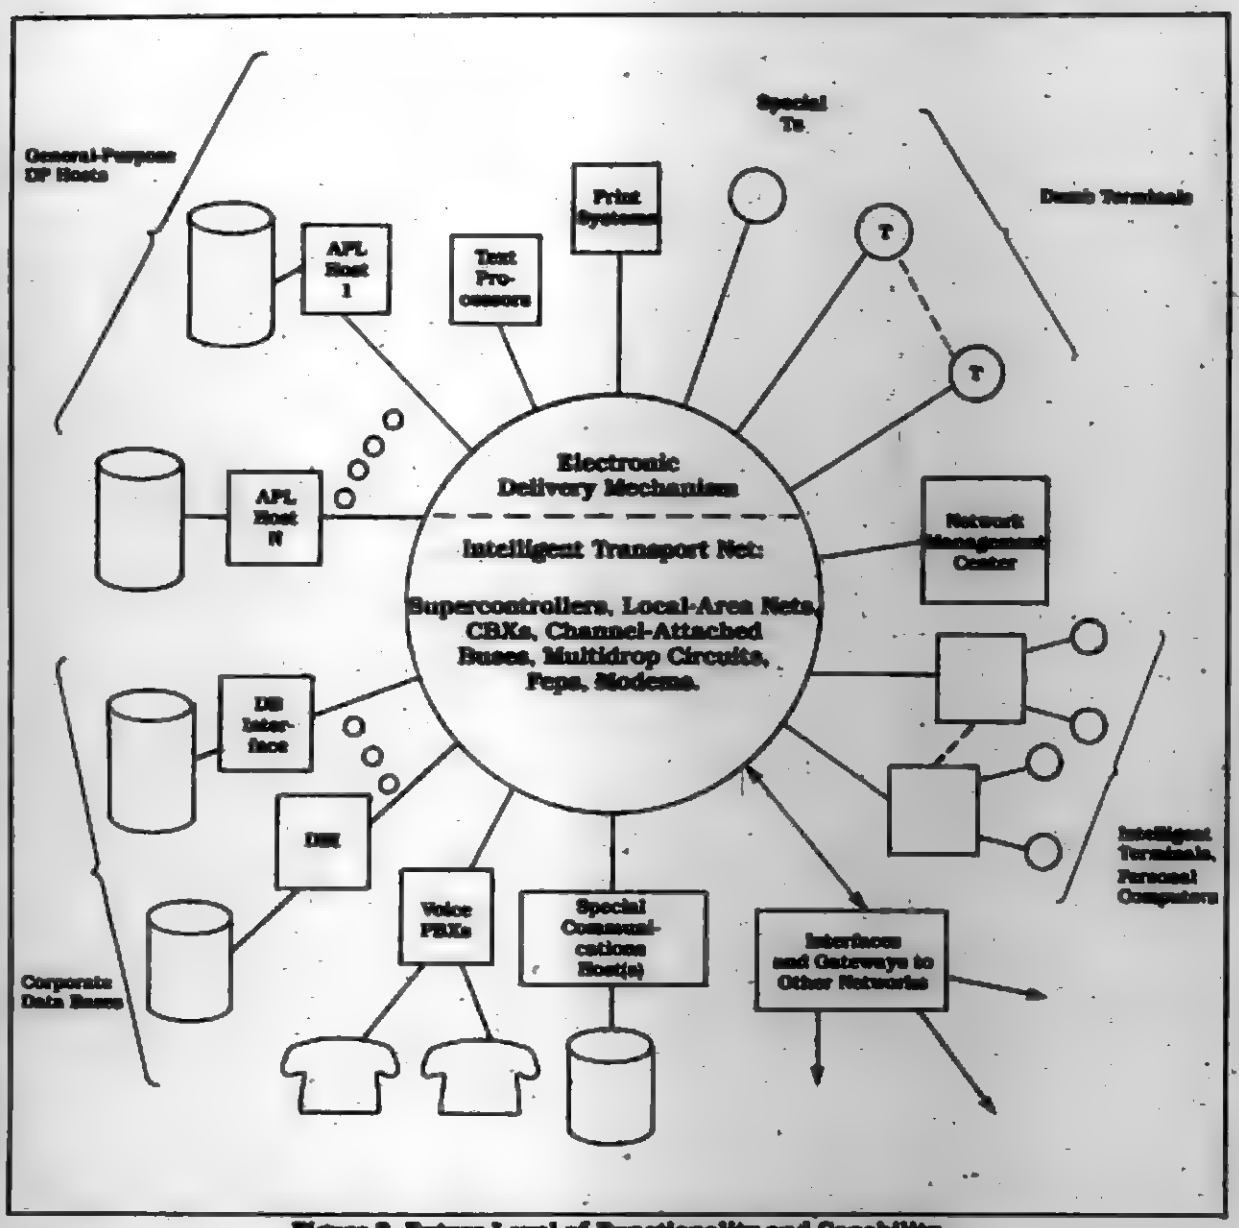

Figure 2. Future Level of Functionality and Capability

In developing a list of alternative networking strategies, planners must comprehensively and exhaustively evaluate a wide range of factors, including the wide proliferation of communications network service alternatives.

Constraints will exist as a result of equipment decisions in the areas of PBX, local-area networks, technologies, gateways to external network services and the selection of DP and OA vendor network architectures — for example, Systems Network Architecture, Decnet and DIA/DCA.

Priorities must be given to installing specific telecommunications technologies and applications. Alternative ways must be found to satisfy business needs through the development of realistic, time-phased actions (commonly called roadmaps) that enable the customer to move in the direction of its goal at the end of the planning horizon. A plan is not a single path on the roadmap. A plan recognizes the need for alternative courses of action and contingencies that may be necessary in the future as various external factors change.

The analysis of the strategic networking alternatives and the formulation of the specific steps in the plan then proceeds with a careful assessment of each alternative step along the various paths on the roadmap. Each potential step has certain associated cost implications, personnel and staffing requirements, functionality enhancements and constraints. Most important, each of the alternative paths and constituent steps will not only have an impact on one or more of the prioritized user needs in varying manners, it will also produce attendent risks to the enterprise if that step is taken.

The process of selecting an organization's best path involves a careful assessment of the advantages and disadvantages of each major alternative path identified at the beginning of the architectural definition step. The ultimate strategic plan will be the result of a highly artistic exercise of sorting through a bewildering array of complex options. The user must understand the consequences of making fundamental commitments to go in certain directions. For example, if major investments are made in new computerized telephone systems in conjunction with the opening of a new plant or facility, such equipment will create a natural potential hubbing site for enterprise telecommunications networking activity in that particular metropolitan area or region of the country for many years into the future.

Users must also make certain that the alternatives they are investigating provide adequate capacity and expansion characteristics. An expensive procurement today should not become out of date tomorrow because of technological obsolescence and adequate capacity or an inability to add new features and functions that might become important in the years ahead, long before the financial amortization of that system has been completed.

The final and perhaps most important aspect of evaluating alternative paths involves the need for performing formal financial comparisons of principal alternatives in the plan. In the final analysis, most enterprise strategic networking plans will be strongly influenced by a combination of factors including financial return on investment, flexibility, ability to remain competitive within an industry and — most important — to increase overall enterprise productivity and profitability. ◊ OA

Doll is president and chief executive officer of DMW Group, Inc., a research and consulting firm headquartered in Ann Arbor, Mich.

PC NETWORKS

By Amy D. Wohl

By the end of 1984, millions of personal computers — especially IBM-compatible personal computers — will have been delivered to office desktops.

Also by that time, far more personal computers will be in place in large companies than all the word processors ever delivered.

Who is buying these systems and for what purpose? How has their arrival in the office changed the notion of how we will computerize our front-office operations?

The office automation industry had a watershed year in 1983, when end users got bored with waiting for OA and started to act. Some customers planned for, ordered or even implemented substantial OA systems. But more customers ordered much larger numbers of personal computers as workstations, apparently confident that these workstations would eventually be the basis for office systems.

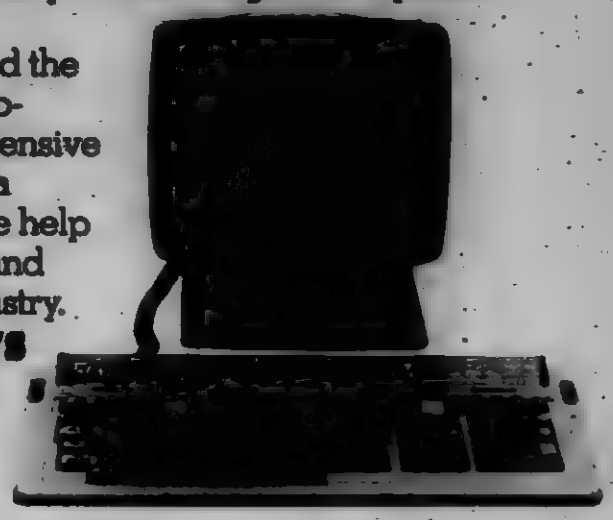
This represents a change both in what is happening (how much is being ordered when and by whom) and also

WITH DATA GENERAL YOUR COMPUTER WON'T BE ABANDONED AT YOUR DOORSTEP.

DATA GENERAL SERVICE—THERE WHEN YOU NEED IT

Some computer companies will sell you their bright new systems—and then disappear.

Not Data General. We understand the service and support needs of the automated business office. Our Comprehensive Electronic Office (CEO™) gives you a system that will run smoothly with the help of one of the most complete service and maintenance plans in the entire industry.



A SERVICE PROGRAM THAT'S RIGHT FOR YOU

Whatever the size of your office system, its locations, or hours of operation, there's a Data General service program designed to meet your needs.

With our "Enhanced Response Program," you'll have a service engineer on your site within 2 hours—24 hours a day, 7 days a week. Or choose our "On Call Service," in which a service engineer responds within 4 hours—Monday through Friday, between 8AM and 6PM.

With the 32-bit ECLIPSE® MV Family of computers, you can choose an uptime guarantee from 96% to 99%. Remote Assistance is also available to help you maintain high performance levels while saving time and money.

And, with our new DESKTOP GENERATION™, select from 16 service programs—the widest range of options for any desktop on the market. These programs will help increase productivity and keep maintenance convenient.

ALWAYS NEAR YOUR OFFICE

Data General has experience with large and small companies that have both local and distributed office environments. Whether you have one office, or a worldwide network, service is always nearby with Data General's 250 offices.

TOTAL SUPPORT FOR HARDWARE AND SOFTWARE

Data General's service organization will be your one source for handling both hardware and software problems. Our service engineers undergo extensive training every year. They'll know your system—no matter how new it is.

CALL NOW

To learn how Data General's Field Engineering Services can keep you a generation ahead, call **1-800-343-8842.** In Massachusetts, call **1-800-451-1014.** Or write Data General Service, 50 Maple Street, M.S. 05 G, Milford, MA 01757.

Data General
a Generation ahead.

in the underlying assumptions customers must be making in their decision-making processes.

One new assumption is that functionality now offered or soon to be offered by the IBM-compatible class of personal computers is adequate for many office users.

Nearly every month, this class of users grows larger as more capable user-friendly software is offered — and, equally important, as more and more users dip their toes in the icy waters of computer literacy and find the water warmer than they expected.

This means two strong trends — more and better software and more and more educated or ready-to-be-educated users — are coming together and reinforcing one another. This does not mean we don't need better workstations, more software capability or easier-to-use systems — it just means our increasing skills and confidence and our increasing impatience to enhance our work tools have made us reluctant to wait.

Another new assumption is that users are actually designing systems to a new kind of model. This model, bottom-up systems design, contrasts strongly with the largely top-down system design users did in the past.

Until recently, users looked first to their DP environment and then to their data communications environment and its interconnected distributed DP (DDP) environment. At that point, the user decided what kind of OA to buy and largely decided between placing OA within the DDP environment or buying separate systems, generally from a different vendor. The OA system choice then determined the type of workstation the user got for his desktop. Top-down system design assumes upper layers determine or limit lower layer choice; as a result, the workstation was often just a predetermined item rather than something users had much say in selecting.

Top-down systems design also usually assumes a fair amount of bundling at the systems hardware, systems software, interconnection, workstation hardware and workstation software levels. Only rarely did systems involve many vendors — and those systems required sophisticated, self-reliant users who would do much systems integration work on their own.

Bottom-up system design is different. It depends upon two notions. First, the workstation and its software are independently useful. Second, workstations and standards for interconnecting workstations are well enough evolved that workstation choices can be made. Underlying assumptions are that systems for interconnection exist and that the workstation being selected will plug into the system.

This process is rather like the way we buy lamps today. Within the U.S., one may buy a lamp in the lamp store, the department store, the hardware store, the five-and-dime store or even at a garage sale. The buyer can still be confident that all lamps plug into all electrical outlets successfully.

Another new assumption is that users are actually designing systems to a new kind of model. This model, bottom-up systems design, contrasts strongly with the largely top-down systems design users did in the past.

But is this confidence justified in the office? No workstation standard has actually been formally accepted and neither has an interconnect standard. No standard has been proposed and accepted on a de jure — or, in the computer industry case, "de committee" — basis. However, a de facto standard for workstations is strongly in place. That de facto standard is currently IBM's PC-DOS and, more generally, its generic MS-DOS parent.

Before you suggest that MS-DOS is an inappropriate standard for user-friendly, highly functional desktop workstations, or that no such de facto standard exists, consider two facts:

- Sales of personal computers as workstations strongly exceed sales of high-end workstations — perhaps by a factor of 50:1 or more.
- More and more customers, particularly larger business orga-

nizations, state that MS-DOS or PC-DOS is their organizational personal computer standard.

A telephone survey of a number of very large business and governmental organizations recently showed that 88% of the organizations surveyed had standardized on MS-DOS (72% had standardized on PC-DOS). Those are impressive numbers — maybe even scary ones.

Some concern is justified that in an industry where technology is moving very fast, strong acceptance of a standard could act as an impediment to users' ability to react rapidly to new or enhanced offerings. Although they would be able to implement on a more stable and less chaotic basis, users might temporarily — or even forever — lose out on some interesting or useful offerings that for one reason or another fall outside the standard.

A telephone survey of a number of very large business and governmental organizations recently showed that 88% of the organizations surveyed had standardized on MS-DOS (72% on PC-DOS). Those are impressive, maybe even scary, numbers.

For that reason, it is pleasant to report that, partly as a result of IBM's endorsement of the Unix operating system environment for the PC XT with the PCIX announcement in January, an alternative operating system environment has been proposed and is now gaining some immediate and enthusiastic approval.

Perhaps the notion that more than one flower should bloom in the garden will catch on. If so, the more monolithic aspects of standardization — particularly the stifling effect standards can have in an infant arena — can be at least partially avoided.

Of course, in order to have a successful, multiflower garden, the colors — or in this case the operating systems environments — must not clash. We will therefore quickly need:

- The ability to access both operating systems and both types of software from the same machine and the ability to access any data set from either environment. In other words, crossing over will be a requirement.
- The ability to see both environments simultaneously, presumably through a windowing environment, but one of greater sophistication than those currently in the marketplace.
- The ability to feel confident that future products will either occur within the current operating systems standards — or the knowledge that adequate migration paths and the ability to reasonably coexist will be features of new product announcements from most vendors.

Basically, when users set off down the path of bottom-up systems design, they are attacking their business problems from first principles. The workstation solves some basic problems; the fact that it will later hook into a system and solve other problems (or prevent them) is a fragile hope rather than an absolute fact.

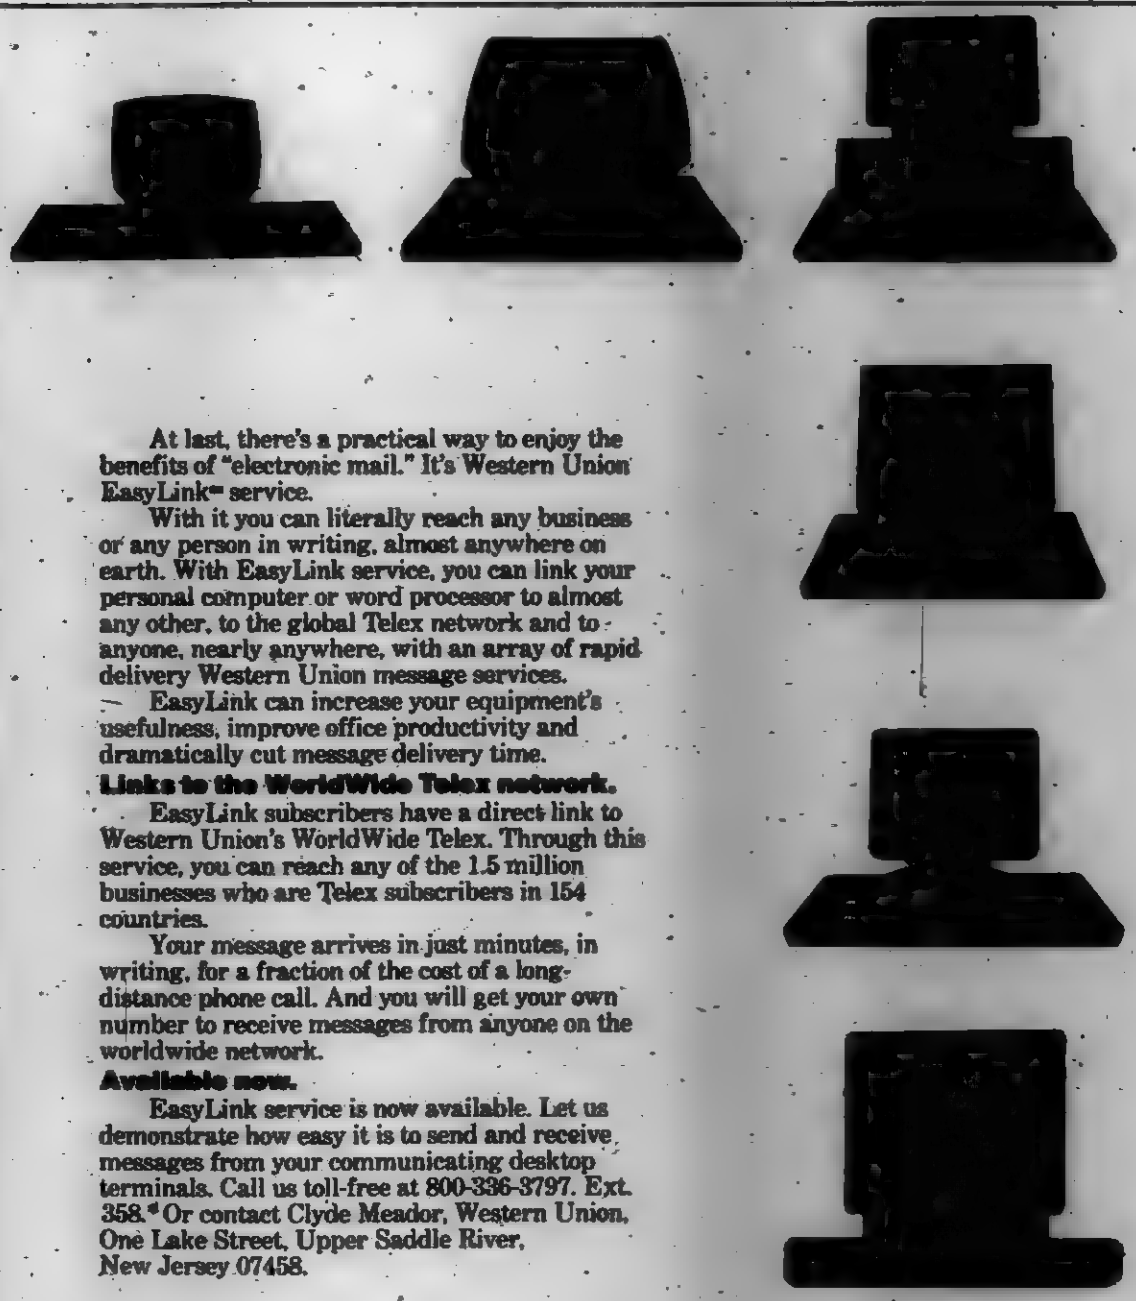
Nevertheless, many systems-level offerings are already available for the IBM class of personal computers. Some are even IBM offerings.

To summarize:

- The user can provide systems function by attaching the personal computers to a higher level system. Systems-level function might typically include electronic mail, file storage and sharing, device sharing and communications gatewaying to other systems.

For example, the IBM PC can be provided with systems-level function through attachment to the IBM 5520, the IBM 8100, the IBM 4300 (with VM and Profs) and the IBM MVS environment (with extended Systems Network Architecture and Disoss-PS). These are only the IBM options. A number of other OA vendors will permit IBM-compatible personal computers (often including their own product offerings) to function as office workstations on their systems.

- The user could attach to an IBM or third-party network. The first IBM network, the PC Cluster, has recently been announced, and at least two other IBM networks are expected in 1984. A number of third-party nets support IBM PCs and provide some systems-level functions mentioned above.
- It will probably be possible



At last, there's a practical way to enjoy the benefits of "electronic mail." It's Western Union EasyLink℠ service.

With it you can literally reach any business or any person in writing, almost anywhere on earth. With EasyLink service, you can link your personal computer or word processor to almost any other, to the global Telex network and to anyone, nearly anywhere, with an array of rapid delivery Western Union message services.

EasyLink can increase your equipment's usefulness, improve office productivity and dramatically cut message delivery time.

Links to the WorldWide Telex network.

EasyLink subscribers have a direct link to Western Union's WorldWide Telex. Through this service, you can reach any of the 1.5 million businesses who are Telex subscribers in 154 countries.

Your message arrives in just minutes, in writing, for a fraction of the cost of a long-distance phone call. And you will get your own number to receive messages from anyone on the worldwide network.

Available now.

EasyLink service is now available. Let us demonstrate how easy it is to send and receive messages from your communicating desktop terminals. Call us toll-free at 800-336-3797. Ext. 358.* Or contact Clyde Meador, Western Union, One Lake Street, Upper Saddle River, New Jersey 07458.

Western Union EasyLink service.

The easy way to link your computer to the world.

*In Virginia, call 703-442-8677. Ext. 358.

very soon to look at mainstream offerings that provide interconnection and systems-level support via the telephone system through the extension of digital private automated branch exchange (PABX) function. Such offerings will initially be through the use of telephone wiring and accessing the DP capability of the PABX, but soon the opposite alternative may show up — a local-area net that treats telephone function as an extension of other information processing capability.

Without interconnection and systems-level function, very little real OA will occur, particularly the synergistic effects that offer very high productivity paybacks. It should be noted that it is important to be able to add systems-level function readily.

Some systems-level function, particularly access to data bases, can be offered without making the personal computer population into its own network. Personal computers can simply access existing information systems through more simple communications hardware and software. Here, three things should be emphasized. The first is matching the user's installed DP environment, as well as the public data network access requirements. The second is permitting data to move freely between environments, not merely to be viewed from one environment to another.

The third and final factor is to make it as easy as possible for relatively naive users to access and use data. This process can take the form of making the interconnection transparent (let the system do it) or very friendly (English menus with no strange communications vocabulary to learn). It might also take the form of easing the access of data from a complex environment on another system (the workstation as a friendly filter).

If we assume that many of us will automate our offices (and our own personal desktops) with personal-computer-level products, it is fair to ask, "Are personal computers going to be adequately useful and adequately friendly?"

If the current success of the IBM PC and its friends and relations is any evidence, acceptance has already occurred with some of us. But for many others, much more is required. Some new product offerings emphasize trying to stretch the current personal computer into a friendlier, more robust machine. Peripherals upgrades (hard disks, better or different keyboards, more memory) can make the machine more pleasant and more useful, but they also make it more expensive. In fact, we seem to have approached a point of parity: A robust IBM PC XT is now about the same price as an advanced workstation with equivalent hardware and functionality (for example,

Some offerings emphasize trying to stretch the current PC into a friendlier, more robust machine. Peripherals upgrades can make the PC more pleasant and useful, but they also make it more expensive.

some Apple Computer, Inc. Lisa models, and the new Exxon Offices Systems Co. 750 Integrated Workstation). This should have a strong effect on the viable pricing of older and less powerful workstations which are still much more expensive.

A few workstations seem much more powerful on a price/performance basis; that is, their price and function taken together seem interesting. However, such products are generally not yet completed or entirely available. For instance, NBI, Inc.'s IWS seems very powerful in function (although still a bit pricey), but it's not yet really in delivery. The Apple Macintosh is so inexpensive and so hardware-robust it almost overcomes its lack of MS-DOS compatibility and its still small software library (three packages, Macwrite, Macpaint and Multiplan, at the time this article was written). Time and software may change the balance point here.

The future clearly holds a mixture of workstation products. A large part of that heady mix is sure to be personal computers. If we can work out the process that permits us to provide system-level function to these useful and relatively inexpensive workstations and a standard interconnect environment — or perhaps a choice of several — we will arrive at the automated office much sooner than we had dared to hope. OA

Wohl is president of Advanced Office Concepts Corp., a consulting firm based in Bala Cynwyd, Pa.

Now your IBM/PCs and mainframe can share information with each other.

Just share a little information with us.

OMNILINK™

OMNILINK software gives your IBM/PCs and mainframe an open channel of communications. So you can use your personal computers to get information from your mainframe or any other IBM/PC connected to your CICS system. OMNILINK lets you make decisions based upon more complete, up-to-date data. You can also use OMNILINK to send and receive all your messages, documents, and batch reports via your existing terminals, word processors or IBM/PCs.

To let you manipulate information on your PC, we've included a copy of OMNIMICRO software.

OMNIMICRO dramatically increases your IBM/PCs' capabilities. It lets you write your own programs on your PC using a simple non-technical language. You can also make queries in plain English. Just key in the information and format you want. OMNIMICRO will search the mainframe or other PCs and deliver the data to your PC. OMNIMICRO even gives PC users integrated word processing, spreadsheet and graphics capabilities.

To learn more about how your IBM/PCs and mainframe can share information, share a few facts with us. Mail the coupon, or call toll-free 800-526-0272.

PBX TECHNOLOGIES

By Angela MacRae

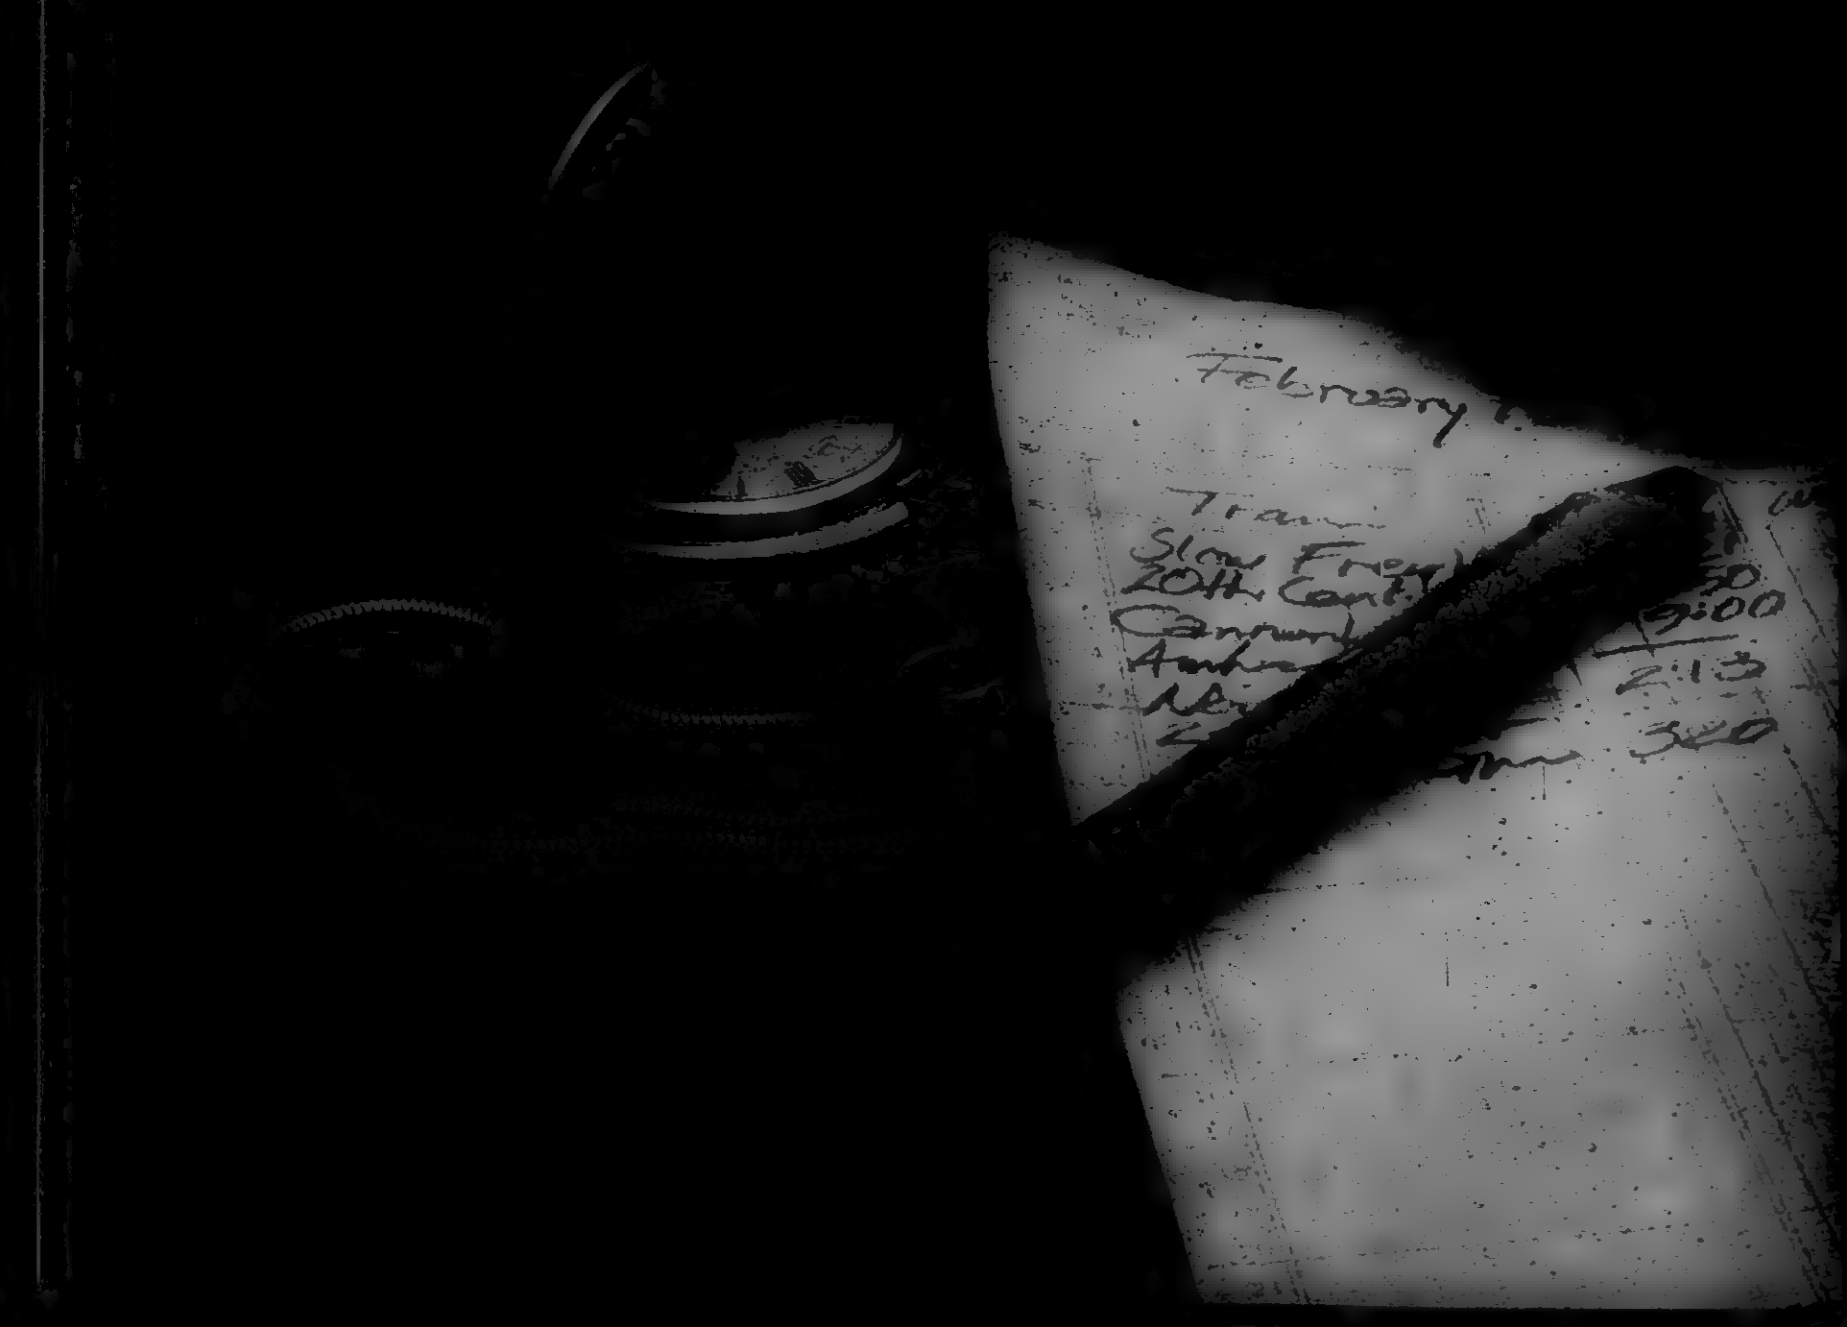
Within the past few years, vendors of data processing, telecommunications and office automation technology have been competing to supply multipurpose systems to the office.

Until quite recently, however, telecommunications vendors had not been very keen competitors in bringing integrated systems — those that handle voice, data, text and image — to the office environment.

Most telecommunications vendors now offer digital switches. The digital private branch exchange (PBX), with expanded switching and processing power under an enhanced architecture, can handle information in virtually any form over standard twisted-pair wiring.

While end users wait anxiously for a single workstation that combines the functions of all office equipment, telecommunications vendors are positioning their products to evolve into the vehicle of office communications in the information age.

The most pressing problem



in managing information is integrating and interconnecting the installed base of systems and devices in the office. The immediate challenge is to help businesses make the best use of their current equipment and prepare for the more powerful, more dispersed and more flexible systems of tomorrow.

Word processing and the proliferation of data terminals and personal computers throughout the office is making information handling an increasingly complex and even chaotic task. Electronic keyboards are connected to a variety of micros, minis and mainframes. Wiring systems connecting terminals are complex, and the languages in which these devices talk are so varied that communication is often difficult or impossible.

It's not uncommon to find a professional-level knowledge worker — an analyst in a large financial corporation, for example — with a number of devices on his desk: a 3270-type terminal to access mainframe applications, a dumb terminal connected to the corporation's electronic mail system and either an asynchronous Ascii-type terminal or a personal computer, if the higher cost can be justified.

At the same time, many other white-collar workers still do their jobs with the same tools used by generations of their predecessors: pencil, paper and telephone. Clearly, the widely proclaimed benefits of OA have been only partially realized.

This situation presents a perfect opportunity for vendors to address present and future applications simply by enhancing today's ubiquitous telephone set as an integrated voice and data workstation. What users need is a device installed via twisted-pair wiring that is a cost-effective alternative to both a telephone set and a separate data terminal. PBX vendors providing such a single device will have the competitive edge over DP and OA vendors installing separate devices and additional wiring systems.

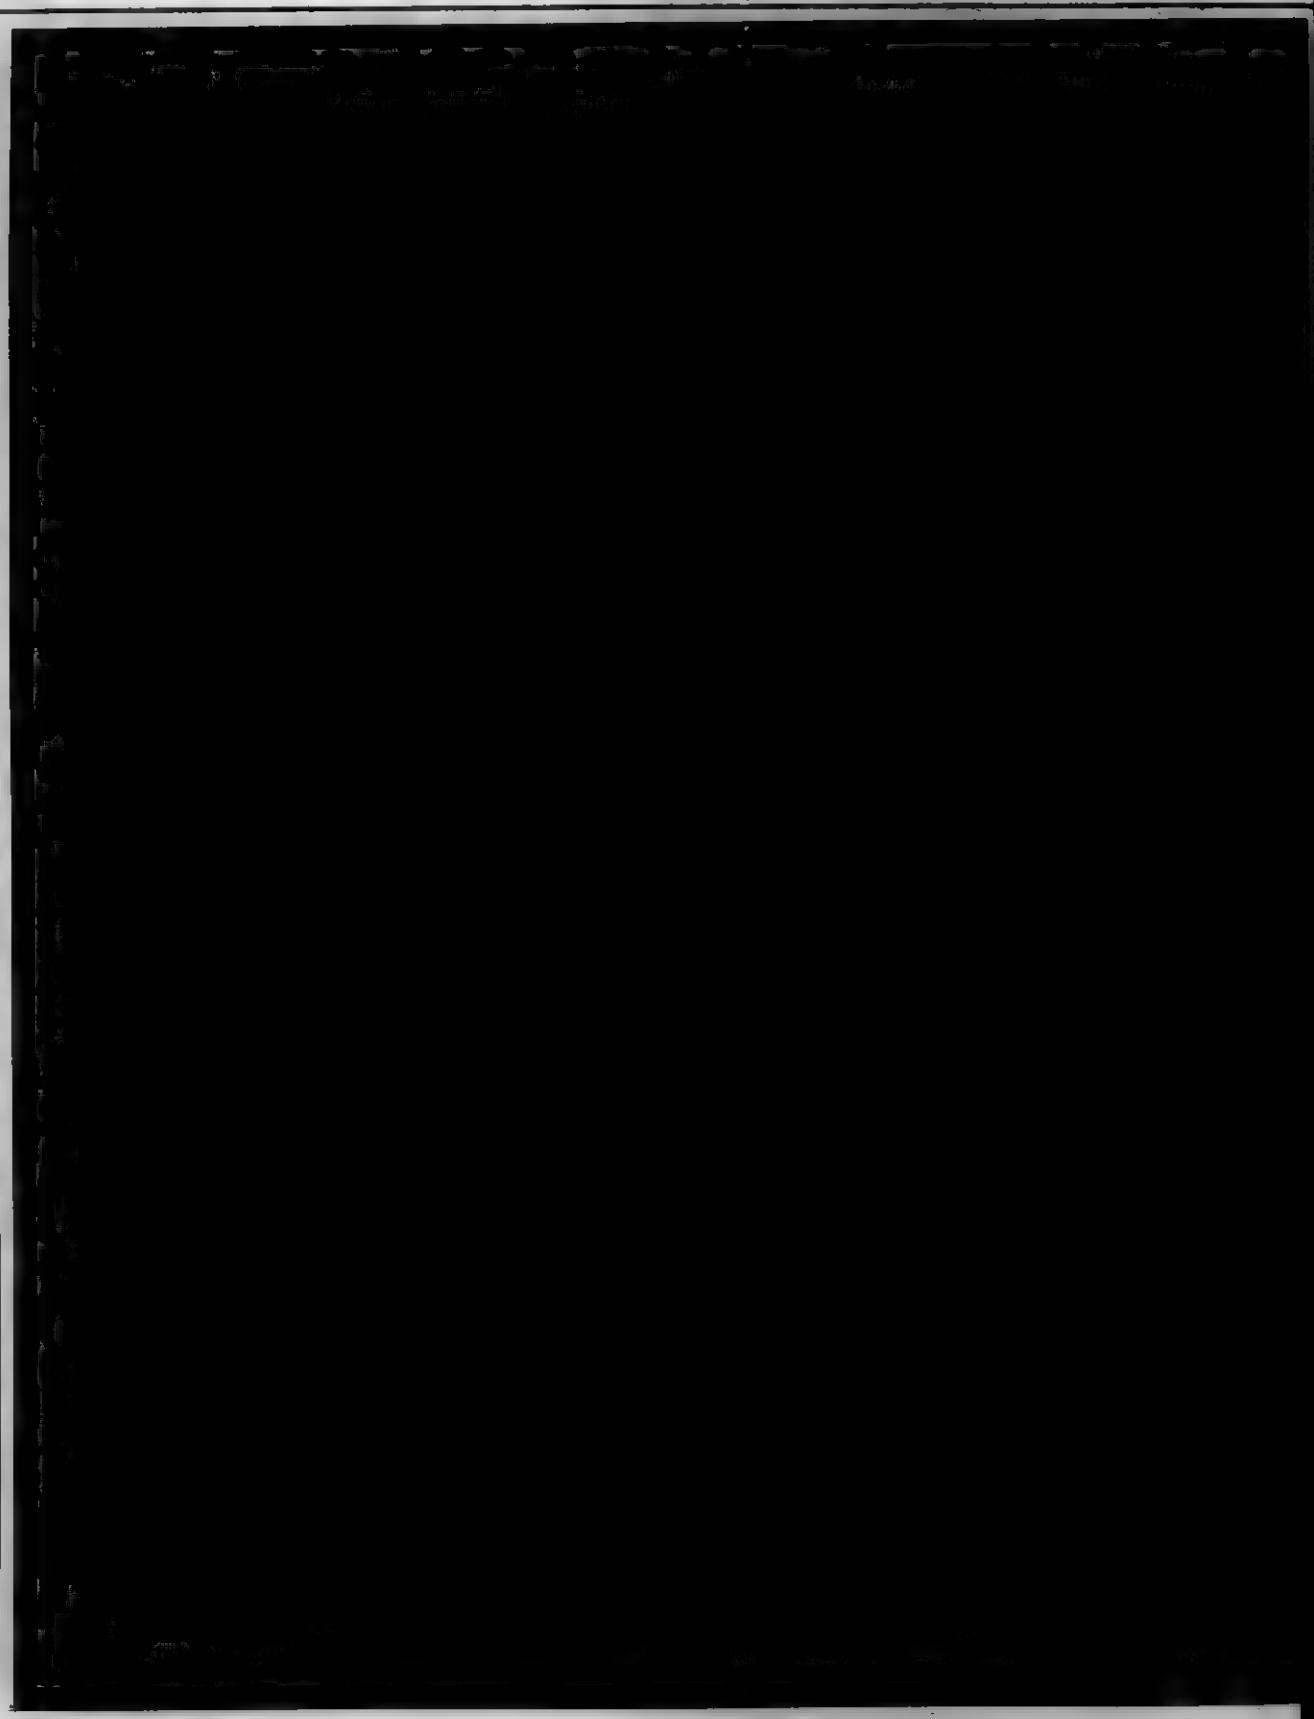
The PBX vendor follows tradition in bringing integrated compatible technology to the office. As the telecommunications industry evolved over the past century, it adhered to universally accepted standards. Hence, any approved system — regardless of where in the world it was produced or when it was developed — can function as an integral part of the communications network.

The more recent evolution of the DP and OA industries has been less orderly. PBX vendors are well-positioned to work with software specialists and organizations concerned with DP standards to provide products that will allow users of existing equipment to integrate and interconnect their hardware. In fact, vendors from all three industries are beginning to work together to set standards: Witness the trendsetting moves toward industry integration by Digital Equipment Corp. and Northern Telecom, Inc., and IBM and Rolm Corp.

The distinctions among telecommunications, DP and OA are blurring. They are blurring across applications and features. They are blurring among the various media. And they are blurring between devices, as single-function desktop telephones and terminals give way to a range of multifunction desktop devices combining voice and data. This merging of technologies will result ultimately in the development of a multipurpose system that handles voice, data, text and image. And this integrated system will derive from the evolution of PBX enhancements. The foundation for this evolution is already in place. The first generation of integrated voice and data terminals is giving way to more enhanced versions. The forthcoming applications on the PBX are well beyond the infancy stage. Although users have yet to see the first portable, attache-type terminal with associated telephone set, surely it is on the way.

PBX vendors are most experienced in the area of voice communications and only more recently in data communications. As a result, applications that evolve out of PBX technology will begin with enhancements to the voice-based service — for instance, conferencing and voice messaging. Integrating the services and media that the PBX can now switch digitally will be the first major change in software offerings. The add-on voice messaging system currently prevalent will be only one of many services offered as part of the PBX. Multimedia messaging — combining voice, text, data, graphics and image in one messaging envelope — will come with changes in software architecture.

The PBX' strong voice-switching capabilities provide for major developments in voice messaging systems and multimedia conferencing. The enhanced PBX will also handle and process multimedia documents — text, data, graphics, image and voice in a single document. On-line documents



can then be distributed much like electronic mail. Protocol converters will allow documents from dissimilar systems to be gathered into a common format for editing.

Combining multimedia documents will certainly increase efficiency and productivity. It will also greatly reduce the possibility of error when a document goes through a number of versions and then in turn is transformed from one medium of exchange to another and another — and back again. With integrated PBX-based document processing, a professional can key in the document or information, using support staff to edit the draft and do final formatting. The document then can be distributed directly to any number of remote locations in an organization by means of the enhanced PBX system.

In short, unlike the previous experience with OA, where separated services were offered through discrete systems, evolving PBX systems will offer a set of distinct yet interconnected services.

Several possibilities are presented by the evolution of enhanced PBX systems:

• Electronic filing for a multimedia system. The traditional tree-structure of filing systems for individuals, project groups and functional units will have the added complexity of filing required for different media. For example, voice compression techniques will be required for documents containing both text and voice information. Key factors in filing systems will be high flexibility with leads or pointers to information in different locations.

• Development and processing of interactive forms. Because of the PBX' messaging capabilities and use of the on-line PBX directory, performing these functions will be far more realistic than on OA systems. Automatic routing of a form to a predetermined list of recipients tracks the form. Automatic calculation and autogeneration of periodic reports from compiled forms will greatly improve efficiency.

• Integration and interconnection for PC users on two levels (the physical link and the applications accessed). Switching a PC to the outside world via the PBX requires the development of interface circuitry to the PC. Once done, however, the interface eliminates the expense and inconvenience of modems and RS-232/coax connections. The PC can communicate over twisted-pair wiring to the closest wall jack, like any telephone set attached to the PBX.

On the applications level, PBXs will be running popular microcomputer operating systems treated like another software application. This will allow PC users to execute programs centrally on the PBX-based configuration, and to have these PC applications integrated with other multimedia applications developed for the PBX. Thus, users who can access the PBX-based applications will also be able to use the PC applications without the expense normally associated with the typical stand-alone PC configuration.

• Speed, code and protocol conversion features (now offered via add-on black boxes) available as an integrated function of the switch. This will increase the efficiency and ease of integrating systems.

• Interfaces to other vendors' coax local-area networks and X.25 gateways to public and private networks. Autocall, auto-log-in and auto-service-select for remote processors will improve user processing power and access to other systems. Freedom to access and process information from many systems according to one's needs and schedule will surely enhance productivity, creativity and the general quality of working life, but these tasks are very much dependent on the operational simplicity of the system. The structure is in place, however, to provide a uniform interface across applications.

PBX evolution is not without its inherent problems. Numerous intermediate stages will take place in this evolution — for example, when an add-on service is integrated with the switch and users are obliged to wade through the complexities of the changeover.

The enhanced digital PBX will evolve into the communications hub of the office. It will bring to users enhanced multimedia communications solutions. The integration of media applications and the interconnection of various systems and devices are evolving realities. We will see more and more high-technology vendors delivering multipurpose systems and devices for the office as users demand more from technology.

The result will be an increased ability to access, process and manage information. And that will lead to increased profitability. CA

MacRae is manager, product application analysis, in the Integrated Office Systems unit of Northern Telecom, Inc., in Dallas, Texas.

Living with errors in computer communications is just another way to play Russian Roulette. Sooner or later something serious is bound to go wrong. Ask the major New York insurance broker where a one-digit miscommunication caused a $1,000,000 error in a client bill. Or the medical lab where a mistransmitted enzyme count came within minutes of costing a patient's life.

But now, Microcom™ introduces the Era 2 SX/1200,™ the stand-alone 1200 baud modem that provides 100% error-free data communications, and that's easy to operate and cost effective. Era 2 SX/1200 implements a machine-independent, error-correcting protocol, called MNP.™ MNP detects transmission errors between Era 2 modems caused by line interference or low quality telephone connections, and retransmits lost or incorrectly received data.

The new Era 2 SX/1200 is Bell 212A compatible, supports RS-232 devices, and can be rack mounted – a major space saving in large multiple installations. It can store up to nine telephone numbers of 36 digits each, with battery back-up. It has a simple, character-oriented command structure, with control of all modem functions from local devices.

All of the above comes for the remarkably low price of $599 – about $100 less than brands that can't deliver 100% error-free performance.

So call, right now, for toll-free information about the SX/1200. The number is 1-800-322-ERA2. We'll send you a complete brochure and spec sheets to show you how dangerous errors in communications are a thing of the past.

Only from Microcom.

The Search For The Perfect Spreadsheet

By Thomas Zappia
and Thomas O'Flaherty

The evolution of spreadsheet software packages has created an interesting paradox: Many features that make spreadsheets attractive also limit their capabilities. With the increasing use of spreadsheets, these limitations will become more apparent. Users should acquaint themselves with both the power and the limitations of spreadsheets.

Spreadsheet packages exist for all types and sizes of computers — personal computers, minis and mainframes — but those designed specifically for personal computers have attracted the most attention. These packages tend to fall into three categories:

- Classic spreadsheets like Visicorp's Visicalc, Perfect Software, Inc.'s Perfect Calc and Microsoft Corp.'s Multiplan.
- Integrated packages, for example, Lotus Development Corp.'s 1-2-3 and Context Management System, Inc.'s MBA.
- Integrating software, such as Visicorp's Visi On and Quarterdeck's Desq.

Although early PC spreadsheet packages offered only a single function, later packages have combined more functions, such as data base management, word processing, graphics, telecommunications and windowing, around the basic spreadsheet.

It is easy to see that various combinations of the above features alone would result in quite a number of different products. If com-

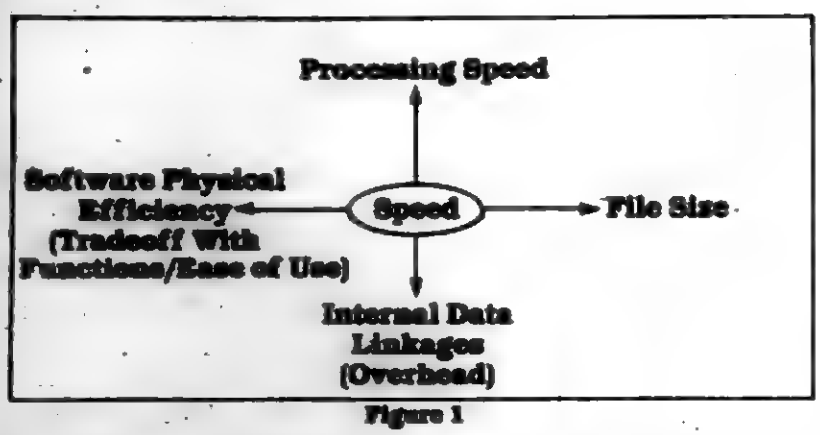

Figure 1

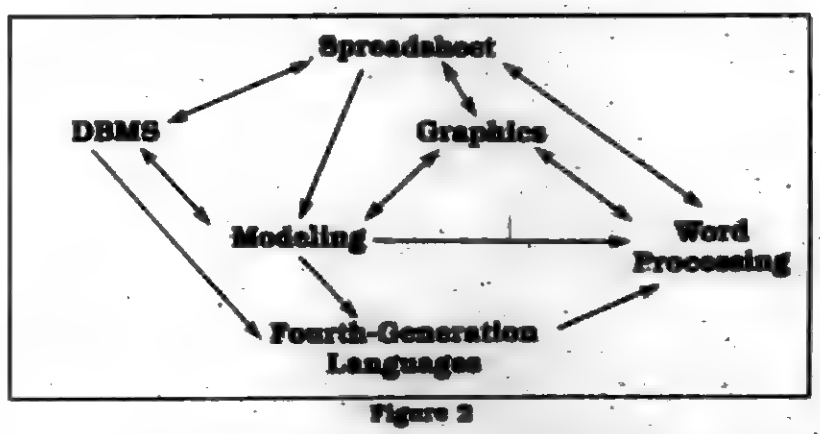

Figure 2

parisons are then made for each product's data base size, arithmetic functions, WP features or any other internal characteristics, the number of such products reaches into the hundreds.

In spite of the wide choices, however, for two reasons it is very unlikely that any single package will meet all of a user's needs. First, no package currently on the market offers all the above features; even after buying an integrated spreadsheet package, users are still left hanging. Visicalc, for example, offers only a spreadsheet; 1-2-3 provides spreadsheet, data base, graphics and WP; MBA provides spreadsheet, data base, graphics, WP and communications; Visi On offers windows, spreadsheets, data base, graphics and WP. Users who buy any of these packages for what they do offer could find themselves wanting the options the packages don't offer. This may not happen immediately, but it is likely to occur in the future when needs change and mature.

Second, regardless of the level of experience, the user will soon stretch each feature of the package to its limit. This tendency is most obvious in the spreadsheet's data capacity. Users quickly find the spreadsheet's capacity limited, particularly when compared with data base management systems.

One frustrating feature is the inability to separate data, modeling and reporting capabilities within a spreadsheet. For example, the relationships specified in the spreadsheet will operate only on the data within the spreadsheet. Those relationships cannot be applied to data residing elsewhere unless that data is reentered. Report generation is also limited to the existing structure of rows and columns of the spreadsheet. Very little flexibility exists to change a report after the spreadsheet has been set up. More problems are encountered when users run into a common business requirement — consolidating financial statements.

Many users are so amazed by the spreadsheet's capabilities that they overlook what may be an even more important consideration — data. These users build fairly sophisticated models and applications with spreadsheets; later they find that the data they need is not available or, if available, does not exist in the right form or in sufficient detail.

Emphasis has been placed primarily on what spreadsheets can do for the user, not on what the user and others must do before the spreadsheet can be utilized. Even when data is available and is in the proper format, the user must usually manually enter the data. Downloading data from existing corporate data bases (when this capability is available) often eases the problem of data availability and entry. However, it does so at the cost of forcing PC users to have a knowledge of existing mainframe systems' hardware architecture and data structures.

In addition, this concept of downloading data presents another area of concern. Spreadsheet packages continue to emphasize the benefits of integrated software with linked functions. A change made to data in the data base is immediately reflected in the spreadsheet and graphics. If a windowing capability is provided, the user can view the change in all three functions simultaneously. For now, these links are local to the particular user's personal computer. With the evolving micro-mainframe hookup, users will want these links to extend from the PC to the mainframe.

This capability will raise many questions about data integrity, security and control; most of these questions do not yet have satisfactory answers.

As discussed earlier, spreadsheets cannot meet all of a user's requirements, either because of lack of particular functions or because of the limitations of available functions. As a result, available functions are subject to misapplications — one admittedly extreme example is the use of a spreadsheet for word processing. Misapplication often occurs when users lack either the knowledge or availability of proper tools. The area of personal computers in general suffers from an overall lack of systems planning. One result of this vacuum is that users often cannot see the full range of their needs until after they purchase a spreadsheet package.

When users do gain some experience with spreadsheets, they tend to place much more importance on processing speed. They quickly become frustrated and annoyed at the length of time it takes to run spreadsheet models. Nevertheless, a clear tradeoff is made between integrated linked functions and processing speed (see Figure 1). The cause of this problem must be shared between the spreadsheet package, which is trying to provide more and more functional capabilities, and the inherent limitations of a fully exercised personal computer.

Spreadsheets provide sufficient capabilities to let users build fairly complex models. But when those models become more complex or are shared, the lack of any self-documenting capabilities within the spreadsheet will lead to confusion about what the model is doing. Other users will find it difficult to understand or to modify the model.

Despite all their shortcomings, spreadsheets have proven to be very powerful tools for business applications, particularly for ad hoc model building. PC spreadsheets provide excellent price performance, so long as users are aware of their limitations.

However, more experienced users can find more powerful tools in modeling packages, such as Express and IFPS; fourth-generation languages; downsized minicomputer packages; and the new supermicros (see Figure 2).

More powerful hardware — such as supermicros or 370s on a chip — may eventually ease some of the limitations, but they will not eliminate them. OA

The Quest For Compatibility

By Glenn Rifkin

The term "IBM PC-compatible" has recently become as much a warning signal as an enticement. "It's caveat emptor — let the buyer beware," Jack Karp, the Gartner Group's director of personal computing services, noted.

When the issue of IBM Personal Computer compatibility was first raised, a laundry list of features and functions were required before a machine got the stamp of approval.

Today, according to Future Computing, Inc. of Richardson, Texas, IBM PC compatibility, although it is a complicated issue, can be measured by one easy test: Does the machine in question run all software intended for the IBM PC right out of the box?

With an estimated 3,000-plus software programs available for the PC, the chances of any single machine being 100% PC-compatible are virtually nil. That, however, doesn't mean it's IBM or bust. A variety of personal computers on the market are close enough to provide a choice. It seems that compatible personal computers are becoming like bellybuttons: Everbody's got one.

For the corporate user, the issue is now twofold. The first question is to find out if the product is indeed PC-compatible and to what extent; the second question: Does it really matter?

Clearly, the IBM PC dominates the marketplace and has spawned an entire industry for third-party software developers. But industry analysts are not convinced the PC is the best offering around in terms of price and performance. Other major vendors have personal computer products with more power and versatility, comparable or better pricing and enough software offerings to satisfy most needs. What they don't have are three large blue letters that seem to spell automatic acceptance.

While the issue of PC compatibility has proven frustrating for some vendors, others are taking an "if you can't beat em, join em" approach. According to Ron Ward, executive vice-president of Future Computing of Richardson, Texas, more than 50 vendors claim to have products that are PC-compatible. Because none can legally be totally compatible, a testing center

at Future Computing has developed a set of conditions that must be met for real compatibility.

One basic requirement is that the machine run Microsoft, Inc.'s MS-DOS operating system. Unfortunately, running MS-DOS does not ensure compatibility. Many machines are functionally compatible — they use one of the Intel, Inc. 8088 or 8086 microprocessors and can read and write to IBM PC disks. But this again doesn't guarantee compatibility. Truly operational compatibility is tough to achieve and it comes in a specific form.

Future Computing asks three questions:

- Does the machine run, right off the shelf, software intended for the IBM PC?
- Can it use add-on boards designed for the PC?
- Can it use peripherals, such as modems and printers, designed for the PC?

Currently, five companies' products have passed Future Computing's tests: Compaq Computer Corp.'s Compaq Portable and Compaq Plus; the Columbia Data Products, Inc. MPC; the ITT Courier Terminals Systems, Inc. Xtra; Seequa Computer Corp.'s Chameleon; and Panasonic Co.'s Senior Partner. According to Ward, several other machines will probably make Future Computing's list, but are either still being tested or have yet to be tested. Among the probables are the Colby Research Industries, Inc.'s PC; Electro Design IMP-12; OSM Computer Corp.'s PC; Visual Computer, Inc.'s Visual Commuter; Televideo Systems, Inc.'s TPC-II; and Tava Corp.'s PC.

Several other companies believe they also belong on the list, but Ward pointed out that although some vendors believe they have achieved compatibility, they have fallen short in one area or another.

"Running one software program, such as Lotus 1-2-3, is not necessarily an accurate test," he explained. "For example, the Bytec Hyperion could run the spreadsheet portion of 1-2-3, but it could not handle the graphics."

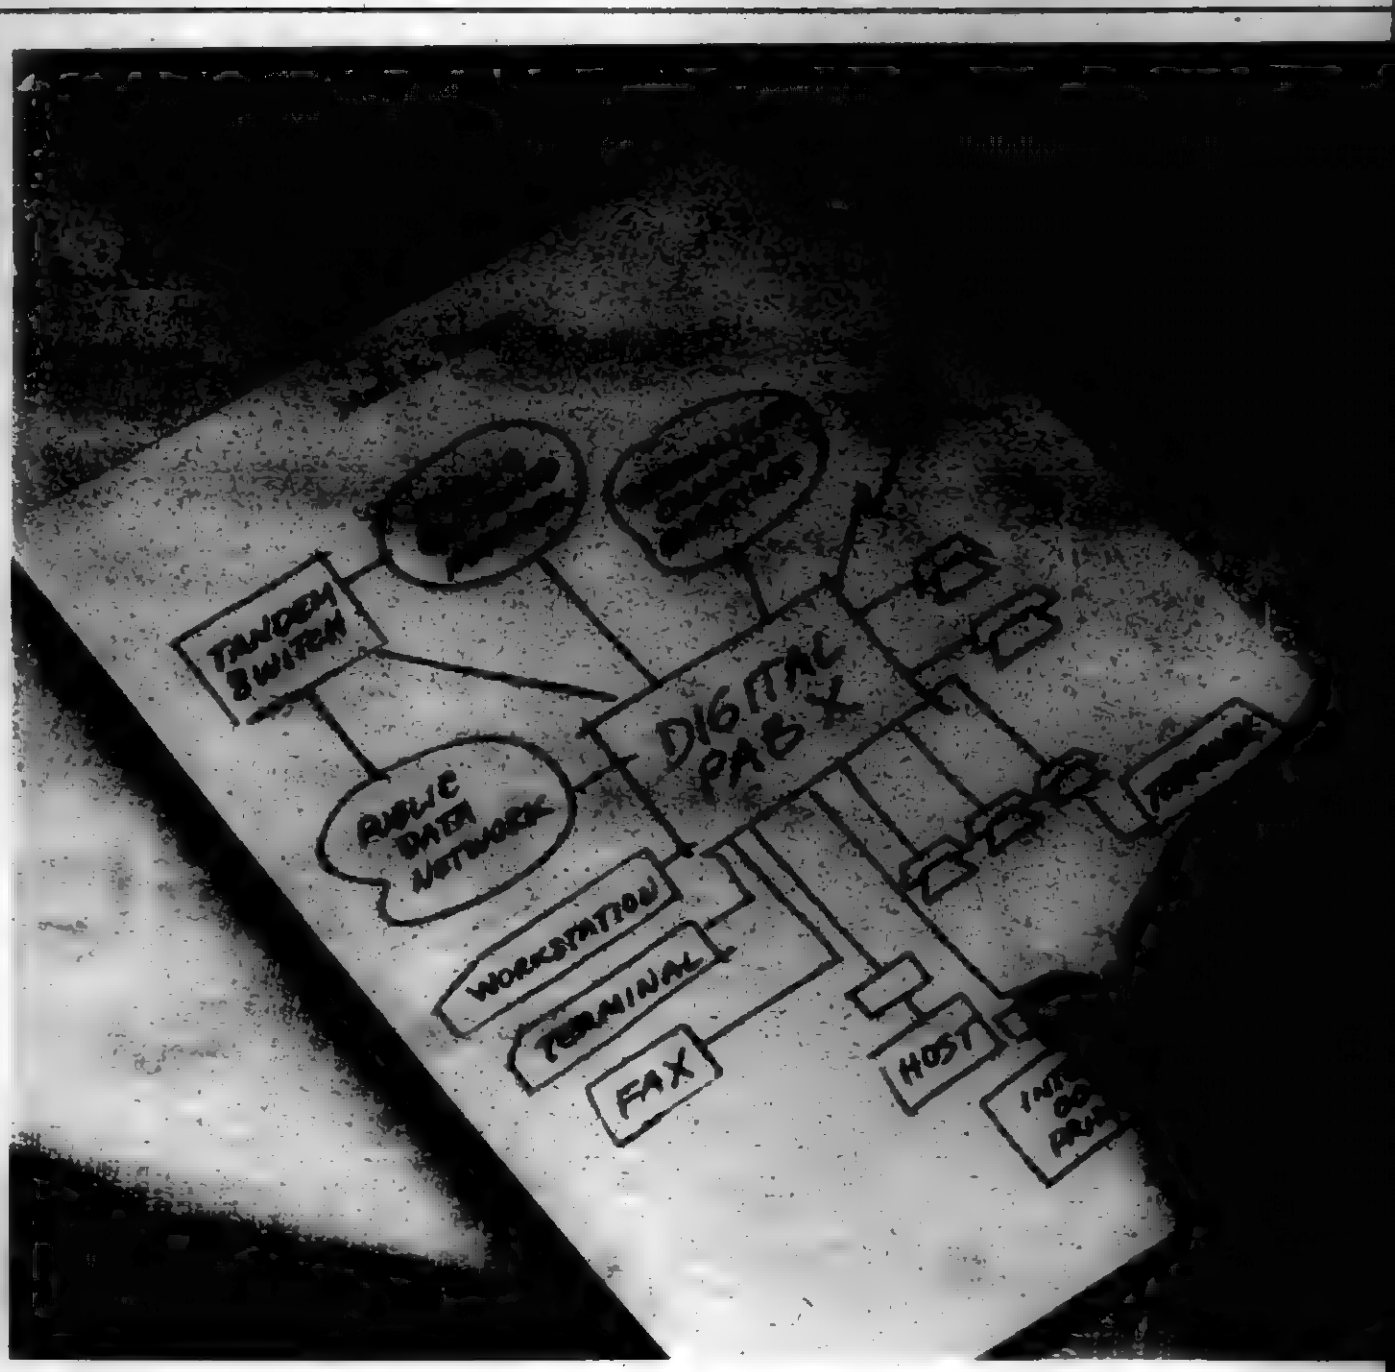
The key to the puzzle is the basic input/output system (Bios). Bios, a software layer built into the hardware, controls such functions as keyboard, video display, disk drives and other peripherals. IBM copyrighted its Bios; therefore, a compatible maker must create a Bios that essentially does the same thing but differently.

To further add to the confusion, PC-DOS, IBM's version of MS-DOS, was inadequate, according to Ward, because it did not provide a complete interface to the machine's hardware. As a result, third-party software developers had to circumvent the Bios to allow their products to handle certain fundamental commands like cursor control or copy protection.

What that means is that all software developed for the PC is tied inextricably to the PC hardware, Ward said, and "compatibles are heavily dependent on the PC architecture. That's why just running MS-DOS doesn't mean compatibility."

Several vendors have already had their hands slapped by IBM for copyright infringement on the Bios. Corona Data Systems, Inc., Eagle Computer, Inc. and Handwell Corp. have all agreed, in out-of-court settlements, to redesign their Bios. "IBM is not in the business of making its products easy to copy," Gartner Group's Karp said.

Despite the difficulties in achieving compatibility, new vendors keep trying. Within the last few months such manufacturers as Sperry Corp., Docutel/Olivetti Corp., North Star Computers, Inc., Kaypro Corp., Zenith Data Systems Corp. and a start-up company called Mind-



It used to take six different companies to build a communication system like this.

Now it only takes one.

set, Inc. have all announced IBM PC-compatible products. In hopes of grabbing a chunk of the market, all offer varying degrees of PC compatibility as well as additional features, such as more speed, memory, graphics and so on. Even those vendors that have been rebuked for copyright infringement have stuck to their game plans. Eagle reportedly never stopped shipping its product while it modified its Bios.

Of course, beyond the issue of legality, consultants question whether the degree of compatibility is all that crucial. According to Karp, "If it gets the job done, fine." He also noted, however, that it's important for buyers to become educated and know what they're getting involved in.

Ward added that several vendors have marketed products they actually believed to be compatible, but that, in fact, fell short. "End users weren't being defrauded; the vendors thought they had a compatible product, but they really lacked knowledge of what compatibility meant."

Another issue is how favorably the compatibles are being looked upon by the corporate world. Though Future Computing credited IBM PC compatibles with grabbing up to 40% of the personal computer market, it was not clear how much of that occurred in the Fortune 500 environs. According to Anne Mayfield, a senior analyst for Arthur D. Little, Inc., most corporations are opting for the IBM PC itself rather than going out on a limb with a "me-too" vendor.

Karp pointed out that the hotly debated shakeout among PC compatible makers may begin now that IBM appears to be getting "very aggressive" and is getting into many unregulated markets. IBM's unveiling of its portable PC as well as increased competition from the Japanese is expected to put tremendous pressure on the compatible vendors. Karp predicted that price cutting, which will be one way to combat IBM, will hurt the competition badly: "There's only a 10% to 15% profit margin on personal computers. As that gets squeezed, the profit margins must come down. That could mean trouble."

"End users weren't being defrauded; the vendors thought they had a compatible product, but they really lacked knowledge of what compatibility meant."

Seymour Merrin, president of Computerworks, a Westport, Conn., dealership, pointed out that among the key questions to be asked about PC compatibility is whether the vendor will even exist in a year or two. "That's no small matter," he stated. "I think the only one that will survive is Compaq."

Indeed, if Compaq is an example of what PC compatibility can mean, the market could literally be flooded. The two-year old Texas-based manufacturer-started shipping its Compaq portable just over a year ago and now is reportedly the fastest growing company in U.S. business history. With first-year sales of more than $110 million, Compaq "is the only company accepted by all major corporations as an IBM PC alternative," Merrin said.

A survey by Future Computing of 107 of the Fortune 1000 companies confirmed Merrin's assessment. The buying pattern showed IBM Number One and the Compaq Number Two. Merrin said he believes Compaq's success is due to several fea-

We've made complex telecommunications simple. As your single source for an entire system we will custom tailor it to your exact needs.

That means fast information flow for both voice and data and increased organizational efficiency. All of which can add up to savings in operating costs.

We provide all components from telephones, to terminals, to PABX's, to transmission equipment. And we offer the experience needed to build a system that will serve you effectively today and grow with you in the future.

Fully integrated data capability and advanced features will be available through easily implemented system upgrades. Just as important, we offer a service organization that will be there when you need them.

But our communication services don't stop at your office door. You can use GTE's Telenet public data network and Telemail electronic mail system to speed communications throughout the country. And GTE's Satellite Communications subsidiary can link your office to a satellite.

In a field as complex as telecommunications you'll find you can simplify your problems by dealing with the company that has it all.

For more information write Marketing Services, GTE Business Communication Systems Incorporated, 12502 Sunrise Valley Drive, Reston, VA 22096. In Canada, AEL Microtel Limited, 1211 Denison St., Markham, Ontario L3R 4B3.

We've simplified a complicated business.

GTE Business Communication Systems

tures it incorporates and which the PC doesn't have, including portability, a high-resolution, monochrome screen and a built-in graphics card.

Compaq, according to Ken Price, the company's director of corporate communications, does extensive testing of software on the market and has published a list of more than 600 packages that run on both the PC and the Compaq without modification. In addition, Compaq's strategy has been to let the retail dealers act as their sales organization. This act of faith has led to more than 1,000 dealers stocking the Compaq.

Although IBM recently unveiled its own portable version of the PC, Compaq is not overly concerned. Price said Compaq's strong relationship with the dealers and the Compaq price, which is below that of the PC portable, will insulate his product from serious harm.

Ward said he believed there will always be room for competing machines in the marketplace because the dealers, like everyone else, simply don't want to become totally dependent on IBM. He also predicted IBM would never overdistribute the PC and that would always leave a channel open to others.

The compatibility issue has not affected hardware makers alone, however. Software manufacturers have reaped the benefits of the PC's popularity, but have also had to confront the confusion themselves. Fallout from the Bios controversy has forced software developers to modify many of their programs for individual machines, a process that obviously favors the biggest selling hardware. Buyers often base their hardware decisions on the availability of software, and from a software perspective, riding IBM's coattails is a must.

Lotus Software, Inc., whose 1-2-3 program is often cited as a worthy test for PC compatibility, has reaped the benefits of IBM's popularity. Chris Morgan, Lotus' vice-president of communications, said the compatibility question "is really a hardware issue.

"We're interested in the most successful machines," Morgan explained. "We'll modify our programs for any new product that we feel is worthwhile. It would be nice if all machines had the same interfaces and drivers, but they don't. It's a fact of life. There are different degrees of compatibility, but we take full advantage of any machine that we write our software for."

Karp pointed out that delays in software modification for a particular machine average from six to nine months, and the fastest selling machines get the software first.

As was the case with 1-2-3, software developers often create their programs on the PC, which automatically makes it first in line, and then proceed to other machines.

Despite the PC's unquestioned success, rumors have abounded in the industry that IBM intends to move away from the MS-DOS environment and create a proprietary operating system. Nevertheless, analysts agree it is unlikely that IBM would forego the mountains of software and well-established channels of distribution in order to shut down a few competitors.

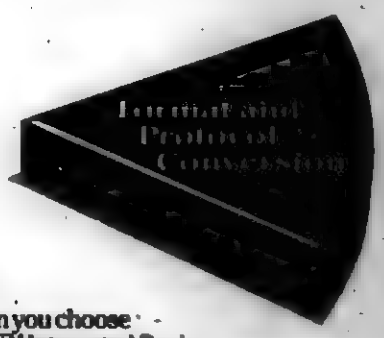
An IBM spokesperson stated that, although the company is always looking for ways to enhance its products, PC-DOS will remain part of the PC. Analysts such as Ward and Thomas Willmott, of the International Data Corp., view MS-DOS as an evolving system that will likely move toward more of a multiuser, multitasking environment. With IBM's impending local-area network on the way, a network interface for the PC will certainly be a requirement.

Much of what happens to MS-DOS could be a matter of the competition between Microsoft and Digital Research, Inc. (DRI). Willmott said he believes DRI, which created the 8-bit industry-standard CP/M operating system, is working on an umbrella operating system for multitasking and multiuser access that would allow MS-DOS to operate within it.

PC-DOS will remain somewhat stable on the PC because of the company's commitment to the PCjr, according to Karp, who predicted that in the long term, IBM will diversify its support of operating systems and possibly move to a proprietary one in which "guests" such as CP/M, Unix and others would work, along the lines of IBM's VM/CMS mainframe environment.

For now, most hardware vendors feel compelled to address the compatibility issue in one way or another. Apple Computer, Inc., for example, introduced its Macintosh computer with its own proprietary operating system. If Apple is successful, it might encourage more movement from IBM's sphere of influence. OA

Rifkin is senior writer at Computerworld OA.



When you choose the IBX™ Integrated Business Exchange from InteCom, you get some important advantages. Like format and protocol conversion. And a tremendous untapped potential for growth. Plus all the benefits of a time-tested system.

The IBX is the first fully integrated, absolutely non-blocking, digital voice/data switching system in the world. It's already operating in companies across the United States. And it's ready to link your multi-vendor systems and equipment into one efficient communications package. Through its unique architecture and a host of advanced features.

InteNet™ Packet Controllers, the IBX family of format and protocol conversion packages, connect certain dissimilar equipment. Establishing communications between word processing systems. Entering X.25 networks such as Telenet and Tymnet. Or emulating 3270 devices.

The IBX architecture also offers you completely non-blocking operation, at all ports, at no extra cost. Wideband LANmark™ local area networking for superspeed packet switching. Shared tenant service. And convenient voice messaging with InteMail℠. For cost efficiency, the system uses two-pair wiring and modern fiber optics.

Designed for up to 12,000 lines, the IBX switch can start as small as 250 lines. And it's already prepared to incorporate new applications, keeping pace with the industry and meeting your needs for years to come.

Invest in the IBX™ today and reserve vast resources for tomorrow.

The IBX communications system from InteCom. It's the indispensable business tool for the 80's and beyond, from the innovative leader in office technology. For complete details on an IBX investment, write or call: 1-800-INTE-800. In Texas, call 1-214-727-9141.

Picking A Winner

THERE ARE SOME NEW PLAYERS IN THE INFORMATION GAME — PROVIDERS OF ON-LINE DATA BASES FOR MICROS.

By Linda L. Winningham and Patricia Carrell

If you manage or oversee personal computing, office automation or information center services within your firm, you are probably aware of the recent explosion of external or remote data bases. Although on-line-data base access is not yet as popular as some personal computing applications (such as word-processing, spreadsheets and financial analysis, for example), it is emerging as a powerful application that is catching the eye of many personal computer users.

End-user data bases are growing even more rapidly than data bases intended for use by intermediaries, such as librarians or staff analysts. What this means to information managers is that they should begin assessing the many issues raised by access to these external data bases.

Among the issues that managers will have to deal with are selection procedures for external data bases, communications software, downloading procedures, cost-control over multiple users of data base sources, training and integration of internal as well as external information.

This article will highlight a few recent data base introductions and will discuss emerging trends. As these newer offerings are described, it will become clear that managers should begin to focus attention on the external data base environment, from a standpoint of both organization and control.

In the year or so, the most significant happening within the data base industry has been the new crop of business services aimed at personal computer users (especially IBM PC users). The objective expressed by vendors of these newer services is to broaden the market for their existing data bases. These new services come from all segments of the data base industry — real-time quote vendors, such as Quotron and Bunker Rame Corp.; text-oriented vendors, such as Dialog Information Services, Inc. and Bibliographic Retrieval Systems (BRS); financial or analytically oriented vendors, such as Data Resources, Inc. and ADP Network Services, Inc.; and, finally, even consumer-oriented vendors like Compuserve, Inc. and Dow Jones News and Retrieval Service. These services all have some common attributes: more easily usable interfaces, more flexible pricing and distribution schemes and packaging that corresponds to the needs of specific business-user groups.

Among these newer services, Newsnet, Inc.'s Newsnet is one of the easiest to use. From its inception, according to Brian Raub, Newsnet's marketing director, the service was "specifically designed for the business executive." Although Newsnet contains the full text of 150 newsletters in 31 industry categories, the new user has to digest only a four-page system overview sheet before logging on. On-line menus are available, as is an 800-number customer-support service.

One Newsnet category is "Electronics and Computers," which contains *The Seybold Report on Professional Computing, Modem Notes, Mini/Micro Bulletin* and the *S. Klein Newsletter on Computer Graphics*. The "Office" category contains *Advanced Office Concepts and The Seybold Report on Office Systems*.

The primary users of Newsnet are middle to upper-level managers who subscribe to the service to stay on top of trends in their industries. They can monitor competitive activities — product introductions and plant closings, for example — for a fraction of the cost it would take to subscribe to all the publications covered within each industry category. They also subscribe because of Newsnet's Newsflash service, which automatically tags articles of interest to each user, according to predefined user profiles. Newsnet is available at a monthly minimum of $15. Hourly charges run between $24 and $48 during daytime hours, and at a $6 discount in the evening and on weekends.

Two new services from Dialog and BRS, although slightly more difficult to use, contain textual information similar to that of Newsnet. These services are Dialog's Knowledge Index and BRS' After Dark. The material contained in both services is abstracted, not full text, and is primarily from advertising-supported business periodicals. Both are subsets of their vendors' primary data base services and, as such, they are more difficult to learn. The Knowledge Index user, for example, must master search commands and Boolean operators. The training manual is about 60 pages long, and I spent an afternoon of study before attempting to use the system.

These services are available only during nonworking hours, but they are offered at a substantial cost savings in comparison with the parents' regular services. For example, information retrieved from the Microcomputer Index on Dialog's regular daytime service would cost $48 per hour, compared with $24 per hour on the Knowledge Index.

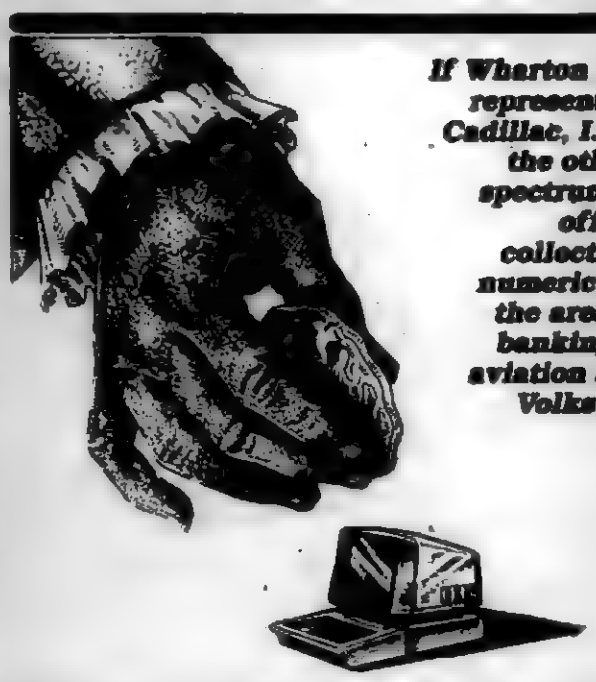
Because of the hours of availability and the relative difficulty of use, these two services appeal to serious after-hours business and professional researchers. Many medical professionals, for example, are among those who use BRS' After Dark service. In an effort to capture a larger chunk of the end-user market, both vendors have plans for daytime services.

Acting as catalysts for some of the newer financial and numeric data base services, popular spreadsheet packages such as Lotus Development Corp.'s 1-2-3 and Visicorp.'s Visicalc are playing a major role.

Staff analysts in corporate planning, finance, investment and economics departments created analytical reports before the thrust of personal computers. Often these reports were done on dedicated terminals hooked up to large time-sharing or remote computer service firms such as DRI, Chase Econometrics/Interactive Data Corp. and ADP. These services continue to be expensive and, although they provide powerful software capabilities, they take a long time to learn. Special retrieval and modeling languages must be mastered, for instance.

With personal computers and off-the-shelf spreadsheet software, these vendors are making their data more accessible to far greater numbers of users. Probably the best known of these newer offerings is Visilink, which was a joint development between DRI and Visicorp. Available on the Apple II and the IBM Personal Computer, Visilink facilitates downloading DRI's information into Visicalc worksheets. DRI has cleverly packaged its data for this new service into what it calls Datakits. Purchasing the $250 Visilink software diskette and specifying a credit card number for billing allows a user to select a Datakit from among a number of prepackaged data bases or to retrieve a user-specified Datakit.

One example of a prepackaged Datakit is the Automotive Analyzer, which sells for $40 and provides statistics for determining market share on the number of automobile engines installed, by number of cylinders, for each of the top four domestic manufacturers. Another is the Company Financial Analyzer, which for $25 provides an income statement, balance sheet and ratio analysis for a single company for eight years or eight quarters.



If Wharton Econometrics represents an industry Cadillac, I.P. Sharp is at the other end of the spectrum, claiming to offer the largest collection of on-line numeric data bases in the areas of finance, banking, economics, aviation and energy at Volkswagon prices.

With its Datakits, DRI is accomplishing two ends. First, it is chopping its vast data base holdings into smaller, vertically aligned segments. Second, it is shifting its pricing away from mammoth charges based on a confusing projection of on-line-time usage, CPU cycles and number of data units to a fixed price based solely on the amount of data accessed.

ADP Network Services offers Data Path, a similar kind of spreadsheet capability which is particularly attractive to personal computer users involved in merger and acquisition analysis. Data Path was announced in May and costs $235. Like Visilink, Data Path is a data-access software package that works in conjunction with Lotus' 1-2-3. It facilitates the downloading of data from ADP's huge reservoir of U.S. and international economic, corporate, financial and banking data into 1-2-3 spreadsheets. It is particularly attractive for merger and acquisition analysis because of its powerful financial software coupled with the Compustat data base, one of the most popular sources for detailed financial information.

Similar in nature to DRI's Datakits, Data Path's Application Library allows business analysts and forecasters to choose an appropriate spreadsheet or report format. The data does not come prespecified, however, as it does in the Datakits. This may not be a problem; analysts seldom have exactly the same analysis needs.

ADP's pricing scheme diverges from that of DRI's. Besides the cost of Data Path — which includes three diskettes and a training manual — a monthly minimum of $100 is charged for maintaining an account with ADP. The actual amount paid for accessing ADP's data bases can then be either charged on a pay-as-you-go basis or (primarily for large ADP clients) negotiated according to projected usage. Usage is calculated based on $.02 to $.25/datapoint, $15/hour, plus $.027/computer-resource unit.

The obvious advantage of DRI's pricing is the upfront knowledge of access charges before logging on.

Three other data base vendors, Wharton Econometrics Forecasting Associates, I.P. Sharp and Chase Econometrics/Interactive Data also compete in roughly the same financial, investment, economic planning and analysis area. Although their strategies differ, they are also realigning their data base services around the personal computer.

According to Ken Wing, Wharton Econometrics' marketing manager, that firm never wanted to be a large time-sharing firm. Accordingly, their data base access charges are part of an overall membership fee ranging from $10,000 to $25,000 per year, per service.

An example of a single service is the Quarterly Model Service, which provides forecasts of the U.S. economy. Besides access to data bases, the membership fee includes a certain number of days of on-site consulting, telephone access to Chase's staff economists and attendance at their Outlook seminars.

Because Wharton does not view its data bases as the mainstay of its business, it has chosen to adopt an extremely flexible distribution approach. Wharton will provide its data on computer tapes so that a client can load them onto an in-house computer; it will download its data onto a personal computer similar to the methods used by DRI and ADP described above; it will even provide its data on PC diskettes; and, of course, it continues to make its data available on a time-sharing basis.

If Wharton Econometrics represents an industry Cadillac in terms of offering a high price value-added service, I.P. Sharp is at the other end of the spectrum. That firm claims to offer the largest collection of on-line numeric data bases (more than 50 million time series) in the areas of finance, banking, economics, aviation and energy. Sharp offers all this data at Volkswagon prices, but includes little or no consulting. (DRI, ADP and Chase Econometrics/Interactive Data all offer consulting as part of their data base services.)

Micom, Sharp's personal computer offering, provides easy communications access to all Sharp's data bases. It allows the IBM PC to emulate a terminal for downloading. It then facilitates the transfer of the downloaded data into any spreadsheet package using the DIF format. (DIF, the format used by Visicorp, has become the de facto standard for spreadsheets).

Sharp's pricing, although it does not diverge from the industry norm of hourly-connect charges, is very reasonable. Only a few of its data bases involve royalty charges (charges which are extra, go beyond the hourly rate and are returned to the source publisher), and there are no subscription fees. The hourly rate is a fixed $60 for terminals operating at 30 characters per second and $120 for those operating at 120 characters per second.

Chase Econometric/Interactive Data offers PC Screen for downloading data into Lotus' 1-2-3 from its many financial and economic data bases. According to Pratt Harris, who is responsible for systems development at Chase, this offering will be enhanced in the future to allow for very flexible formatting. Chase is not assuming users will be happy with the fixed-format capabilities of standard spreadsheet packages (using Dif, for example) such as Lotus DIF 3, Visicalc and Multiplan. Instead, Chase believes users will want greater latitude in creating individualized reports from their data, and the firm is currently developing a capability for data format interchangeability.

These are only a very few of the many data base announcements that have zeroed in on the personal computer during the past year. Other new services of note from Dow Jones, Compuserve, The Source, Electronews, Mead Data Central, Disclosure and Compustat are beyond the scope of this article.

Lenn Bergstrom, vice-president at Real Decisions Corp., a Stamford, Conn.-based consulting firm, offered one way to make sense of these new services. The

external data bases of the '80s share many of the same characteristics with the computers of the '60s, according to Bergstrom. They are large, no one needs a whole one and they are incredibly expensive to maintain.

He predicted the following trends:

- Vendors will continue to recast their services in an attempt to capture their share of the rapidly expanding base of personal computer users.
- They will begin to stress their network capabilities by offering electronic mail and other value-added network services.
- They will develop more powerful, easier-to-use software.

Another way to look at data base trends was offered by Anne Caputo, a visiting assistant professor at The Catholic University of America and a Dialog trainer. Caputo pointed out the importance of ease of use to the future growth of end-user services. Most users cannot be expected to learn more than a few access methodologies or retrieval languages, she said, and industry consolidation will have to take place. The aim will be to make the user interface as transparent as possible. The possible result will be only a handful of very large vendors that provide common interfaces across their data base holdings.

Another trend that is clearly under way is that various data base vendors will be crossing traditional lines. So-called data base vendors, such as Dialog, will be moving into the domain of the numeric. The opposite will also be true; vendors like ADP can be expected to offer more in the way of textual services.

Full-text data bases, such as those offered by Newsnet, will also become more predominant. If managers are to use the services themselves, they want to be able to read the full text of articles retrieved, not just their abstracts. They certainly don't want to wait the several days currently required before an article is delivered.

As all these trends unfold, the message to managers of personal computing, office automation and information centers is that they will be subject to increased pressure from both users and upper management to become knowledgeable about these burgeoning data base services and to take control of them.

Information managers will need to assess, for instance, whether it is cost-efficient for all of their personal computer users to have individual passwords and separate subscriptions to each data base in use within their organization, or whether it makes more sense to download certain segments of data base offerings onto a mini for shared departmental use.

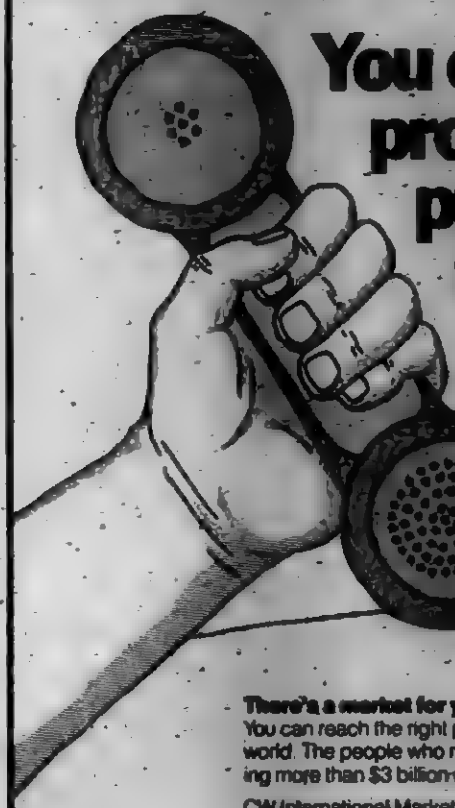
Another question will be who should decide which data bases are the most appropriate for in-house acquisition? In the future, it may not seem strange for corporate librarians to sit down with members of OA and management information systems departments to draw up a joint plan of a firm's external data base resources.

Finally, it seems clear that information managers should broaden their perspectives of information resources. They should recognize the value of integrating external data bases into their firms' existing management information systems. They should also begin to take an active role in assisting end users to take full advantage of these new data base services. OA

The message to managers of personal computing, OA and information centers is that they will be subject to increased pressure from both users and upper management to become knowledgeable about these services and to take control of them.

Winningham is president of Osprey Information Corp., a Princeton, N.J.-based consulting firm that specializes in the areas of personal computing and on-line data base access.

Carrell is an independent OA consultant in Wharton, N.J.



You can advertise your product in 40 computer publications in 25 foreign countries—with one phone call.

There's a market for your product abroad.
You can reach the right people in the major computer markets throughout the world. The people who make the buying decisions—in countries already importing more than $3 billion in computer hardware, software and supplies.

CW International Marketing Services gives you one, efficient source for direct contact with the leading local computer publications in the world's major computer markets. How can we do this for you? We have a wide network of editorial offices around the world and provide first hand marketing information to our clients. Plus, we have over 10 years experience in the publishing industry.

We're a division of CW Communications/Inc., publishers of *Computerworld* and the world's largest publisher of computer-related newspapers and magazines.

CW International Marketing Services makes it easy.
We'll translate your ads for you and give you production services to meet the specifications of any or all the newspapers and magazines we publish or represent—and—we'll even bill you in dollars. What's more, when you place your advertising through CWIMS, you save the V.A.T. (value-added tax). It's as easy as advertising in your local publications.

We'll even help you with market facts, and, in the case of the People's Republic of China, we can arrange for you to give product and marketing seminars there! You can run your ads in our periodicals in these countries:

KENNEDY SPACE CENTER LAUNCHES OA

BY GLENN RIFKIN

The moment is historical. The sleek Space Shuttle *Challenger* glides in over the palm-dotted landscape and touches down on the Cape Canaveral runway. For the first time, the shuttle is landing at its launch site, marking one more leap forward in the U.S. space program.

In 1984 there will be no fewer than nine shuttle missions. Although several years behind schedule, the shuttle program is now reaching its potential. The days of regularly scheduled space flights (quite possibly with private citizens aboard) are apparently not far off.

The increased number of launches has turned Kennedy Space Center into a beehive of activity, busier than at any time since the Apollo moon missions of the 1960s. As shuttle missions proliferate, the 2,000 civil servants who populate the center need faster, more efficient information flow. With this in mind, the center has initiated an extensive office automation program, which promises to be no less complex to complete than a shuttle launch itself.

The National Aeronautics and Space Administration (Nasa) has been an innovator in computer usage since the space program got under way more than 25 years ago. In the early 1960s, Nasa brought in vast amounts of Honeywell, Inc. equipment, and that vendor has dominated launch-related computing ever since. As the space program heated up, particularly during the Apollo era, nonlaunch-related computing began to mushroom. Since then, diverse systems have popped up in every quarter of the facility for support of business and information services-type applications. Unfortunately, those systems have traditionally been stand-alone, noncompatible equipment that actually contributed to the paper flow.

What the space center would like to accomplish is simple enough: to eliminate, or at least control, the tidal wave of paper that washes over the 140,000-acre facility. The complexity and sensitivity of the work done at Cape Canaveral — combined with the everpresent government bureaucracy — have resulted in paperwork that traditionally has been a labyrinthian obstacle to space center workers. As Roy E. Lealman, manager of the Kennedy Data Management Systems Division (KDMS) put it, "During Apollo, we used to say that if all else failed, we could climb to the moon on our stacks of paper."

In addition, Nasa plans to keep the size of the center's civil service work force relatively stable and, with the pressure of increased launches, worker productivity has become a key issue.

Dallas K. Gillespie, deputy controller of the Kennedy Space Center and leader of the Office Automation Task Team (Oatt), was asked to look into productivity at the center and to "beef it up." It has become clear to Gillespie that newer and better computing tools are needed to support the effort.

"We are here to get the shuttle in the air," Gillespie pointed out. "We have to make use of these new tools or we won't be able to handle the work load. You can't launch 18 shuttles a year using pencils and paper."

"Each launch is unique," added Georgia Brock, project manager for OA. "With turnaround time decreasing, there is a need to move information faster to accommodate each vehicle. We're under a lot of pressure to do more, better."

To this end, the center established Oatt in early 1983 to create a comprehensive and structured OA policy for the center. Oatt will also, after thorough investigation, provide the data necessary for

Nasa to make recommendations on a single vendor to install a state-of-the-art, integrated OA system for the entire Kennedy Space Center operation.

Because of government regulations on procurement, the process of bringing in a vendor must be subject to open bidding. Although this process allows task team members to get a good view of what is on the market, it also considerably lengthens an already complicated procedure.

Cost-justification is a major consideration in the procurement process. The automators at the center found very few quantitative studies on cost-justification, Gillespie said, and they realize their proposals will be scrutinized on several levels up to that of the General Services Administration.

In January, Oatt sent an open invitation to vendors to show their products to the team. After they collect data on available systems and potential uses, a centerwide source evaluation board will look over the data and make recommendations to a Nasa selecting official in Washington, D.C., who will choose the vendor. Gillespie estimated implementation would begin sometime in late 1984 and would take 18 months to complete.

His goal is to eventually have 1,000 workstations in place around the center as a fully compatible system with communication linkups to data bases at the space center. He anticipated that all managers at the center would be tied into the network to some extent and that substantial numbers of them will have personal computers on their desks. Among the expected applications are electronic mail, scheduling and personal resource aids, a Kennedy Space Center automated decision support system, a center action tracking system and a centerwide menu support system.

Though the search for a single vendor-integrated system is only now being undertaken, Kennedy Space Center is no stranger to OA. The center has had widespread word processing systems since 1976 and personal computers have been used extensively for four years. There has been timesharing on a wide variety of minis and mainframes around the base. In addition, a major pilot program involving Datapoint, Inc. workstations and Northern Telecom, Inc. Displayphones was implemented in 1983 and has proven highly successful on the executive level.

The campus-like facility has also implemented a growing data communications network with local-area networks in place in several of the center's eight major buildings. According to Larry Grimes, senior systems engineer for communications, a large-scale integrated data network implemented in conjunction with the proposed OA system is in its final planning stages, and Kennedy Space Center foresees a state-of-the-art telecommunications system in place in the next two years.

Besides Gillespie and Lealman, other key figures in automating the center facilities are Jim Akin, chief of the computer services division; Brock, an assistant to Akin; and Ed Odisho, a systems analyst in the Computer Services Division. Odisho was WP manager during the 1970s until WP ceased to be a separate function and began to merge with DP.

Odisho, who now serves as an internal consultant for acquiring OA equipment, said he has seen vast changes at the center in terms of information systems. Prior to 1976, office systems consisted of IBM Selectric typewriters and IBM mag-card machines. When the center opted for a CRT-based WP system, Odisho discovered an additional hurdle beyond that of finding a satisfactory system. Nestled on the mid-Florida coast, hard by the sleepy villages of Titusville and Cocoa Beach, Kennedy Space Center simply was too isolated to attract major vendors. A major requirement for any vendor the center chose would be close proximity in order to provide service and support.

As the cost of systems started to come down, much of the WP work was consolidated and, according to Odisho, the center found the advantages of WP could be applied to other tasks as well.

In 1980, Odisho decided that the personal computer would be the perfect solution for those who needed some word processing, but had other requirements as well. He brought in several vendors to demonstrate their wares and selected Commodore Business Machines, Inc. With more than 100 Commodores installed, Odisho then turned to Convergent Technologies, Inc. and began to install those in September 1982.

Though a small number of IBM Personal Computers, Digital Equipment Corp. Rainbows and others are on the base, Commodore and Convergent Technologies remain the most widespread. When the single OA vendor is brought in, that situation will undoubtedly change. But both Odisho and Gillespie agreed the economic value of the older

systems will not disappear.

Odisho pointed out that the systems have already provided a payback over the years and that if a particular piece of hardware does not fit in to the overall OA plan, it can still be placed in a situation where it will meet a need. "We are of the opinion that economic life continues long after a system ceases to be technologically exciting. We keep moving equipment to the highest economic purpose it can serve," he said.

> ***"We are of the opinion that economic life continues long after a system ceases to be technologically exciting. We keep moving equipment to the highest economic purpose it can serve."***

The personal computers at the space center have served a number of functions in the non-launch-related realm. According to Odisho, many were acquired for word processing, but others have been used for accessing data bases, user programming, spreadsheet analysis, property tracking and as communications devices. Every personal computer purchase must be routed through Odisho's office for approval and must contain a positive statement as to need and cost-justification. Odisho has also set up a loan pool of portable computers including Osbornes and Radio Shack Corp.'s Model 100s for certain immediate utilities.

Though the approval process places some limits on what is brought in, the lack of a preferred vendor list has left the space center with a potpourri of information systems equipment that has made compatibility a mounting problem. Odisho pointed out that there are "clusters of compatibility," but, as Roy Lealman put it, "we have to get our act together on information systems at the center."

In fact, the lack of direction for these systems caused such serious problems for Lealman's KDMS group (akin to a management information systems [MIS] department) that he called for a moratorium on purchasing equipment. "I figured we'd be sorry we had so many different kinds of equipment all over the place," he stated. With Lealman spearheading the effort, Oatt was chartered in early 1983 to focus on the problem.

According to Jim Akin, the equipment in place is so diverse that a centerwide plan became necessary. "Our goal is to have a fully integrated OA system in place so that employees on all levels can have access to the data that will help them do their jobs better. We see OA as a means to improve productivity."

Lealman added, "We've had two monsters: MIS on one side and OA on the other. Now we're trying to erase the road that divides those two."

One of the first steps taken to accomplish that task was a recently completed Datapoint Corp. pilot initiated more than a year ago. The pilot, under the direction of Darwin Brown, a member of KDMS, was designed to provide a gateway for managers back to the center's automated management information systems.

After a parade of vendors displayed their equipment, Brown settled on Datapoint. At its zenith, the pilot had 24 workstations on the desks of executive secretaries around the center, including the director's office. On the executives' desks, hooked by modem to the Datapoint workstations, were Northern Telecom Displayphones. The systems are used for such applications as electronic mail, WP and spreadsheet analysis.

Initially, the pilot met with some resistance. Brown pointed out that accessing data bases requires training, and they "couldn't get the executives to stand still long enough to learn." Secretaries, who had been relatively untouched by the technology on the executive level, were also apprehensive.

To alleviate the problem, Oatt turned to Margaret Rosenberry, computer assistant and former executive secretary, to help familiarize the users with the systems. The secretaries, who were used to typewriters, encountered the dual problem of having to perform their jobs while learning a new technology, Rosenberry said. She formed a user's group and set up a "buddy system" in which the users would help each other out of crisis situations.

Oatt members are confident that when it comes time for overall implementation with a single OA vendor, the vendor will provide the necessary training. They don't think the technology will pose a threat to the workers at the space center.

"This is a technical organization," explained Georgia Brock. "Most of our managers are from the engineering world and are not standoffish when it comes to technology."

Although it didn't meet all his expectations, the Datapoint pilot has been very successful, Brown said. It has whetted a lot of appetites for OA and has gained the interest of many professionals and managers. The Kennedy Space Center plans to stick with Datapoint, he stated, but added that he realizes more is needed: "There simply isn't any single commercial system today that meets our requirements."

With that in mind, Oatt is assuming the vendor chosen to implement the overall OA plan will subcontract work to other vendors to solve specific needs. Oatt might, in fact, look to a systems integrator rather than a manufacturer to handle the implementation if such a bid is made.

Among the goals upon implementation is to allow access to the various data bases within the KDMS arena as well as data bases of the many contracting organizations that inhabit the space center (there are more than 12,000 contract workers at the base). These data bases will facilitate such needed applications as problem tracking, work control and modification management.

As the excitement builds for OA, interest has also increased in improved communications. Larry Grimes explained that planning for an overhaul of communications at the base began three years ago, and his group has been getting a sampling of user needs ever since. "We're like a small town here. We have users everywhere and office automation is drawing a lot of attention to telecommunications."

The center currently has a GTE private branch exchange and a Develcon, Inc. pure data switch in place. Grimes foresees the need for gateway switchers to handle the information flow from the local-area networks already in place in several buildings. He predicted 3,000 to 5,000 connections initially, with growth up to 10,000. The center is also installing a fiber-optics network, which Grimes said "is the wave of the future."

Coincidentally with the Kennedy Space Center's OA project, Nasa has begun developing an overall OA plan for the entire agency. A Strategic Office Automation Planning (Soap) committee has been formed with members coming from all the agency's centers. The committee meets once a week via teleconferencing to monitor what is transpiring. According to Akin, a member of that committee, a report is due out in May with overall recommendations.

Gillespie doesn't anticipate conflict with the agency. "We intend to make sure what we buy is compatible with what Nasa does. Conceivably, we'll have the best of both worlds."

Rifkin is senior writer for Computerworld OA. OA

Are your computers getting the "shock treatment"?

Static electricity, humidity and other environmental problems can cause all kinds of annoying disruptions to your computer or word processing work flow. And it's totally unnecessary! A New Generation Of Software

By David A. Boucher

Choosing office systems forces some tough decision making on users faced with the wide array of technologies now available, and those choices won't be getting any easier.

Hardware technology is an important element in the comparison of systems, but the decision should not be based on hardware considerations alone. A new generation of applications software with sophisticated features will be the driving force behind the automated office. Fully utilizing the power of the 32-bit workstations just beginning to move out of engineering environments and into the office, this generation of software goes far beyond simply performing more advanced analytical or number-crunching tasks.

A key software feature that will lead to increased utilization of office automation technology is an advanced user interface. This interface will enable users to work with the system in an intuitive way; it includes features such as mice, icons and windows.

For specific applications such as document production — which includes everything from client proposals and management reports to technical manuals — two other features will advance the use of office systems. The first, advanced text formatting capabilities, includes multi-font features and facilities for easily modifying the overall format of a document (for example, changing margins and indentations). The second feature consists of graphics capabilities fully integrated with text editing features, and it allows users to produce illustrated documents easily.

For a system to be truly easy to use, a number of features need to be built into the software technology. A feature rapidly growing in popularity is the mouse, a hand-held pointing device that enables the user to move the cursor on the screen without using the keyboard.

Icons are another increasingly important way of making software systems easy to use. Icons pictorially represent objects or functions; users select or operate them by pointing to them with the mouse-driven cursor, rather than through keyboard entry.

Advanced user interfaces also often use a window system. Windows are a way of organizing a CRT screen to allow simultaneous presentation of data from different applications. Windows also allow the overlaying of Help messages, command menus or other useful information on top of or next to the material a user is currently editing or examining.

However, a window system by itself is no guarantee that software is easy to use. It is essential that the windows be used properly by individual applications (such as text processing, graphics and spread sheet) available on the system. By working together with the specific applications packages to present related data and choices to the user, windows enable the user to operate efficiently in performing complex tasks.

Windows are particularly helpful in integrating text

with graphics. For example, a user can decide in the middle of preparing a report that he wants to add a bar chart to represent graphically the data presented in the text. He might call up a window that would appear over or next to his text, select the type of chart he wants to insert from a set of choices presented in the new window, then create that graph. When the graph or diagram is positioned correctly within the text, the window disappears.

Xerox Corp.'s Alto system, an internal project of the Xerox Palo Alto Research Center, represented a major step forward in advanced user interfaces. It attempted to give users multifront text and graphics capabilities through a set of simple and consistent commands. Out of this research came the Xerox Star System, the first commercially available OA product with a mouse/window/icon-based user interface.

The user interface design of the Star was largely successful, but newer generation systems just emerging have greater speed, responsiveness and — most important — substantial additional design advances to make them even easier to use.

Seeking to make fundamental advances in text editing and formatting technology, a group of researchers at MIT, led by Michael Hammer, undertook the Etude project. Etude was state-of-the-art research in developing an entirely new approach to using computer technology to produce documents, and it started with a fundamental change in perspective. Rather than focusing on merely editing lines of text and strings of characters, the Etude researchers looked into how the higher level structure of a document was used to present information most effectively, and they worked toward developing techniques to allow that structure to be modified easily. They focused on the entire format structure of a document, from the type fonts used to the paragraph margins, leading-line indentations and so on.

The Etude researchers developed more intuitive techniques for creating documents; their structured document editor represents a breakthrough in easy-to-use multifont text editing and formatting systems.

The structured document editor enables a user to modify the structure of individual components (for example, paragraphs, section headings and titles) easily and rapidly and to see the changes instantaneously.

Unlike standard text editors or even more advanced dedicated WP systems which permit extensive rearrangement of blocks of text, a structured document editor gives the user a much more global perspective and complete control over the entire document. For example, by issuing only one command, a user can change all section headings throughout a document to boldface.

The generation of commercial software surfacing today incorporates the breakthroughs in user interfaces achieved in the 1970s, using multiwindow environments and, often, pointing devices such as the mouse.

Other advanced features are also possible with the new hardware and software technology.

Transportability of software has freed software developers from dependence on a single hardware vendor. It will dramatically accelerate the rate at which new-generation software becomes available to improve OA systems.

Not only is this generation of software more responsive, but also it opens new creative outlets for users, such as the ability to produce documents that make use of the rhetorical value of multifont typography and the efficient presentation of data with graphics.

By means of these new options, users can think about the immediate visual impact of the documents — for example, the way the form of a graph will affect the reader's perception of the data. Many clerical people find an avenue for developing new skills that increase their value within a company as well as their personal productivity and accomplishment.

One major issue with new-generation systems — and one that particularly concerns management information systems (MIS) directors — is compatibility with existing equipment. If new technology is going to find a place in offices where a substantial base of older equipment already resides, software designers must provide special features for translation of data from external sources. In addition, they must also provide communications facilities that allow new equipment to be connected with older systems.

By means of heuristic programming techniques originally developed through research in artificial intelligence, facilities can be developed to allow communication with systems not specifically foreseen by the software developers. These facilities will further enhance the ability of a new system to fit into an environment populated by a variety of other equipment.

In years past, hardware from different vendors was largely incompatible from the software standpoint. Computer language implementations were frequently inconsistent; to achieve acceptable performance in spite of the limitations in the power of the hardware, programming often had to be done in machine-specific assembly language. More recently, software developers have been able to write sophisticated applications programs entirely in high-level languages that are consistent from machine to machine. This allows software transportability — the same program can be found on many different hardware systems, produced by a variety of manufacturers.

Transportability of software has freed software developers from dependence on a single hardware vendor and will in turn free the user from being tied to any one piece of equipment. Transportability also has a tremendously stimulating effect on the rate of software development in the industry; it will dramatically accelerate the rate at which new-generation software becomes available to improve OA systems.

One aspect of the new-generation of software stands out as being of primary importance for future applications: its ability to integrate and centralize in the office functions previously handled separately or even out-of-house — for example, producing documents with multifont text, graphics and diagrams. This software offers users many different approaches to graphics, from drawing a pie chart directly on the screen within the text, to using the mouse to draw user-defined diagrams. The user makes the important aesthetic decisions.

Therefore, the new-generation software not only increases productivity through faster and more efficient production of documents, but it also enhances the communication of information — which is what OA is all about.

This integrated software was made possible by the advent of more powerful desktop workstations — the 32-bit systems now sold by Sun Microsystems, Cadmus, Apollo Computer, Perq Systems and others. Software to fully utilize these advanced systems has been lagging.

The generation just emerging will open up a number of new applications, increasing productivity and communication. Among them will be decision support systems (such as natural language data base query and project scheduling programs), computer-aided design and expert systems using artificial intelligence techniques to provide sophisticated problem analysis.

Those on the leading edge of this technology will offer systems that enable users to work intuitively with their data, allowing them to prepare and analyze information quickly, easily and efficiently. OA

OA Q&A

Tony Abbott is president of Commercial Software, Inc. of New York, an applications software firm with products geared to telecommunications management during postdivestiture. He is chairman of the Association of Data Processing Service Organizations (Adapso), Inc.'s dialog committee with AT&T and has kept an eye on problems facing telecommunications managers.

What are the key communications issues during divestiture?

For users, the era of the single-source telephone system is a thing of the past; a very simple procedure like ordering a new telephone is now complicated. For instance, when you order a phone from AT&T Information Services, the building wiring must be installed by a local operating company and perhaps you order a Wats line from AT&T Communication. The user has to coordinate all of these activities.

Productivity within the communications management group has been dramatically and adversely affected. The telecommunications manager also has a big people shortage problem; there aren't enough qualified people out there. In addition, the feasibility of delivering a high level of service to his organization is impaired because of the traditional vendor reponsibility problem. Whose problem is it? Who do I call? How do I get them to respond?

His other big problem is turmoil with rates, tariffs and pricing. Costs are unclear, and to gain control, large organizations must confront some unknowns that require a fair amount of analysis.

What about the technology? How is that being affected?

It's hard enough to to manage and control what's already in place, and divestiture hasn't helped. Some people are assimilating the new technology fairly well and are able to evaluate it, and others are not. Major changes had already occurred in telecommunications management with the arrival of voice-mail, electronic mail, teleconferencing and other equipment and services. Now the manager's energies have been diverted toward more day-to-day mundane issues and away from keeping pace with new offerings and how they might best fit into his organization.

How will all this affect OA?

I think you'll see AT&T announcing some computer processors that look very much like what Wang or IBM offers. Clearly, AT&T has an advantage — it knows how to deploy equipment throughout an organization very easily. It's also dealing with a buyer who has traditionally bought from AT&T. It may very well have a larger impact on OA than most people suspect. AT&T is having some problems getting its product out the door, but when it does, it will be based on some very current technology. I think it will be a major player.

What about software issues?

The telecommunications function is the most information-intensive job in a large organization. Every time someone picks up a phone, a record is created. To move a phone, you have to worry about a whole variety of records, not the least of which is the corporate directory.

Keeping records on how things connect; charging users and making them aware of what's causing outside expenses to incur; improving the productivity of people dealing with outside vendors — these are important issues.

Have some of the changes you've seen surprised you?

When it became clear what the initial form would be after divestiture and that the Bell system was going to be broken up, we felt pretty sure it would create tremendous management problems. The task of managing telecommunications is so information-intensive we knew we would have a major opportunity to help. We think there's a billion-dollar market in telemanagement systems.

Telecommunications seems to have been a hardware-intensive business up to now. Will software take a larger role?

Software is going to become a big part of it, and telecommunications suppliers themselves will provide a lot of the standard protocol interfaces in the software that meets some of the communications requirements. OA

OA TECHNOLOGY

BILLERICA, Mass.— The **Commterm, Inc.** EVX-1000 voice messaging system can now be integrated with the Northern Telecom, Inc. SL1-digital business communications system. The PBX integration reportedly provides SL-1 system users with automatic telephone answering capability, delivers a greeting in the person's own voice, stores the caller's message and notifies the called party through the use of a message-waiting lamp or tone. The called party can retrieve the stored message at any time from any push-button phone in the world.

The EVX-1000 has also been integrated with the Ericsson Information System ASB-900, designed for PBX integration, and the Plessey Co. Ltd IDX communications system. Subscriber costs are approximately $75 per user per year from Commterm, Inc., 900 Middlesex Turnpike, Building 5, Billerica, Mass. 01821.

CAMBRIDGE, Mass.— A multifunction IBM PC software package combining relational data base, presentation-quality business graphics, a spreadsheet, word processing and communications from one IBM PC to another or to a mainframe is being offered by **Mosaic Software, Inc.**

The package, called Integrated-6, reportedly allows information to be created and stored; analyzed; displayed graphically; combined and consolidated; transferred among modules or from one computer to another; and output in a variety of formats for presentation. It requires 256K bytes of memory.

Integrated-6 will be sold for $495 from Mosaic Software, Inc., 1972 Massachusetts Ave., Cambridge, Mass. 02140.

CUPERTINO, Calif.— **Apple Computer, Inc.** has announced Appleline, a coaxial attachment unit designed to connect Apple personal computers to an IBM or IBM-compatible network. Appleline connects the Macintosh, Lisa and Apple III to 3270 cluster controllers and reportedly allows the user to access information stored within the IBM mainframe network from local and remote environments.

Each Appleline supports one Apple computer and requires only minimal changes to the host software. The Appleline costs $1,295 from Apple Computer, Inc., 20525 Mariani Ave., Cupertino, Calif. 95014.

DELRAY BEACH, Fla.— The IBM Portable Personal Computer, a lighter and smaller version of the IBM PC, was introduced by **IBM.** The portable, priced at $2,795, will be available in limited quantities initially. It will feature 256K bytes of memory (expandable to 512K bytes), a built-in 9-in. amber monitor, a

IBM's Portable PC

360K-byte slimline diskette drive and adapter and a color/graphics monitor adapter. It reportedly weighs 30 lbs.

The product uses the 16-bit, Intel 8088 microprocessor with IBM's PC-DOS operating system.

IBM also introduced its Personal Computer Cluster program, which reportedly supports the connection of up to 64 IBM PCs. A Cluster Program license is required for each system, and IBM is offering a Five-Pack available with one program diskette, five publications and licenses permitting use of the program on five machines. A typical cluster might include five computers; with licenses, adapters and cable kits, such a configuration would cost $2,540 from an IBM Product Center.

For more information contact: IBM Entry Systems Division, P.O. Box 2989, Delray Beach, Fla. 33444.

IBM also unveiled a new version of its System 9000, the 9002 desktop computer, a Motorola 68000-based system that reportedly runs an optional Xenix operating system. The 9002, aimed at the engineering, scientific and business market, can operate as a stand-alone unit or, with Xenix, as a host supporting three attached terminals.

The 9002 has 128K bytes of random-access memory, expandable to 5.2M bytes. Up to four 10M-byte hard-disk drives, four 5¼-in. or 8-in. diskette drives and a system printer can also be added.

The 9002 will be priced at $6,495 for the system unit, display, keyboard and standard operating system. The Xenix operating system and its licensed programs will be available for a one-time license charge of $995. The system is scheduled for second quarter 1984 from IBM, 900 King St., Rye Brook, N.Y. 10573.

ANDOVER, Mass.— **Software International Corp.** unveiled a real-time link between its mainframe general ledger package and a variety of applications that run on the IBM PC.

The product, Smart Link, reportedly enables PC users to extend the data extraction and manipulation resources of the company's on-line General Ledger and Financial Reporting System at the micro level. The product is said to provide for on-line, real-time extraction of live data and does not use any batch processing mechanisms to create a shadow file accessed by the micro.

Smart Link is available for $2,995 per micro from Software International, One Tech Drive, Andover, Mass. 01810.

SANTA CLARA, Calif.— A fiber-optic, Ethernet-compatible local-area network, reportedly the industry's first, was announced by **Ungermann-Bass, Inc.** Called Fiber Optic Net/One, the product is an expansion of the company's existing baseband and broadband systems and reportedly has added advantages of optical fiber, such as noise immunity, secure transmissions and longer network distances.

Fiber Optic Net/One is available in single or multiple cable configurations and operates at a 10M bit/sec data rate. The cost of an entry-level system starts at approximately $25,000. A typical fiber-optic Net/One with 200 device interface ports would cost $135,000, Ungermann-Bass said from 2560 Mission College Blvd., Santa Clara, Calif. 95050.

BOSTON, Mass.— **Altertext, Inc.**, a developer and marketer of media conversion systems, unveiled the Altertext Communicator, an advanced protocol

The Altertext Communicator

converter that reportedly permits direct exchange of text, codes and commands among previously incompatible word processors, typesetting equipment and computers. The product translates all codes and format commands so that information can be retrieved on equipment from numerous vendors' products, including IBM PCs, Wang Laboratories, Inc. and Lanier Business Products, Inc. word processors and various other personal computers.

The system consists of a Z80 microprocessor with 64K bytes of memory, a 9-in. diagonal CRT and a detachable keyboard. Both asynchronous and bisynchronous interfaces can be used with the Altertext Communicator. The company also announced media conversion software programs for the Altertext Communicator. The Altertext Communicator is available for $7,500 from Altertext, 210 Lincoln St., Boston, Mass. 02111.

KING OF PRUSSIA, Pa.— **Integrated Technologies, Inc.** announced the expansion of its Soft-Switch Document Control System (DCS) to include support for IBM's Professional Office Support System (Profs). This reportedly allows users of diverse products such as Wang, Xerox Corp., NBI, Inc. and IBM personal computers to exchange revisable form documents with Profs users.

The interface to Soft-Switch for the Profs user is integrated with the standard Profs mail system. This allows Profs users to send revisable form documents to Soft-Switch-supported OA devices by executing ITI-supplied Profs commands. Soft-Switch automatically translates the Profs DCF format to the revisable form at the destination system.

The Soft-Switch interface for Profs is available for $10,000 from Integrated Technologies, Inc., 200 N. Warner Road, King of Prussia, Pa. 19406.

WESTBORO, Mass.— **Data General Corp.** has introduced a communications interface that reportedly permits direct communications between IBM mainframes and DG's Desktop Generation, Eclipse S/20 and Eclipse C/30 low-end processors. The product, the ISMC/2 is a two-channel front-end intelligent synchronous micro controller board that enables its processors to offload high-speed synchronous communications for more efficient file transfer and interactive communications. The product is available for $1,650.

DG also announced enhancements to its Comprehensive Electronic Office system (CEO) that reportedly let CEO offer portable hard-copy terminal access, Telex capability and an integrated typesetting function.

In addition, DG became the first office vendor to announce an agreement with one of the recently liberated AT&T operating companies. The agreement between DG and Pactel Communications Systems — a subsidiary of Pacific Telesis Group — calls for Pactel to offer DG's CEO system in their headquarters and sales offices in California.

For more information contact Data General, 4400 Computer Drive, Westboro, Mass. 01581.

STAMFORD, Conn.— **Exxon Office Systems Co.** announced the Exxon 750 Professional Workstation, which reportedly extends the Exxon Business Support System to executives, managers and professionals. The Exxon 750 reportedly can handle text editing, electronic spreadsheets and business graphics in multiple windows. It has a high-resolution, monochrome, bit-map display and

OA TECHNOLOGY

The Exxon 750

uses floppy and hard-disk storage with a main memory of 512K bytes. It will run both 8-bit and 16-bit applications software and permits the user to move back and forth from text to numeric and graphic operations without changing programs, the vendor said. Exxon has also announced support for MS-DOS for the product.

The Exxon 750 is an addition to Exxon Business Support System, which has at its core the Unix-based 8400 Series controller. The 750 will be available in the second quarter for $7,750 from Exxon Office Systems, 771 Long Ridge Road, Stamford, Conn. 06902.

SAN JOSE, Calif.— The Automatic Speech Exchange Network (Aspen), a voice message system, was introduced by **Octel Communications Corp.** Aspen, reportedly a compact, high-performance computer and disk system offers any business that uses a private branch exchange or Centrex the ability to exchange information via telephone without requiring simultaneous participation by the caller and receiver. The system offers the lowest cost per user of any high-performance voice message system on the market and is capable of interfacing with any PBX on the market, the vendor said.

Aspen includes automatic delivery of recorded messages to lists of people; message forwarding; the ability to edit messages, add comments and redirect messages; and delivery of messages at a prearranged time. The Aspen system will be available in June for $55,000 (for 100 to 200 users) from Octel, 1841 Zanker Road, San Jose, Calif. 95112.

CAMBRIDGE, Mass.— **Lotus Development Corp.** introduced Symphony, an all-in-one software package that claims to be the first complete business productivity tool offered for the desktop and portable microcomputer market. Symphony combines word processing, a data base with forms and mail merge capabilities, state-of-the-art communications, an advanced spreadsheet and business graphics. Symphony also offers windowing capabilities, which work in conjunction with all of the packages functions.

Symphony features WP with multiple documents on screen, and mail-merge capability; forms-oriented, multiple data base capability; communications that includes terminal emulation, asynchronous operations, point-to-point file transfer of any file; window management with simultaneous display of spreadsheets, documents, forms and graphs on screen.

Symphony requires a minimum of 320K bytes of random-access memory and is initially offered for $695; Lotus is offering current registered Lotus 1-2-3 users a credit for the full price of that program toward the purchase of Symphony. The company said it would continue to sell, service and support 1-2-3 for users who choose to stay with that product.

More information is available from Lotus Development Corp., 161 First St., Cambridge, Mass. 02142.

Lotus' Symphony

LOWELL, Mass.— **Wang Laboratories, Inc.** introduced the Wang OIS 60, a clustered information processor for small and medium-size businesses.

The product offers advanced word processing, a range of optional software applications, and networking capabilities. It has 33.5M bytes of fixed-disk memory supporting up to eight users and five peripheral devices such as communications facilities, printers and tape drives. Four of the workstations can be any standard OIS workstation, and four can be "internal" OIS devices with logic and memory housed within the master.

The OIS 60 will support up to 10 Wang printers, including the OIS-PTR20, a 20 char/sec daisy printer. The OIS 60 will also support the Wang Systems Networking for information processing between Wang systems over local- and wide-area networks.

The OIS 60, which includes work processing, utilities and advanced systems software, costs $9,000, from Wang, One Industrial Ave., Lowell, Mass. 01851.

MAYNARD, Mass.— **Digital Equipment Corp.** has announced a new video monitor with a touch screen interface. The monitor, called Dectouch, is a color graphics display unit that reportedly responds to a variety of input devices such as a finger, joystick, mouse, as well as a standard keyboard.

The VRTS1 Dectouch monitor

Dectouch

was designed for use with the Professional 350 Workstation.

The monitor, with connector panel and internal controller, is available for $3,295 from Digital Equipment Corp., 125 Main St., Maynard, Mass. 01754.

PALO ALTO, Calif.— A fast 11-in. by 17-in plotter featuring 31.5 in/sec plot speed and 6G acceleration has been introduced by **Hewlett-Packard Co.** The plotter, the HP 7550A, is available with automatic cut-sheet paper feed.

Other features include a liquid-crystal display with function keys for reporting plotter status and program messages.

The HP 7550A is available for $3,900 from HP, 3000 Hanover St., Palo Alto, Calif. 94304.

PALO ALTO, Calif.— **Xerox Corp.** has reduced the price of its current Star 8010 network workstation from $15,055 to $9,995. Xerox also announced two new models of the Star 8010 information system. The remote workstation, which can reportedly transfer information through a private branch exchange to an Ethernet network, is available for $9,995. The company also unveiled a stand-alone version of the Star, available for $8,995 from Xerox Office Systems Division, 3333 Coyote Hill Road, Palo Alto, Calif. 94304.

CUPERTINO, Calif.— **Tandem Computers, Inc.** has expanded its line of terminals with the introduction of the 6531 and 6532 models and has reduced the price of the existing 6530 terminal.

Tandem has enhanced the entire 6530 family of terminals with the introduction of voice recognition and 3270 emulation.

The 6531 is available for $2,100 and the 6532 for $1,950 Tandem Computers said from 19333 Vallco Parkway, Cupertino, Calif. 95014.

Do lightning storms "pull the plug" on your computer efficiency?

Electrical storms can cause "terminal paranoia" for small computer and word processing operators. And that causes some totally unnecessary work disruptions. A sensible solution is both available and affordable. Check out Liebert environmental control and power protection systems. Call 614/888-0246. We help make your computer investment pay off!

CLEAR YOUR DESKS FOR THE PERSONAL TERMINAL BOOM.

Introducing a desktop revolution. The Personal Terminal™ from TeleVideo.® This smart terminal is no bigger than the in-basket it replaces. Yet it costs much less than a full-size terminal. And it will clearly simplify the way your company works.

Use it to send and receive electronic mail. Check inventory and sales figures from the corporate data base or tap into outside data services. The 9-inch screen is easy to read. The professional keyboard is easy to use. Standard features include two RS-232 ports and 7 function keys (shiftable to 14). An attached telephone is optional, as well as a 300 or 300/1200 baud internal modem which can autodial up to 28 phone numbers. For a more productive and cost-effective office environment, get in on TeleVideo's Personal Terminal revolution.

Call us at (800) 538-8725 for more information. (In California call (408) 745-7760) or contact your nearest TeleVideo office:

NAS counters IBM's X models by expanding its 8000 series

By Jeffry Beeler
CW West Coast Bureau

MOUNTAIN VIEW, Calif. — National Advanced Systems, Inc. last week countered the recent announcement of IBM's 3080 X mainframes by introducing five intermediate and large-scale processors that reportedly offer up to 10% greater performance than their Big Blue equivalents at a 5% lower price.

Three of the additions to NAS' processor line — the 8042, 8052 and 8062 — correspond to IBM's recently announced 3083 Models EX, BX and JX, respectively. Rounding out last week's announcement were two other 8000 series newcomers: the 8022, which competes with IBM's 4381 Model Group 2, and the high-end 8082, which competes with the industry giant's 3081 Model KX.

Although neither the 8022 nor the 8082 has any 8000 series predecessors, the 8042, 8052 and 8062 will replace NAS' existing 8040, 8050 and 8060, respectively, according to the company's president, David Martin. Users of installed 8040s, 8050s and 8060s can upgrade their systems in the field at no cost and, in so doing, transform the machines into 8042s, 8052s and 8062s, respectively, Martin said.

In addition to providing 6% to 8% greater internal throughput than the 8000 series machines they replace, the 8042, 8052 and 8062 models boast a maintenance price tag that is approximately 11% lower, according to NAS' large systems marketing manager, Robert Ludwig.

Together, the maintenance price cuts and the introduction of the five 8000 series mainframes constitute the second half of NAS' re-

Survey uncovers ironic twist to spread of micros in Fortune 1,000 companies

By Jeffry Beeler
CW West Coast Bureau

LOS ANGELES — The suddenness with which personal computers burst on the scene caught many information systems managers by surprise and deprived them of a large measure of control, which they are now scrambling madly to regain.

Ironically, however, personal computers remain woefully underused within most big businesses — a problem with which MIS directors have only recently begun to come to grips.

These and similar conclusions highlight the results of a recent survey conducted by Management Science America, Inc., which asked Fortune 1,000 companies to describe their current microcomputer installations and predict how their personal computer purchases will change in the future.

The survey by the Atlanta-based software publisher also produced at least two other major findings:

■ Large corporations have begun only recently to buy small quantities of microcomputers for evaluation purposes and are now busily experimenting with the machines in an effort to find out whether their benefits truly outweigh their costs.

■ As the year progresses and as personal computers gradually prove their ability to yield a significant return on investment, purchases of microcomputer products in the big

FYI

Look before leaping, Juneau learns hard way

By Edward Warner
CW Staff

JUNEAU, Alaska — It was the kind of mistake that often happens in a home computer store. The customer does not know what he wants and ends up spending more than he should.

In this case, it happened on a bigger scale, and the price tag could reach $490,000.

That is what the city-borough of Juneau — with a $1.2 million data processing budget — could end up paying for continued use of its outside service bureau and a software needs assessment study by a local consulting firm. It will incur those unanticipated costs because its new in-house computer system, which was slated to go on-line in February, is unlikely to be on-line for another two years, according to DP director Jeannie Miller.

The Wang Laboratories, Inc. VS 90 minicomputer system and software, purchased for a total of $500,000, were expected to go on-line six months from installation. That, Miller admitted, was an unreasonable expectation. The computer is now in place, but the software, from S-Cubed, Inc., is being held back until it can be tailored to the city-borough's specific needs.

What are those needs? That is the hitch. Miller, who was not hired until after the implementation program was under way, said that no thorough assessment of software needs was ever made by the city-borough, a combined city-county form of government, when it dove headlong into the in-house computer project.

The problem, according to Miller, is that no one involved in the decision to convert to an in-house system knew all that much about data processing. She noted that prior to her arrival, the city-borough's DP department consisted of two data entry clerks working at terminals linked to the service bureau Systems Northwest, Inc.

Miller was quick to note that of the unstated $490,000 in costs, the $120,000 the city-borough expects to pay consultants David George and Associates for the needs assessment is the cost for a project the city should have undertaken in the first place. She admitted, however, that the $300,000 to $370,000 planned into her department's budget for the remainder of this and all of the 1984-85 fiscal year could be exceeded if the computer system does not come on-line until April 1985.

Miller refused to point a finger of blame at any individual or entity within the city-borough. "There isn't anybody to point to," she said. "The people who wanted this

Stratus to extend its supermini line

By Tom Henshel
CW Staff

NATICK, Mass. — Stratus Computer, Inc. is scheduled to announce tomorrow two high-end additions to its Stratus/32 line of fault-tolerant superminicomputers.

While Stratus is calling the processors its Extended Architecture (XA) models, a spokesman said the term is not to be confused with IBM's MVS/XA operating system. Like the original Stratus/32 processor, which has been renamed the FT 200, the new XA 400 and XA 600 use the firm's VOS operating system.

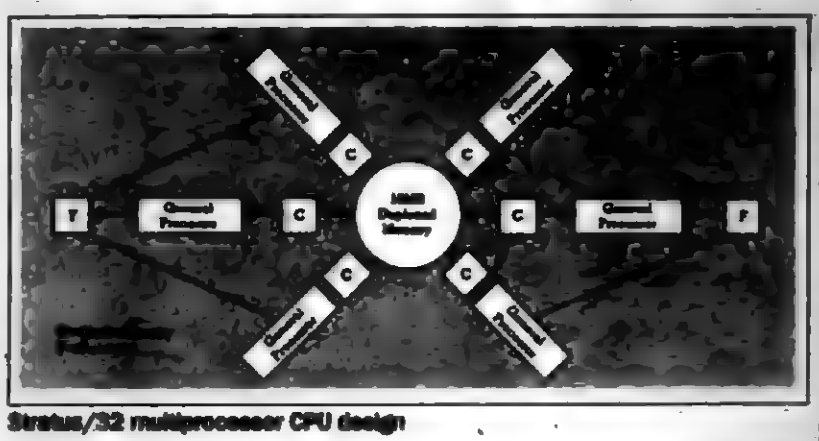
An enhanced version of VOS, Version 3.0, is being announced to support the XA 400 and XA 600. However, all applications developed for the FT 200 will run without modification on the newly announced machines, Stratus noted.

Use Motorola 68010

Unlike the FT 200, which uses the older Motorola, Inc. 68000 microprocessor, the XA 400 and XA 600 use Motorola's 68010 microprocessor. In addition, the XA 400 offers 3.1 times the internal performance of the FT 200, and the XA 600 offers 8.2 times the performance of the FT 200, according to Stratus' director of product marketing, Nicholas J. Bologna.

Current FT 200 users can field-upgrade to the XA 400, but not to the top-of-the-line XA 600. The reason, Bologna explained, is that in addition to using a different CPU board, the XA 600 offers twice as much main memory (up to 16M bytes) as the FT 200 and XA 400 and incorporates 48K bytes of cache memory. The FT 200 and XA 400 have a maximum 8M bytes of main memory and do not offer a cache memory.

The XA 400 has four internal CPUs, which can simultaneously execute instructions. The XA 600 has six internal CPUs. Both have redundant CPU boards, which perform the same operations in lockstep; if an error is detected in one CPU board, the system shuts it down, allowing the second CPU board to continue processing. As a result, Stratus claimed, the user will not experience performance degradation.



Stratus/32 multiprocessor CPU design

Purpose and prices

The Stratus/32 line was developed primarily to perform transaction processing applications, and, Bologna said, all three models have been geared to complement IBM mainframe environments.

For example, some financial users install Stratus/32 series processors as front-end processors in IBM-oriented automated teller machine applications.

Up to 32 Stratus/32 systems, in any combination, can be linked in a network with existing FT 200 systems by using the firm's Stratalink local-area network.

A basic XA 400 configuration, which costs $185,000 and is slated to be available in October, includes a 20-slot chassis, two multiprocessor CPUs, 4M bytes of duplexed main memory, two communications controllers, two disk controllers, a tape drive and systems software. It can be expanded to up to 8M bytes of duplexed main memory with up to 21G bytes of disk storage. Up to 128 workstations and up to three tape drives can be attached to the system.

The basic XA 600 configuration includes a 40-slot chassis, two multiprocessor CPUs with 48K bytes of cache memory, 8M bytes of duplexed main memory, two communications controllers, two disk controllers, a tape controller and tape drive and systems software. In addition, the XA 600 incorporates arithmetic processors, which are said to improve the unit's performance in compute-intensive applications.

The XA 600 can be configured with up to 16M bytes of duplexed main memory, 42G bytes of disk storage, 256 workstations and three tape drives. The basic configuration costs $270,000 and will be available in May, Stratus said.

An upgrade kit that allows FT 200 users to migrate to the XA 400 costs $45,000 until July 17. It will be priced at $64,000 after that date, Bologna said.

Stratus is located at 17 Strathmore Road, Natick, Mass. 01760.

NAS from page 1

ply to IBM's recent additions to its X model processors [CW, Feb. 27]. The first half occurred in late March, when NAS announced reductions in purchase prices and expansions in main memory for its existing AS/9000 line of large-scale processors.

NAS' two-stage response to IBM came hard on the heels of the industry giant's announcement of six X models for its 3083, 3081 and 3084 mainframe families. Although it boosts the 3080 line's performance by 5% to 14%, the IBM offering suffers from at least one serious shortcoming: Users of existing 3083, 3081 and 3084 systems are reportedly unable to upgrade the machines in the field to their X series equivalents.

No such barrier to field upgradability, however, applies to any of NAS' five new 8000 mainframes, Martin said.

In addition to offering a less wrenching migration path than the X series machines, the 8000 processors reportedly compare favorably to their IBM rivals in internal performance. The 8023, for example, at least equals the power of the 4381 Model Group 2 and, in some instances, outperforms its IBM counterpart by as much as 10%, Ludwig said, while the 8043 typically provides 10% greater throughput than the 3083 Model EX.

The 8053, 8063 and 8083, meanwhile, match the performance of their 3083 or 3081 equivalents, according to an NAS spokesman.

Intended primarily for remote, decentralized computing sites rather than for large corporate MIS facilities, the five members of NAS' 8000 line span three mainframe performance ranges, Martin said.

The 8023 is classified as an intermediate-scale processor and provides a migration path for 4381-class users who need additional capacity, but want to continue using comparatively old IBM operating systems, such as DOS/VSE.

The 8063, by contrast, qualifies as a true large-scale, dual-processing CPU, with performance exceeding 8 million instructions per second (Mips), and serves as a bridge to NAS' largest mainframe family, the 9000.

Together, the 8063 and 8023 bracket the 8043, 8053 and 8083 models, which NAS categorized as entry-level, large-scale machines with internal performance ranging from 4 to 8 Mips. The 8043, 8053 and 8063 define the boundary where users typically make the transition from DOS or VM to newer operating systems like MVS, Martin said.

As long as they remain at the 8023 or 8043 end of the mainframe performance spectrum, most users will probably be content to continue operating in relatively old software environments, such as DOS/VSE. But once they migrate to the 8053-class performance level or beyond, customers are usually forced to convert to MVS, Ludwig added.

All five members of the 8000 mainframe line expand to hold up to 32M bytes of main memory and 24 channels. The processors also support the 2K-byte, storage-protect key, which is reportedly necessary for accommodating older IBM operating systems like DOS/VSE, DOS, VM, VS1 and MVS 3.8.

A 4M-byte 8023 with eight channels costs $639,000, while the 8043, 8063 and 8083 sell for $1.26 million, $1.76 million and $2.25 million, respectively, in 8M-byte, eight-channel configurations. A 16M-byte 8083 with 16 channels costs $3.5 million.

Although the 8043 is available now, shipments of the 8023, 8053 and 8063 are not set to begin until the third, second and fourth quarters of this year, respectively. The 8083 is scheduled to be available during next year's first quarter.

NAS is located at 800 E. Middlefield Road, Mountain View, Calif. 94042.

Geisco selling dial-up use of its T/S net

By David Myers
CW New York Bureau

NEW YORK — General Electric Information Services Co. (Geisco) last week went to the commercial end-user market offering dial-up use of its 600-city teleprocessing network.

In a related announcement, the company revealed it has entered into a joint marketing agreement with Wang Laboratories, Inc. for end-to-end document distribution to Wang personal computers via the Geisco Quik-Comm electronic mail service.

Geisco, which had been expected to make its network available to customers last year, introduced a value-added net for transmission, processing, storage and integration of data between privately owned computer installations within the U.S. It thus became one of a growing number of old-line time-sharing firms to sell access to its teleprocessing network as a way of filling excess capacity left by the dwindling of the once-lucrative remote computing business.

Christened Mark-Net, Geisco's data communications network will be unbundled from the company's 14-year-old Mark III packet-switching network and will combine satellite transmissions with 100,000 miles of land lines. However, the Rockville, Md.-based firm is aiming to construct an all-satellite system in order to integrate voice and data transmissions in a single shed on customers' property and to bypass anticipated access charges, according to Gerhard O. Mueller, engineering manager at Geisco.

Mueller admitted the all-satellite network represents Geisco's bid to make information networking profitable through "economies of scale." It is doubtful if any information services company has yet turned a profit through networking, according to industry analysts.

The value-added network announced last week will offer electronic mail and bulletin board software as well as error detection and retransmission, full redundancy and central site control of remote nodes, said Robert D. McCalley, general manager of Geisco's network operation. McCalley added that the net will support synchronous and asynchronous communications through either X.25 or asynchronous interfaces.

In addition, the information network will enable data communications between IBM hosts and 3270 terminal clusters or bisynchronous controllers at remote sites.

Support of IBM 2780 and 3780 remote job entry terminals as well as Systems Network Architecture and Synchronous Data Link Control is yet to come, McCalley said.

Microcomputers sold by IBM, Apple Computer, Inc. and Radio Shack can be hooked up to the network. Wang personal computers will be the next pieces of hardware expected to be able to plug in, McCalley said.

Geisco's remote computing services sales force will market the value-added network with the help of a number of "specialists," McCalley said. Observers noted Geisco's marketing strength with Fortune 1,000 firms, but questioned whether time-sharing sales representatives would be successful at selling a different technology and bundle of services.

The joint marketing agreement with Wang caught visitors to Geisco's news conference here last week by surprise. Under the agreement, sales reps from each firm will essentially recommend the other's product. Wang, however, has made known its intention to build an information network of its own under contract to Bolt Beranek and Newman, Inc. of Cambridge, Mass. [CW, Sept. 26].

On-Line exits applications market

By Paul Gillin
CW Staff

FORT LEE, N.J. — On-Line Software International, Inc. is immediately halting development and marketing of the Production and Inventory Optimization System (Pios), its manufacturing resource planning (MRP) software for IBM's CICS/DL/1 environment.

Introduced two years ago, Pios was On-Line's first departure from its traditional systems software focus. Billed as a modular manufacturing control system, the package consists of eight functional modules and sold for up to $300,000 for an entire system.

Pios is a version of an MRP product developed by Rath & Strong Systems Products, Inc. for Cullinet Software, Inc.'s IDMS data base management system. On-Line invested $1.5 million converting it to run in the CICS/DL/1 environment. The company has sold two complete Pios systems and one partial system.

On-Line President Jack Berdy said it became apparent in recent months that the staff commitment required to support the product was running far ahead of revenues from the product. "We didn't realize the support requirements for each sale," he said. "It was a draw on both talent and money. It takes so long to make a sale in the first place, and then customers want a lot of extra support after that."

Since all development costs have already been expensed, the decision to discontinue Pios will not affect the company's bottom line, he said. On-Line is negotiating maintenance contracts with existing customers, but maintenance will probably be picked up by Rath & Strong eventually, Berdy said.

The 18 On-Line employees who were assigned to Pios have all been reassigned within the company.

Berdy said he believes the MRP market is underpriced and is not yet mature enough to reap large profits.

He said On-Line has no plans to re-enter the applications market in the foreseeable future.

IBM first-quarter profits up 23%, hit $1.2 billion

ARMONK, N.Y. — IBM showed profits of $1.2 billion for its first quarter, up 23.1% over the $976 million reported in the year-ago period. Earnings per share were $1.97, up 21.6% from the 1983 quarter, the company announced last week.

Worldwide revenues for the quarter totaled $9.5 billion, up 15.7% from the $8.2 billion reported a year earlier. Revenues from sales grew 38.4% to $5.4 billion, while revenues from rentals decreased 26.2% to $1.9 billion. Revenues from services were $2.1 billion, up 25.8% from the $1.7 billion reported in the 1983 first quarter.

"Order activity for our products continues to grow at a strong pace," IBM Chairman John E. Opel said. "The growth spans the product line and is significantly above last year's levels."

Costs of sales, rentals, services and expenses were $7.5 billion, an increase of 16% from $6.5 billion a year ago.

MSA from page 1

business realm will steadily grow.

The purpose of the survey, which elicited about 500 responses, was to lay the information groundwork for the creation of MSA's Micro Distribution Division, according to the firm's senior vice-president, Howard Smith. Headquartered in this Southern California city, the division provides large corporations with personal computer application packages from multiple vendors.

Although micros are slowly gaining acceptance in the commercial world, big businesses have barely scratched the surface of the machines' potential usefulness. "Most large corporations use their personal computers for only about an hour a day and run only one application on the machines," Smith said.

Smith's conclusion is borne out by the survey, which shows that most Fortune 1,000 firms use their micros strictly for doing spreadsheets. The only other personal computer applications found to be significant in the study are office productivity, data base management and accounting.

Although many microcomputers may be able to justify their existence solely as spreadsheet generators, the machines are equally capable of serving in many other capacities as well. Moreover, the vast untapped potential of personal computers is slowly being recognized by top management, which is increasingly demanding that users squeeze as much information processing mileage from the products as possible, Smith said.

Toward that end, many Fortune 1,000 corporations are beginning to shed indifference to personal computing and are planning to increase their personal computer acquisitions incrementally. "Large companies are starting to feel a lot of pressure from their end users and are now trying to learn how microcomputers work in big organizations and determine whether they want to buy additional personal computers," Smith said.

The big business world's budding infatuation with micros is reflected in MSA's survey results, where 11% of the respondents indicated their intention to buy 100 to 500 personal computers this year, and another 11% indicated 50 to 100 units.

As the business sector's microcomputer population has grown, large corporations have shown an increased interest in justifying the machines' costs. A case in point is a large Northern California user company that recently evaluated the performance of its 50 to 100 personal computers and ultimately credited the products with cutting costs by $6 million, Smith said.

In other comments, the MSA senior vice-president described most MIS managers as woefully ignorant about microcomputers and their potential applications. "Many DP directors were unprepared for the personal computer field's explosive growth and have been standing on the sidelines [ever since]," he said. "By the time they turned around and realized what had happened, a lot of personal computers had already entered their companies, and they had simply lost control. Now many of them are at a complete loss to know what to do."

"SHOCKING!"

The Facts of Life About Maintenance and Documentation.

(And how SYDOC can change 'em!)

Call (201) 568-9700.

SYDOC:
Structured Documentation System

In keeping with our tradition of privding "all the DP news that fits," we present *Six Unexpurgated Facts About COBOL Maintenance and Documentation:*

1. Very few programmers—male of female—have ever established a meaningful relationship with documentation. What they produce is seldom very good—and it's almost never updated.

2. The result is a generation that might be called "Orphan COBOL Programs." They may have fathers. And they may have mothers. But birth certificates they have not got!

3. The rub comes when you try to update these orphans to meet the demands of the brave new world of DP. You can try to deduce the logic of such orphans by referring to the source code. But that's a slow and dangerous business. And your name had better be Sherlock Holmes.

4. Or you can simply ask the author of the program about the underlying logic. But guess what? He or she has just left for an exciting new job in Tahiti.

5. What you're probably left with is hand-drawn hierarchical charts—a long bus ride from structured programming techniques. And if you try to insert new code without understanding the logic, watch out. You'll probably introduce so many bugs you'll never be free of the exterminator!

6. The cost to society is high. It's been estimated that as much as 80% of your entire DP budget may be going into modifying complex COBOL programs!

WITH SYDOC YOU CAN SAY GOODBYE TO ALL THAT: SYDOC is not a sort but a new and exciting Structured Documentation System for OS/VS. It takes the responsibility for documentation out of the hands of programmers and puts it on the broad shoulders of the computer. SYDOC works three ways:

1. SYDOC IS GREAT FOR MAKING MODIFICATIONS: It works like an X-Ray. It analyzes existing programs and prints out charts that tell you everything you need to know about the program's logic, hierarchical structure, variables, and relationships between statements. You can quickly and safely pinpoint code to be changed. And you're far less likely to introduce bugs because you *know* the logic.

2. SYDOC IS GREAT FOR DOCUMENTING NEW BORNS: It tracks new programs and automatically produces first-rate structured documentation. You have an accurate and concise record of every program your staff develops. A record that can never be lured away by an executive recruiter.

3. SYDOC IS GREAT FOR MANAGERS: It permits you to establish uniform, structured-documentation standards and stick to them. You don't have to nag programmers about documentation. The ball is in the computer's court.

So if you'd like to reduce the size of your COBOL maintenance budget, give us a call. Dr. SYDOC will be glad to put you on his famous "Waste Watcher" diet!

SYDOC:
STRUCTURED DOCUMENTATION SYSTEM

DEC ties micros more tightly into office environment

By Ellis Booker
CW Staff

NEW YORK — Digital Equipment Corp. last week introduced a host of products here that it said enhance its Professional and Rainbow personal computers and integrate the micros more closely into that vendor's office system environments.

Highlighting the Professional side of the announcements were Decnet local-area networking for the Professional 350 and a software package for both the Professional 325 and 350 that brings many features of DEC's VAX/All-In-1 office automation software down to the desktop micro (story below).

On the Rainbow side of the announcements, DEC replaced its Rainbow 100 with a more powerful floppy disk version that will sell for the same price.

The firm also unveiled Binary Synchronous Communications packages enabling Rainbows to emulate IBM 2780/3780 and 3270 terminals (story below).

The announcements "expand Digital's office strategy to provide systems solutions at every level of an organization — personal, departmental and corporate — with the communications to tie those products together," the company said.

However, some industry analysts remarked that one remaining gap in the product line is a Decnet interface for the Rainbow, but DEC is expected to introduce this feature at a later date.

The new products will be on display this week as DEC begins a nine-city exhibition tour that will focus on its personal computers, microcomputers and terminals. The Spectrum '84 tour will open on April 18 in Dallas at Loew's Anatole, then move to Atlanta's Peachtree Plaza April 25-27; Houston's Albert Thomas Civic Center, April 30-May 3; Chicago's Conrad Hilton, May 8-10; the Salt Lake Palace in Salt Lake City, May 15-16; the Memorial Coliseum in Portland, Ore., May 18-19; San Francisco's Sheraton Palace, May 22-24; and St. Louis' Chase Park Plaza, May 30-31. The tour will make its final stop at the Meadowlands Hilton in the New York area on June 11-13.

Among offerings for the Pro: Ethernet local networking

NEW YORK — Digital Equipment Corp.'s introduction here last week of enhancements to its Professional 325 and 350 microcomputers represents "the most important product announcements since we began shipping the product," said Nathan Kalowski, Professional product group manager. Among those announcements were:

■ Ethernet-based local-area networking with Decnet, which allows the Professional 350 to act as a distributed workstation within the Digital Network Architecture, along with PDP-11 minicomputers and VAX-11 superminis.

The Professional previously offered file-structure compatibility with PDP-11s and VAX-11s, but links were primarily limited to data transfers. The Decnet connection gives the Professional full access to all resources on the network, Kalowski said.

Additionally, intensive processing functions can be handled locally, enabling host computers to handle data base operations more efficiently, DEC said.

The PRO/Decnet software, which runs on the Professional 350's 10M-byte Winchester disk, will cost $95 when it becomes available next month. The Digital Ethernet CTI Network Adapter network controller, also available in May, is priced at $895. The Digital Equipment Local Network Interconnect, which allows Ethernet-compatible devices to be grouped together up to 50 meters away from the network connection, is available now for $985.

■ The PRO/Office Workstation software package, which allows the Professional to function as a distributed workstation for the VAX/All-In-1 office automation package.

DEC's All-In-1 office information system is an applications software package that provides a range of integrated tools, such as document processing, electronic mail, calendars and decision support. The package will be ready next month for $950.

■ For videotex applications, two software packages that allow the Professional 350 to act as a North American Presentation-Level Protocol Syntax (NAPLPS) videotex terminal or as a stand-alone desktop videotex host.

PRO/NAPLPS works on the Professional's existing hardware and will be available next month at $195 for P/OS Version 1.7 systems. PRO/Videotex permits users to store a complete videotex data base on the Professional's hard disk drive, significantly reducing the communications costs associated with accessing a remote videotex host. PRO/Videotex will be available in May for $895 for P/OS Version 1.7 systems.

■ Version 2.0 of the P/OS operating system, with enhancements, including Decnet support. Version 2.0 now comes standard with both the Professional hardware and with Decnet software; it can be purchased separately for $250.

■ The Professional CTS-300 software system, which offers Dibol as a software development tool to business users. It is available for $995.

■ Engineering Systems Corp.'s Design Graphix/Executive computer-aided design and drafting software, available now for $595.

More information about these products is available from DEC in Maynard, Mass. 01754.

DEC's Model 100B heads string of Rainbow announcements

NEW YORK — Digital Equipment Corp. announced here last week that it is replacing its Rainbow 100 personal computer with the Rainbow 100B, a more powerful version of the floppy-disk-based microcomputer that will sell for the same price. The Rainbow 100B offers twice the base memory (128K bytes) and four times the expansion memory (768K bytes) of the Rainbow 100 and can be upgraded to accept a hard disk drive.

The Rainbow 100B is available now for $2,750, excluding keyboard and monitor. With keyboard and monitor, it costs about $3,500, said Robert Nusbaum, Rainbow marketing manager. An option that adds a 10M-byte hard disk to the Rainbow 100B, creating a Rainbow 100 Plus, will sell for $2,800.

In announcing the Rainbow 100B, DEC emphasized its plans to support existing Rainbow 100 users. In other Rainbow announcements, the company introduced:

■ An expansion of the Rainbow 100's memory, adding up to 768K bytes of random-access memory (RAM) for a total of 832K bytes. The company said 64K-byte boards cost $149; 256K-byte boards are priced at $695.

■ For a limited time, two systems based on the Rainbow 100, each featuring a 5M-byte hard disk drive and everything else included in a basic system except a monitor. A system with 128K bytes of RAM will sell for $3,995; a version with 256K bytes of RAM will be offered for $4,595.

■ The Gold Key Country Kit package, which allows the Rainbow 100B and 100 Plus to be used as VAX-11 terminals for the All-In-1 office information system. The package is available now for $245.

■ Poly-BSC/RJE and Poly-BSC/3270 Binary Synchronous Communications (BSC) programs, allowing Rainbows to emulate IBM 2780/3780 and 3270 terminals, respectively. Both are currently available, Poly-BSC/RJE for $500 and Poly-BSC/3270 for $595.

■ A Rainbow version of Digital Research, Inc.'s Concurrent CP/M, which allows up to four CP/M applications to run simultaneously. Most off-the-shelf CP/M applications "which are well-behaved and don't dive down to call the hardware directly" will run under Concurrent CP/M, Nusbaum said.

■ The availability for the Rainbow series of third-party application software now sold by DEC: Context Management Systems, Inc.'s Context MBA, priced at $695; Samna Corp.'s Samna Word II, $450; and Software Publishing Corp.'s PFS:File and PFS:Report, each offered for $140.

■ A Personal Presentation System, available under agreement with Polaroid Corp., which turns Rainbow screen graphics into 35mm color slides and prints "on your desk" for less than $1 a slide, Nusbaum said. The system costs about $7,200.

■ The Rainbow Remote Graphics Instruction Set (Regis) program, which permits Rainbow users to work with VAX-11-based and PDP-11-based graphics applications, available now for $175.

■ The Technical Character Set, a read-only-memory-based product for generating special characters. It is slated to be ready in June for $95.

More information about these products is available from DEC in Maynard, Mass. 01754.

CORRECTIONS

Due to a reporter's error, the story on Page 6 in the April 9 issue of *Computerworld* said the DEC high-end VAX adds 30% to 50% more power." According to Digital Equipment Corp.'s performance claims for the VAX-11/785, the system can actually operate 50% to 70% faster than the Model 780 in compute-intensive applications in both commercial and technical markets.

The story about the reinstatement of criminal charges against three defendants in a highly publicized trade-secrets theft case ["Judge reinstates charges," CW, April 9] incorrectly identified National Advanced Systems, Inc. (NAS) as a subsidiary of Tokyo-based Hitachi Ltd. NAS is owned by National Semiconductor Corp. and acquires its IBM-compatible mainframes from Hitachi.

"Software conference seeks new committee members" [CW, April 9] incorrectly stated that the Conference on Software Maintenance will be held Nov. 11-13, 1984. The conference is set for Nov. 11-13, 1985.

JUNEAU from page 1

wanted it very much and were very sincere."

She also refused to blame S-Qubed for the software delays, saying those delays are the city's fault and arise from its lack of certainty about its software needs. She speculated that the software purchased for the system is better suited for use with commercial applications and will have to be tailored for municipal uses.

Not everyone involved in the city-borough's government is so magnanimous, however. According to press accounts, one city-borough assemblyman chastised the city-borough's administrators and consultants, who reportedly recommended the system last year. "We were convinced our people were right — they were wrong," Assemblyman Hugh Grant told the *Juneau Empire*.

Miller could not say where the idea originated that a new, in-house system could be brought on-line in only six months.

She said she arrived on the job shortly after the decision was made and found "they [S-Qubed] were going to start dropping software on us. I just finally said that we've got to stop this."

infodata

What's in a name? Success, if a vendor is lucky

Makers of large systems software tell how they named their products

What's in a name? That which we call a rose
By any other name would smell as sweet.

— William Shakespeare
Romeo and Juliet

By John Gallant
CW Staff

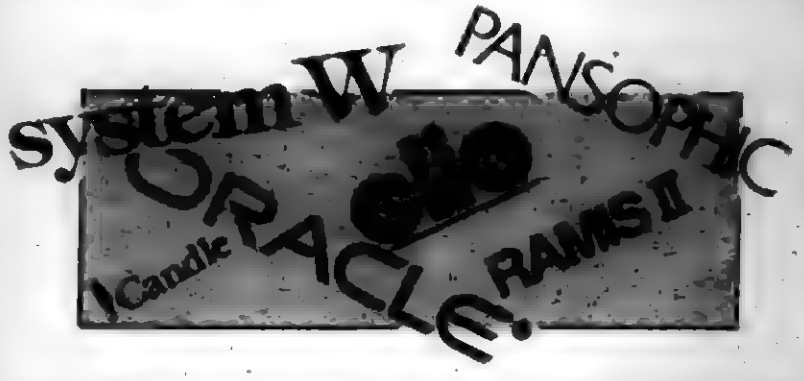
What's in a name, indeed. For the manufacturers of large systems software, whose product labels are carefully crafted to convey a lasting image or grab a prospective buyer's eye, a name can sometimes spell success for a package. And the stories behind the names are often as interesting as the names themselves.

"It's very difficult to come up with a name for a new product," said Richard Peres, head of marketing for ADR Corp.'s Adroit software. "You need a one-word name that people can easily identify with. But that word can't be too common, or people won't associate it with the product for very long.

"It should either be a name that says exactly what the product does or an adjective that describes the product or an acronym for a longer name."

Peres and colleague Barry Walter, product manager for Adroit, spent nearly four months mulling over names for the recently developed computer-based training course generator.

The duo was unhappy with the product name — Naturalwrite — that came with the package when it was acquired from CAI, Inc., so Walter went to the dictionary for assistance.



"He looked at every word that started with ADR in that book," Peres recalled, "and the best one was Adroit.

"It means 'skillful and clever,' which we feel is a good image for the package, and it also worked out to an acronym — the ADR On-line Interactive Training system. I didn't like it at first, and I spent a month trying to beat it, but I just couldn't."

Unfamiliar with the Wizard decision support system (DSS) and the Socrate data base management system (DBMS)? Those are the names under which two widely used software packages are marketed in Europe.

Their respective manufacturers, Comshare, Inc. and United Software Systems & Services Corp. (USSS), had hoped to use those names in the U.S., but were unable to do so because of possible copyright violations.

The products are better known here as the System W DSS and the Clio DBMS. "When the development project for System W began," said Comshare spokesman Larry Eilar, "we code-named the project W as a sort of front-end acronym for the 'World's Best Modeling System,' which was what we set out to make. When the software was ready to be marketed, we developed the name Wizard, but when problems arose with that, we settled on System W. Naturally we were disappointed, but the System W name seems to have worked out just fine."

When the first version of Clio was developed by Syseca, Inc. at the University of Grenoble in France, the DBMS was named in honor of the Greek philosopher Socrates. Finding that name already spoken for in the U.S., the company labeled the software Clio instead — a reference to the Greek goddess of memory, according to a spokesman for USSS, which supports and distributes the system here.

McCormack & Dodge Corp. (M&D) held a companywide contest to name what would later be known as the Millennium fourth-generation language system.

As a group of marketing strategists reviewed the contest entries, M&D Vice-President of Marketing Bob Weiler stood and listened. After a few moments, according to a spokesman, Weiler turned to the group and said, "We're talking about the future, aren't we? How about Millennium?" Despite all the other offerings, that name stuck.

Images of the future

Images of the future were also behind the name of Intel Corp.'s System 2000 DBMS, according to spokesman Dale Weisman. "System 2000 was developed by a company known as Management Research International, Inc., which Intel later acquired.

"While they were working on the product at their headquarters in Austin, Texas, a theater nearby was playing *2001: A Space Odyssey*. They came up with System 2000 to reflect the kind of advanced technology portrayed in the film."

There isn't always a logical explanation behind how a product is named, though, as the case of Bell Laboratories' Unix operating system illustrates. "About 14 years ago, Bell Labs was working on the Multics operating system with MIT," according to spokesman Ralph Dobriner. "We dropped out of that project because Ken Thompson, one of the co-developers of Unix, felt he could develop a simpler operating system. He came up with the name Unix as a pun on Multics, a play on words, even though the systems have nothing in common."

IMS VERSUS CICS
DO YOU KNOW THE DIFFERENCES?
Once, it was enough to know only CICS or only IMS. Today, the on-line world is expanding so that you can no longer afford not to know the capabilities of both.
The Educational Services Division of R.L. Rogers Consultants, Inc. now offers a comprehensive course to give you the critical information you need to compare these products and understand how each can work for you.
IMS VERSUS CICS: A DETAILED COMPARISON
This two-day seminar provides concise and practical information regarding technical and functional differences between IMS and CICS. Among the topics covered will be:
• Transaction Management/Flow
• Backup/Recovery
• Data Security/Integrity
• File/Database Management
• Operation (Commands)
• Applications Coding Differences
• Checkpoint/Restart
• IMS/CICS Workshop
The seminars will be presented in the following locations:
Los Angeles, CA — May 21 - 22
New York, NY — May 24 - 25
Dallas, TX — May 28 - 29
Chicago, IL — May 31 - June 1
ON-SITE PRESENTATIONS CAN BE ARRANGED
Please send the coupon below for more information or call Patrick Bowser at (212) 697-1460
ATTENTION MANAGERS: One-day seminar, with emphasis on the decision maker's perspective, also available. Check the box on the coupon for further information.

Sometimes a code name or project name sticks

When it finally comes time to market software after a long development effort, some manufacturers just cannot let go of the project name.

Take Oracle Corp.'s Oracle data base management system (DBMS). "In 1977, when we were still named Relational Software, Inc., we got a contract with a government agency to develop a relational DBMS," spokesman P. Michael Seashols recalled.

"The code name for that project was Oracle, and the founders of the company decided to stick with that name when the software was offered commercially," according to Seashols.

"In 1983, we changed the company name based on the wide product recognition Oracle had earned," Seashols went on to say.

Computer Corp. of America

A spokeswoman for Computer Corp. of America said that company's Model 204 DBMS, the offspring of a sponsored research program, was initially known as Model 101.

The numeric portion of that title was to change as the software underwent revisions on the road to becoming a commercially viable system.

When the package was released, Computer Corp. of America chose to retain the internal naming structure.

Mathematica Products Group

Originally developed as a marketing application program for Allied Chemical Co. in the mid-1960s, Mathematica Products Group's Ramis was an acronym for the Rapid Access Marketing Information System.

When the application later became a "full-blown product," according to Mathematica spokesman Paul Grabecheid, the company retained the Ramis acronym, simply replacing "Marketing" with "Management."

"In the mid-1970s, we completely rewrote the package to Version II, and it came to be known as Ramis II," Grabecheid said.

"Some people confuse the name with the Egyptian king Ramses, but it isn't quite that glamorous. It's nothing more than an acronym that few people remember today," according to Grabecheid.

Vendor names: Odd logic

The Cat's Pajamas, Pansophic Systems . . .

By Paul Gillin
CW Staff

From the sublime to the ridiculous, the names of software companies are often the result of a thought process that only a computer person can understand.

A mention surely must go to The Cat's Pajamas, a Berkeley, Calif.-based seller of software for the publishing industry. The small company got its name one night when its founder and president, Wayne Olson, was mulling over the idea with his four children.

"I told the kids I was going to start a software company. The kids wanted to know why it was called 'software,'" Olson said. "I said it was something that had to fit comfortably. One of my children said, 'Just like the cat's pajamas.'"

The unusual tag has caused some problems. "At the University of Nebraska, the purchasing people refused to issue a purchase order to a company named The Cat's Pajamas," Olson said. "We've also had some people call the company and think they've got a wrong number."

But Olson plans to keep the name. "I think it's memorable," he explained. "So many software companies are named Automation something or Service something that it all begins to sound the same."

Goal Systems International, Inc. sounds obvious enough, but "Goal" is actually an acronym for the last names of four Westinghouse Electric Corp. employees who in 1975 talked about starting their own company. Although the four eventually went their separate ways, Steve O'Donnell, the "O," liked the acronym enough to keep it as the name for his fledgling firm.

But the name has generated some misunderstanding. "People sometimes think it's a company that specializes in motivating people," O'Donnell said.

Pansophic Systems, Inc.'s name was chosen by founder and chief executive officer Joe Piscopo. "It comes from the Greek derivations 'pan' and 'soph,' which roughly translates to 'universal wisdom,'" a spokeswoman said. The company was founded in 1969.

Tower Systems, Inc. of Irvine, Calif., was named for a building. One day in 1975, Tower President J. Gregory Sicmon was talking with his lawyer about possible names for his newly established company. "Like all good decisions, this one was made in a bar," according to Greg Collins, vice-president of marketing and sales.

Sicmon and his lawyer had adjourned to a watering hole at the top of the Occidental Building in downtown Los Angeles. There, on the back of a napkin, Tower Systems was christened in honor of the building that housed the tavern.

Management Science America, Inc. started out as Management Science Atlanta, Inc., but as the company grew, so did the scope of its name. The change took place in 1971.

Candle Corp. draws its name from a slogan. The company was founded in 1977 with the motto, "innovators in illumination."

"It involves lighting the way for systems analysts and programmers into the mysteries of systems software," said spokesman Michael Olins.

Tone Software Corp., like many companies, was named for its flagship product. Introduced in 1974 and still on the market, the product is a utility that allows IBM's TSO to run under IBM's VS1 operating system. Combining the "T" from TSO and the "one" from VS1, Tone was born.

Today, Tone markets about a dozen products, but is still latched firmly onto its 10-year-old identity. "We

See NAMES, page 10

What makes a name work? Expert offers guidelines

By Paul Gillin
CW Staff

SAN FRANCISCO — What do Digital Equipment Corp.'s Rainbow, Software Publishing Corp.'s PFS series and Mathematica Products Group, Inc.'s Ramis software all have in common?

They're all poorly named products, according to an expert here.

Ira Bachrach has some very strong opinions about names. He is president of Namelab, Inc., a company that commands a good deal of respect and a lot of money for the names it formulates for products and companies.

Namelab earns up to $30,000 per name and boasts a list of over 120 clients, including many of the top consumer products companies, Bachrach said. Its client base of late has increasingly included computer and software companies.

See THE page 10

TAG from page 9

Namelab is painstakingly scientific in its approach. Its names are the result of months of psychological, linguistic and legal research. They are intended to hit a carefully targeted audience with a message that conveys emotions, experiences and images and does it in one or two syllables.

More importantly, the name must be memorable, according to Bachrach.

Bachrach gave a linguist's eye view of some popular computer industry names:

■ IBM Personal Computer: "Brilliant. They defined what the personal computer was."

■ Lotus Development Corp.'s Symphony: "Also brilliant. It conveys many things working together and implies intellectual superiority. In software, that's wonderful."

■ DEC Rainbow: "DEC decided this was a name that was going to make you smile. But it was so far away from their usual product names that I suspect a lot of buyers didn't see it as anything substantial."

■ The PFS series: "Absolutely silly. It's a good idea to [give continuity to your product names]. But it's mystical and not easy to understand."

■ Panaophic Systems, Inc.'s Easytrieve: "So simple and obvious that it makes the product seem trivial."

■ Ramis: "Moronic. It means 'rapid-access management information system,' but RAM means 'random-access memory,' and it's confusing."

■ Oxford Software Corp.'s UFO (User Files On-Line): "This is called an adapted metaphor. Unfortunately, the acronym UFO has nothing to do with software."

■ Musys Corp.'s Turbodos: "Ugh. [The turbo concept] is so obviously appropriated that it's not effective."

■ Cullinet Software, Inc.: "Pretty good."

■ Apple Computer, Inc.: "Very effective. It conveys simplicity."

Bachrach also described the thought behind some Namelab creations:

■ Compaq Computer Corp. (formerly Gateway Technology, Inc.): "We wanted a name which took command of the idea of portability. 'Pack' does this, and the letter 'q' conveys an advanced technical quality."

■ Datago Corp.: "This will be a chain of stores oriented toward high-volume sales of computers and communications. We think Datago communicates this volume nature."

NAMES from page 9

thought about changing it a couple of years back," said Gary Cooper, director of marketing, "but we'd been with it long enough that it was hard to change."

Although Software AG of North America, Inc. is a mouthful in itself, the name doesn't begin to compare to Software Aktien Gesellschaft, the title of the Darmstadt, West Germany, company from which the American counterpart was formed. Software AG President John Maguire considered numerous naming options when he founded his company in 1972. He elected to emulate the German firm because of the revered status the AG title carries in that country.

By the way, the name of the company's Adabas product is short for Adaptable Data Base System.

Networks from users' viewpoint focus of New York conference

NEW YORK — An in-depth, case-oriented approach to telecommunications networks will be the focus of "Networks: The User's Perspective," a conference that will be held at the Doral Inn here June 20-21 by the Institute for International Research.

The conference will feature Kailash Khanna, vice-president of corporate systems and technology for American Express Co., who will speak on the network installation at the company's new 51-story New York headquarters.

Roberta W. Frackman, vice-president of corporate telecommunications for Manufacturers Hanover Trust Co., will discuss that company's 10-year plan to integrate its domestic and international transmission facilities.

Steve LaPorte, manager of communications network services for Medtronics, Inc., is scheduled to speak on the topic of hardware and software purchasing in a multivendor environment, the conference sponsor said.

Chase Manhattan Bank Vice-President Harvey S. Hershkowitz will speak on the impact of the AT&T divestiture and will examine its effect on tariffs, network planning and control.

"Getting the Best Return on PBX Investments" will be the topic of Richard Mazzo, who is telecommunications vice-president for the American International Group.

The cost to attend the "Networks: The User's Perspective" conference is $695.

More information is available from the Institute for International Research, which is located at Suite 1105, 310 Madison Ave., New York, N.Y. 10017.

A Workable Disaster Plan Is No Longer A Nightmare

Are you prepared for the worst? Until recently, the development, implementation and testing of a workable DP disaster plan could have been a nightmare. That was before Disaster Plan/80. Presently in use at over 700 data centers throughout the United States, EDP Security's Disaster Plan/80 is the industry's most comprehensive and proven Automated Model Plan. If you're an MIS manager or DP professional considering implementing a disaster recovery plan, take the first step. This is one presentation you can't afford to miss!

If you're interested in ensuring that your firm will survive the destruction of your data center, attend the EDP Security presentation nearest you.

DOD, Commerce collide

Over control of micro exports to Soviets

By Bryan Wilkins
CW Washington Bureau

WASHINGTON, D.C. — With an Apple Computer, Inc. Apple II+ and a 256K-byte Grid Systems Corp. portable computer as witnesses, top officials of the U.S. Department of Defense (DOD) last week showed a Senate committee how commercially available systems have become critical to their battlefield management plans.

The Apple and Grid microcomputers have been deployed in the last two years with Nato forces in Europe, where they are performing battlefield functions such as strategic analyses and troop management decisions. "I cannot stress enough the extraordinary potential of the small computer on the battlefield," Richard Perle, assistant secretary of defense for policy, told the Senate Permanent Subcommittee on Investigations.

While DOD was recently given authority to review the export of computers to Western countries suspected of being shipment points to the Eastern bloc [CW, April 2], a messy interagency dispute has pitted the DOD against the Department of Commerce over the issue of controlling exports of small computers to the Soviet bloc. The interagency dispute broke into the open last December, as the U.S. met in Paris with its European allies and Japan at the Coordinating Committee for Multilateral Export Controls (Cocom).

Negotiations with Cocom

Cocom is the formal agency that the Western allies use to coordinate the transfer of technology to the Soviets through a formal licensing procedure. The U.S. negotiating team was forced to ask its allies for an extension of time while the U.S. government hammered out a formal position for presentation to Cocom this coming May on the issue of export controls on small computers. Last week, Perle told the Senate committee that the U.S. is currently negotiating within Cocom on the issue of small computer and electronic sales to the Soviets.

"Some people believe that because these machines are widely available on the open market, we shouldn't try to control the Soviet acquisition and [should] let it pass," Perle said. "We believe that a control regime can be established. . . . We seek to control the ease with which the Soviets can buy computers, especially like the Grid.

"We know we cannot put a hermetic seal around the Soviet Union," he added, "but we don't want them to be able to import them by the thousands."

Lionel Olmer, Assistant Secretary of Commerce for International Trade, told the committee that it is "a gross misstatement to suggest that the Soviets are technologically backward. They are producing 100% of their semiconductors used for military purposes and 45% for commercial uses." He agreed with Perle on the need to restrict exports of semiconductor manufacturing equipment to the Soviets.

"Volume controls are an issue when it comes to commercially available equipment," Olmer said. He added that he is optimistic that agreement could be reached with DOD on the dispute. However, Perle revealed during his testimony that there are differences of view even within his own agency on the extent of the controls needed over commercially available computers.

Large U.S. companies that manufacture computers that would be affected by the export controls have been putting pressure on the Reagan administration to ease up on the restrictions that have been coming down on export licenses in recent months.

Give Ada to USSR, he says

By Edward Weiner
CW Staff

NORWALK, Conn. — The U.S. should lift its embargo on shipments of sophisticated computer equipment to the Soviets and give them free training in the Ada language, which the Defense Department is now using to develop all its mission-critical applications.

Sound preposterous? Not if you want to save humanity from "World War Last," writes Steven B. Weissman in the April issue of the "Adadata Newsletter," which he edits.

According to Weissman, a nuclear war could be caused by a glitch or soft error in the Soviet Union's "all but obsolescent processors." A soft error occurs when natural radiation fools a computer into thinking an instruction has been input. "Our very lives," he wrote, "hang on the slim hope that either Russian computer environments are proofed against soft errors or that Soviet technicians know how to stop a launch in the face of a computer rebellion."

The article goes on to suggest that sales of computers to the Soviets will boost the domestic computer market and that sending the Soviets "a present of Ada" will "not only act as a sort of nuclear insurance policy, but will also help drive the domestic Ada market."

Is Weissman joking? Only in the article's tone, he said in a telephone interview last week. He's serious about the article's central idea, one he admitted he has heard no other person put forth. "It seems like an oddball idea," he said, "but it really isn't."

While humorous in tone, the article had a darker point to make — that, in Weissman's words, "thanks to automation, we know we can obliterate each other any time we want. Isn't it time we worked toward a point where we could at least trust each other's technology, if not each other?"

The basis for that trust, Weissman argued, could be the high reliability of the Ada language, developed for the Defense Department for military uses in a worldwide software competition. The language is so reliable it was named in January as the standard for all U.S. military computer systems, according to Adadata publisher Kenneth G. Bosomworth.

In an interview last week, Bosomworth said that Weissman was joking about selling any computer hardware to the Russians. "I'm not at all in favor of letting the Russians have more computer hardware than they already have," Bosomworth said.

But Weissman may not have been joking about offering the Ada language to the Soviets who, he wrote, are no further along in Ada development than we are. The language, a variant of Pascal, could be taught to Russian programmers and students by U.S. technicians, he wrote.

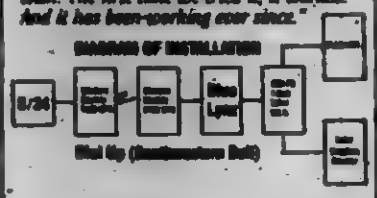
How Charles E. Ames Made The Micro To Mainframe Connection

You'd be hard pressed to find someone who keeps up with IBM's smaller systems better than Charles E. Ames does. He's president and editor of Basic Society News, an independent journal devoted to the subject.

When Charles found out about BLUE LYNX™ 5251 terminal emulation for the IBM Personal Computer, he saw an immediate answer for a pressing need.

"We were using a System/34 in Fort Worth, doing our programming in Dallas and driving 50 miles to Fort Worth to run them. Then driving 50 miles back to Dallas for more programming. This was happening three times a week. With Metroplex traffic being what it is, this was a real drag!"

BLUE LYNX was the economical way to eliminate the tiresome commute. *"Now with BLUE LYNX on our PC we just dial up the S/34 in Forth Worth any time we wish. The first time we tried it, it worked. And it has been working ever since."*



Charles conducted his own torture-test of the setup: *"We left the telephone line open for two weeks. That's seven days per week and 24 hours per day. We wanted to see if it would work. It did."*

Our terminal packages include:

3270 emulation with SNA/SDLC or Bi-synch, hardware and software package $630 complete or $1230 complete for SNA/SDLC *and* Bisynch, software selectable. *Available now.*

5251 emulation for S/34, S/36 and S/38 users, hardware and software package $630 complete. *Available now.*

VT100H – Asynchronous Communications and DEC VT emulation – $125
(requires IBM Asynchronous Adapter)

BLUE LYNX 3270 is a joint development of Software Systems, Inc. Jefferson City, Missouri & Techland
BLUE LYNX is a trademark of Techland Systems Inc 4/84

The Auto-Dial VA 212PA

Get 'em while they last!

MTI has the Racal-Vadic 212 PA modem in stock.

- Operates at 1200 and 0 to 300 bps.
- Built-in automatic dialer.
- Non-volatile memory stores 15 phone numbers of up to 31 digits each.
- "Talks" in English to terminal operator.
- Up to 26 user-programmable options are stored in modem memory, and can be keyed in from the front panel.
- Calls can be originated or answered from terminal keyboard or modem front panel.

MTI is an authorized distributor for Racal-Vadic, so we get their latest equipment first. We are the one source for all the terminals, peripherals, systems, applications expertise and service you'll ever need. At great prices, whether you lease, buy or rent. Call us today.

Software developer sues Hertz for program payment

By Edward Warner
CW Staff

NEW YORK — A software development firm is suing auto rental giant Hertz Corp., claiming that it put Hertz in the driver's seat of a custom-made terminal emulator program but was never paid for its service.

Filed late last month in New York Supreme Court by Micro/Macro, Inc., the suit asks $250,000 in compensation. It claims that Hertz requested Micro/Macro to develop the terminal emulator so that Hertz could replace its Lear Siegler, Inc. ADM-32 terminals with IBM Personal Computer XT microcomputers and Victor Technologies, Inc. 9000 microcomputers in its Fleet Rental Division offices across the country.

Micro/Macro produced the terminal emulator in a six-week crash effort, gave it to Hertz management and received its approval but no money, according to John Potye, Micro/Macro's vice-president for software service. "All they said was, 'That's nice,'" Potye said. "We performed the work to specifications in good faith, and Hertz just ignored its commitment."

Potye said he does not think Hertz ever put the emulator program into use. He speculated that Hertz lost interest in acquiring the emulator software when the executive who headed the project was transferred and his replacement "didn't want to go down that path."

Hertz's manager of public affairs, John Britton, said he hadn't seen the suit and that his firm would prefer "to answer charges in court and not in the press." He declined to comment further on the case.

Hertz had still not responded to the suit through its attorneys by early last week, Potye said, noting that the 30-day limit for such a response was drawing close. If the firm fails to respond, Potye said, the court could enter a default judgment against it.

Micro/Macro's manager of legal systems, Wayne Robertson, said that while he knows of no contract signed between the two firms, an exchange of letters had informed Hertz that Micro/Macro "does not do work on speculation." Potye said that approximately $65,000 was spent by Micro/Macro in developing the software and that its agreement with Hertz promised reimbursement for those development costs, plus $52,000 for licensing the software to the rental firm and $11,000 for support and services.

Introducing the new NCR COM Systems

Designed for people who thought they couldn't afford high-speed computer output.

A state-of-the-art COM system is now within your budget. And more than that, when you select the NCR 5310 or 5320, you'll enjoy the latest technology and the best value in COM systems.

Controlled by the versatile NCR Personal Computer, these two COM systems offer the most cost-effective methods of producing microfiche today.

Of course that NCR PC is only one of the reasons these COM systems are among the most advanced in the industry. For further proof, take a look at the other features you can have working for you:

- wet or dry film processing
- highly sophisticated camera system
- self-loading streaming tape drive
- optional console printer
- job statistics
- detailed diagnostics
- upgradable to NCR mini-computer COM systems.

Learn more about the affordable COM systems: the 5310 and 5320. Call or write NCR Micrographic Systems Division, 520 Logue Ave., Dept. 1650, Mountainview, CA 94043. 1-800-227-9964.

Security panel recommended

WASHINGTON, D.C. — A Congressional subcommittee has wrapped up hearings on computer and communications security and privacy by recommending the establishment of a national commission to investigate a range of computer-related problems.

The recommendation was one of several presented at a press conference last Wednesday by Rep. Dan Glickman (D-Kan.), chairman of the House Science and Technology Subcommittee on Transportation, Aviation and Materials, and Rep. Bill Carney (R-N.Y.), ranking subcommittee minority member.

The two congressmen, whose subcommittee has conducted a year-long investigation into computer security problems in the government and the private sector, released a report prepared by the Congressional Research Service of the Library of Congress. The report maintains that insufficient attention is paid by the federal government to the growing problems of computer crime, privacy and unauthorized access of data bases.

Commenting on the findings of the subcommittee, Glickman accused the government of paying "good lip service" to these issues without taking proper action to prevent what he called "catastrophes in this country waiting to happen both in and out of government."

Besides calling for a national commission, he listed several other steps to correct this situation:

- The Office of Management and Budget (OMB) should "provide a focus" for computer and telecommunications security and privacy activities within government, including the preparation of a manual to give agencies guidance in planning and implementing security measures.
- "An intensive [security] training effort is needed in this country for both computer users and security personnel. . . . The federal government ought to be involved in that, the National Science Foundation [and] universities."
- OMB should establish security data classification to protect sensitive computer data.
- The National Bureau of Standards should be given the resources to certify security methods and systems for government and private computer users.

Glickman said that if the administration does not adopt the national commission plan he will push the idea legislatively.

AT&T, communications users oppose rate compromise

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — A compromise to resolve the complex, increasingly bitter battle over pending rates for dial-up and private-line service appeared headed for the scrap heap last week after it was vigorously opposed by both AT&T and key communications user groups.

The proposal, which elicited comments from about 120 carriers, users and related organizations, was advanced last month by the National Exchange Carriers Association (Neca), which represents most of the nation's local telephone companies. The plan's key features include the following:

■ Rates for dial-up, long-distance service would be reduced 2% to 3%.

■ Pending tariffs covering switched local access services would become effective today, and pending tariffs for special access — local private lines — would become effective "as soon as possible."

■ AT&T would be allowed to increase its private-line rates 5% to 10% and its rates for 800 service 5% to 7%.

■ Local exchange carriers would be allowed to retain their existing 12.75% rate of return, subject to later adjustment.

The Neca proposal contains "elements that could ameliorate, in part, the problems that the pending access tariffs would create," AT&T said, but "it is evident that these changes could not restore AT&T's earnings to reasonable levels."

The International Communications Association (ICA), whose members include many of the nation's largest corporate communications users, charged that pending access tariffs contain a "windfall" worth "as much as $2 billion" to the exchange carriers.

Half comes from the allegedly excessive 12.75% rate of return that local carriers are currently allowed to earn on the circuits, switches and other facilities they use for local access service; the other half comes from assigning excessive costs — technically "revenue requirements" — to these services.

The ICA said the Federal Communications Commission should lower both. "Substantial reductions" would then be possible not only in the rates charged by exchange carriers, but also in the rates charged by AT&T Communications, Inc. and other long-distance carriers, the association said.

The Ad Hoc Telecommunications Users Committee, another big-company communications user group, said that Neca seems to "imply that so long as AT&T's financial position is improved, the switched access tariffs filed on March 15 and 19, 1984 should become effective." This represents "an outrageous disregard for the rights of users to pay only just and reasonable rates," the group added.

TELECOM BRIEFS

FCC guidelines hasten new private-line services

WASHINGTON, D.C. — Guidelines aimed at bringing new private-line services to market more quickly were adopted by the Federal Communications Commission last week.

The commission also decided that a carrier offering a volume-sensitive private-line service must make similar, lower volume versions of the same service available to avoid discriminating against some users. But the rates for each offering do not have to be based on fully distributed costs.

The new guidelines for private-line services require carriers to file tariffs containing "simple and easy-to-understand" rate structures, to group together similar service offerings and to use consistent definitions of rate elements and service functions.

The commission also decided not to reconsider its earlier ruling that a telephone carrier offering network channel terminating equipment must do so through a separate subsidiary unless it first obtains a waiver from the commission. Such equipment provides the terminal interface to Dataphone Digital Service and other wideband digital communication services.

Business surcharge gaining opposition in Congress

WASHINGTON, D.C. — Opposition to the monthly surcharge of $6/line on business communications users, scheduled to begin June 13, began building in Congress last week.

A recommendation calling on the Federal Communications Commission to defer the surcharge until June 30, 1985 was circulated among members of the Senate. It was drafted by Sens. David H. Pryor (D-Ark.) and Bob Kasten (R-Wis.).

A few days before the Senate recommendation surfaced, 175 members of the House of the Representatives sent a letter to FCC Chairman Mark Fowler asking for deferral of the surcharge until June 30, 1985. The letter was drafted by Ron Wyden (D-Ore.) and Larry Craig (R-Idaho). "It is clear," Wyden said, "that even if the surcharge reduces long-distance rates, only a few businessmen will benefit; for the vast majority, the vast bulk of their communication is local."

FCC ruling on free telex helps some, hinders others

WASHINGTON, D.C. — Letting prospective telex customers use terminals free of charge for three months is legitimate, but requiring a user to give a carrier all or some of his telex transmission business in exchange for a free terminal is illegal.

That's the gist of a ruling made early this month by the Federal Communications Commission's Common Carrier Bureau. As a result, TRT Telecommunications Corp. can continue to offer three-month free trials of its telex service. But Western Union International, Inc. and RCA Global Communications, Inc. must amend their offers, which require the user to guarantee the carrier a specified volume of telex business.

Such "tying" arrangements, the bureau explained, enable the carrier to cross-subsidize its costs of supplying terminals with revenue derived from transmission activities, which violates the Record Carrier Competition Act of 1981 and subsequent commission orders.

Justice believes FCC can loosen hold on AT&T

WASHINGTON, D.C. — The Justice Department believes Federal Communications Commission regulation of AT&T's rates and facilities can be lessened without increasing the carrier's ability to disadvantage its customers or competitors.

In a comment submitted to the commission early this month, the department said FCC rules requiring AT&T to obtain prior commission approval for new services and to submit extensive cost-support information allow "competitors to stifle innovation and use the regulatory process for competitive gain."

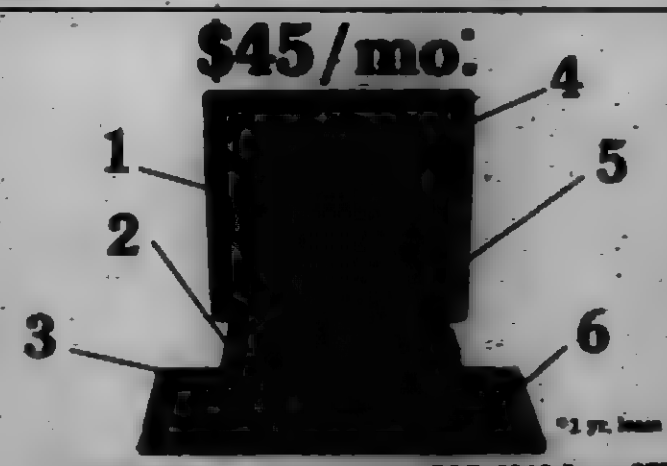
A better approach, Justice said, would be to let the new services begin and to monitor them afterward.

The department advocated a similar approach to rates. It recommended that the commission let tariffs be filed without cost-support information and make them effective 14 days later, subject to challenge by any party who can show that a tariff is unlawful or that "the harm from implementing the tariff outweighs the harm based on the unavailability of the service at the tariffed rates."

Rep. Dingell to USTA: Shift interstate costs to local users

WASHINGTON, D.C. — Shifting costs from interstate to local communications users is a better way of addressing the long-distance bypass problem than the Federal Communications Commission's approach, which involves imposing an access surcharge on all users of local exchange facilities, Rep. John Dingell (D-Mich.), chairman of the House telecommunications subcommittee, told a meeting here this month of the U.S. Telephone Association.

Dingell suggested reducing "the amount of joint and common fixed costs allocated to the interstate jurisdiction from its current level of approximately 25%."



*1 yr. lease

Lease Esprit's new-generation ESP 6210 from MTI with on-site service for only $45 per month.

1. Extensive emulations and display attributes with line drawing capability and smooth scroll.
2. Small footprint saves space.
3. 22 non-volatile programmable function keys.
4. Large 14", high resolution, high contrast, non-glare green phosphor screen.
5. Tilt and swivel display provides operator comfort.
6. Low-profile sculptured DIN standard keyboard with numeric pad, non-reflective surfaces.

MTI is an authorized distributor for Esprit Systems, so we get their latest equipment first. Like this new terminal that offers so much more for so much less than its competition. Whether you lease, buy or rent our equipment, you'll find MTI is the one source for all the terminals, peripherals, systems, applications expertise and service you'll ever need. And our prices are hard to beat. Call MTI today.

Growth of home banking linked to micro proliferation

CW AT ABA

By James Connolly
CW Staff

NEW YORK — Home banking will grow in the coming years, but only as the use of personal computers and home modems grows, according to speakers at the American Bankers Association (ABA) Retail Banking Conference here last week.

The industry observers also claimed that banks have a natural advantage over their competitors in the home banking battle. "We do have the customers already," noted Charles S. Forbes, vice-president of the electronic banking division at Chemical Bank in New York.

Joining Forbes in discussing the future of video banking was Arthur Hill, director of client services for CSP International, who predicted that the number of U.S. home computers will rise from 10 million at the end of 1984 to 60 million in 1990.

But since communications devices are key to services such as home banking, it will be equally important that the proliferation of modems for those computers rises from 5% this year to 20% by the end of the decade, he added.

Hill emphasized that while consumers will not buy personal computers just for video banking, video banking could give a person one more reason for buying a computer or one more use for an already owned computer.

Speeding the spread of home banking, according to Hill, is the agreement of manufacturers to standardize videotex communications — the North American Presentation-Level Protocol Standard. Further fueling this movement is the likelihood that modem prices will drop and that modems will be built into home computers.

According to Hill, one of the incentives for banks to move into electronic banking is reduced costs. It now costs $1.20 for a single bank teller transaction; Hill said that can be slashed to 18 cents for an automated teller machine (ATM) transaction once ATM transactions increase.

Hill and Forbes predicted that a vital part of video banking will be small business video banking, a service that Forbes said Chemical Bank plans to test in conjunction with its 5,000-user Pronto home banking system. Chemical Bank charges home users $12 per month for the right to use personal computers to pay bills, check account balances and do other basic banking electronically.

Those who will be competing with banks for the video banking dollar include current information providers such as Knight-Ridder Co., operators of a test videotex project; communications organizations such as AT&T; hardware manufacturers; data processing companies such as Automatic Data Processing, Inc.; retailers such as Sears Roebuck & Co.; and financial service companies such as Shearson/American Express, Inc. But the advantage that banks hold is that banks have established multiple relationships with their customers, as opposed to the single-faceted relationships on which competitors have focused, such as charge cards, Forbes said.

Accord reached on hacking bill

ALBANY, N.Y. — New York's attorney general expects the Empire State to become the 21st state in the union to make hacking a crime when a bipartisan bill is passed later this legislative session.

Attorney General Robert B. Abrams was joined by Brooklyn Assemblyman Melvin H. Miller, a Democrat, and State Sen. Ronald B. Stafford, a Republican from Plattsburgh, in announcing bipartisan accord on legislation making it a crime to break into computer systems via remote access.

"The computer is a fact of life in the '80s, and it has created a whole new area of crime. This bill is a very important weapon for prosecutors and the public," Abrams told reporters in announcing the accord.

Passage of the bill is considered certain; Miller and Stafford chair the Codes Committees in the two houses of the New York legislature. No computer crime bill could have hoped to get out of committee without their support.

If signed by Gov. Mario Cuomo, the law would make it a felony to break into computer memories and change or ruin the data contained therein.

Under the bill, a felony conviction would be punishable by up to four years in prison and a fine of $5,000.

New York State currently has no law prohibiting outsiders from breaking into computers through phone lines and remote terminals. Twenty other states have already passed laws to put a stop to hacking.

ATM, POS nets don't guarantee instant savings: speaker

CW AT ABA

By Jeanne Connolly
CW Staff

NEW YORK — Shared automated teller machine (ATM) and point-of-sale (POS) terminal networks are inevitable, but do not assure banks of immediate savings, the American Bankers Association (ABA) Retail Banking Conference was told here last week.

The key to marketing such networks is not savings for an institution or a customer, but convenience, stressed Phillip A. Parker, president of First Virginia Services, Inc., owner of the Network Exchange in the Washington, D.C., area. "[POS] can provide convenience and should be marketed that way," Parker said, noting that computerized POS and ATM services allow residents of Washington, D.C., Maryland and Virginia to shop and bank in the surrounding jurisdictions, which previously had been impossible.

Banks must cut prices on electronic services at the early stages to help "create an environment that encourages use of the cards," Parker said. But, he added, "If you think you are going to get into [POS] to save money, forget it."

Speaking with Parker, Hugh J. Barrett, senior vice-president of First City Bank Corp. of Texas, Inc., added that the proliferation of electronic services will eventually bring down banks' costs to a point of economic returns. The speakers noted that a key issue to be decided in establishing networks is how costs are to be split among the bank that issues a debit or credit card, the merchant and the merchant's own bank. They agreed that, in the end, the customer will foot the bill.

However, the current question for banks is not whether they will share their ATM or POS systems, but with whom. It is unclear whether POS is accelerating awareness of the sharing issue or whether the interest in POS is a result of ATM sharing, Barrett noted.

The ATM environment is much more forgiving than POS, because if an ATM customer finds a terminal not working, he can move to another terminal; with POS, a merchant cannot afford to let a customer leave the store if the network is down, Barrett warned.

Barrett suggested that the ideal network for most institutions would be designed along the lines of the one in which his bank participates, the Pulse system. He said that when ATMs were growing in popularity, Texas passed a law requiring banks with ATMs to enter sharing agreements.

Both speakers noted that ATM proliferation is nearing the saturation point, where any degree of customer use will not pay for the ATM equipment and communications lines. But they claimed that POS is unlikely to reach such a point because such a high percentage of merchants already use electronic cash registers, which can make the transition to POS easier.

Arrests slow in export case

BOSTON — Only one arrest has been made so far in the case of the seven businessmen and four firms indicted by a federal grand jury here for allegedly shipping millions of dollars worth of sophisticated computers and equipment to the Soviet Union and East Germany in 1981 and 1982.

Leslie Klein, owner of the Canadian firm Eurodata, Inc., was released on $1.25 million bail after his arrest at Miami International Airport earlier this month. Klein claimed the indictment is faulty for charging him with, among other things, failure to obtain a re-export authorization from the U.S. Department of Commerce before shipping U.S.-made computer equipment from Canada to European nations.

"You don't need a re-export license when you ship to West Germany from Canada," Klein said in a telephone interview last week.

The indictment alleges that the computer hardware, most of it from Hewlett-Packard Co. and Digital Equipment Corp., was shipped from the U.S. to Canada, the only nation to which such equipment can travel without a U.S. export license, and from there to West Germany and Switzerland. It was then allegedly shipped on to East Germany and the Soviet Union [CW, April 9].

The two Americans charged in the indictment remain at large. They are Albert C. Besson Jr., vice-president and contract administrator of MLPT Systems, Inc. of Phoenix, and R. Paul Boucher, owner of Young Sales and Service, Inc. of Nashua, N.H.

Also named in the indictment are the two Europeans, Dieter Enderlein and Fred Schiavo.

One-vendor approach to OA compatibility called old hat

By Lynn Weber
CW Staff

PHILADELPHIA — The single-vendor approach to office equipment compatibility is quickly becoming a thing of the past as users realize that compatibility is more a function of underlying equipment specifications than brand name, members of Women in Information Processing (WIP) were told here this month.

Speaking at Advance '84, the first annual international conference of WIP, Mark McElroy, a partner in the Wilmington, Del.-based consulting firm Traux, McElroy & Co., said that because many vendors protect "their proprietary domains," users have suffered the consequences associated with varying degrees of incompatibility.

CW photo by L. Weber
McElroy

"For many users, the approach to equipment compatibility was a single-vendor approach," McElroy said. "That meant confining equipment acquisition to a single brand." But after examining industry trends over the past five years, McElroy concluded that the single-vendor approach to compatibility is changing as the result of an evolution in industry standards that encompasses operating systems, applications software and even hardware.

McElroy based his premise on two underlying assumptions: First, that no one vendor in the office automation marketplace can provide all the solutions; and, second, that the method by which a company establishes compatibility in the office becomes the substance of that firm's OA strategic plan.

According to McElroy, the operating system is the most significant contribution to industry standards and the creation of compatibility.

"A generic operating system yields a generic programming language which yields generic application software which yields industry compatibility," he said.

So from now on, the underlying theme to the computer industry will be, according to McElroy, "standardization, not customization, as found in traditional minicomputer and word processing products."

In such a rapidly changing industry, where hardware is becoming a "throwaway" product due to short life span and obsolescence and where the value of user training with specific hardware is much greater than the hardware itself, standardization and the generic world become increasingly important, according to McElroy.

"In the generic world, investments in software training, operating systems and so on are protected by virtue of the ability to move software and data easily from one brand to another," he added.

Wohl outlines challenges facing women, strategies for growth

By Lynn Weber
CW Staff

PHILADELPHIA — "We work in an industry in which change is the only constant. Therefore, we must be flexible and adjust to that if we're to be successful."

Helping to set the theme for Advance '84, the international conference held here recently by Women in Information Processing (WIP), keynote speaker Amy Wohl outlined many of the challenges that women in the industry confront and presented strategies to meet professional opportunity and growth.

Wohl, president of Advanced Office Concepts Corp. in Bala-Cynwyd, Pa., addressed both personal and professional issues that women must overcome if they are to move ahead in their careers.

Two key elements to professional growth and advancement, Wohl said, are taking risks and accepting the possibility of failure. "Growing is trying those things you might be interested in, even if that means failing," she said. "There are many people who start businesses without knowing what the risks are."

She noted that it is important to realize that all business decisions are not going to be the right decisions, reminding her audience that "making mistakes is not failing."

How is success measured? Wohl pointed out that while one woman's definition of success is not necessarily the same as another woman's, in today's society money is one well-rooted indication of success. But, she added, it may not be a good way of measuring success.

Being successful both personally and professionally isn't a guaranteed lifetime ticket if the self-learning and growth process is stifled, Wohl cautioned her audience. "It is important to learn over time if what you're doing now is what you want to be doing later on," she said.

$61/mo.*

DOS/VSE and CICS/VS Frustration?

BIM gets it out of your system.

BIM presents a line of proven programs that maximize your system's capabilities, saving you time, labor and expense. These program products help get the most out of your system and people.

BIM-EDIT — the editor with more than 25 significant features that ICCF can't match.
BIMSPOOL — Prints output in POWER/VSE spooling queue on local or remote 3270 terminal printers. (Received ICP Million Dollar Award 1982).
BIMSPOON — On-Line to Batch Print Spooling. Prints data passed from CICS application programs into the POWER spooling queue.
BIM-PDQ — POWER Dynamic Queuing performance enhancement. Eliminates 66% of the I/O to heavily used POWER queue.
BIM-CDMS — Comprehensive problem analysis and display of operational CICS system.
BIMTEXT — Word processing, document composition system. Create formatted documents from free-form input.
BIMSWAP — Switch local 3270 BTAM terminals between multiple CICS partitions without special hardware or additional ports.
BIMCMPRS — CICS 3270 data compression system. Reduces response time for remote terminals significantly. Available for OS/VS1 and MVS also.
BIMP3270 — Comprehensive CRT screen image print facility. Copy to terminal printers or spool queue for system printer.
BIMSERV — On-line display of library directories and entries, VSAM Catalog entries, disk VTOC's, etc.
BIMDSLOG — Console Message File display. Used by computer operations and programmers.
BIMMONTR — DOS/VSE System Status, Performance Measurement, and POWER Queue display.
BIMDEVC — Displays Logical Unit assignments for physical devices, to resolve operational problems.
BIMSUBMT — On-line Job Edit and Submission facility.

BIM programs are cost-efficient, many less than $600, highest $4000. You can save even more with our group package offerings. Products are available on permanent, annual, or monthly leases, and shipped on a 30-day free trial basis. Product documentation is available on request.

BIM also performs systems programming consulting, with consultants based in Minneapolis and Washington, D.C. Computer time services are also available on our 4381-2 system, on-site or remote.

"In your development center, ADS/OnLine will increase productivity and reduce your company's applications backlog." —Don Heitzmann*

Using ADS/OnLine Cullinet created the best applications software ever built.

The Application Development System, Cullinet's fourth generation language, became available in 1981. ADS/OnLine was the key element in our database software system needed to address the application software business in a whole new way.

We set out to develop advanced financial and manufacturing applications; applications designed in the 1980's all built using this fourth generation language. Today, Cullinet offers the finest financial and manufacturing applications available, featuring both horizontal and vertical integration. Horizontal integration means that all applications share a common database so redundancies and inconsistencies are eliminated. Vertical integration means all applications are built using ADS/OnLine and advanced database technology so they are easier to install, tailor and maintain.

Using ADS/OnLine, we developed advanced applications much faster than if we used traditional methods. In your development center, ADS/OnLine can increase productivity and reduce your company's backlog.

ADS/OnLine eliminates up to 70% of the lines of code in a typical COBOL program. This can result in a dramatic increase in programmer productivity. In addition, ADS/OnLine is easily learned by COBOL programmers, so your programming staff can become more productive in less time.

Applications can be built more efficiently with ADS/OnLine because it is a non-procedural language. The developer simply paints the screens on a terminal and fills in the blanks to define the applications program. Plus, automatic editing and automatic error handling detect input errors with no code written at all. And the complete integration of ADS/OnLine, with all Cullinet Database facilities, not only ensures control over the application development function, but also guarantees the performance necessary to run these applications in day-to-day operations.

ADS/OnLine has been a key to our success in applications software. It could do the same for you in establishing new information systems and eliminating your applications backlog in the 1980's and 1990's.

Attend a comprehensive seminar explaining this advanced fourth generation language and Cullinet's other database software products. To participate in one of the 700 Cullinet seminars scheduled internationally, send in the coupon or call 1-800-225-9930. In MA, 617-329-7700.

Harris: Computers unnerve Americans

WASHINGTON, D.C. — Pollster Louis Harris warned Congress recently that while 45% of adult Americans claim to know how to use a computer, a big majority — 77% — are worried about threats that computers pose to their privacy.

These fears about privacy have grown substantially in the last five years, as the use of computers to maintain credit card accounts, monitor loans and administer credit has grown, Harris told the House Subcommittee on Government Information April 4.

"By a massive 84% to 15%, most people are convinced that it would be easy — no problem at all — to put together a file on them that contains their credit information, employment records, phone calls, where they have lived over the past 10 years, their buying habits, their payment records on debts and the trips they've taken," he said.

Fear information sharing

Harris said that the poll he took last fall showed that people fear institutions that possess personal information do not treat it confidentially and are inclined to share it with other institutions.

According to Harris, the public favors the enactment of laws by Congress to regulate the future use of computers. "This indicates once again that the people, in recognizing that restrictions on the use of computers are an important objective, are well ahead of their leaders in the precious subject of freedom and privacy in an open society."

Harris characterized the results of the poll as "startling, to say the least. They must be taken as a warning shot across the bow of the establishment in this country that the people are in a nononsense mood about the vast and sweeping changes they see coming."

Concerns questioned

While the public sentiment for privacy protection may be evident in the opinion polls, Rep. Glenn English (D-Okla.) wondered whether the concerns may only be "a mile wide and an inch deep."

English, who is the chairman of the subcommittee, said that the Harris poll should be viewed primarily as an early warning signal to Congress.

English went on to say that other members of Congress are not feeling any particular pressure to enact privacy protection laws despite the evidence of public support. "It's just not likely," he maintained.

Multiuser net proves successful

In GSA's four-state federal data coordination effort

By Robert Batt
CW West Coast Bureau

SAN FRANCISCO — The world of office automation has come to a major federal agency here with the successful implementation of a $450,000 local multiuser microcomputer network.

The network installed at the General Services Administration's (GSA) Office of Information Resource Management (OIRM) is made up of 80 workstations shared by senior managers, professionals, technical specialists and four senior secretaries. Connected by a Nestar Systems, Inc. local-area network, the workstations are used for word processing, calculating, electronic mail, filing information and the scheduling and controlling of meetings and projects.

A feasibility study, carried out before the project was launched, estimated that a 17% increase in productivity could be achieved by using such a network. A follow-up survey to estimate the actual productivity increases achieved by the local-area network is due to begin in May.

"The San Francisco project is the only one of its kind in the GSA at this time and was considered as a pilot project for the whole agency," said Edward Messerly, assistant regional administrator for the GSA. "Prior to this project, we didn't know anything about networking, and what we have learned has certainly helped us in shaping future projects."

The GSA acts as one of the major disseminators of information for federal government agencies. With a budget of about $45 million and an employment roster of about 650 people, the San Francisco office is responsible for coordinating information flow among federal agencies in four states — California, Arizona, Nevada and Hawaii, as well as GSA facilities in Guam.

Operates 55,000 telephones

The OIRM here operates 46 telephone switches and 55,000 telephones for government agencies. It also provides processing and software development services to different departments of the federal government, as well as two federal records centers containing national archives and income tax and historical records.

In setting up the local-area network, GSA requested bids from 150 vendors. Eleven responses were received, including one from Data General Corp., but in the end Nestar's Plan 4000 File Server was chosen because of its greater versatility, Messerly said.

"The criterion that determined our decision was not price competitiveness, but performance characteristics," he explained. "We wanted a network that could run data base management systems, word processing packages, electronic mail ... one in which we were not locked into the product development cycle of any one manufacturer. By being able to run off-the-shelf software, we have the choice of the greatest number of vendor packages."

The network, which was up and running by July, nine months after being conceived, had an initial configuration of 45 workstations. Each senior manager in OIRM was given an IBM Personal Computer with 256K bytes of random-access memory, a single floppy disk and 5M bytes of local hard disk.

The microcomputers were attached to a local network, which included a 137M-byte File Server, one print server with three dot matrix printers and a Xerox Corp. 2700 laser printer. The GSA system includes a central software library, with an Apple Computer, Inc. Apple IIe micro acting as a print screen and Epson America, Inc. FX 100 dot matrix printers attached.

Since the original network was installed, GSA has expanded it to include 80 users and has added an additional File Server and 10 IBM Personal Computers that act as shared workstations.

According to Nestar, the Plan 4000 system can support up to 255 workstations, which may consist of IBM micros, Apple IIs and Apple IIIs. The architecture is a baseband, token-passing network that uses Datapoint Corp.'s Arcnet protocols for the physical and data link layers, combined with Ethernet NS protocols for the network and transport layers. The system supports up to 548M bytes of disk storage with 137M-byte drives.

According to Messerly, the only real barrier in developing the network and increasing productivity is copyright-protected software, which he described as "a pain in the neck."

In the words of our users.

"The Fortune 32:16 was so easy to learn that I taught myself from the manual."

Bill to ban medical records access gains support

By Byron Wilkins
CW Washington Bureau

WASHINGTON, D.C. — A bill that would make the unauthorized access of medical records by electronic communications a federal crime gained support in recent hearings before Congress.

The bill specifies that "unauthorized direct access to individual medical records through a telecommunications device" would carry penalties ranging from six months in jail and/or a $1,000 fine to a five-year jail term and/or a $25,000 fine when the illegal access results in injury. It was proposed by Rep. Ron Wyden (D-Ore.).

Congressional concern for the privacy of medical records has been prompted by changes in the payment reimbursement system for Medicare that were ordered by federal regulations and will result in the creation of computerized medical information files that are believed to be vulnerable to unauthorized access and tampering.

Broad support for the legislation, H.R. 4954, surfaced in testimony April 6 before the U.S. House of Representatives Commerce Committee's Health Subcommittee. The American Medical Records Association told the subcommittee that the "increase in the amount of computerized health data, including data needed for immediate treatment decisions, the merging of clinical and financial data for billing under the prospective payment system and the development of large data banks all pose new threats to confidentiality in the health care system."

While the development of large computerized files containing an individual's medical and financial billing data are being pushed as a result of the new Prospective Payment System for Medicare required by government regulations, the merging of the two has just started to take place. Robert W. Coeburn, president of The Commons Management Group in Columbia, Md., which provides data processing services to hospitals and other health care clients, told the subcommittee that hospitals are more likely at the present time to have computerized only their billing systems. "Few as yet computerize, in full, the patient medical record," he said.

Detecting unauthorized access to confidential medical files poses a "significant potential problem" as hospitals rapidly develop computerized systems to handle data, Coeburn said. Most hospitals are instituting security systems restricting user entry, he noted, adding that existing security techniques such as passwords, computer callbacks and access monitoring logs should be adequate.

Coeburn supported the bill, but recommended that it be expanded to include all patient-specific data maintained in a health care setting, not just medical records.

A dissenting view on the need for legislation as specific as H.R. 4954 came from the National Institutes of Health. Dr. Arnold Pratt, director of its Division of Computer Research and Technology, told the subcommittee that the existing Privacy Act should be strengthened or that H.R. 4954 should be folded into other computer crime legislation now under congressional consideration.

Pratt is "concerned about moving ahead in this area on a piecemeal basis."

The American Hospital Association told the committee it strongly supports the bill, but said the penalties its calls for should distinguish between unauthorized access and misuse of the data.

The penalties outlined in the bill are established in a three-tier system. The first would set a maximum penalty at a six-month jail sentence with a $1,000 fine; the second tier for access and tampering with records would result in a one-year jail term and/or a $5,000 fine; and the third tier would set a five-year jail term and/or a $25,000 fine for access and tampering that result in injury to an individual.

Book to detail micrographics

NEW ROCHELLE, N.Y. — The 1984-85 "International Micrographics Source Book," a nearly 400-page directory of micrographic services and equipment, will be published this summer, according to Microfilm Publishing, Inc.

The directory, which provides a keyword index, lists service companies and their services, storage centers and dealers, consultants and their specialties, micropublishers and their products and associations and their officers, as well as other organizations in the micrographics field.

The directory's prepublication price is $52; its postpublication price is $65. Quantity discounts are also available. The directory can be obtained from Microfilm Publishing through P.O. Box 313, Wykagyl Station, New Rochelle, N. Y. 10804.

Rockwell International eliminates order management paperwork and ships products faster with a Tandem NonStop computer System."

right on down the line to shipping. And, because the system is on-line, other departments have immediate access to this information as well. Accounting, for example, now generates invoices automatically, resulting in much improved cash flow. Manufacturing is saving $175,000 a year in internal freight charges due to the reorganization of ordering and shipping procedures, and the Group as a whole has been able to eliminate more than 300,000 reproduced documents a year. Other system benefits contributing to our improved

customer service include better control of backorders, more accurate pricing information and the ability to make detailed forecasts of market conditions for planning purposes. The net result is an operation that is helping us achieve some very significant gains in plant productivity.

The NonStop System.

Ideally suited to on-line transaction processing where continuous availability of up-to-the-second information is critical to your business.

Tandem. Fully supported by worldwide sales, training, service and manufacturing organizations.

County DP manager cleared of wrongdoing

By [illegible]
Staff Writer

JACKSON, Miss. — Pocketing almost $7,000 for producing town tax rolls on the county computer wasn't criminal conduct, according to police investigators who looked into the actions of Hinds County Data Processing Director Ray Palmertree.

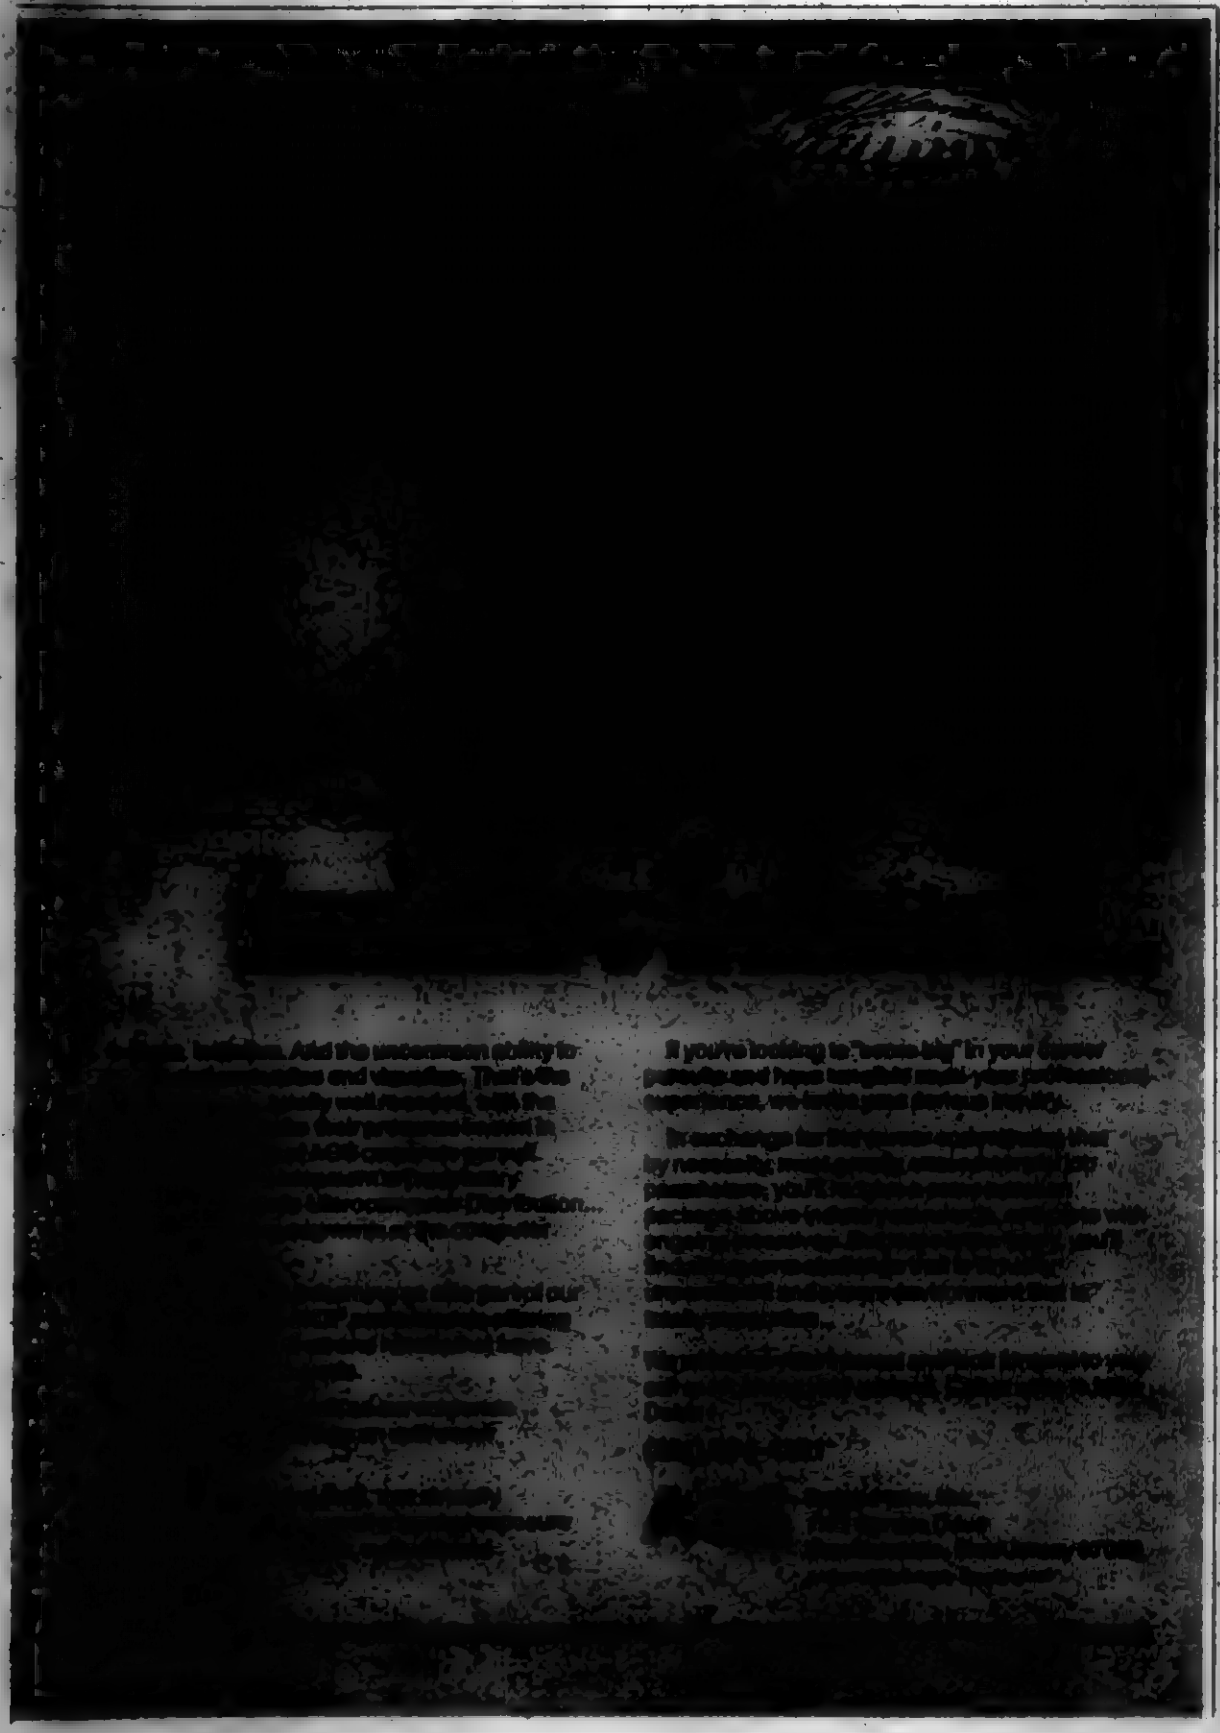
"I'm just glad it's over with," said Palmertree, who earlier admitted charging the town of Clinton $6,750 for processing the town tax rolls on Hinds County's Sperry Corp. 90/40 mainframe here [CW, Jan. 30].

Investigators from the sheriff's office and the district attorney's office told Palmertree and county supervisors last month that he had been cleared of criminal wrongdoing. The supervisors requested a probe after town officials questioned why they were paying to have their taxes processed while other towns received the same service free.

Palmertree, employed by the county since 1973, countered that his predecessor had a similar arrangement with Clinton and that the deal had been approved by county officials "back in the 1970s." He said he had performed the work on his own time.

Although investigators declined comment on the investigative report, the Jackson *Clarion-Ledger* reported that several former county officials had confirmed Palmertree's claims when interviewed by investigators. Those ex-officials reportedly said Palmertree and his predecessor were allowed to charge the town for services done on their own time because the county didn't have the personnel to process the rolls during regular working hours.

However, the report did not address the question of whether Clinton should continue to pay to have its tax rolls processed. "I expect that between now and July, when the tax rolls are filed, or at least by the end of the calendar year, they are going to do something about it," Palmertree said.



A/E Systems meet scheduled for June 4-7

BALTIMORE — A/E Systems '84, the fifth annual conference on automation and reprographics for design professionals, will be held June 4-7 at the Baltimore Convention Center. It is sponsored by "A/E Systems Report," a monthly newsletter targeting professional design firms.

Representatives from four computer-aided design (CAD) firms will discuss "The Inevitable Shakeout" in the CAD market: Dr. Malcolm Davies, vice-president and general manager, A,E & C Division, Calma Co.; John W. Hurd, vice-president, A-E-C Industry Marketing, Computervision Corp.; Robert E. Thurber, executive vice-president, Intergraph Corp.; and Robert Tiel, director of CAD and manufacturing marketing in IBM's National Accounts Division.

The registration fee for the conference is $145. More information is available from A/E Systems '84, P.O. Box 11316, Newington, Conn. 06111.

AI among topics of April 29 meet

TORONTO — The Association for Systems Management is holding its annual conference April 29 to May 2 at the Sheraton Center here.

Highlights of the conference will include a seminar on artificial intelligence led by E. Robert Keller of Renaissance International Corp. in Harvard, Mass.,; a tutorial on electronic mail led by George Sekely of Canadian Pacific, Ltd.; and a seminar on motivation and personnel value systems by Kay Kutchins of the University of Texas.

The registration fee is $395 for members and $495 for nonmembers. More information is available from the Association for Systems Management, 24587 Bagley Road, Cleveland, Ohio 44138.

IIE conference to run May 6-10

CHICAGO — A Software Swap, a demonstration and exchange of software programs, will be held during the Institute of Industrial Engineers' (IIE) 1984 Annual International Industrial Engineering Conference and Show at the Hyatt Regency O'Hare here. Slated for Tuesday, May 8, the swap is sponsored by IIE's Computer and Information Systems Division.

With "Engineering the Future" as the theme, the conference runs May 6-10 and will feature guest speakers, 130 education sessions, plant tours, workshops, a productivity management symposium, preconference seminars, an exhibit show, simulation lab and IIE business meetings.

Registration information is available from IIE, 25 Technology Park/Atlanta, Norcross, Ga. 30092.

The Philips 3000 Series. Future Included.

Building Blocks. The 3000 Series universal workstations. The vital building blocks in the Philips Information Systems Office Automation strategy. A strategy that assures you today's purchase won't become obsolete in the years ahead. We include the future by providing a migration path from electronic workstations, upward and outward to distributed processing, sophisticated local area networks, and beyond.

Versatility. The 3000 Series includes award-winning* word processing software recognized for ease of use and versatility. Each 3000 Series workstation functions as a word processor, a desktop computer using off-the-shelf programs, and a sophisticated telecommunications terminal including Miconet for Philips-to-Philips electronic mail, as well as asynch, bisynch, and 3276 emulation.

Resources. Our parent, N.V. Philips, a 16-billion-dollar multinational corporation, is the third largest corporation specializing in communications and electronics with 200 factories in over 100 countries and 300,000 employees worldwide.

We put the power of over one billion dollars in research behind our Office Automation systems. Technological firsts, from the original cassette recorder to the videodisc and digital optical recorder allow us to expand our Office Automation strategy in the future, while keeping compatibility intact.

Support. All products in the Philips Office Automation strategy are backed with an extensive guarantee and comprehensive user training and service.

To find out more about making our 3000 Series the building block in your Office Automation future, call toll free 1-800-828-6211. In New York State 1-800-462-6432. Or, send the coupon below.

Site of the Hannover Fair, Hannover, West Germany (above). Attendees examine vendors' newest gear at this industrial trade show (above and at right).

Germany's 'Fair of Fairs' opens

Hannover plays host to 120 countries

By Susan Blakeney
CW Staff

HANNOVER, West Germany — "The Fair of Fairs" is the name rightfully bestowed upon the Hannover Fair, the massive industrial trade show held here earlier this month.

The sprawling annual event spanned 10 million square feet across seven buildings and hosted 750,000 visitors, effectively doubling the population of this town. People traveled from some 120 countries to attend the fair and visit its 1,700-plus exhibits.

The fair was actually 10 trade shows rolled into one, representing such diverse manufacturing industries as office equipment, data processing, factory equipment and energy.

The largest portion of the show was devoted to information processing technology. Not only was the computer segment of the show the largest in size, but it was also the most popular. Its many exhibit halls were packed each morning.

One industrial equipment maker suggested that the fair was "really turning into a computer show. . . . Hardly anybody has visited our booth all day." When asked why his company came to the show at all, the manufacturer said, "If you don't show up, everybody thinks you've gone — as you say — Chapter 11."

The general atmosphere at the show was decidedly upbeat. The West German minister for economic affairs and transport for Lower Saxony, Brigit Breuel, best summed up the prevailing spirit at the show during her keynote address.

She explained, "A short while ago, it was fashionable to point to the allegedly overwhelming backwardness of Europe's economy." Breuel continued, "This we can disregard and apply our talents and strengths and really keep abreast of the competition. The signals to the world's economy are set on 'go.' "

In the words of our users.

"The Fortune System is very complete. It is easy to update and the programs are well-written."

NEWS

INTERNATIONAL REPORT
CW International News Network

AUSTRALIA

NORTH SYDNEY — The first installation of IBM's X models of 3080 mainframes is to be made at the Australian Gas Light Co. in early June. A second installation will follow shortly at Sydney County Council, the city's electrical utility.

■

SYDNEY — The Commonwealth Banking Corp. has veered from the path of other banks by selecting hardware and software from NCR Corp. instead of Tandem Computers, Inc. to run its electronic funds transfer system. In a deal worth more than $1.9 million, the Commonwealth has bought an NCR V-8575 dual processor, two NCR 721 communications processors and the electronic rental banking software package. The Commonwealth has also signed Mobil Oil Australia as the first retailer to use its point-of-sale system.

■

MELBOURNE — Wealthy Asian businessmen are seeking joint venture partnerships with Australian computer companies following a campaign by the Victorian Economic Development Corp. to encourage foreign investment in Australia. The corporation's efforts, in conjunction with those of the federal government's Department of Immigration and Ethnic Affairs, are aimed at attracting successful investors who have a minimum of $278,000 unencumbered capital to invest in Victorian business.

BRAZIL

BRASILIA — The National Security Council, which, in collaboration with the Department of Informatics, regulates activites in the information sector of the economy, is expected to present a proposal for a Brazilian information system to the national Congress. Not mentioned in the proposal is the current policy of market reservation, which reserves the Brazilian market exclusively for Brazilian vendors of minicomputers, microcomputers and peripherals.

■

RIO DE JANEIRO — Total sales of the Brazilian computer industry increased only 7% last year vs. 51% in 1982, according to figures released by the Brazilian Association of Computers and Peripherals. Until last year, the computer industry was thought to have escaped the economic problems affecting the rest of the country, but the industry's lackluster performance in 1983 indicated that this sector of the economy is apparently no more immune to economic crisis than any other.

CHINA

BEIJING — The computer maintenance center established here in January by Wang Laboratories, Inc. is providing its users with a variety of services, such as installation, maintenance and retailing of circuit boards. The center currently stocks about $100,000 worth of spare parts.

■

SHENGYANG — Shengyang Computing Institute, which is under the China Academy of Sciences, has developed a time-sharing operating system which the institute said is fully compatible with Unix. In addition to all standard commands and routine programs supported by Unix, the institute's Shenix also supports Fortran 77, C, Basic and Pascal.

■

BEIJING — Sixteen IBM 4341 processors, two IBM 3081s and two IBM 3083s sold to China last year are scheduled to be delivered in the second half of 1984.

FRANCE

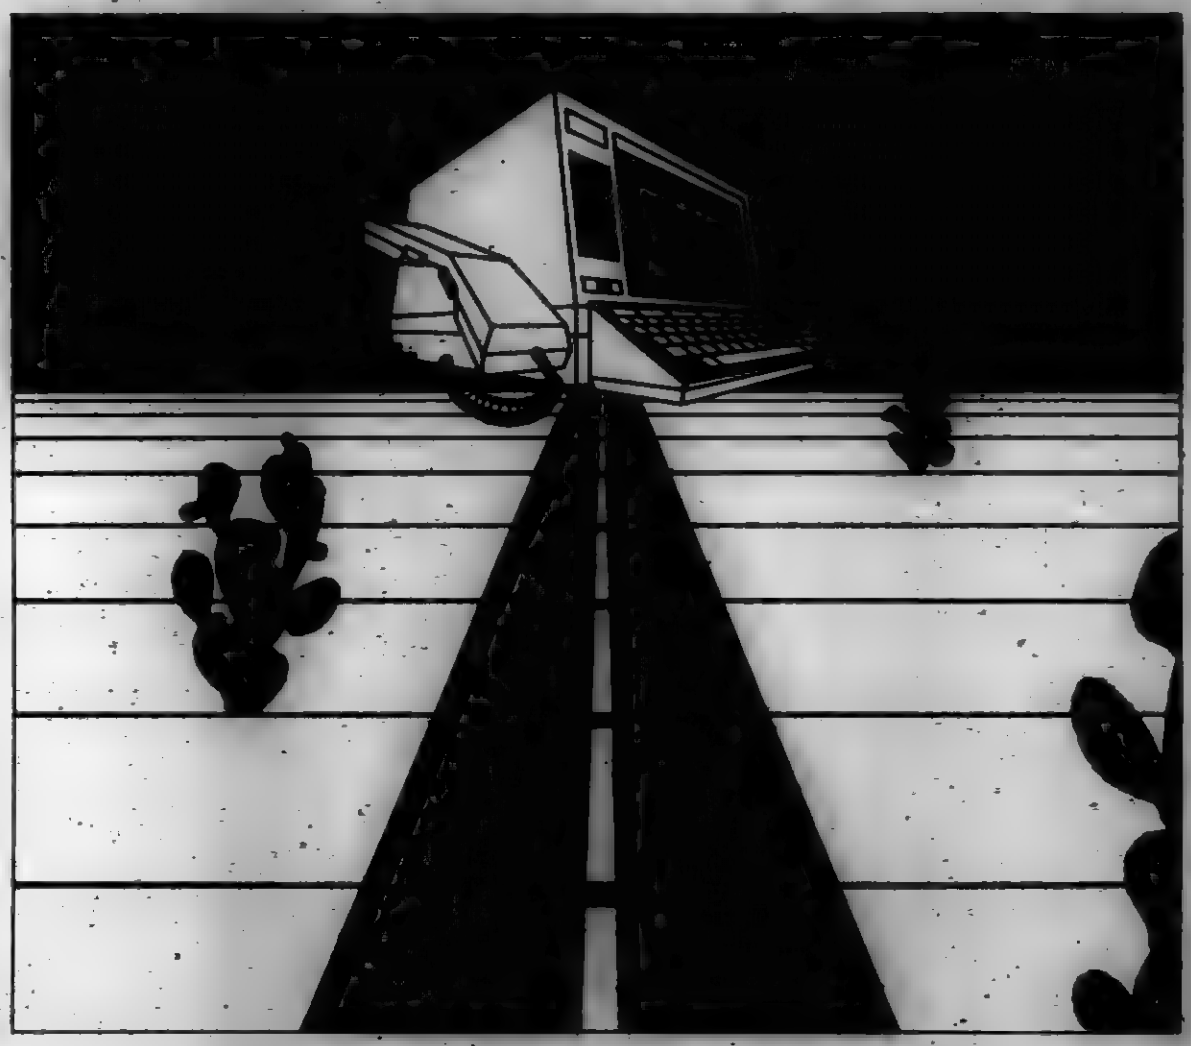
PARIS — Bull-Sems, the subsidiary of Group-Bull that manufactures and markets industrial and scientific data processing systems, has signed an agreement with Ridge Computers of Santa Clara, Calif., for technical, industrial and commercial cooperation. Bull-Sems, which will make a capital investment in Ridge and receive a seat on Ridge's board of directors, gains the right to produce the 32-bit Ridge 32 system in France at its plant at Echyrolles near Grenoble. Production will begin before the end of the year. The agreement also provides for the two companies to extend the 32-bit product line.

JAPAN

SINGAPORE — Syscon, a subsidiary of Kongsberg Corp. of Norway, has made the first Asian sale of its utility mapping system to the Public Utilities Board, which will use the system to keep a more accurate data base of its power lines, water and gas pipes. The sale is valued at $5 million.

PHILIPPINES

MANILA — Lack of data communications facilities and technical expertise have been major factors in the underutilization of computers in the Philippines, according to a study by the Philippine Computer Society. The study showed that not enough technical expertise is available to maximize the potential of installed hardware and that a lack of communications facilities is seriously hampering data transmission to users.



The Telecommunications Revolution is here.

At the International Communications Association 37th Annual Exposition. May 8–10, 1984. Las Vegas Convention Center. Las Vegas, Nevada.

Telecommunications is moving faster than ever before. The ICA Exposition presents the opportunity to see the premier showcase of telecommunications products and technologies.

Over 250 exhibitors will display the latest in voice and data communications, office automation and communications integration. If you purchase, recommend or use telecommunications products or services, this is an unprecedented opportunity to gain first-hand knowledge of this rapidly growing and changing field.

The ICA would like to extend its invitation to you. Just bring this ad to the Exposition and your admission is free.

Dates and Times:
May 8 & 9, 9:30 am to 6:00 pm
May 10, 9:30 am to 12:30 pm
Regular Admission: $10.00

ICA

For more information regarding the Exposition or ICA membership, call 800-ICA-INFO or 214-233-2000.

CALENDAR

WEEK OF MAY 6

MAY 7, WASHINGTON, D.C. — **The Second National Conference on DP Software Maintenance Strategies and Opportunities.** Contact: U.S. Professional Development Institute Maintenance Conference, Department KLMNOPQRS, 1620 Elton Road, Silver Spring, Md. 20903.

MAY 7-9, SAN FRANCISCO — **International Data Corp. (IDC) Micro Guide Conference — Micro War: Shape Up or Shake Out.** Contact: IDC, 5 Speen St., Framingham, Mass. 01701.

MAY 7-9, BOSTON — **The Fundamentals of Data Communications.** Contact: American Management Associations, 135 W. 50th St., New York, N.Y. 10020.

MAY 7-9, LAS VEGAS — **The Annual International Communications Association Conference.** Contact: Norman Sefton, Duke University, 114A Tel-Com Building, Durham, N.C. 27706.

MAY 7-9, HOUSTON — **DOS/VSE Internals, Debugging and Problem Determination.** Contact: Goal Systems International, Inc., 5455 N. High St., Columbus, Ohio 43214.

MAY 7-9, NEW YORK — **Automating the Office: A Tactical Guide for Success.** Contact: American Management Associations, 135 W. 50th St., New York, N.Y. 10020.

MAY 7-9, PARSIPPANY, N.J. — **MVS Dump Debugging.** Contact: Chubb Institute, 8 Sylvan Way, Parsippany, N.J. 07054.

MAY 7-9, ARLINGTON, TEXAS — **Data Analysis.** Contact: QED Information Sciences, Inc., QED Plaza, P.O. Box 181, Wellesley, Mass. 02181.

MAY 7-9, CHICAGO — **Personal Computers: Strategies for Managing.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

MAY 7-9, DALLAS — **Capacity Management Forum.** Contact: Institute for Software Engineering, 510 Oakmead Pkwy., Sunnyvale, Calif. 94086.

MAY 7-9, WASHINGTON, D.C. — **Strategic Planning for Telecommunications.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402.

MAY 7-9, WASHINGTON, D.C. — **Information Systems: Modeling, Analysis and Planning.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

MAY 7-9, ATLANTA — **Financial Analysis for Telecommunications Equipment Acquisition.** Contact: Business Communications Review, 950 York Road, Hinsdale, Ill. 60521.

MAY 7-9, SAN FRANCISCO — **Evaluating, Selecting and Using Computer Software Packages.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

MAY 7-9, NEW YORK — **Fundamentals of Data Processing for the Non-DP Executive.** Contact: American Management Associations, 135 W. 50th St., New York, N.Y. 10020.

MAY 7-9, SAN FRANCISCO — **Computer Performance Measurement and Capacity Planning: Tools and Techniques.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

MAY 7-9, WASHINGTON, D.C. — **Strategic Planning for Telecommunications.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402.

MAY 7-9, SEATTLE — **Relational Data Bases.** Contact: Software Institute of America, Inc., 8 Windsor St., Andover, Mass. 01810.

MAY 7-9, CHICAGO — **Introduction to Office Automation: Concepts, Technology and Applications.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

MAY 7-9, DALLAS — **Office Automation: Technology and Integration.** Contact: Software Institute of America, Inc., 8 Windsor St., Andover, Mass. 01801. Also being held May 14-16 in Los Angeles.

MAY 7-9, WASHINGTON, D.C. — **Data Communications and Networking for Personal Computers.** Contact: Software Institute of America, Inc., 8 Windsor St., Andover, Mass. 01810.

MAY 7-11, ATLANTA — **C Language.** Contact: Advanced Technology Systems, Inc., 302 Research Drive, Norcross, Ga. 30092.

MAY 7-11, ANNAPOLIS, MD. — **How to Develop an Effective Long-Range Data Processing Plan.** Contact: Keston Associates, 11317 Old Club Road, Rockville, Md. 20852.

MAY 7-11, DAYTON, OHIO — **Quality Assurance and Testing Workshop.** Contact: Structured Methods, Inc., 7 W. 18th St., New York, N.Y. 10011.

MAY 7-11, SAN FRANCISCO — **Systems Workshop III.** Contact: Ware Associates, P.O. Box 948, Groton, Conn. 06340.

MAY 7-11, HOUSTON — **Structured Program Design/Maintenance.** Contact: Georganna Carson, Ken Orr and Associates, Inc., 1725 Gage Blvd., Topeka, Kan. 66604.

MAY 7-11, ORLANDO, FLA. — **IDMS-DB Programming Workshop.** Contact: Harris Education Center, 1025 W. Nasa Blvd., Melbourne, Fla. 32919.

MAY 7-11, CHICAGO — **Tutorials for Professional Development.** Contact: Association for Computing Machinery, 11 W. 42nd St., New York, N.Y. 10036.

MAY 7-11, TEANECK, N.J. — **Systems Analysis.** Contact: QED Information Sciences, Inc., QED Plaza, P.O. Box 181, Wellesley, Mass. 02181.

MAY 7-11, NEW YORK — **MVS JCL.** Contact: Syscd, One Park Ave., New York, N.Y. 10016.

MAY 7-11, LOS ANGELES — **Information Modeling Workshop.** Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036.

MAY 7-11, ST. LOUIS — **MVS Diagnostic Techniques.** Contact: Center for the Study of Data Processing, Campus Box 1141, Washington University, St. Louis, Mo. 63130.

MAY 7-11, HOUSTON — **Project Planning and Control Workshop.** Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036.

MAY 7-11, CHICAGO — **Structured Analysis/Design Workshop.** Contact: Structured Methods, Inc., 7 W. 18th St., New York, N.Y. 10011.

MAY 7-11, MEMPHIS — **Structured Analysis and System Specification Workshop.** Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036. Also being held May 14-18 in Atlanta.

MAY 7-11, WASHINGTON, D.C. — **Structured Analysis and Design Workshop.** Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036. Also being held May 14-18 in Pittsburgh.

MAY 7-11, NEW YORK — **Structured Design Workshop.** Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036.

MAY 7-11, CHICAGO — **Structured Design for Real-Time Systems.** Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036. Also being held May 14-18 in New York.

MAY 7-11, TORONTO — **CICS Command-Level.** Contact: QED Information Sciences, Inc., QED Plaza, P.O. Box 181, Wellesley, Mass. 02181.

MAY 7-11, BOSTON — **Systems Workshop II.** Contact: Ware Associates, P.O. Box 948, Groton, Conn. 06340.

MAY 7-18, ATLANTA — **CICS Command-Level: Evening Workshops.** Contact: Advanced Technology Systems, Inc., P.O. Box 6900, Norcross, Ga. 30091.

MAY 8-10, NEW YORK — **SAS Macro Language Course.** Contact: SAS Institute, Inc., P.O. Box 8000, Cary, N.C. 27511.

MAY 8-10, BOSTON — **Cost Benefit Analysis.** Contact: QED Information Sciences, Inc., QED Plaza, P.O. Box 181, Wellesley, Mass. 02181.

MAY 8-10, CARY, N.C. — **SAS for New Computer Users (OS) Course.** Contact: SAS Institute, Inc., P.O. Box 8000, Cary, N.C. 27511.

MAY 8-10, NEW YORK — **Understanding Modern PBX Systems.** Contact: Business Communications Review, 950 York Road, Hinsdale, Ill. 60521.

MAY 8-10, MONTREUX, SWITZERLAND — **Computer-Integrated Manufacturing.** Contact: Rhonda Gergsness, Computer-Aided Manufacturing International, Inc., Suite 1107, 611 Ryan Plaza Drive, Arlington, Texas 76011.

MAY 8-11, PALO ALTO, CALIF. — **Hands-On Unix Workshop.** Contact: Ruth Dordick, Integrated Computer Systems, P.O. Box 45405, 6305 Arizona Place, Los Angeles, Calif. 90045.

MAY 8-11, SAN DIEGO — **Hands-On Microprocessor Troubleshooting.** Contact: Ruth Dordick, Integrated Systems, P.O. Box 45405, 6305 Arizona Place, Los Angeles, Calif. 90045.

MAY 8-11, LOS ANGELES — **How to Manage Software Projects.** Contact: Ruth Dordick, Integrated Computer Systems, P.O. Box 45405, 6305 Arizona Place, Los Angeles, Calif. 90045.

MAY 9, NEW YORK — **Communications Network Design.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

MAY 9-10, FRAMING-

In the words of our users.

"After months of researching computer systems, the Fortune 32:16 offered everything we needed."

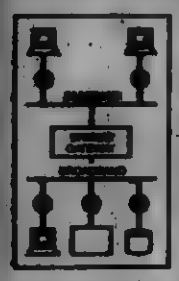
Now there is a company that can satisfy your LAN needs both today and ten years from today. A company with flexible solutions backed by over 20 years of networking experience.

Codex.

In the 4000 Series LAN, we offer a system that lets you configure and control the precise mix of LAN technologies that suit your company needs.



A system, for example, that lets you combine a broadband backbone for data, video and voice applications, and less expensive Ethernet baseband feeders to support individual work areas.

A system that supports a wide array of industry standard interfaces. So you can connect practically any vendor's equipment.

Later, when your needs for internetworking and network management expand, those needs can best be met by the company that has literally written the book on adaptive routing, network management, protocol intervention, and statistical multiplexing.

Codex.

We just made the decision to get into local area networking a safe decision to make.

For more information, call 1-800-821-7700, ext. 879. Or write: Codex Corporation, Dept. 707-79, 20 Cabot Boulevard, Mansfield, MA 02048.

ATM boom seen linked to better security, user appeal

By James Connolly
CW Staff

ORLANDO, Fla. — The growth of automated teller machines (ATM) is linked to better security procedures and to making the machines more appealing to consumers, according to vendors who addressed the recent Electronic Funds Transfer Association Convention here.

The proliferation of ATMs has translated into a growth in the U.S. from four million transactions on 7,100 machines in 1978 to 3.4 billion transactions on 40,000 machines in 1983, reported James Leierzapf, vice-president for marketing at Diebold, Inc. Leierzapf said that about 35% of all U.S. bank customers now use ATMs, which have helped to change banks from a transaction orientation to a sales orientation as bank business moves off premises.

Leierzapf predicted that ATMs will spread throughout workplaces, convenience store/gas station combinations and supermarkets. However, he noted that high-traffic locations such as supermarkets will insist on greater reliability for the systems and that banks will want to save money by substituting withdrawal-only machines for full-service machines that require more maintenance.

Meanwhile, David Baker, Fujitsu Systems of America marketing support manager, warned that vendors must make ATM usage easier for the consumer if it is to rise above the 35% mark. "We have to generate a confidence level," he said.

He cited Fujitsu Ltd.'s ATM success in Japan, where the 13 major banks report that 70% of cash withdrawals and 40% of cash deposits are done through ATMs.

Tools that U.S. vendors should use to attract current nonusers include color graphics, touch screens, passbook handling, telephones for customers to seek help in operating the machines and cash handling, Baker recommended.

Christopher Williams, director of product marketing for Docutel/Olivetti Corp., said greater market penetration may be obtained by use of ATMs in the workplace. He noted that this concept essentially failed at one time, but that with the opportunity to link ATMs into networks, machines at work are making a comeback.

Robert Fagens, national network coordinator for NCR Corp., predicted that entire payrolls will be moved through ATMs in coming years and that the U.S. government would prefer to make its retirement, welfare and payroll payments through ATMs.

However, Fagens added that the government is awaiting tighter security measures before making a full commitment. Personal identification number systems are too unreliable for the government, and voice recognition systems are too expensive, Fagens said, adding that fingerprint identification systems are unlikely to see widespread ATM use.

IMC meet set for Oct. 2-4

SINGAPORE — The International Information Management Congress (IMC), Infomatics '84, is scheduled for Oct. 2-4 here. It will include seminars on information management and advanced micrographics, along with displays of state-of-the-art and advanced technology.

The Micrographics Society of Singapore will host the event at the Hyatt Regency Hotel in Singapore.

Registration fees are $350 until Aug. 15, $400 after Aug. 15 and $175 for one day. More information is available from IMC '84 through P.O. Box 34494, Bethesda, Md. 20817.

Efta members cite prerequisites for business success

By James Connolly
CW Staff

ORLANDO, Fla. — Time, capital investment, more personal computers and a lot of marketing are prerequisites if electronic money systems are to be business — not just technical — successes.

That was a commonly shared view of the Electronic Funds Transfer Association (Efta) members, who met here recently for a four-day convention.

Several members also said they were surprised at how strongly retail chains feel about wresting the control of EFT networks away from banks.

"You kind of think of bankers as taking a leading role, but the retailers are very aggressive," said Joseph Pantone, vice-president for Money Access Center Operations at Philadelphia National Bank. "What they've been saying here is that they want us to give them what they want and not to worry about marketing, that they will take care of that and make it fly."

Pantone noted, however, that only large retailers such as Sears Roebuck & Co. and J.C. Penney have the capital to run their own networks with their own debit cards. He said that regional stores, like smaller banks, will still rely on major networks such as his bank's Major Access Center for most of their point-of-sale network communications.

While some of those smaller companies, whether retailers or gas station chains, may want their own networks, "when they look at the cost of establishing a network, they will change their minds," Pantone said.

Several attendees as well as speakers said the challenge for banks will be increasing customer usage of computerized transfers, such as automated teller machines (ATM), home banking and telephone bill-paying. Increasing that usage means strong marketing efforts, perhaps even more than many technically oriented EFT managers realize, observed two officials of Western Union Telegraph Co.

"The public is fickle, and a lot of people forget that. The public really hasn't found a need for these services," said John J. Durkin, Western Union's assistant vice-president for consumer operations. "I know that I personally am quite content writing 25 to 30 checks a month. I haven't felt the need for home banking."

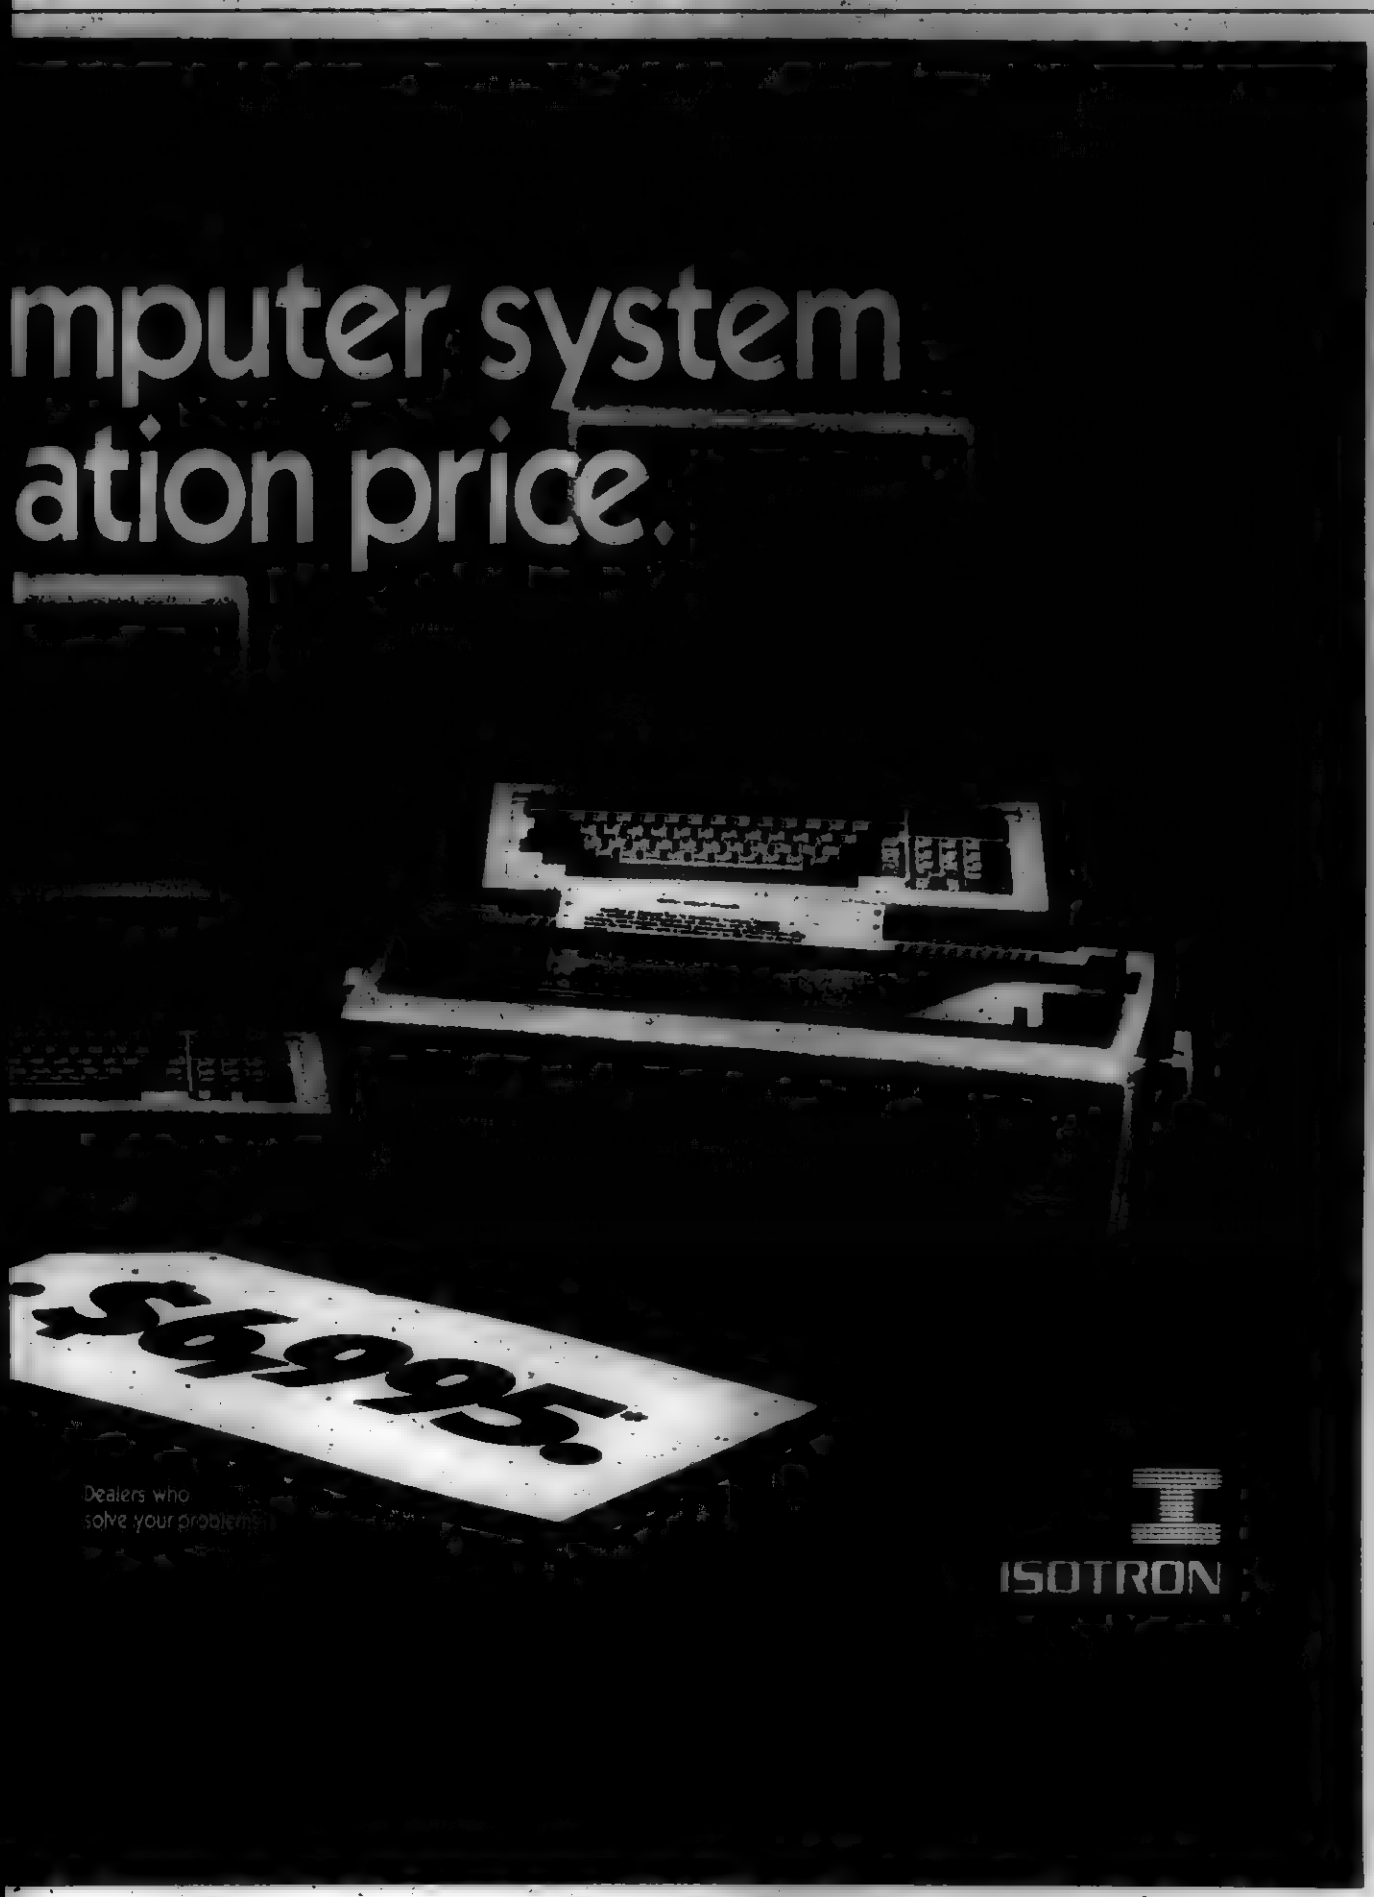
Market leader

Added Mary Ann Sprow, Western Union director of marketing for financial transfer services, "We were told here that technology drives the market. It doesn't. It leads the market." She cited as a misconception some EFT managers' view that the mere existence of a technology will lead customers to demand services.

Sprow linked the future of home banking to services such as videotext — which she said has shown little progress — and to the continued proliferation of home computers. But she and Durkin noted that even with the rapid growth of the personal computer market in recent years, it will take several years for home banking to become viable.

Home banking is another step in the progression that began with ATMs and continued with retail point-of-sale debit cards, now in the start-up phase, according to G. Henry Mundt, sales manager for Cirrus Systems, Inc. But, said Mundt, "I don't think anyone has made a business case for home banking. Maybe they will be able to five or seven years from now."

He, too, linked home banking to the spread of the personal computer, saying, "I think it's going to be that people will have a personal computer that they bought for things like keeping track of recipes, and home banking is going to be just one more thing they can use it for."



EDITORIAL

Eating the wounded

To have a winner in any fight, there must also be a loser. In the case of the bitter struggle for control of Management Assistance, Inc., the number of losers may vastly exceed those few winners who emerge from the dust of battle with fatter pocketbooks.

The victory of arbitrageur Asher Edelman and friends [CW, April 9] has already taken its toll on the health of a company that was hurting to start with. The expense to MAI of fighting the successful takeover attempt — more than $5 million — will translate into a quarterly loss. No doubt, that kind of money would have been better spent on items like research and development than on high-ticket lawyers, in vain no less.

But worse may be coming. MAI's Basic Four computer sales, which comprise more than half of the company's nearly $400 million annual revenues, could be seriously impacted by the cloud now hanging over MAI.

This is exactly what Edelman and friends want, because their plan is to sell off MAI's computer business and emphasize service and maintenance — or sell the entire company. In fact, selling the company is also what a beleaguered Raymond Kurshan, MAI president, intends to do.

This is not to say that Edelman's or Kurshan's intended direction for MAI is not the right one for the long-term vitality of the company and its shareholders. But what of the hundreds of MAI customers in the manufacturing and commercial sectors? Will the dividend of their customer loyalty be a line of machines that dies an early death for want of enhancements and new models?

Let's forget about customer loyalty for a moment and talk about proxy wars, a topic dominating an increasing number of corporate annual meetings at computer firms and others. Essentially, the idea is to parlay a minority stock holding, under 13% in Edelman's case, into de facto corporate control by gaining a majority on the board of directors. This is accomplished by soliciting proxies on behalf of "partnerships" controlled by the lead arbitrageur, such as Edelman, then convincing shareholders that the partnership has their best interests in mind.

But the interests any such partnership holds most dear are, of course, its own, and the rules by which both parties end up playing in such a battle echo the "All's fair in love and war" aphorism. Consider that when MAI filed suit against Edelman in January, seeking injunctive relief in the proxy fight, Edelman was already the subject of a year-old federal injunction obtained by the Securities and Exchange Commission. That injunction required Edelman to refrain from filing false and misleading documents with SEC, the result of Edelman's actions during a previous proxy fight in 1983 with Canal-Randolph Corp. Edelman countered with a suit of his own, charging Kurshan with publishing injurious statements about Edelman in two newspapers.

So what's all this mean? For one thing, the hostile takeover atmosphere is fostering several attempts to adopt antitakeover measures. Burroughs Corp. shareholders recently approved sweeping measures, such as staggering directors' terms and creating a new class of stock, to guard against hostile takeovers.

And why not? It's one thing if a company is being ridden into the ground by incompetent management. It's quite another when a group of takeover sharks swim unannounced into calm waters to practice what they do best — eating the wounded.

LETTERS

Where will middle manager be 10 to 15 years from now?

I was interested in the Special Report article "Middle managers feeling automation ax" [CW, March 26]. It seems to apply almost exclusively to factory automation.

I expect that in the next 10 to 15 years almost all middle managers in all phases — particularly those in larger firms — will no longer be needed. Most or all of the functions between lower levels and upper levels can and will be done by computers.

That leaves us with the question of what will happen to all of those middle managers.

When the smoke has cleared, the former middle manager class will have either fallen back to production level or will have grown to the top levels.

Lesson to be learned: When does warranty begin?

We ran into a problem that might interest *Computerworld*'s readers. One of our remote sites had problems with its terminals, and we determined that the modems were at fault. We called the manufacturer, which informed us that both units would need to be serviced. We wanted to confirm that these units were still under warranty. Both modems were purchased July 1983, with a one-year warranty. We were informed that the warranty began on the date the board was completed by manufacturing. Both boards were dated August 1982. Since the modems had been sitting on the shelf for 11 months before we purchased them, we had essentially lost the warranty.

Superstar trek

LECHT
ON SCIENCE
Charles P. Lecht

Although the number of supercomputers in the U.S. is very small, our need for the powers engendered through their usage is very great. About 100 of the millions of computer systems in America's installed base can qualify as a supercomputer, and as a percentage of its if-sold value, they account for a dismal .1% or less. The elite group includes systems like Cray Research Inc.'s Cray X-MP, Denelcor, Inc.'s Heterogeneous Element Processor and Control Data Corp.'s 2XX systems.

It seems strange that there has been so little investment in the creation of supercomputer systems when the benefits of our doing so are so great. Perhaps the most overriding reason is the most obvious — very few companies can make them; too few people know how to use them.

But talk about return on investment! One better fighter plane design obtained through supercomputer usage can save American taxpayers many times the cost of its discovery — and priceless lives, too. The smallest improvements in safety in the peaceful uses of atomic energy will do no less; through the usage of supercomputers, calamities like Three Mile Island or worse could be avoided. And, unlike other capital layouts, the assets that produced the innovation — the supercomputer, its staff and facilities — remain as good as new, if not better, for the experience. Using the most conservative investment criteria applied by Wall Street's most cautious investors, a supercomputer is a super investment, maybe even better than a TV station or a satellite.

Investment opportunity

As you may surmise, I believe the competent supercomputer companies to be a great investment opportunity. The demand for more supercomputer facilities in government, education and just plain old big business will grow much faster than most analysts think. That the cost of these giants is, in comparison to today's large mainframes, high reflects, among other things, serious supply shortages. I've yet to attend a supercomputer meeting (or any other for that matter) at which anyone has ever convincingly demonstrated the contrary. The long waiting period for Cray's most advanced systems, CDC's underwriting of Electronic Technology Associates and the emergence of Microelectronics Computer Corp., Star Technologies, Inc., Elxsi Corp., Denelcor and other such developments confirm our belief in the commercial viability of supercomputer systems. Our government's deep involvement confirms our belief in their essentiality for our national health and welfare.

Even though a single system may cost four or five times that of today's widely used and largest commercial mainframes, its cost as a percentage of our gross national product has plunged over the past 20 years or so. The Univac Livermore Atomic Research Computer (Larc), yesteryear's superduper computer, costs $30 million dollars each — in 1960 dollars! If you had invested the cost of one Larc at 10% interest compounded per annum, it would have produced $300 million in today's dollars. In comparison, the cost of one Cray X-MP, say $8 million, is an astounding bargain without even considering that it would take thousands of Larcs to equal its megaflop performance.

The meeting held at Salishan Lodge, Gleneden Beach, Ore., was held to explore the means of extending today's supercomputer power through the application of parallel processor technologies, a stunt that, at its foundation, is motivated by shortages in the supercomputer power we need to address today's pressing problems. It is true that other factors, some limiting in the creation of improved performance very large-scale integrated chips and some emanating from the discovery of new computational techniques, would prompt us to investigate parallel processing methodologies anyway. But we know that the results achieved could never fully overcome the additional systems research, development and manufacturing of supercomputers needed to alleviate their shortage significantly. You cannot tie 25 cars together to make an all-purpose tractor-trailer. Anyway, it should come as no surprise that the biggest problems facing our scientific community simply are not solvable by any single method or by one that is well known.

The parallel processing conference at Salishan was an educational and exciting event. The assembled group included such supercomputer superstars as B. Smith of Denelcor, K. Batcher of Goodyear Research, A. Heller of IBM, K. Miura of Fujitsu Ltd. and many other stars known for fantastic achievements in science. The lectures were dynamic, and interest was very high. The intellectual friendship and honest discourse between the members of this group was a pleasure to observe. Experiences like these refresh and energize their participants' minds in a manner you might expect would occur on their emergence from a scientific sauna. Our Department of Energy deserves our praise for sponsoring this meaningful event.

Upon return from the conference, I've had cause to think about America's supercomputer efforts in general and the struggle our senior scientists have had to get these moving, especially those in our government. This group, upon whose shoulders falls the responsibility of most supercomputer usage in America, is too often viewed by our nonscientist public as self-indulgent, if not downright sinful, in its dedication to a science, the tools of which are so expensive and abstract. To those government scientists who forfeited the possibility of ever achieving real wealth because of an unadulterated idealism expressed through persevering service to America and science, these views are particularly saddening. Our praise and encouragement is called for instead. That I find myself in the unaccustomed position of praising anything underscores the magnitude of my empathy with this group. Those of you who regularly read this column know that were the contrary the case, shyness wouldn't have prevented me from expressing it.

Government service in science

I worry about the future of our government service in science. The evident disparity between expense account reimbursements due employees of the government and those outside of it in attending any conference just begins to suggest the gap dividing public service scientists and their private sector cohorts in all areas of technology, from micro to macro systems. Had the Oregon conference been sponsored by private industry, it would have been held in Palm Springs, Calif. Salishan is for the summer. This gives us pause for reflection.

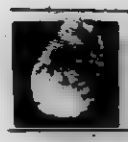
Word processing goals of aspiring writers



HUMAN
CONNECTION
Jack Stone

A few weeks ago, while instructing a class of non-DP professionals in office automation basics, I waxed on rather eloquently and in a prideful way about the capacity of my personal computer speller package to generate a form of a concordance, an alphalist of key words along with their frequencies of occurrence and the associated passages in which the words appeared. I mentioned that my package is early generational in the sense that the processing is automatic (except I am forced to use conventional word processing search techniques to identify the passages).

"Why would anyone care about how many times a particular word appears in some text?" a bright, but outspoken, student asked.

I didn't expect the question because I erroneously thought that everyone was aware of word and content analysis techniques. But I came through with this explanation: If one's material is restricted to routine business correspondence, engineering reports and studies or systems documentation, it is hard to make textual outpourings sparkle. However, if one has more creative leanings and is writing in areas less technically oriented, stylistics play a much more important role.

For example, a useful writing technique is the varied use of synonyms for significant words, an action that reduces repetition and thereby tends to intensify reader interest. It is the concordance that provides the data needed by the author to make the choices.

I went back to class and expanded the answer along these general lines: With the continuing and rapid hardware advances, coupled with dramatically falling costs — particularly mass storage costs — we must recognize that the software and data files floating around these days to aid writers are mere harbingers of things to come.

Capabilities, productivity tools

Some systems capabilities and productivity tools that writers could dearly use at their fingertips and that are not, I hope, idle fantasies, but will be practical and economically justifiable not too far down the technology road, are:

■ Multiple Spelling Lists. A range of optional, user-modifiable word lists supplied by vendors for speller programs that cover areas other than common English words, for example, foreign, geographical, scientific, engineering and biographical words and phrases plus a processing function that allows for temporary concatenation of multiple lists for a specific spelling task.

■ On-Line Dictionary. Impressive gains have already been made in this area, including hyphenation and homonym dictionaries; dictionary probes using wild-card letters to provide entries at the word level; and dictionary lookups to find words similar in spelling to a target word. The next step is the expansion of a word probed by the author into its complete dictionary entry. Information presented at various levels of detail would include: variant spellings and forms; alternative parts of speech and definitions; homographs; prefixes and suffixes; inflected forms; idiomatic phrases; and run-in forms.

■ On-Line Thesaurus. Synonyms and antonyms of the selected word with the detail expansion of the list into complete dictionary definitions.

■ On-Line Grammar Analyzer and Synthesizer. Automatic analysis of sentences and paragraphs to detect errors of structure and punctuation, plus the ability to synthesize alternative forms for the writer's perusal.

System needs to support these capabilities include: permanent storage; a very fast processor, such as a 32-bit plus; a multitasking operating system to perform time-consuming search and analysis tasks in background mode; and an extremely simple user interface to avoid frightening the non-DP-oriented professional writer away from the machine altogether.

Letters to Stone should be addressed to him at P.O. Box 33699, Washington, D.C. 20033.

VIEWPOINT

Relational vs. network/hierarchical DBMS

Examining the issue from a user's point of view

READER'S PLATFORM
Powel Crosley

As pointed out by E.F. Codd and C.J. Date in their Reader's Platform article "The real strengths of relational systems: Two experts review the performance issue" [CW, Feb. 6], the main contention in William H. Inmon's In Depth article "What price relational?" [CW, Nov. 28] is that "poor performance is, in fact, inherent to the relational environment." Codd and Date clarified several of Inmon's statements and primarily concentrated on identifying the strengths of relational systems at the machine and conceptual levels. As an applications developer and data base administrator, there were several practical considerations related to our use of a relational data base management system (DBMS).

Our primary application is an information system for commercial real estate investors accessing a 125M-byte data base using a Digital Equipment Corp. VAX-11/780 32-bit minicomputer. The nature of the commercial real estate investor demands that our application programs be user-friendly, user-flexible and fast. We achieve a high degree of user friendliness through a third-party, terminal-independent, forms management system. User flexibility and acceptable response time are achieved through our relational DBMS.

In his article, Inmon states that the expense of system flexibility is "having to search for data in diverse places."

If a relational query is properly constructed and the data base has been normalized with primary and secondary indexes, searching in diverse places is not a problem.

What may become a problem is retrieving from diverse locations, which can be minimized by using contiguous disk storage and/or spreading the data base over several physical devices. In fact, proper data base design and indexing can reduce some so-called "long-running" activities (for example, highest account balance from the payroll data base where accounts of executives are considered) to "short-running" activities.

In his comparison of demands on system resources, Inmon claims that the typical relational environment will queue short-running activities behind long-running activities. It appears that the assignment of system resources should be attributed to the machine operating system rather than the relational DBMS.

At our installation, on a heavily loaded CPU (greater than 95% utilization), there is no problem with long-running activities superceding short-running activities.

Assuming equal priorities, a simple indexed retrieval executes long before a full data base scan. Obviously, assigning a higher priority to the long-running activity will change the results somewhat, but even then the low-priority, short-running activity beats the long-running activity to completion.

Data base integrity

Another area in which Inmon is in error is his criticism concerning data base integrity. Any process that performs data-sensitive calculations should execute, as a matter of normal procedure, an exclusive lock on the table being utilized. This precludes the possibility of any mid-process change to the table that would invalidate the results. The fact that the results may be out of date because the next process updates the table is a scheduling problem, not a relational DBMS problem.

All DBMS packages deviate somewhat from the pure theoretical constructs on which they are based. Some of Inmon's theoretical concerns may be valid, and the reader should address Codd and Date's article to weigh those aspects further. From a pragmatic, user viewpoint, though, there is no performance penalty in the relational environment if the data base is properly designed and indexed, and applications are similarly optimal in their design. Our commercial real estate investors application would be unable to provide nearly as much user flexibility and speed in a network/hierarchical environment. ‡

Crosley is geographic information systems coordinator for Data Research and Applications, Inc. in Knoxville, Tenn.

TREK from page 31

All our talk about threats to the erosion of America's supercomputer superiority as emanating from abroad may cause us to overlook emerging threats at home inadvertently, for example, discouragement of our future supercomputer scientists from entering our government service — the same government to which the private supercomputer industry has been hawking its need for greater subsidization — by limiting their professional opportunities (as well as income). Sponsorship of congresses like Salishan can go a long way to alleviate this. In the past few years, our government has increased such sponsorship, but this alone will not be enough.

If someone is smart enough to work in the supercomputer field, he may be smart enough to deduce that our government scientists face work that is as demanding as any in the private sector, but is devoid of the stock options, profit sharing and comparable income potential available in our newly emerging supercomputer companies. It follows that with the demand for supercomputer professionals exceeding their supply, our government will find it tough sledding attracting and keeping new superstar supercomputer scientists, who will be inclined to trek to private industry. More incentives will be required, including public recognition for achievements of the kind given private sector scientists who make it big in industry. With our government's role in supercomputer development growing, we must take care to ensure that it has the scientific strength to succeed. Failure to do so will cause our falling behind in the world race to produce supercomputer power, not through improvements abroad, but decay at home.

This is the second in a three-part series.

VIEWPOINT

DP management: coping with personality changes

READER'S PLATFORM
Jim Lowe

To be a good manager in the data processing world, one must have qualities that cannot be found in a textbook. The manager must gain experience through the years by being exposed to a great number of systems, computers and people.

The data processing manager sees and deals with a host of different personalities each day. Not only does he deal with the somewhat unusual personalities of technical people, but the data processing manager must also deal with changes in personalities that come from user departments, peers, upper management, vendors, sales representatives, customer engineers and headhunters.

In fact, personalities can cause one not to see the real issue at hand. In order to get around this problem, the manager must be able to deal with the employee by switching to the personality at hand, that is, each time the employee's personality changes, the manager must recognize the change and deal with the issue accordingly.

Daily personality changes are caused by many different reasons, including job stress, constant deadlines that must be met, personal matters and the lack of upward mobility in one's career.

The data processing department today is the nucleus of the company. The success of the data processing manager depends on how long he can keep the user departments happy, stay within budget, convince upper management to spend money for new hardware and software when needed, maintain a good technical staff and be able to bring systems in on time.

Underlying obstacles

All of the above deals with underlining obstacles — power failure, mistakes of computer operators, the unexpected resignation of a key technical person or a slowdown in development because of a psychological personality change in motivation of your development team — that might surface at any time. Such obstacles have a profound impact on the data processing manager. At this time, the manager must make adjustments and conduct maneuvers that will lead him to recover from the situation.

The goal of a manager in any profession is the same: to do the job that has been defined by the company. How he goes about this with the resources at his disposal will vary from manager to manager and company to company.

If he has the financial backing and the support of upper management, the manager's job becomes much easier, and the goal is more likely to be obtained. However, a variance in any one of these two crucial elements will cause problems.

A proper data processing department is expensive. In itself, the department is a service department. Its production efforts are hidden within the walls of a CPU. Therefore, the end product has far less to do with quantity than it does with the steps necessary to arrive at the results.

The true understanding of such efforts can only be known to people who work in the field of data processing or who have had extensive data processing training or education in the field of data processing. ‡

'Gnosis' project addresses security

In a couple of years, the IBM mainframe operating system arena could begin to get crowded. Coming just a few months after Amdahl Corp.'s confirmation that it is working on an "alternative" to IBM's MVS operating system [CW, Dec. 19], Tymshare, Inc. has acknowledged that it too is planning a security-oriented operating system for the big machines.

Gnosis, as the project is code-named, attacks the soft underbelly that most operating systems expose in the security area. According to Norman Hardy, a senior scientist at Tymshare, conventional operating systems and security procedures still do not protect against unscrupulous programmers who can write hidden procedures into their code that bypasses conventional security. Gnosis is a "capability-based and object-supported" system that essentially shields programs and data from unauthorized access.

Gnosis will pose no threat to MVS, but Tymshare believes it could be popular with firms that provide on-line data bases or time-sharing and with large, multidivisional financial institutions. "This is oriented toward facilities where there are programmers with differing loyalties trying to work together," Hardy said. The product has been under development since 1976, but will probably not be available for another two years, he said. Price and packaging have not been determined.

The problem Gnosis is intended to address most often occurs with programs

Sensible software selection

Techniques offered to enhance the evaluation process

The following article first appeared in ICP Interface Administrative & Accounting, *copyright May 1983.*

By Royce Green
Special to CW

Approaches to software evaluation and selection range from extensive systematic processes to relying on consultants to simple guidelines. Regardless of the approach, however, a few commonsense techniques can strengthen the selection process.

Functions performed by software products affect areas and activities which are central to an operation. The critical nature of the functions and the activities that will be affected should dictate the degree of management participation in the selection process.

If a task force or selection committee is formed to evaluate software, people with the appropriate skills and backgrounds must be included. Additionally, each member of the committee should be given specific responsibility, authority and schedules.

Most software evaluation and selection processes involve some sort of specification development. A prerequisite to this is recognizing and understanding the requirements, including the requirements in the specifications.

For example, if specifications are developed solely on the assumption that a particular system is required, real needs and objectives may be overlooked. If specifications are developed with knowledge of the objectives to be addressed, the specifications will focus more clearly on real needs.

It's also best to avoid an "outside in" approach when developing product specifications, that is, making wish lists from

Ingres/VAX/VMS Version 3.0 boasts greater application generation ability

BERKELEY, Calif. — Relational Technology, Inc. (RTI) has extended the application generation capabilities of its Ingres data base management system (DBMS) in a new release due for shipment this summer.

Ingres/VAX/VMS Version 3.0 includes Applications-By-Forms+ (ABF+) and Query-By-Forms+ (QBF+), two additional tools in RTI's Visual Programming kit that are said virtually to eliminate coding in the creation of applications and query routines. The products are oriented toward end users and are based on fill-in-the-blank forms. Users reportedly can perform queries spanning multiple rows and tables and execute transaction-type query/updates twice as fast as in previous versions of Ingres.

ABF+ lets the user integrate and link modules developed with Ingres' forms editor, query-update tool, report generators and graphics subsystems without coding, an RTI spokesman said. The application is structured as a hierarchy of forms and menus called frames. Applications are built using the frames, and custom code can be inserted using RTI's Operations Specifications Language (OSL).

OSL allows data base access through Ingres' Quel query language and integrates it with forms control. The combination of ABF+ and OSL allows users to build command menus, designate conditional flow

Study: AI may blossom soon if cultivated by commercial market

By Paul Gillin
CW Staff

CAMBRIDGE, Mass. — Artificial intelligence-based systems will become commercially viable sooner than is commonly predicted, growing to as much as a $1.3 billion market by 1988, according to a report recently released by Brattle Research Corp. However, *Artificial Intelligence Computers and Software: Technology and Market Trends* said that such rosy predictions could fall flat if the commercial market fails to invest in the technology.

The study pointed to the use of bit-mapped displays, mouses, windows, icons and object-based programming as technologies that have emerged from AI research and have already had a market impact. In addition, improving price-performance ratios will make Lisp-based processors viable in the near future. Lisp is likely to remain the standard language of AI, the survey stated. Lisp eliminates the need for separate operating systems, applications systems and data base management systems. The report predicted that the market for Lisp machines and pure AI applications will top $1 billion by 1988.

Dedicated Lisp hardware, such as Xerox Corp.'s Dandelion, Symbolics, Inc.'s 3600 and Lisp Machine, Inc.'s Lambda, are generally thought to be the best methods of organizing and presenting AI software; however, they are fairly expensive and of questionable reliability, the report said. Inexpensive 32-bit microprocessors may soon begin to support performance levels comparable to the dedicated machines, but, conversely, most lack adequate software.

There is a great deal of AI research now going on in academic institutions and in government. But this market could become saturated if commercial products do not emerge within a few years, the study said. The authors believe that the commercial success of AI interfaces could soon lead to the development of a breakthrough in a commercial product. But a number of barriers must be overcome first.

For one thing, the machines are comparatively expensive, according to the survey. Another factor is the shortage of programmers who are trained in the complex syntax of an AI language. A third barrier is confusion about what AI really is. Unrealistic expectations about AI's capabilities present the risk that management may overlook immediate opportunities in pursuit of unrealistic goals, the survey stated. A final barrier is the lack of marketing experience available in the AI community.

For now, AI workstations appear viable in three major areas, the study said. The first is as software development tools. AI workstations can improve programmer productivity by a factor of 30 compared to Cobol. The second area is in design, simulation and testing of complex systems and circuits. "This is the way the CAD/CAM [computer-assisted design and manufacturing] market evolved, and it is starting to happen in [the AI] market," the survey said.

Possibly the largest market will be in information management and decision support systems, in which Lisp machines can greatly automate data integration and manipulation. However, the report predicted that the amount of effort required to commercialize these products will make this one of the last markets to develop.

The survey puts forth a best-case and worst-case scenario for AI workstations. Should the technology stay in the domain of specialized research and development, sales will grow from $64.8 million in 1984 to $469 million in 1988. However, if a landmark commercial AI product does appear on the market, sales will grow from $97.5 million in 1984 to $1.3 billion in 1988.

The study costs $5,000 from Brattle Research, Athenaeum House, 215 First St., Cambridge, Mass. 02142.

CFsoftware unveils IBM micro-to-mainframe link

CHICAGO — CFsoftware, Inc. has announced a microcomputer-to-mainframe link package that reportedly connects IBM Personal Computers to IBM mainframes running IBM's CICS teleprocessing monitor.

A spokesman said the PCmainframe package features upload and download file transfer capabilities, data selection and summarization, automatic formatting for spreadsheets, data bases, text and binary data, six levels of security, centralized control and hard-copy and on-line audit trails.

The micro-mainframe link is said to download selected records and fields directly from mainframe files to an IBM Personal Computer, making the data available for use in most popular spreadsheet programs and other micro applications.

The vendor spokesman said many applications on the Personal Computer can share information contained in a central data base, and PCmainframe allows data created or modified on the micro to be uploaded to mainframe data files or special user libraries.

The package's uploading features reportedly also allow sharing of data between Personal Computers, storing of micro-created data for future retrieval and uploading to the mainframe without re-entry of data. Versions of PCmainframe operate under all current IBM operating systems that support CICS, including DOS/VSE, OS/VS1 and MVS, according to the vendor.

PCmainframe is priced at $4,500 per mainframe, including three Personal Computer packages. Each additional Personal Computer package is priced at $200 from CFsoftware, Suite 1010, 151 N. Michigan Ave., Chicago, Ill. 60601.

Oracle offers DBMS version for AT&T 3B20

MENLO PARK, Calif. — Oracle Corp. has introduced a version of its Oracle relational data base management system (DBMS) for AT&T's 3B20 minicomputer under Unix System V.

According to a spokesman, the transport of Oracle to the 3B20 under the Unix System V operating system required modification of only 4% of the software's more than 2,000 modules.

The Oracle relational DBMS is also compatible with IBM's SQL/DS.

Oracle features a set of software development tools, including a screen-oriented interactive application generator, a report writer, a document preparation system and an integrated data dictionary, the vendor said.

Oracle runs on a variety of hardware systems, including IBM mainframes, Digital Equipment Corp. VAX-11 and other minicomputers and a variety of microcomputers, the spokesman said.

The Oracle relational DBMS on the AT&T 3B20 minicomputer is priced at $48,000.

More information on the Oracle DBMS for the AT&T minicomputer is available from Oracle, which is located at 2710 Sand Hill Road, Menlo Park, Calif. 94025.

Cincom unleashes enhanced TIS DBMS

Said to improve Logical User View system

CINCINNATI — Cincom Systems, Inc. has announced an enhanced version of its TIS integrated relational data base management and application support system.

The enhancements to Release 1.5 of TIS reportedly improve the performance of the TIS Logical User View (LUV) system, which insulates programs and users from data structures. Features of Release 1.5 include automatic data integrity control, binding of logical views, global view capabilities, improved directory maintenance facilities and an on-line logical view test utility.

The enhanced version of TIS is said to allow a field within a view to be equated to any number of additional fields within the same view. When a program updates a field, all identical fields within the view are updated automatically by LUV, a spokesman said. In addition, performance improvements in the TIS DBMS component include record holding, "quiet" processing, "commit" overlap, searching the record-holding queue, buffer flushing, task dispatching and Event Control Block list binding.

The spokesman said that TIS uses between 18% and 26% less CPU time than Cincom's Total DBMS Version 8.1 when performing identical functions.

TIS Release 1.5 runs on IBM processors under IBM's DOS, OS and MVS operating systems. TIS with Cincom's Data Communications Support system can be purchased for $250,180 or leased for $10,424 monthly. TIS with IBM CICS support is priced at $180,780. Monthly leases are available for $7,532.

Cincom Systems is located at 2300 Montana Ave., Cincinnati, Ohio 45211.

Goal Systems' security system for IBM CICS touts adaptability to changing environments

COLUMBUS, Ohio — Goal Systems International, Inc. has announced an IBM CICS security system that can be customized and quickly modified to meet changing environments.

Alert/CICS provides security at the transaction, file, program and map levels, with definitions at the terminal, operator and system levels. Features include random generation and automatic distribution of passwords; security for IBM DL/1 data bases; security definitions by time of day and day of week; automatic clearing and sign-off of terminals after a specified period of time; and audit trail logging facilities, which can be displayed through both batch and on-line reports.

System resource security controls transactions and the inquiry and update of files. Terminal and operator resource security identifies who is using the system and controls and records any unauthorized activity, a spokesman said. User exits are provided to allow custom tailoring, the vendor said.

Available immediately, the product is priced at $12,180 for a permanent license or $305/mo for a three-year renewable license under IBM's OS operating system. Under IBM's DOS, the prices are $9,100 for a permanent license or $228/mo for a three-year renewable license.

More information is available from Goal Systems, located at 5455 N. High St., Columbus, Ohio 43214.

TSO USERS

- Split-Screen facility (Two fully-active screens)
- Customer-defined exit facility (Controls all FSE+ functions)
- FSE+ tuning parameters (Optimize performance)
- Structured menus for new users
- Command oriented for experienced users
- MVS 3.8, SP and XA support
- Free trial period

Honeywell licensed to market Oracle DBMS for DPS 6 series

WALTHAM, Mass. — Honeywell, Inc. and Oracle Corp. have signed a nonexclusive worldwide license agreement under which Honeywell will offer the Oracle relational data base management system (DBMS) on Honeywell's DPS 6 family of microcomputer, minicomputer and superminicomputer systems.

The agreement also contains provisions for Honeywell to market Oracle on its large-scale systems, including the DPS 7, DPS 8, Level/66, Level/68 and DPS 88 mainframes. A Honeywell spokesman said the DBMS probably would be made available on the large systems; however, the spokesman would not offer pricing or availability information on those models.

Oracle is compatible with IBM's SQL/DS query language and is capable of running on a wide range of hardware.

Software development tools.

Software development tools included with Oracle are a screen-oriented interactive application generator, report writer, document preparation system and integrated data dictionary, according to the vendor spokesman.

Final prices have not been set, but Oracle is expected to cost less than $1,000 on the microprocessor-based Honeywell systems and less than $25,000 on the superminis, the spokesman said.

More information is available from Honeywell, which is located at 200 Smith St., Waltham, Mass. 02154.

Coping with change with EPILOG/MVS

Before EPILOG/MVS, performance information was often hidden in piles of printouts and pages of reports.

With EPILOG/MVS, an Installation Performance Management System from Candle, you can find the answers to questions about MVS performance: user response…paging and swapping…the System Resource Manager (SRM)…I/O contention…tuning measures…hardware bottlenecks…and more.

The powerful Change Analysis feature of EPILOG/MVS will help you to better understand the results of system changes. For example, Figure 1 is an EPILOG/MVS display which shows that average TSO trivial response time was over five seconds for a one-week period. The main bottleneck was paging, shown by the WAIT FOR LOCAL PAGE value of 3.65 seconds (about 65% of response time). In other words, about 65% of TSO response time was caused by paging.

A high-speed paging device was then installed in order to improve TSO performance. Figure 2 is another EPILOG/MVS display which compares TSO response time before and after installing the high-speed paging device.

Note: Both displays were created in a matter of seconds, using simple commands that took less than a minute to enter.

If your data center has frequent hardware or software changes (new applications, more users, tuning measures, new operating system releases, CPU upgrades, more main memory, new disks, etc.), the Degradation Analysis feature of EPILOG/MVS can quickly and simply show you the impact

Figure 1. *EPILOG analysis of TSO trivial response time.*

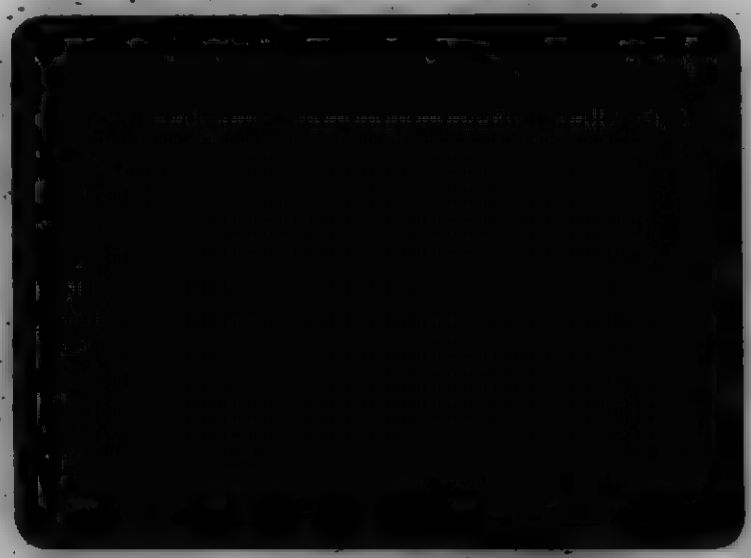

Figure 2. *EPILOG analysis of TSO trivial response time before and after installation of a high-speed paging device.*

of those changes on end-user service and its resource analysis can show you the effect on resources. In this way you can verify that your investment—in time or money or both—is producing the intended results. Or, if not, you can modify your actions and use EPILOG/MVS to check the results again.

Change—almost constant change—is becoming a way of life in a modern data center. With EPILOG/MVS you can be confident of achieving the results you want.

SOFTWARE & SERVICES

SYSTEMS SOFTWARE

GROUP OPERATIONS, INC.
Superstructure enhancements

Group Operations, Inc. has announced enhancements to its Superstructure package.

Superstructure is said to convert automatically "spaghetti" code Cobol into structured Cobol. The enhanced package now supports IBM CICS command-level and CICS macro-level and Cullinet Software, Inc. IDMS and IDMS/DC Cobol programs. The system is said to be a cost-effective alternative to rewriting manually unstructured programs.

Superstructure is available for IBM and compatible processors under all IBM OS and OS/VS operating systems. Superstructure prices range from $28,000 to $45,000.

Group Operations, Suite 800, 1110 Vermont Ave. N.W., Washington, D.C. 20005.

HONEYWELL, INC.
Syntax-Directed Editor

Honeywell, Inc. has introduced the Syntax-Directed Editor (SDE), which provides an interactive programming environment for writing, editing and executing Cobol source programs.

According to the vendor, the SDE supports the creation of Cobol 74 programs in Honeywell's Gcos 8 environment on its large-scale computer systems.

The shorthand method of the SDE reduces the amount of code that a programmer must enter and checks for format and syntax errors, the company said.

The release of the SDE for Cobol is set for July. It will be available for a monthly license fee of $225, with a minimum of 12 months.

Honeywell, P.O. Box 2000/A-79, Phoenix, Ariz. 85066.

RAXCO, INC.
Rabbit-6

Raxco, Inc. has introduced the Rabbit-6 image monitoring system designed for resource management on Digital Equipment Corp. VAX-11/750 and 11/780 computers.

With Rabbit-6, a system designer can locate high-resource consumption areas within a program, Raxco said. A histogram display indicates which routine and which lines in a routine are consuming excessive system resources by noting the amount of time spent in the various scheduling states and processor modes for sampled images. The system designer can then optimize the specified modules or subroutines to improve the program and system performance, the company explained.

Both the sampling rate and display parameter may be dynamically modified. Rabbit-6 does not require a sysgen or system modification, Raxco noted.

The Rabbit-6 image monitoring system is available for a purchase price of $3,995, plus options, or may be leased for $200/mo.

Raxco, 1370 Piccard Drive, Rockville, Md. 20850.

SPECIALIZED SOFTWARE, INC.
Table Management System

Specialized Software, Inc. has released an enhanced version of its Table Management System that operates on IBM mainframe computers using IBM's CICS or IMS/DC teleprocessing monitors.

This system is said to enable users to define files or tables with a simplified interactive procedure. Immediately after defining a file, the user can begin accessing it on-line with a generalized file maintenance program that allows add, change, delete and browse functions.

On-line file maintenance screens can also be customized by using the optional screen painting facility, which allows nontechnical users to design the appearance of the screen dynamically, the company said.

Initial license fee for the OS version is $25,000, with an additional $10,000 for the screen painting option. The DOS version is $15,000, plus $5,000 for screen painting.

Specialized Software, 207 Union St., South Natick, Mass. 01760.

JEFFREY J. SILDEN SOFTWARE
Laser, Tanfer and Filer

Jeffrey J. Silden Software has announced three pack-

The Northern Telecom system:
A benchmark in batch processing that keeps getting better.

Northern Telecom batch processing systems have proven themselves, in more than a decade of use in a variety of applications, to be among the most reliable, practical, cost-effective systems ever developed. They deliver more throughput per dollar than any competitive system.

Now, as solid evidence of our commitment to batch processing, we're improving these already-successful systems for even more productivity. For instance, we're introducing a new high-speed band printer with changeable type. Operating now with IBM's SNA, we've also added new, low-cost distributed data processing capabilities for more system versatility, and to provide for future growth toward the integrated office.

We're back

SOFTWARE & SERVICES

ages for IBM's System/34 minicomputer.

Laser reportedly traces, spots and corrects logical-device address errors interactively. It costs $185.

Tenfor allows the user to sign off idle terminals from the system console in less than five seconds, the vendor said.

Tenfor reportedly costs $185.

Pilot is said to provide users with the capability to vary off and on communications lines and/or terminals from a procedure.

Combining the power of Tenfor and Pilot allows dedicated procedures to be run completely unattended, eliminating the need for an overtime operator, the vendor claimed.

Pilot costs $225, the vendor said.

Jeffrey J. Sildon Software, Suite 100, 21500 Calif. St., Woodland Hills, Calif. 91367.

3M OFFICE SYSTEMS DIVISION
Document management packages

3M Office Systems Division has introduced two software packages for document retrieval and management for users of IBM 4900 systems.

One package reportedly is designed for the IBM 4900 with the IBM DOS/VSE operating system and IBM's CICS. The other package also utilizes the IBM 4300 and CICS, but requires IBM's OS/MVS operating system.

The vendor claimed that the software can reduce index and retrieval time by up to 90%, compared with conventional document-based programs. The speedier retrieval is made possible by a procedure in which a master record file is called up on a CRT screen. One keystroke then provides a list of all the documents associated with that master record, according to the vendor.

The packages are priced at $35,000.

3M Office Systems Division, P.O. Box 33600, St. Paul, Minn. 55133.

HONEYWELL, INC.
Multics Release 10.2

Honeywell, Inc. has introduced an update to its Multics operating system for the DPS 8M line of large-scale computers.

According to the vendor, features of the new release include a report writer and enhancements to the Fortran language processor and communications software.

An improvement to the video terminal manager helps simplify the ability to generate and interface menus. A new tutorial system has been added to assist new users with basic Multics functions.

Release 10.2 incorporates a report writer for the Logical Inquiry and Update System (Linus), which reportedly enables users to produce ad hoc or fully formatted reports from a relational database.

Multics is a bundled operating system with Honeywell mainframes.

Linus is available for $560 a month. The Multics Fortran language processor licenses for $200 a month.

The remainder of the enhancements are distributed free of charge as part of the Multics update.

Honeywell, P.O. Box 8000/A-79, Phoenix, Ariz. 85066.

CUSTOMIZED DATA SERVICES
The Disk Manager

Customized Data Services has introduced a file handling package, reportedly designed to minimize the amount of overallocated file space on hard disk devices, for use with IBM System/34 and System/36 small business computers.

The Disk Manager determines the user files and libraries resident on disk and calculates whether or not their space requirements have been allocated to achieve the maximum efficiency on their system, according to a spokesman.

All user files selected as overallocated, except those that the user specifies to be bypassed, are then rebuilt to reflect the most efficient use of disk for that data set.

The package, priced at $275, includes a starting clock function that reportedly allows the user to set a time for job initialization or to incorporate the job into any user procedure.

Customized Data Services, 1430 Olive St., St. Louis, Mo. 63103.

AIM TECHNOLOGY
Benchmark Suite II

Aim Technology has announced Benchmark Suite II, its second Unix benchmark product. The product is intended for multiple-purchase buyers to evaluate how various Unix systems perform in specific processing environments, according to the vendor.

Suite II is said to allow the evaluator to set parameters to weigh the benchmark for particular applications, such as word processing, spreadsheets, compiling and editing and computer-aided design. It can reportedly be used on any Unix system. The product consists of two programs written in C.

Suite II is available for $2,575.

Aim, Suite 190, 3333 Bowers Ave., Santa Clara, Calif. 95051.

ABLE COMPUTER, INC.
Easyway/E Decnet

Able Computer, Inc. has announced a software package that will allow its Easyway/E Unibus network controller to function as a valid device in either Digital Equipment Corp. Decnet or Parq Systems Ethernet local-area networks.

The Easyway/E Decnet interface package reportedly consists of an operating system driver to interface Decnet and non-Decnet users to Easyway/E and an application program to configure and initialize the device driver.

The Easyway/E itself reportedly connects DEC VAX-11 or PDP-11 computer systems to an Ethernet/IEEE 802.3 local-area network. It is said to contain the Unibus interface, data link layer interface and the transport protocol.

The Easyway/E interface software package is priced at $500 for the first VAX-11 and $250 for each additional VAX-11.

Able Computer, 1732 Reynolds Ave., Irvine, Calif. 92714.

ABLE COMPUTER, INC.
RSX-11M sysgen patch

Able Computer, Inc. has announced a sysgen patch to Digital Equipment Corp.'s RSX-11M operating system Version 4.1, which provides extended support for Able's Enable/34 controllers.

The patch streamlines usage and implements peripheral control features previously not available to users, a spokesman said. The new features include support for DEC's Decnet, device commons, connect to interrupts and cluster libraries.

The price for the software patch is $500.

Able Computer, 1732 Reynolds Ave., Irvine, Calif. 92714.

BOSTON SYSTEMS OFFICE
CY65XX

Boston Systems Office has introduced a cross-assembler that allows programmers to write for 65 series microprocessors while working on the Digital Equipment Corp. VAX-11, PDP-11 and Micro-11 computers.

The cross-assembler, called CY65XX, includes a high-speed linker and a librarian. The 65 series microprocessors — from Rockwell International Corp., Synertek, Inc. and NCR Corp. — are based on the 6502 microprocessor.

CY65XX also reportedly features commands that add more than 25 instructions to the standard 6502 instruction set. It is available for the DEC PDP-11 series and the Micro-11 in a price range from $1,000 to $2,000. It is also available for all DEC VAX-11 model computers for $2,000.

Boston Systems Office, 469 Moody St., Waltham, Mass. 02154.

APPLICATION PACKAGES

MEGATEK CORP.
Template Version 4.0

Megatek Corp. has announced Version 4.0 of its Template interactive graphics software system, which features an Escape interface.

Template is said to be a three-dimensional, computer-independent graphics and data display subroutine library that supports more than 125 graphics devices from dumb terminals to workstations on 32-bit or larger processors.

The subroutines can be used to create, display, modify and save graphics information for scientific and engineering applications, a spokesman said.

The new version of Template reportedly includes 24 user-callable routines.

Version 4.0 provides full upward compatibility for Template Version 3.0 applications programs, the vendor said.

It also includes the Escape interface, which enables users to access device-dependent features of a display device not supported by Template, and it offers user-defined segment clip boundaries, the vendor spokesman said.

Version 4.0 also allows enhanced device-independent display surface definition and provides logical file name support for user files and extended postprocessing capability, the vendor said.

For supermicrocomputers, the system is priced at $6,000; for minicomputers, it is priced at $25,000; and for mainframes, Template is priced at $32,000, according to a vendor spokesman.

Megatek, 9605 Scranton Road, San Diego, Calif. 92121.

Good news for companies that had to sacrifice quality for price!

On-Line Software will credit you 110% of the purchase price you paid for Computer Associates' E-Z Test when you upgrade to InterTest.®

It's no accident the industry has recognized InterTest® as the premium product for testing and debugging. On-Line Software has always been dedicated to maintaining high quality standards in the software industry. And we feel you shouldn't have to settle for anything less. So On-Line Software is giving you an opportunity to get the quality you want without losing out on the investment you already made. For a limited time, On-Line Software will credit you 110% of the purchase price paid for Computer Associates' E-Z Test towards your purchase of InterTest. To qualify for this offer you had to be an E-Z Test user prior to this advertisement and must purchase InterTest before May 31, 1984.

When you buy InterTest, you'll not only get the industry standard for CICS testing and debugging, but also a way to increase productivity by 46%*. Join the 1400 users of InterTest. Simply show us proof of purchase for your Computer Associates' package. You can even keep your copy of Computer Associates E-Z Test. We don't want it and quite frankly, we can't imagine who would.

Contact On-Line Software International today at 800-526-0272, about InterTest. You'll be able to "fly" through CICS testing and you'll be traveling first class.

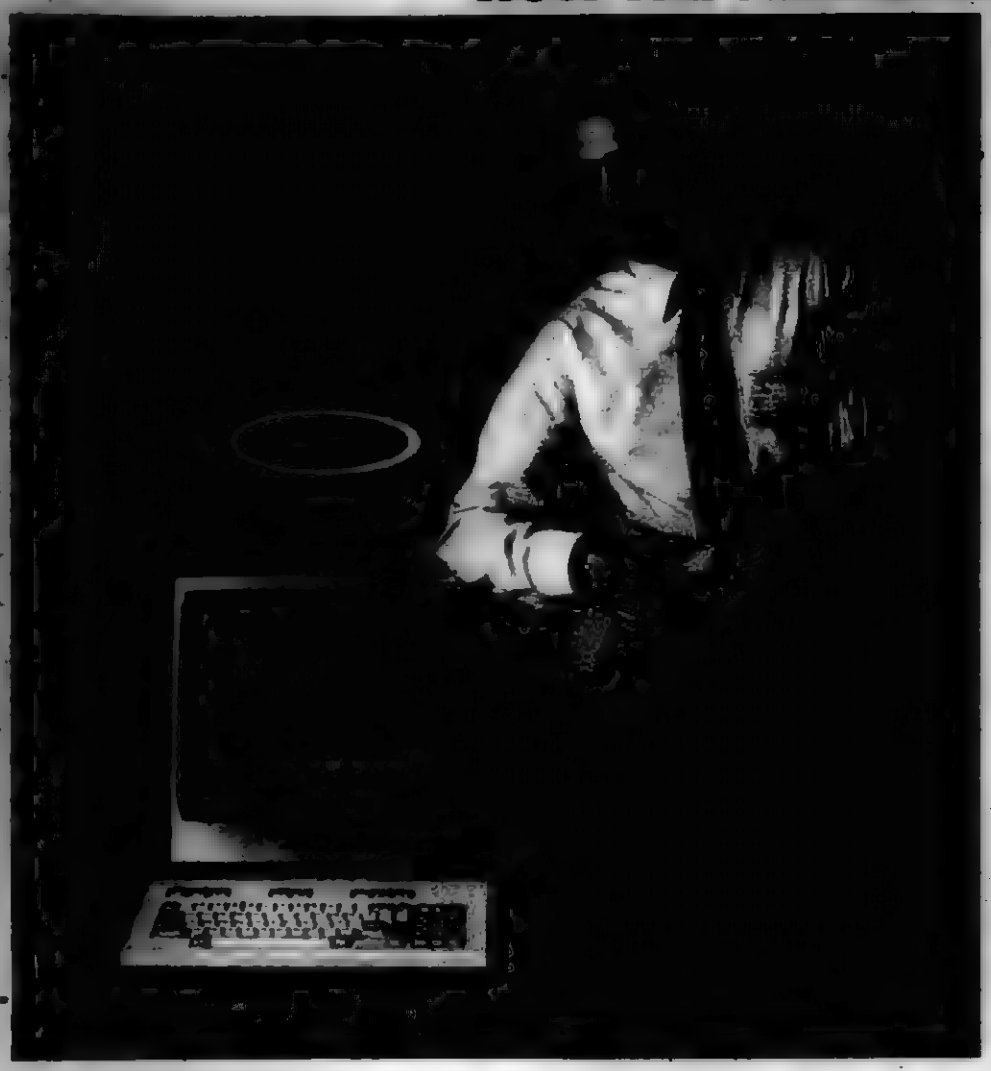
HOW THE TERMINALS THAT GIVE YOU SO FEW PROBLEMS CAN WIND UP GIVING YOU NONE AT ALL.



While we at Teletype Corporation like to talk about our terminals' remarkable record for reliability, we have to admit that every once in a while you just might have a problem with one.

But if you contract with Teletype's Product Service Organization, getting good service is no problem at all. That's because no one can service our full line of CRTs and teleprinters as well as our service technicians. Each one of them is a company-trained, job tested professional who must continually meet our expectations—and yours.

Help is never more than a phone call away since our technicians are on-call 24 hours a day, 7 days a week. And with our network of 100 offices nationwide, we're able to provide fast response time, even to remote areas. You can contract with us for response times as low as 2 hours, or less, as your needs dictate.

But at Teletype, we feel there's something more important than fast response time. And that's fast restoral. So when our technicians call on you, they'll have the necessary test equipment and original Teletype® parts to get your terminals up and running in no time flat.

We'll even help solve problems before they occur with scheduled preventative maintenance. You can also choose our installation service option that includes everything from getting your terminals on-line to user orientation. It's all a part of our Full Service Maintenance Agreement.

So to keep your problems from becoming big problems, write Teletype Corporation Product Service Organization, 2330 Eastern Ave., Dept. 2800-A Elk Grove Village, IL 60007. Or call toll free at 800-323-4226, ext. 300. (In Illinois, 1 800 942-4192, ext. 300.)

ADP NETWORK SERVICES, INC.
Apecs/8000

ADP Network Services, Inc. has announced an integrated project management system for processors ranging from supermicrocomputers to mainframes under the Unix operating system.

The Apecs/8000 (ADP Project Evaluation and Control System) package is said to incorporate a relational data base management system (DBMS) that provides a collection of data drawn upon for all calculations, reports and graphs. The system includes earned value analysis, critical path analysis, application building techniques, work breakdown, organization structure consolidation and a range of data entry screens, report writing and graphics capabilities.

The package is said to summarize information to different levels of detail as defined by organization, work breakdown, accounting or other management structures. The results can be reported for analysis or displayed graphically to show status.

The mainframe version of Apecs/8000 is priced at $150,000.

ADP Network Services, 175 Jackson Plaza, Ann Arbor, Mich. 48106.

DATA PROCESSING DESIGN, INC.
IB Graph

Data Processing Design, Inc.'s (DPD) IB Graph, a menu-oriented business graphics software package for the Digital Equipment Corp. PDP-11 systems, is now available for use on DEC's VAX-11 computer systems.

IB Graph includes all the features in the previous DEC RSTS/E version, plus support of DEC VT200 terminals and the Tektronix, Inc. 4105 terminal and 4695 plotter, a spokesman said.

IB Graph is implemented in native mode using Macro-32 and VAX Basic for VAX/VMS. According to DPD, it can be used on any valid VAX/VMS configuration version 3.5 or later, with a working-set size of 200 pages and at least 2,000 free blocks of disk space.

With IB Graph, nontechnical users can create bar, line and pie charts on a variety of graphics output devices.

The price for IB Graph for users operating under VAX/VMS is $7,500 for the 11/730 and 11/725 and $9,500 for the 11/750 and 11/780. It is distributed on magnetic tape compatible with 9-track, 800- or 1,600-bit/in. drives and most DEC removable media disks.

Data Processing Design, 1400 N. Brasher, Anaheim, Calif. 92807.

THETA BUSINESS SYSTEMS
RSX upgrades

Theta Business Systems has released several upgraded versions of its RSX Accounting Packages for Digital Equipment Corp. RSX-11 operating systems.

The new features include added support for more than 10 terminals, faster times between screens and an option allowing the user to choose either the screen or the printer when creating reports. The printer can be spooled or not, allowing a printer to be directly attached to a terminal. These options are individually setable for each terminal when installing the system.

The accounting systems are all written in Pascal and include general ledger, accounts payable, order entry with inventory control, billing and files analysis and payroll. The new RSX releases are available for $1,495 per accounting system.

Also announced was a Digital Equipment Corp. VAX-11 Pascal version of the accounts payable, accounts receivable, general ledger and payroll systems. The software is priced at $2,500 per accounting system.

In addition, a Digital Research, Inc. CP/M 86 version of the Pascal Accounting Software has been released, configured for the IBM Personal Computer XT, the DEC Rainbow 100+ and other compatible microcomputer systems. All accounting packages are offered. The business packages have been priced at $595 per accounting system.

Theta Business Systems, Suite 106, 1110 Sonora Ave., Glendale, Calif. 91201.

DATA BASE MANAGEMENT SERVICES

MICHAELS, ROSS & COLE LTD.
MRC-Technician Release 2.0

Michaels, Ross & Cole Ltd. (MRC) has announced Release 2.0 of its MRC-Technician relational data base management system and productivity aid designed for the IBM System/36.

The vendor said MRC-Technician allows users to view and modify any information in the data base, regardless of how it is stored. It also allows users to create new physical files, reports and file maintenance programs and to download information to personal computers, MRC said.

Other features of MRC-Technician include help key documentation, menu-driven operation, multilevel security, multiple retrievals, relational file joining, single or multimember file capability, unlimited sequencing and total levels, Boolean selection criteria, summing and averaging at total levels, free format calculation definition, output device control and report modification.

Part of the modular MRC-Query series, the MRC-Technician module is

Continued on page 59

So you'd like to add the flexibility of a popular personal computer to the power of your WANG 2200. But you don't want to spend $10,000 to do it.

IF YOU OWN A WANG 2200, YOU JUST SAVED THOUSANDS OF DOLLARS.

What if you could get that personal computer – say an Apple IIe or an IBM XT – for thousands less than you'd expect to pay. Plus a hard disk and printer at no additional cost. And you could run just about any software package on the market today?

Interested? If you could get all of this and pay only $1,995, you'd be standing in a long line to buy one. Well, forget about that line. You've already got almost everthing you need. In fact, you *don't* need another computer...you *don't* need another hard disk...you *don't* need another printer...and you *surely don't* need to spend another $10,000.

All you need is Micro-Bridge 80, a plug-in board that allows any terminal on your WANG 2200 system to act like a CP/M-based personal computer. This revolutionary new product is the most economical way to expand your 2200 system without buying additional

computers and peripheral equipment. And it costs just a fraction of what you'd pay for a popular personal computer.

Choose the software that's best for you. With Micro-Bridge 80, you don't have to compromise any more. Now you can choose the software that works best for you...software that's easy to use or software with sophisticated features designed to fit your specific requirements. With over 2,000 CP/M programs to choose from, you can design a system that works for you. Powerful software applications that others have been using for years are now available to you. Like dBASE II™, Supercalc, WORDSTAR™, the Peachtree Accounting Series, and many, many others. And to get you started in the right direction, we've got a bonus for you.

Free CP/M operating system and Microsoft's Multiplan! Of course you get a copy of the CP/M operating system (Version 2.2). But that's not all. You also receive a copy of Microsoft's Multiplan spreadsheet. This best-selling, easy-to-use package was voted Software Of The Year by *Infoworld* magazine, which is why we include a copy of it with every Micro-Bridge 80...we want you to start off with the best.

Remember, CP/M 2.2 and Multiplan are included at *no extra charge* with your purchase of Micro-Bridge 80.

Communications made simple. Micro-Bridge 80 has two serial (RS-232) communication ports that make it easy to communicate with public data bases like The Source and CompuServe. It's not only easy, it's fast, because Micro-Bridge 80 communicates directly with on-line services. There's no need to tie up the Z200's CPU with communications protocols and log-on procedures.

Simple and easy to use. When you want to use CP/M, just type in a single command on your WANG terminal keyboard, and Micro-Bridge 80 turns control over to CP/M. That's all there is to it. And Micro-Bridge 80 doesn't interfere with normal WANG 2200 operations. In fact, on multi-user systems you can run CP/M at one terminal while someone else runs WANG software at another terminal on the system.

Easy to install. Anyone can install Micro-Bridge 80 easily in 15 minutes. No special tools are needed. No technical expertise. Simply remove the I/O panel cover of your 2200 and slip Micro-Bridge 80 into an empty slot. No other hardware alterations are necessary.

Order your Micro-Bridge 80 today and begin running CP/M software on your 2200 tomorrow.

Micro-Bridge 80 is not a promise for the future...it's fully tested and ready for shipment *today.*

Order your Micro-Bridge 80 package today and start using the CP/M software you've needed for years. For more information concerning Micro-Bridge 80, or for the location of the Micro-Bridge 80 dealer nearest you, just call us toll-free and ask for Micro-Bridge.

The entire Micro-Bridge 80 package sells for $1,995 and includes:

- Micro-Bridge 80 circuit board
- Installation & operating instructions
- CP/M 2.2 operating system
- Multiplan spreadsheet software
- 90 day limited warranty on parts & labor

‡Options hardware maintenance and warranty enhancement programs available. Ask for details when you call.

LANGUAGES

TARTAN LABORATORIES, INC.
C and Modula-2 compilers

Tartan Laboratories, Inc. has announced C and Modula-2 language compilers for Digital Equipment Corp. VAX-11 processors and National Semiconductor Corp. 16032-based Unix systems.

The compilers are said to provide optimized code while allowing program portability across different architectures.

The compilers' error diagnostics not only provide a line number and cryptic phrase for an error message, but also display the incorrect line and the ones surrounding it for context, point to the error and explain the problem and how the compiler attempts to recover from it, a vendor spokesman said.

Each compiler reportedly incorporates a tool called the Production Quality Compiler. This takes machine and language definitions and produces a compiler for specific languages on specific machines, the spokesman said.

The C and Modula-2 versions for VAX/Unix systems are priced at $2,000.

Versions for 16032-based Unix systems are priced at $1,000 each, the vendor said.

Tartan Laboratories, 477 Melwood Ave., Pittsburgh, Pa. 15213.

CLINE, INC.
CEnglish Compiler

CLine, Inc. has announced the CEnglish Compiler, a C language compiler for use with the company's CEnglish fourth-generation language under the Unix operating system.

According to a spokesman, the CEnglish Compiler is a stand-alone program that can be invoked through CLine's Application Workbench — a command-oriented development environment — or from a command line of the host operating system. The compiler provides for file and macro expansion, semantic and syntactic error checking and data typing with implicit conversion.

The spokesman said the default action of the CEnglish Compiler is to generate an executable version of a specified CEnglish source file, and the compiled C programs have the features of a standard C program, including speed and efficiency.

The microcomputer version of the CEnglish Compiler is priced at $300 for the first user. The minicomputer version is priced between $4,000 and $10,000, and the mainframe version is priced between $15,000 and $30,000, depending on the host processor.

CLine, Portsmouth Parade, Portsmouth, N.H. 03801.

SIGNETICS CORP.
C cross-compiler

Signetics Corp. has announced a C language cross-compiler that allows routines written in C to be combined or linked with routines written in the Signetics SC68000 macro assembler.

A vendor spokesman said the cross-compiler is designed for system engineers developing products based upon Signetics' SC68000 16- and 32-bit microprocessor family. The cross-compiler reportedly allows users to create programs in the most appropriate language and to manipulate hardware via the program's linking capability.

The system is said to conform to Version 7 of Unix C and to produce assembler code.

The operating environment is based upon any Digital Equipment Corp. VAX-11 processor.

The Signetics C programming language cross-compiler is available immediately at $3,400, including the C cross-compiler and the SC68000 macro assembler on ½-in. magnetic tape, the vendor said.

Signetics, P.O. Box 409, 811 E. Arques Ave., Sunnyvale, Calif. 94086.

REMOTE COMPUTING SERVICES

COMPUSERVE, INC.
TWA's Fare available

Compuserve, Inc. and Trans World Airlines (TWA) have announced that TWA's automated reservation system will now be available to subscribers of the Compuserve information service.

Fare includes flight schedules serving approximately 100,000 pairs of cities for every published airline schedule in the world, according to a spokesman.

Micro owners who subscribe to Compuserve can use the service to book reservations and arrange for tickets to be issued by a travel agency, through the mail or at any participating airline ticket office.

The reservation system will be available on both the vendor's Executive and Consumer Information Services beginning Oct. 1, the spokesman said. User costs are estimated to range from $20 to $40 per hour.

Compuserve, P.O. Box 20212, 5000 Arlington Centre Blvd., Columbus, Ohio 43220.

MITRON'S STD 1600 Simplifies Data Transfer By Communicating Off-Line Tape-To-Tape

Mitron's STD 1600 provides an efficient method for sending and receiving data anywhere in the world. STD 1600s communicate with each other and with other companies' bisynchronous terminals and computers.

The STD 1600 solves machine compatibility problems. It transfers data reliably without mailing tapes. It can communicate off-line to relieve an overworked computer.

STD 1600s transfer data at speeds up to 56KB. Double-buffering eliminates delays caused by read/write cycle times.

The STD 1600 can be leased or purchased.

STD 1600 features:
- Easy-to-install
- Needs no software
- Data rates to 56KB
- RS-232 or V.35
- Dial-up or private line
- Multiplexers
- 800 or 1600 bpi
- 1200' or 2400' reel sizes
- Bisynchronous protocol
- Transparent or non-transparent
- Space compression
- Variable size records to 16K
- Labels and multiple files

STD 1600 options:
- Autodialing
- Asynchronous
- Code conversion
- Modem eliminator

Compare the price and performance of the STD 1600 with your present tape-to-tape system. Call Mitron to arrange a live test with your tapes.

Since 1969, Mitron's magnetic tape systems have been used in a wide variety of data communications applications. Let one of our Applications Engineers explain how you can connect the Mitron STD 1600 to your system or data communication network. Call 800-638-9665. (In Maryland, call 301-992-7700.)

ent service that reportedly permits electronic transmission of hospital chargeback reconciliations between pharmaceutical manufacturers and wholesalers.

The feature is designed to improve cash flow for wholesalers dealing with hospital customers who get discounted prices from manufacturers in exchange for volume purchases.

With Orderset, manufacturers can electronically transmit chargeback reconciliation in National Wholesale Druggists' Association-approved formats, and with a single transmission, one or more reconciliations can be sent to wholesalers, according to a spokesman.

The Orderset service is available at a cost of 1 cent per record sent or received.

Information General, 1651 Northwest Professional Plaza, Columbus, Ohio 43220.

LITTON SYSTEMS, INC.
Computer graphics service

Litton Systems, Inc.'s Mellonics Information Center has introduced a high-resolution business and presentation graphics service that supports IBM's Graphical Data Display Manager computer graphics programs for IBM mainframes.

The price of the service is based on computer resource units on the time-sharing network.

The standard rate for interactive work is $2.70 per computer resource unit, with lower rates available during off-peak hours, according to the vendor.

Mellonics Information Center, 6701 Variel Ave., Canoga Park, Calif. 91303.

ON-LINE DATA BASES

DATA RESOURCES, INC.
GML CORP.
Computer Specs

Data Resources, Inc. and GML Corp. have introduced software that reportedly enables users to access 11 data bases containing detailed technical specifications of computer industry products.

The Computer Specs data bases contain specifications, characteristics, prices and applications data on more than 1,600 computer hardware companies covering more than 7,000 products. The data bases also contain information from 1,200 producers about 6,000 microcomputer software packages, including prices, functions, markets, descriptions and hardware compatibility.

The data bases reportedly can be accessed through a local telephone number using the vendor's software, any microcomputer or Ascii-compatible terminal and a dial-up modem.

The hardware data bases include information on mainframe, minicomputer and microcomputer systems, disk units, printers, terminals and magnetic tape and cassette units.

The software needed to access the data bases is priced at $850.

Data Resources, 24 Hartwell Ave., Lexington, Mass. 02173.

INGRES from page 41

control between frames, transfer data between frames, manipulate the data in the fields of the form and trigger data base access.

QBF+ uses a full screen form that acts as a window into the data base and allows users to view, query and update data in multiple rows and tables at the same time. Previously, users could only view and manipulate one row at a time in a single table, the spokesman said. Users enter any combination of values and operators, and QBF+ automatically generates a Quel query to retrieve and display the data.

The new version also is said to double the speed of transaction-oriented applications by eliminating the overhead for queries that are repeated over the same data item and using a B-tree storage structure. The B-tree is the fifth access method incorporated into Ingres.

Version 3.0 is a free update to current users. A license for Ingres ranges from $20,000 to $40,000, depending on Digital Equipment Corp. VAX-11 CPU size.

RTI is headquartered at 2855 Telegraph Ave., Berkeley, Calif. 94705.

SOFTWARE from page 41

brochures and literature provided by vendors. Any vendor can supply a list of features that look like those found in other products. The important thing to remember is not whether a product has a particular feature, but how the feature addresses requirements.

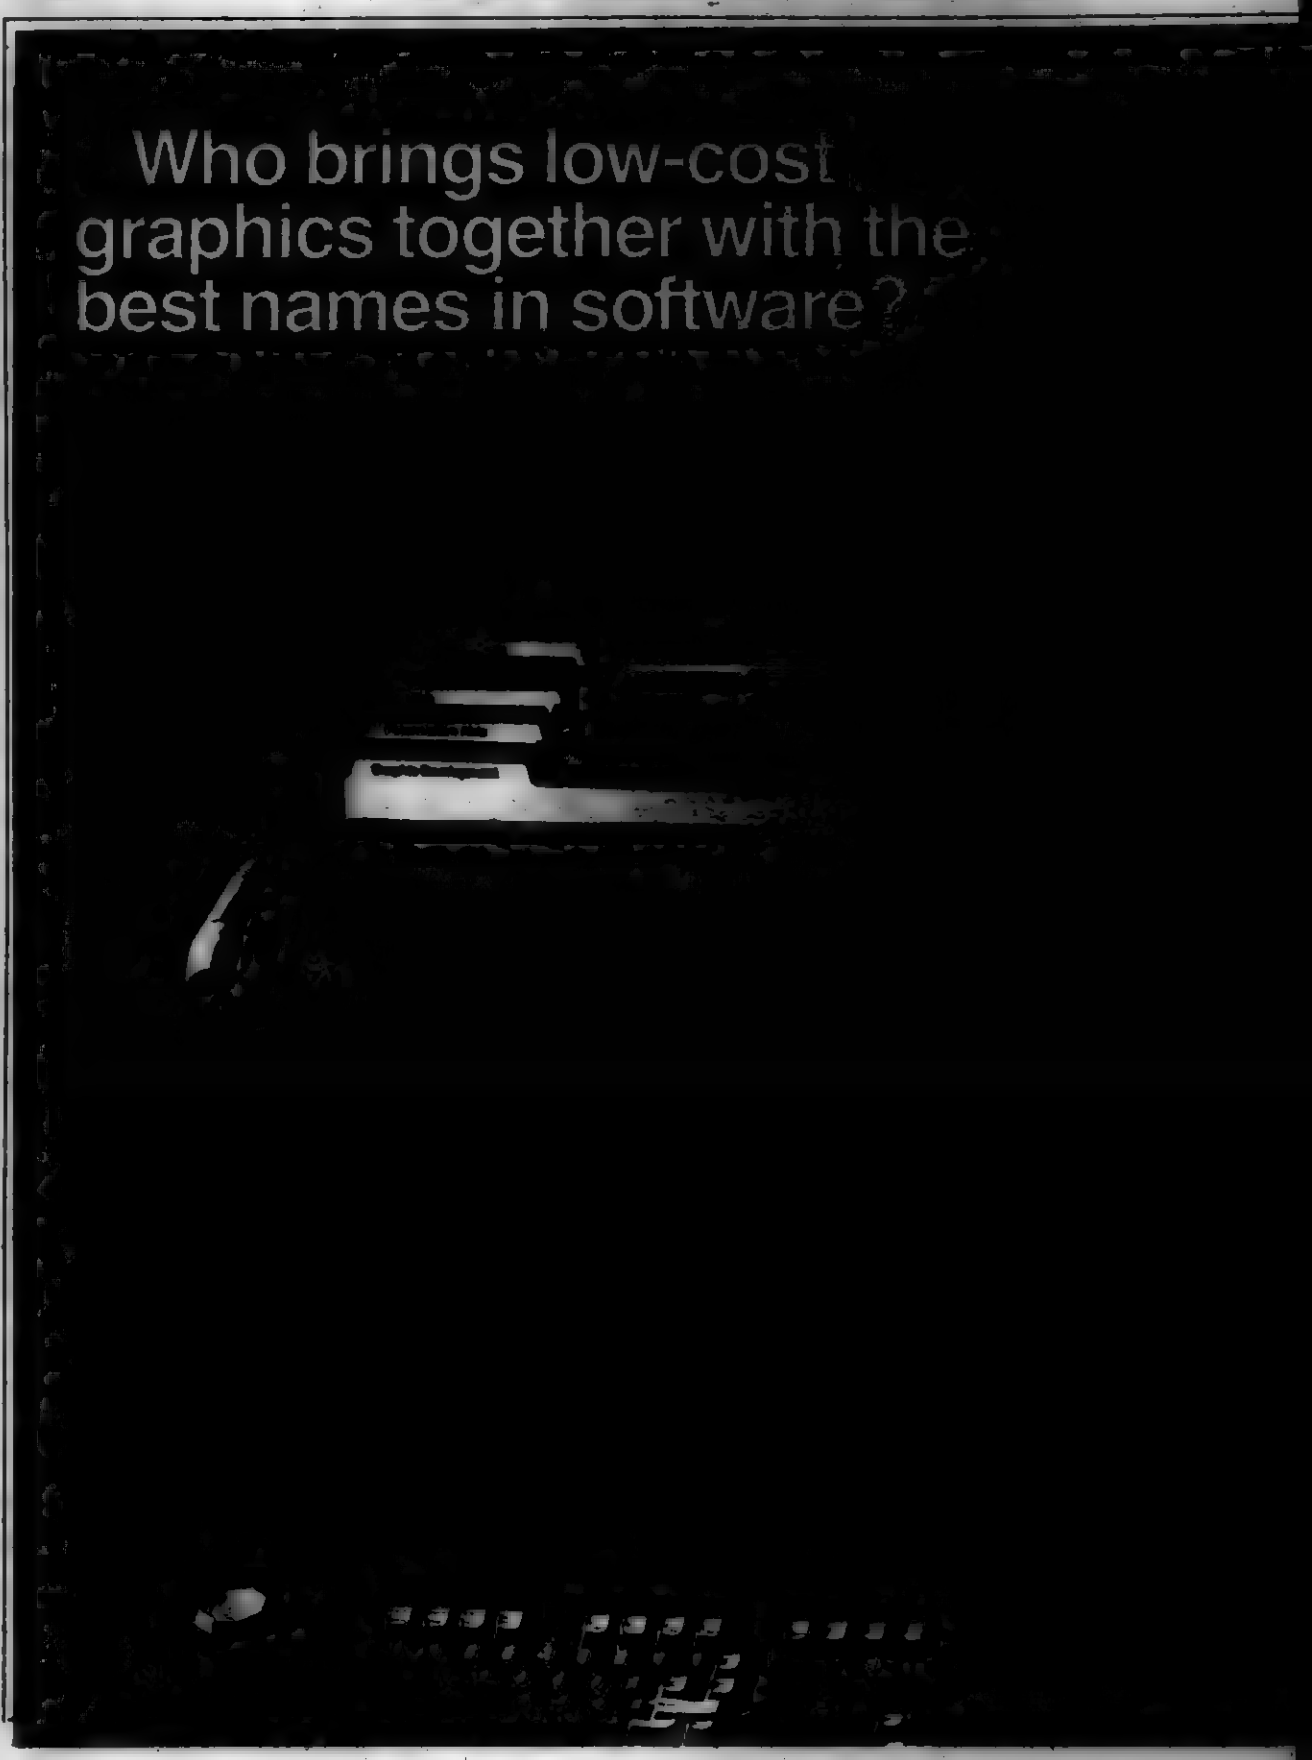
When dealing with vendors, it's necessary to find out not only what they offer but also why they offer what they do. Generally, vendors use formal presentations to explain product functions and capabilities. During these presentations, it is important to refer to a needs or requirements list and to use the list to pull information that is presented by the vendor into focus.

Two kinds of questions should be asked during a presentation: why questions and how questions. How questions are helpful in concept presentations. How does the product address this or that need? During a feature presentation, however, you should ask why the feature does what it does. This line of questioning guides vendor responses to the information needed.

If the vendor can't answer a ques-

See SOFTWARE page 53

Who brings low-cost graphics together with the best names in software?



SOFTWARE from page 52

tion during a presentation, don't assume that the answer is a negative one. He may simply be unable to respond correctly without research. Write unanswered questions down, and ask the vendor to get a specific answer by a later date.

Often evaluation and selection projects include interviewing current users to determine if the product and vendor perform as represented. When checking references, talk with the people involved in direct use of the product, but also be sure to talk with the person who has responsibility for the area in which the product is used. This provides the best overall view of the product and the vendor.

Also, when checking references, start with indirect questions rather than specific ones. Ask, for example, how the product handles a particular function rather than how a specific inquiry is made or report is generated. Often these indirect questions will uncover product/vendor advantages or disadvantages which may otherwise be overlooked.

Justifying an applications product is another consideration. Determine if the software can be justified through more than one approach — cost, productivity improvement and consistency with direction. Chances are it will be a good fit if you can justify it from more than one angle.

Developing a scenario of how an operation will function with the product installed is another useful step. Think through the functions performed by the product, the points where it interfaces with people and the likely impact on the organization. After developing this scenario, test it with the vendor to verify your understanding.

Finally, look at total product cost rather than product price. When supporting elements such as service, support and training are considered, the product which appears to cost the least may turn out to be the most expensive.

Acquisition of a major applications software product is an important decision. When making that decision, look beyond the product to the vendor that backs it. Who is the vendor? How does the vendor conduct business? What is the structure of the organization behind the product? What is the vendor's financial status?

GNOSIS from page 41

that are accessed by a large number of users, such as an editor, Hardy explained. Despite the sophisticated security procedures many businesses employ, the operating system is not impervious to a crafty programmer who can write routines to copy the contents of any file accessing the program.

"Every time you use an editor on a conventional system, you're copying your data to a place where anybody who wrote the editor can see it," he said. Of course, if the editor was purchased as a package, this is not a problem, but for shared utilities that use software written in-house, protection is scanty.

As a capability-based system, Gnosis can support sharing and isolation at the same time, Hardy said. Authority to access data can be parceled out to the programs on a very limited basis. "This allows programs to run independently so that they are dedicated to a particular user and particular files," he said. "You know that the only copy of the program is your copy." The system even allows such common areas as spooling queues to be bypassed.

Hardy said Gnosis' object orientation involved associating data with a fixed set of programs that can access it. Object-oriented systems include Apple Computer, Inc.'s Lisa or Xerox Corp.'s SmallTalk. Object programming ensures that programs and data can only be accessed through a single object, thus protecting against programmers writing hooks into the program and offering an easier audit trail.

Gnosis is not a new concept, Hardy noted. A similar technology is already employed on Plessey Co. Ltd.'s Plessey 250 computer, which is used primarily for communications switching. However, Tymshare believes the time is right for a high-security operating system. "The technology has been well known in the computer science field and is now viable in commercial applications," Hardy said.

Tektronix.

No graphics terminals connect you to better utility or applications software, or with a broader range of computers, than Tek's desktop 4100 Series terminals.

Among the dividends of Tek's long leadership in graphics are the scores of program development tools and powerful applications packages already on file and immediately compatible with most computers.

From analysis to reporting, cartography to CAD: compatible software helped make Tek's low-cost 4100 Series an immediate success.

Major software vendors like ISSCO, SAS, Precision Visuals and many others offer 4100 users flexibility in data analysis and presentation.

In more technical, engineering and scientific environments, users can take advantage of ANSYS,™ PATRAN-G,™ ANVIL-4000,™ GEO-MOD,™ Tek PLOT 10 Computer-Aided Drafting and Easy Graphing II.

Tek PLOT 10 graphics development software library is installed on more computers than any other in the world. It now includes the new international standard, GKS, and the Core based IGL, plus TCS, the nucleus for scores of specialized packages.

The 4100 Series lets you take full advantage of all these powerful software resources.

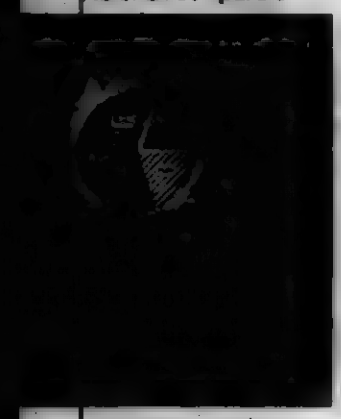
Fast, flexible, and priced fully equipped from just $3995, quantity one, the 4100 Series includes VT100 compatibility and ANSI X3.64 text editing right along with its exceptional graphics.

Choose from a range of resolution, segment memory and color capabilities, backed by performance unique to the price range — including a flicker-free 60 Hz non-interlaced display, 38.4K baud communications. And color manipulation by keyboard function keys.

The companion 4695 Color Graphics Copier now makes color copies practical.

It's a very quiet and reliable push-button easy desktop unit that doubles as an alphanumeric printer. Single quantity cost is just $1595.

Powerful graphics team with Tek 4695 color copies and transparencies for a complete desktop analysis and presentation system.



Presentations come alive with the communications impact of full color transparencies that can be produced in minutes.

RFP MANUAL
$29.95

Most dp libraries have books on contracting, leasing and even proposal writing. But, prior to these activities, you should issue an RFP. Dyna Systems now introduces the missing link...a manual on:

REQUESTS FOR PROPOSALS
Preparation Guidelines for
Data Processing Acquisitions

Our Manual defines the most important characteristics of Data Processing-oriented RFPs. The Manual dilineates a standard approach to the preparation and issuance of RFPs and is designed to improve the contractual process.

It teaches you to construct RFPs that clearly identify requirements for the purchase or lease of goods and/or services. To fully protect your company, you will learn how to address the following specific areas:

- Administrative Requirements
- Technical Requirements
- Business Requirements
- Legal and Insurance Requirements

Extensive check lists and over 80 examples of sample language provisions are provided to address various issues.

N.Y.S. residents add appropriate sales tax. Order direct from

Study reveals chaos in long-distance billing

Consumer group investigates eight carriers

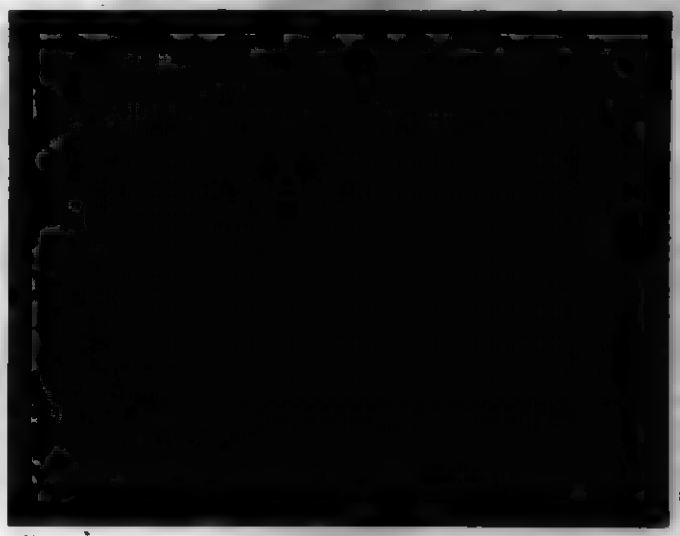
By Lynne Hefner
CW Staff

WASHINGTON, D.C. — A study conducted here recently concluded that the manner in which long-distance telephone carriers measure the duration of calls might be a more important consideration for would-be customers than those carriers' actual rates.

The findings, released recently by Consumers' Checkbook, a nonprofit consumer group based in Washington, D.C., and San Francisco, are part of a larger study that will be published this summer in a book called *The Complete Guide to Lower Phone Costs*.

According to Checkbook, the decision to release the conclusions of the study prior to publication of the completed book was prompted by the controversy sparked by recent customer lawsuits growing out of MCI Communications Corp.'s and GTE Sprint's billing practices [CW, Feb. 27].

The findings are based on a study conducted between September and November 1983, in which Checkbook made — or attempted — more than 2,000 calls on eight long-distance networks: AT&T's direct distance dialing, MCI, Sprint, ITT's Niteline, Western Union Co.'s Metrofone, Allnet Communications Services, Inc.'s Allnet, Telesaver and Satellite Business System's (SBS) Skyline.



According to the consumer organization, a portion of the calls were made in the evening billing period and another portion in the night/weekend period. Results might be different for calls made predominantly during daytime hours, to different destination cities or using different service options. But Checkbook claims that the findings have broad applicability. Each call was timed so that actual call duration could be compared to billed time. Checkbook reported that:

■ The Western Union Metrofone system billed for 32% of no answers, busy signals and other uncompleted calls. This included many calls the company couldn't place due to the busy conditions of its own switches.

■ ITT's Niteline did not charge the customer at all for any call that lasted 20 seconds or less.

■ Telesaver charged an average of 40 seconds per call in excess of the actual call length.

■ AT&T charged 20 seconds more than actual call length. But unlike the other companies, AT&T was accurate in tracking call connections; it charged for all completed calls and never charged for uncompleted ones.

■ Allnet charged for about four seconds more than actual call length.

■ SBS' Skyline had, by far, the most generous billing practices. It allowed the highest percentage of free calls; it billed for no uncompleted calls; and it often charged for substantially less than actual connect time. SBS has changed its billing system since the time of the test, but the consumer group expects SBS to remain the most generous of the studied companies.

The carriers' bills vary because of several factors, the consumer group said. First, all companies approximate the length of each call for billing purposes. Most round up to the next full minute, so a 10-second call, for example, is billed as a one-minute call, the group explained. Two of the studied companies — SBS and

Voice/data/video transmission market seen ripe for CATV

SAN JOSE, Calif. — Two-way CATV could play a major role in the development of a universal communications system capable of simultaneously transmitting voice, data and video signals, a study recently released here reported.

The report, entitled "Two-Way Cable TV: Issues and Opportunities," from Strategic, Inc., suggested that the market for universal communications services is expected to be greater than the market for telephone services today. In fact, according to the researchers, the new system might well absorb telephone services as we know them.

Facing declining revenues and increasing costs, CATV operators are hoping to increase revenue by adding relatively low-cost, two-way communications dedicated to nonentertainment application. According to the research firm, CATV is driving hard to become the first supplier of universal broadband, integrated communications networks capable of simultaneously transmitting two-way voice, data and video signals.

In 1983 there were approximately 5,000 cable television systems servicing nearly 30 million subscribers in over 13,000 U.S. communities. This subscription level will generate $6.14 billion in revenues before year's end, the report said.

Since 1979, the number of subscribers has doubled, and this trend is expected to continue through the end of the decade. What is significant for CATV operators, the report points out, is that the current $6 million annual revenues represent only an 18% penetration by cable television in the top 20 U.S. television markets.

By the end of the decade, the total available market will have reached slightly over $24 billion. The increased penetration producing this fourfold growth in the market by the end of the decade will be fueled by new two-way services, the report suggested.

Like pay television services, these new two-way services will generate added sales above the basic 55-channel television service currently being supplied. Moreover, Strategic stated, these new sales will come from both households and businesses. Unlike current pay television service, new services will involve two-way trans-

TI announces Ethernet links

DALLAS — Texas Instruments, Inc. has unveiled hardware and software products to allow connection of the company's Business System series computers to Ethernet-type local-area networks.

The new products include the EI300 interface for the Business System 300 series; the EI990 interface for the Business System 600 and 800 series and DS990 models with the company's TIline bus structure; Distributed Network I/O (Dnio) 2.0 software; and Business System Access, a software package that enables TI Professional Computers to access Business System resources, a company spokesman said.

The EI300 interface, EI990 interface and Dnio 2.0 software will be available in August, with the Business System Access software package scheduled for release in September. The EI300 costs $2,950; the EI990 costs $2,950; the Dnio 2.0 software is priced at $3,500; and Business System Access costs $195, the vendor said.

Additional information can be obtained from TI Data Systems Group, which can be reached through P.O. Box 402430, Dallas, Texas 75240.

Dynatech offers bisynch-X.25 tie

ALEXANDRIA, Va. — Dynatech Packet Technology, Inc. has announced a packet assembler/disassembler that reportedly allows equipment operating with IBM's 3270 bisynchronous protocol to be interconnected via X.25 packet-switching networks.

The Protopadx.25 reportedly is capable of connecting up to 32 terminal devices in point-to-point or multidrop mode to one packet-switched line.

When operating in either switched or permanent virtual circuit mode, the Protopadx.25 also has the capability of multiplexing data calls at the logical channel level using the Canadian standard Datapac 3023 procedures, a vendor spokesman said.

Call setup is under the control of each connected 3270 device. A plain English command menu is available, via a teletypewriter-compatible diagnostic and configuration port, to set up poll tables and systems parameters, the spokesman said.

Protopadx.25 is available for $1,400.

Dynatech Packet Technology is located at 6464-G General Green Way, Alexandria, Va. 22312.

COMMUNICATIONS

COMMUNICATIONS CONTROLLERS

NCR Comten, Inc.
MAF/RHO

NCR Comten, Inc. has announced the Comten Multiple-Access Facility with Remote Host Option (MAF/RHO) for the company's 3600 communications processor systems.

The product allows IBM System Network Architecture (SNA) and bisynchronous 3270-type terminals in an IBM SNA or pre-SNA network to access non-IBM hosts. It also allows access to IBM hosts located in separate networks, the vendor said.

Polling and addressing of terminals for the host, error recovery and control function and alternate routing for remote nodes are all provided by the MAF/RHO. The product also is compatible with earlier releases of the company's multiple-access facility, a company spokesman said.

The price is $6,435.

NCR Comten, 2700 Snelling Ave. N., St. Paul, Minn. 55113.

VOICE/DATA COMMUNICATIONS

TELESAVER, INC.
Quick Call 2000

Telesaver, Inc. has announced the Quick Call 2000 autodialer featuring speed dial, memory storage and retrieval and least-cost routing.

With the autodialer, one to 24 users can access alternative long-distance services by dialing only two- and three-digit numbers. The system operates with single-line telephones, key systems and private branch exchanges and works with AT&T and other common carriers as well as international calls, the vendor said.

Features of the product include the ability to store and speed-dial up to 250 local and long-distance numbers; the ability to determine which subscribed common carrier offers the least expensive service for a particular call; the ability to redial a call until completed, with information entered one time only by the user; and a cost accounting feature for billing by person, department, cost center or client, the vendor said. The price for a one-line unit is $455.

Telesaver, 20 Gwynns Mill Court, Owings Mills, Md. 21117.

GATEWAY TELECOM
X25PC

Gateway Telecom has introduced an X.25 communications product to connect IBM Personal Computers with packet-switched networks. The product reportedly utilizes a multitasking operating system supporting up to 32 logical I/O channels.

The product, called the X25PC, also is said to implement the full CCITT X.25 recommendation for data transmission on packet-switched networks. The X25PC software reportedly will provide document exchange facilities on the Personal Computer. It includes an option card, a floppy disk and documentation.

The X25PC is available for $1,900.

Gateway Telecom, 853 Broadway, New York, N.Y. 10003.

MULTIPLEXERS/MODEMS

LOCKHEED-GEORGIA CO.
Data Sentry

The Getex Division of Lockheed-Georgia Co. has introduced Data Sentry, a modem that can reportedly prevent data theft and other security breaches of personal, mini and mainframe computer systems without requiring encryption or changes in systems programming.

The modem uses a call-up, callback and password sequence and offers all the telecommunications features of conventional intelligent modems, the vendor said.

The asynchronous modem operates full duplex at 300 or 1,200 bit/sec and has autodial, autoanswer, autospeed and autoparity selection. Terminal interface is a standard RS-232C cable. The telephone interface is a single telephone number drop with an RJ-11C connection.

The price is $895, according to the vendor.

Lockheed-Georgia, Department 8403, Zone 18, Marietta, Ga. 30063.

KINEX CORP.
2400/FDX

Kinex Corp. has announced the 2400/FDX modem intended for full-duplex synchronous and asynchronous data transmission at rates of 1,200 and 2,400 bit/sec over two-wire switched or leased lines.

Standard features of the modem reportedly include automatic answer/disconnect, automatic rate recognition, transmission status and line signal quality indicators plus internal and remote-controlled digital loopback testing.

The price is $1,695, the vendor said.

Kinex, 6960 Bryan Dairy Road, Largo, Fla. 33543.

HALCYON COMMUNICATIONS, INC.
4001A

Halcyon Communications, Inc. has introduced a statistical multiplexer that concentrates up to 32 channels over a single phone link.

The 4001A features expandability from four to 32 channels, supporting a mix of asynchronous traffic and half- and full-duplex synchronous data.

Speed selections range from 50 to 9,600 bit/sec, including autobaud, with speeds at each end of the channel selected independently, a company spokesman said.

Asynchronous channels support all standard inband and outband flow controls, which can be independently selected at each end of the channel for traffic balancing throughout a point-to-point network, the vendor said.

Special flow control conventions are also supported, according to the vendor.

The price for a four-channel unit is $1,795; an eight-channel unit costs $2,595.

Halcyon Communications, 2121 Zanker Road, San Jose, Calif. 95131.

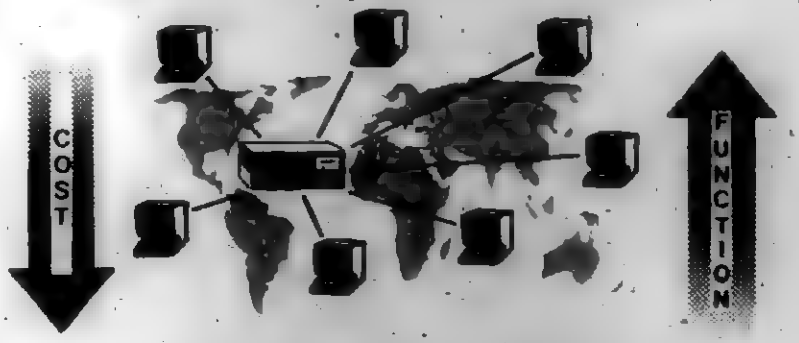
Remote SDLC 3270's Appear As Local 3270's



With IBM Compatible Channel-Attached Controller

The Virtual Local Controller (VLC) can accommodate multiple lines while supporting all features of both dial-in and dedicated SDLC 3270s without a 3705 and without costly teleprocessing software. Avoid the NCP generation process. Simply generate your IBM system as if it has one or more SNA 3274 local controllers. The VLC does all the rest.

The VLC takes care of all transmission error detection and recovery. Internal diagnostics and powerful on-line trace capabilities are standard. Remote concentration and networking can be included. If desired, concurrent enhanced 270X/370X-EP emulation is available.

Although attaching to either a block or byte multiplexer channel, the programmable VLC is self-loaded, independently of the host. Installation is straightforward. On-site spares make maintenance easy.

Since 1976, Lemcom Systems, Inc. has been a leading supplier of IBM compatible Front-End Processors and custom data communications products. Over six hundred users are already benefiting from our economical and reliable solutions to their needs.

The VLC is available for purchase or under flexible lease alternatives. Talk with us about how to simplify your entry into SNA data communications. Call or write today.

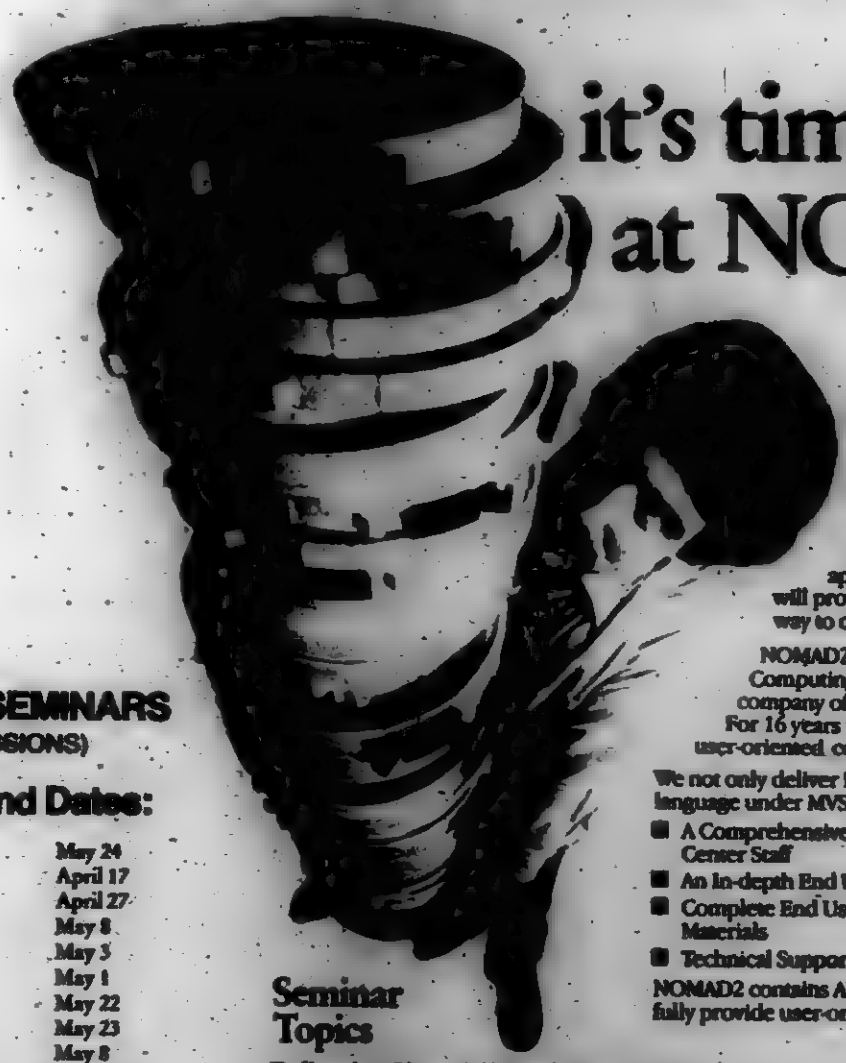
If delivering user-oriented computing is getting you down...



it's time to look at NOMAD2!

Delivering user-oriented computing can be a tricky business. If it's your objective to satisfy the user community in your organization, it's time to speak to the experts. We'll share our experience with you at our FREE NOMAD2 Seminars.

Whether you're interested in an Information Center, Development Center, end-user computing or just quick applications development, our seminars will provide you with a closer look at the best way to deliver user-oriented computing.

NOMAD2 is a unique product created by D&B Computing Services, the information services company of The Dun & Bradstreet Corporation. For 16 years we have been delivering value added user-oriented computing services.

We not only deliver NOMAD2, the premier fourth generation language under MVS and VM, but also provide . . .

- A Comprehensive Training Program for Your Information Center Staff
- An In-depth End User Training Program
- Complete End User Documentation and Training Materials
- Technical Support for Your Information Center Staff

NOMAD2 contains ALL the components you need to successfully provide user-oriented computing services.

NOMAD2: On-Line Application Development

See the "reality" of user-oriented computing with NOMAD2. Watch us build and dynamically modify a NOMAD2 application on-line. We'll build a data base structure, load data, generate reports and graphics, modify the data base and much more.

If delivering user-oriented computing is your objective, it's time to take a closer look at NOMAD2.

NOMAD2 . . . Experience the difference

COMMUNICATIONS

MODEMS from page 55

DIGILOG, INC.
Modem Wrap Around Box, Model WRB/1

The Network Control Division of Digilog, Inc. has introduced the Modem Wrap Around Box, Model WRB/1, a remote-controlled data communications device that enables the testing of communications lines and local remote modems.

The product performs the following five tests: loopback (digital and analog); bit error rate; polling test; analog levels (transmit and receive); and self-test, the vendor said.

For four-wire, leased-line modems operating from 1,200 to 4,800 bit/sec, the secondary channel operates at 150 bit/sec. For 9,600 bit/sec modems, the secondary channel is set at 75 bit/sec.

Model WRB/1 costs $960.

Digilog Network Control Division, 1370 Welsh Road, Montgomeryville, Pa. 18936.

CODE-A-PHONE CORP.
Tel-A-Modem

Code-A-Phone Corp. has announced Tel-A-Modem, a two-line desk-type telephone that houses an intelligent modem and is said to be designed for both commercial and residential applications.

Tel-A-Modem features include 300 and 1,200 bit/sec data transmission rates, full-duplex operating mode, automatic answer and instant status indication.

Telephone features include audio-visual phone status, hold function for both lines, last-number automatic redial, nine-number memory automatic dialer and individual volume controls for ring signals and line monitor, the vendor said.

The price is $595.95.

Code-A-Phone, P.O. Box 5656, Portland, Ore. 97228

LOCAL-AREA NETWORKS

CONCORD DATA SYSTEMS, INC.
Token/Net

Concord Data Systems, Inc. has announced its Token/Net local-area network, which the company said is the industry's first local network to meet the IEEE 802.4 token-passing standard approved last September.

The product uses the token-passing access method and a broadband, CATV-type physical medium.

The price is $500 to $850 per port, depending on configuration. A four-port box costs $3,485; a 10-port box costs $5,500.

Concord Data Systems, 303 Bear Hill Road, Waltham, Mass. 02154.

ABLE COMPUTER
Easyway/ET

Able Computer has introduced a network controller that connects Digital Equipment Corp. Unibus-based PDP-11 and VAX-11 computers to Ethernet-type networks that are compatible with IEEE 802.3-specified protocols and TCP/IP protocols (the latter being the Department of Defense's Transmission Control Protocol/Internet Protocol.)

The controller, Easyway/ET, consists of two physical modules, a Host Protocol Processor (HPP) and a Communications Adapter Board (CAB). The HPP module contains the Unibus interface, and the CAB provides the data link and physical-layer protocol to the Ethernet network.

Easyway/ET software device drivers are provided for the DEC VMS and RSX operating systems.

Easyway/ET is available for $7,200.

Able Computer, 1732 Reynolds Ave., Irvine, Calif. 92714.

BRIDGE COMMUNICATIONS, INC.
CS/1-HSM

Bridge Communications, Inc. has introduced a new model of its Communications Server/1 that reportedly provides single-cable connection between a Digital Equipment Corp. VAX minicomputer and a Xerox Corp. Ethernet-type local-area network.

The CS/1-HSM high-speed multiplexed host interface system is a front-end processor connecting up to 48 terminal sessions from other nodes on an Ethernet to a VAX over a single high-speed serial line, a vendor spokesman said.

It reportedly consists of the vendor's CS/1 network interface system incorporating an HSM interface card linked via a single RS-422 cable to the vendor's hex-size Unibus host adaptor board inside the VAX.

The CS/1-HSM is priced at $16,500. Per-port connection costs begin at $350 for 48-terminal support.

Bridge Communications, 10440 Bubb Road, Cupertino, Calif. 95014.

CORVUS SYSTEMS, INC.
Omnishare

Corvus Systems, Inc. has introduced a product called Omnishare that is said to permit the fixed disk of an IBM Personal Computer XT to emulate a Corvus disk system. The modification reportedly permits the creation of a low-cost Corvus Omninet local-area network.

Omnishare allows users to decide how much space on an IBM fixed disk is to be used by the host computer and how much is to be shared, the vendor said.

The host computer reportedly may also use and manipulate the data in the common portion of the disk.

The product reportedly uses simple twisted-pair cabling and allows 64 computers or peripherals to operate together over distances up to 4,000 feet.

It is available from the vendor for $795, including the emulation software, an IBM Personal Computer XT transporter card, Omninet cable and manual.

Corvus Systems, 2160 Corvus Drive, San Jose, Calif. 95124.

TEST EQUIPMENT

HEWLETT-PACKARD CO.
Enhancements for 4955A

Hewlett-Packard Co. has announced enhancements for the 4955A protocol analyzer. According to a spokesman for the vendor, the enhancements include software and hardware to help increase a user's ability to solve data communications problems for international applications.

The enhancements include: the 18146A, a software applications accessory providing additional capability to decode and display the CCITT No. 7 common-channel signaling protocol; the HP 18145A remote testing pack that allows a high-end HP 4955A to talk to another 4955A at remote locations; and read-only memory changes and a software package that enable the 4955A to display in the Japanese katakana character set using JIS-8 data code.

The price of the HP 4955A protocol analyzer with Basic is $17,880. The HP 18145A remote testing pack is $500; the HP 18146A is $500; and JIS-8 data code costs $250.

HP, 1820 Embarcadero Road, Palo Alto, Calif. 94303.

ADF Users — Get A Grip!

Don't get carried away with ADF before you know how to use it right!

DKI's one week ADF class covers a wide variety of topics including: standards, procedures, usage guidelines, design methodology, coding techniques, testing, performance considerations and problem solving.

ADF Designers & Coders, Systems QA Personnel, DBA's, Performance Tuners and Project Managers will all benefit from attending our course.

Introducing *COMPUTERWORLD BENELUX*

Here's your chance to reach the Dutch computer community.

Computerworld Benelux is Computerworld's new sister publication in The Netherlands. We consider The Netherlands an exciting marketplace because 90% of the Dutch EDP equipment market is served by imports, and American manufacturers are presently the leading suppliers with 41% of the import market. More importantly, The Netherlands must increase EDP investments in order to maintain their competitive position in the world market.

The Netherlands ranks high in Western Europe for installed general purpose computers. And, according to figures from International Data Corporation, the world's leading information industry market research firm, it has an installed value of $1.7 billion. In 1983, an estimated $380 million was spent on purchases of computer and peripheral equipment. At the present time, there are 4,000 larger computers installed with a projected 15% annual increase.

Computerworld Benelux is circulated throughout The Netherlands, Belgium and Luxembourg to 20,000 key decision makers in middle and senior management in industrial and government organizations. The editorial focuses on the new developments in the local computer market, hardware and software applications, and company news.

CW International Marketing Services makes it easy for you to advertise in countries all around the computer world. For more information on *Computerworld Benelux*, just fill out and return the coupon below.

Figure $50 a line for programming.

When people look at business computers, they sometimes overlook a crucial consideration: the price of writing and maintaining software.

But we didn't. When we designed the HP 3000 family, we created special productivity tools to reduce the high price of developing applications software. With dramatic results.

Many HP 3000 customers now use 1/5th the amount of code writing these programs, compared with using high-level applications language. Since the average program costs you about $50 a line to develop, you can see why EDP budgets go so much further on an HP 3000.

You can use our development tools with the entire HP 3000 family. And, as all four systems are fully compatible, you can run the same, identical programs on your small branch office computer and on the big system in your regional headquarters. Without spending a penny to rewrite code or recompile.

Now divide by five.

Features like these have helped many of our customers recoup the entire price of the hardware by cutting the time and effort involved in developing and maintaining the software.

So if you're looking for ways to lower your computing costs, take a look at the HP 3000. Call your local sales office listed in the white pages and ask a Business Computer Specialist about the HP 3000. Or write for more information to Tom Rappath, Hewlett-Packard, Dept. 03185, 19447 Pruneridge Avenue, Cupertino, CA 95014. In Europe, write to Henk van Lammeren, Hewlett-Packard Nederland B.V., Dept. 03185, P.O. Box 529, 1180 AM Amstelveen, The Netherlands.

tic controller for the company's Netcon family of network management systems.

The product serves up to 64 multipoint lines and 1,024 diagnostic addresses, providing real-time reporting of network alarms in point-to point networks over analog, digital and wire link facilities, the vendor said.

This dual diskette-based controller reportedly comes standard with a color CRT console, accepts an optional printer and will support all current and planned Netcon hardware. The disk package is available in a self-contained shelf with two 600K-byte side-by side 8-in. floppy disk drives. The price is $16,000.

General Datacomm Industries, One Kennedy Ave., Danbury, Conn. 06810.

AUXILIARY EQUIPMENT

ASTROCOM CORP.
Dual 16 Squeezeplexer

Astrocom Corp. has announced the Dual 16 Squeezeplexer, a coaxial multiplexer that permits connection of up to 32 IBM 3270-type terminals and/or printers to a single coaxial cable.

The system consists of two 16-port devices in a rack-mounted unit. The Dual 16 operates in point-to-point, multidrop, star or a combination of these configurations, has individual channel diagnostic and fault/status indicator lights and provides up to 32 drops per 3274 controller, the vendor reported.

The price is $3,472.

Astrocom, 120 W. Plato Blvd., St. Paul, Minn. 55107.

PARADYNE CORP.
Info-Lock-1027

Paradyne Corp. has announced Info-Lock-1027, a data encryption device that uses the National Bureau of Standards Data Encryption Standard algorithm.

The product reportedly meets Federal Standard 1027 and will protect information transmitted over various communications media, including terrestrial, microwave or satellite facilities.

The device can be used with point-to-point or multipoint circuits, independent of the link protocol, the vendor reported. The device can be configured from the front panel for synchronous or asynchronous operation.

The price is $2,668.

Paradyne, 8550 Ulmerton Road, Largo, Fla. 33540.

CONTEMPORARY CONTROL SYSTEMS, INC.
Network control module

Contemporary Control Systems, Inc. has announced a network control module that provides standard bus users with an interface to Datapoint Corp.'s Arcnet local-area networks.

Individual 8571 modules provide users with transparent network operation, control and protocol in the passing of data within the Arcnet system. Arcnet networks reportedly support up to 255 nodes and data rates up to 2.5M bits.

The price is $495.

Contemporary Control Systems, 4840 Forest Ave., Downers Grove, Ill. 60515.

CONNECTICUT MICROCOMPUTER, INC.
Buster RGA

Connecticut Microcomputer, Inc. has introduced the Buster RGA, a microprocessor-based interface that enables up to 15 individually addressed IEEE-488 devices to be connected to a single RS-232 port.

Features of the interface serial port include switch-selectable bit/sec rates (300 to 19.2K) and switch-selectable parity and word length.

The RGA is compatible with service request, serial poll, parallel poll, remote/local, local lockout, device clear and device trigger interface functions.

The price is $695.

Connecticut Microcomputer, 36 Del Mar Drive, Brookfield, Conn. 06804.

KAPTRON, INC.
WDM-01; WDD-02.

Kaptron, Inc. has introduced the Wavelength Division Multiplexer (WDM-01) and Demultiplexer (WDD-02).

The multiplexer combines light signals at two wavelengths from two input ports and delivers them to a single fiber output channel, and the demultiplexer separates the signals and delivers them to two output ports with minimal cross talk. The devices, which have specially coated mirrors, are 7/16-in. in diameter and 2.5-in. long. A pair costs $1,900.

Kaptron, 3460 W. Bayshore, Palo Alto, Calif. 94303.

Lineguard system enhanced

YOUNGSTOWN, Ohio — Western Datacom recently introduced an expanded Model 3060 Lineguard system designed to prevent unauthorized dial-up access to stored data.

According to the company, when a caller dials into the 3060, he is prompted for an access code. The caller is given 20 seconds and two chances to enter his code correctly. If the entry is incorrect, Lineguard will instruct the modem to disconnect and log an error. An optional monitor is also available to create an output log for either a printer or computer.

If the caller's code is verified, the device reportedly will call him back at a predetermined number. The user is informed if the callback can be placed immediately or if it must be queued for the next available line. The user then chooses to accept or reject callback.

An added feature of Lineguard is that group codes assigned to each user provide for least-cost routing, port contention and port selection. The device assures the same level of security normally limited to private lines, the company said.

The price of the Model 3060 Lineguard is $995 for rack-mounted installation.

Western Datacom is located at 5083 Market St., Youngstown, Ohio 44512.

Cut through teleprocessing tie-ups with WESTI.

WESTI—the Westinghouse Teleprocessing Interface—is an easy-to-use, comprehensive teleprocessing monitor that can help make telecommunications a joy instead of a burden.

WESTI gives you the system, terminal, printer, and applications control you need to provide all vital telecommunications functions. But even more importantly, if you're currently using the CICS telecommunications package, WESTI software can cut through system tie-ups to help improve response time and overall system efficiency.

WESTI's efficient task-dispatching mechanism manages all telecommunications functions in a full multi-thread, multi-task environment—with minimum memory requirements. So you don't waste valuable system resources. Using an optional converter, WESTI can run CICS command level programs so you don't have to write new ones to integrate WESTI into your telecommunications system. In fact, users find that because of WESTI's teleprocessing "shortcuts," it's often faster (and less expensive) to run their converted programs through WESTI than in native mode.

What's more, WESTI application programs may be written in any combination of Assembler, COBOL, PL/I, or RPG II. And personnel trained to use CICS don't have to start all over again to learn the WESTI system. They can simply add WESTI's short training program to what they already know.

WESTI can also use all Westinghouse interrelated productivity software like SPOOL-PRINT, VISUAL AIDS, SCEPTER, and MAIL-TRONIC, so it's expandable to meet your needs as they grow. And best of all, WESTI is top-ranked by users. A recent survey in Datamation magazine gave WESTI top marks in ease of use, reliability, and performance.

Telecommunications tie-ups can make your life miserable—and cost you money. Cut through those tie-ups with WESTI. For more information, contact your Westinghouse Management Systems Software representative, or write Westinghouse Electric Corporation, Management Systems Software, 777 Penn Center Blvd., Pittsburgh, PA 15235. Or call (412) 825-7000.

You can be sure...
if it's Westinghouse

CHARGES from page 55

Alinet — round up to the nearest tenth of a minute.

A second reason for variation in billing accuracy, according to Checkbook, is the difference in the various telephone companies' measurement capabilities. There are three telephone call measurement approaches: answer supervision, audio detection and guesswork.

The most precise approach to telephone measurement is answer supervision, which determines when a called party lifts the phone's receiver. AT&T has this capability; SBS has set it up on many of its routes; and a few other companies have it on some routes, but many calls on these carriers' systems cannot be measured by this approach, Checkbook reported.

An alternative approach used by telephone companies is the use of audio detection equipment, which "hears" a difference in sound when the called party lifts the phone.

Another approach used by carriers to measure calls involves timing. Ordinarily, carriers that rely on this method wait a specified amount of time, maybe 30 to 45 seconds, before a call is charged. But after that period, the caller may be charged even if the phone is still ringing.

The Complete Guide to Lower Phone Costs will be available for $6.95 from Washington Consumers' Checkbook, Suite 925, 806 15th St. N.W., Washington, D.C. 20005.

CATV from page 55

fer of digital data.

Besides the homeowner, to whom two-way cable services such as videotex, access to official airline guides, banking, burglary protection and sensors will be available, businesses like banks and large corporations will be the new breed of cable subscribers thanks to two-way cable capabilities, the reports stated.

These businesses, with offices scattered about in many different locations in a local geographic area, will continue hooking up their large computers at these different sites over high-speed channels on the cable. For the cable operator, adding data communications capability onto the entertainment network could be profitable with as few as ten subscribers, the researchers reported.

The report costs $3,000 and is available from Strategic through P.O. Box 9747, San Jose, Calif. 95157.

RATES from page 55

consumers and small and medium-size businesses to determine costs for the same calls on each of more than a dozen alternative long-distance networks.

Criteria included in the evaluation will be the rate periods during which the calls are made (day, evening or weekend), length of call, call origination and destination and volume of calls.

The projected cost for businesses using the rate service evaluation will be 2% to 3% of the company's annual telephone bill. A yearly one-time update will be offered to customers at a substantially lower fee.

Further information is available from Washington Consumers' Checkbook, Suite 925, 806 15th St. N.W., Washington, D.C. 20005.

IN DEPTH

The tyranny of words

While all technical writing departments appreciate the importance of verbal communication, few adequately value visual communication. No department should be without an art director. A technical manual that consists of a stack of pages spit out by a word processor is unfinished.

By Priscilla Burgess

Jack, a warehouse forklift driver, held up a plain blue notebook. It was a standard, three-ring binder containing perhaps 200 pages. Each page was dense with words. Jack thumbed through the pages and, looking up, said, "I'll never be able to use this computer."

Jack has discovered that between him and the computer is a huge barrier — the technical manual. In order to learn to use this new tool in his work, he will have to read and understand more words than he has dealt with in the last 10 years.

The technical writers who prepared this manual sincerely believed that they had done the best job possible. Because Jack and his co-workers are new to the technology, the writers were careful to provide extensive detail about the application as well as information about the operating system and file management. The manual had been checked by the programmers for technical accuracy and by a former English teacher for grammatical accuracy.

The gap between Jack's needs and the information provided by the computer company is a formidable one that is well recognized by computer companies, their customers and technical writers. As competition among those companies increases, customers look to see which system or which software will be easiest to learn to use. A good technical manual can be a company's most powerful selling tool.

Considering the amount of interest, energy and money invested in improving manuals, why are they still the albatross of the computer

IN DEPTH/THE TYRANNY OF WORDS

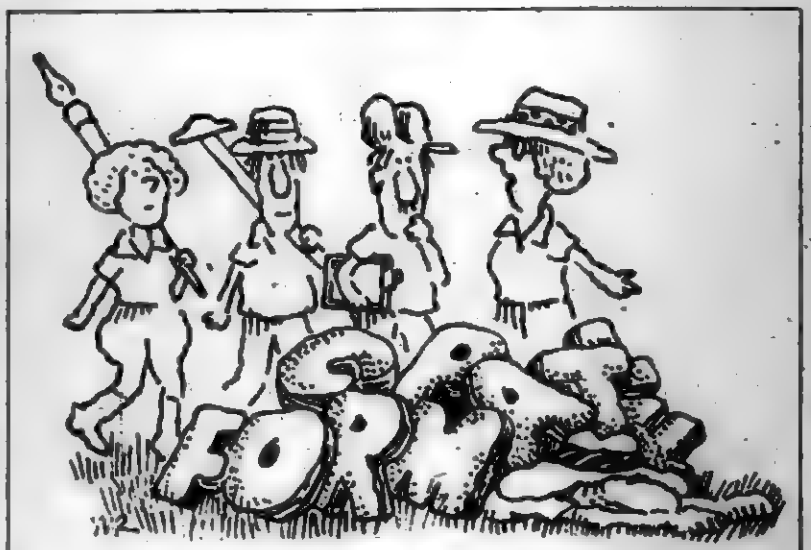
industry? A major clue is in the title of the people who produce them: technical writers. This title defines and restricts how the world thinks about communicating computer information — it is technical and it is written. Technical manuals are repositories of words — created by a joint effort of writers and technicians — that describe what a computer does, not how to use it.

Technical writers are perpetuating the approach started early on when only highly trained technicians were using computers. The kind of information they needed is very different from the kind of information the computer-naive user needs today.

In an effort to accommodate the new users, the technician-turned-writer is changing to the ex-English teacher and the former journalist. While the writing style has changed, the kind of information and the way it is presented have not. The computer industry appears to be committed to burying its users under an avalanche of meaningless words.

Not a writing exercise

We need to get out from under the words and look at communicating technical information in a different way. Putting together a technical manual should not be considered a writing exercise. It should begin with the idea of communication. The typical communication event consists of a sender, a message and a receiver. The goal, therefore, is to prepare a message that carries the information the sender wishes to send in a way that is optimally comprehensible to, and usable by, the receiver.



If the idea of communicating a message is kept in the fore, it is easier not to fall into the trap that the message must be confined to the written word. All of us gather information all day long from a variety of sources. When we learn to do something, like using a computer system, we may watch someone for a while, ask questions, read a bit and practice a lot. Rarely will anyone learn anything from only one source. And it's virtually impossible to learn a skill by reading a book.

First, we need to look at the people who produce the manuals — the source. Should the staff include other kinds of employees besides writers — such as visual communicators and researchers? And if so, how do they work together? Second, we need to look closely at the users — the receiver. Who are they, how do they work, how do they get the information they need? Third, we need to look at the way we present the information — the message. Should it always be written? What kind of information is really necessary? What should be written, what should be illustrated, what should be on the screen, and what should be told to the user?

A communication approach to preparing technical manuals draws upon theory, research and creative expression of various fields such as anthropology, psychology, communication research, art, education and consumer research. It was used to prepare a second manual for Jack and his fellow warehouse workers.

The source

When a company prepares a high-tech product for the marketplace, millions of dollars and a good deal of time are spent in research, development and manufacturing. Close to the day when the product is to make its debut, technical writers are given a small amount of time and an even smaller budget to prepare the instruction manual. Anyone who has worked in this industry is familiar with the last-minute panic and chaos of the writing staff.

This was the exact situation at the company that was preparing the inventory system for Jack's warehouse. Because of the size and complexity of the system, several years were spent in software development. Even though there was an effort to document the system as it was developed, the number of changes from the first specification to the final software delivery was so great that

original documentation was outdated.

During the development stage, technical writing projects were divided between the technical representatives and the marketing secretaries, occasionally assisted by technical writers. As the delivery date approached, the management started looking seriously for someone to prepare the manuals. As with virtually every other computer company, the qualifications they sought were a certain level of technical knowledge and a proved competence in writing.

Departmental structure

The typical structure of a technical writing department is a manager who has had experience as a technical writer and is frequently a former teacher. Under this manager are several writers with similar backgrounds, but perhaps not as much experience in the computer field. Usually, each writer is responsible for every aspect of one manual.

White space frequently causes anxiety in writers. If you give writers a blank piece of paper or a blank screen, they will fill it up, leaving about an inch of margin around the edges. This is a natural and proper thing for a writer to do. When writers produce a manual, they concentrate on what they know and do best — words.

It is hardly fair to expect people who have devoted their lives to words to suddenly, upon demand, provide illustrations, design page layouts, spec type and deal with printers. Nor is it reasonable to expect them to have made a study of audience analysis techniques so that they can design the manual based on researched needs. At the very least, if writers are expected to be competent in such a wide range of activities, they should be paid accordingly.

When professional artists are employed to design or illustrate manuals, writers have difficulty in figuring out what should be illustrated and what should be written. Left on their own, artists will frequently decorate rather than illustrate. The problem is not too bad when the product has a physical reality, such as a microcomputer. But when the product is software, how does one visualize millions of electrical impulses?

Computer companies do not necessarily staff a department with writers because they believe it is the best way to achieve their product. It is often simply because no one has offered a better alternative.

In order to get away from a tyranny of words, we need to restructure the organizational chart and pull in a few people who are not presently represented. The person in charge of producing user manuals needs to have a broader view of message design than is currently the case.

Different kinds of information needs to be communicated in different ways.

Experience with and knowledge of the users of all media, not just printed words, is highly desirable in a project director. If the project director is used to working with various kinds of artists, as well as writers, he will be better able to break a message down into appropriate words, pictures and media.

While all technical writing departments appreciate the importance of verbal communication, few adequately value visual communication. No department should be without an art director. A technical manual that consists of a stack of pages spit out by a

Scribe supports laser printers

You've heard a lot about laser printers . . . high print quality, attractive fonts, fast, quiet, affordable. But you haven't heard a lot about software to support them.

The Scribe Document Production System supports more laser printers than any other software. Laser printers like the Xerox 2700, 9700, 9790, the IMAGEN IMPRINT-10™, the Symbolics™ LGP-1, the CADO Lasergraphic 1200™, and soon the IBM 6670.

Buying a laser printer? No matter which one you choose, you'll get the most from it with Scribe.

IN DEPTH/THE TYRANNY OF WORDS

The title "Technical Writer" not only defines how the industry perceives this function; it also limits the way the rest of the world perceives it as well. People with research or media communication skills would probably not think to apply to technical writing departments.

word processor is unfinished.

Technical writers are often considered to be the in-house user advocates. They are consulted by programmers on problems of screen design and the construction of on-screen instructions and messages. And yet, many technical writers have never seen or spoken with the intended users. How is one to know the best way to construct a message if one knows nothing about the person who will receive it?

The last addition to the staff is the researcher. Before a project begins, a user-needs assessment and audience analysis must be done. Without this information, there is little hope of creating an effective and useful message. Throughout the development of the materials, the selection of visuals and instructions needs to be carefully tested to ensure that they are sufficient and accurate. At the end of the project, there needs to be an evaluation of the manual's overall effectiveness to guide the staff on future projects.

Where does one find these people? As things are today, they are not likely to be sitting in the personnel office. The title "Technical Writer" not only defines how the industry perceives this function, it also limits the way the rest of the world perceives it as well. People with research or media communication skills would probably not think to apply to technical writing departments.

Recruiting sources

The best source of these people would be advertising agencies that handle high-tech accounts. Several companies in California's Silicon Valley have already started the trend by hiring people who have extensive marketing backgrounds in promoting traditional consumer goods.

This assortment of skills — media experience, writing, art and research — does not necessarily represent four separate individuals. The staff that was brought together to create the manuals for the warehouse consisted of a project director, who had media skills as well as research ability; an illustrator; a design consultant, who also did the final editing; a technical writing trainee, who also did pasteup; and one genuine, experienced technical writer, who also did the final proofreading.

Rather than turning the entire project over to one writer, everyone worked on every manual, each person doing only what he did best.

The project director did the initial audience analysis and user-needs assessment. With this detailed information about the user, the project director and the design consultant outlined the basic approach. An illustrator was selected and called in to help prepare a formal presentation to the president of the company.

The writing was produced in several stages. The experienced technical writer prepared a technically accurate draft describing the workings of the system. Meanwhile, the project manager wrote a chapter as a sample of the writing style to be used. This chapter was then revised again by the design consultant. The novice writer was assigned to do the glossary and error messages and to edit the original technical draft.

While the writing was in progress, everyone participated in brainstorming sessions to come up with appropriate illustrations. All the way

IN DEPTH/THE TYRANNY OF WORDS

through the project, the illustrations and the copy were tested to be sure that they were communicating as planned.

The last stage of the project was production: page design and layout and printing. The novice writer, whose training had been in photography and graphics, was responsible for preparing the pages for the printer. The experienced technical writer did the final proofreading.

The success of any project has a lot to do with the variety of minds and talents of the people involved. Most important, however, is the concept of the integration of the work of several specialists, rather than expecting one person to be a generalist, trying to do all functions well.

The receiver

The second major part of preparing successful communication materials is a profound understanding of the user. How can we communicate with people if we know nothing about who they are or about the way they think, feel and learn?

At first glance, it seems overwhelming to try to understand the vast armies of people, growing daily, who are computer users. In dealing with any large audience, it is always easier to break it into segments. Users of high-tech products can be broken down into four segments: Captive positive, captive resistant, noncaptive positive and noncaptive resistant.

The captive positive user is one who must use a computer and wants to do so. An example would be someone who actively participates in the automating of his work. A captive resistant user is one who must use a computer to keep his job but isn't happy about doing so. A noncaptive positive user is one who doesn't have to use a computer but wants to, such as someone who buys a home computer. The noncaptive resistant user doesn't want or need to use a computer and, as a rule, will not be a target for communication materials.

Jack and his co-workers are a captive audience that has wavered between being positive and being resistant. On the one hand, they are resistant to changing the way they work and are concerned about their job security. On the other hand, they are a bit excited about learning to use a computer and want to support the warehouse manager, whom they like and respect.

At the beginning of any communication project, it is necessary to spend some time with the intended users to find out as much as possible about them. A formal approach to audience analysis, such as having people fill out questionnaires, can be costly and time-consuming. People will often say things in casual conversation that are too lengthy to write down. The project director decided to spend a week at the warehouse and gather the information by observation and casual conversation.

The "foreigners from Funnyvale" were fascinating objects of curiosity, and their presence broke up the routine of the warehouse. Curiosity about life in California was more powerful than any shyness, and there were as many questions asked as answered.

Learn by observation

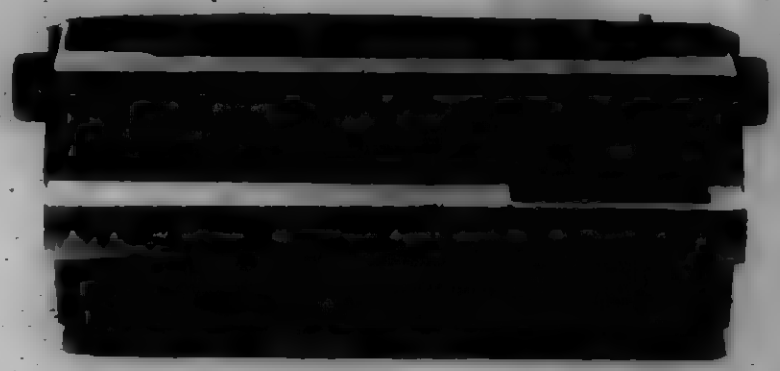
One can learn much by observation and a few casual questions. It is important for the person asking questions to explain how the information will be used. Usually, a direct approach is best; information is being gathered so that communication materials address the needs of the user.

The best way to gather the information is in naturally flowing conversation rather than going down a list of preworded questions. It is necessary to know in advance what kind of information is needed and to make sure that over the course of the time everything has been covered.

A skillful communicator will keep track of the words his audience uses to express itself and then incorporate this vocabulary into the final message. The same technique should be applied to visual communication as well. If the users depend upon TV for learning about their world, perhaps video may be a more effective training tool than a manual.

The result of the research was that, except for a few office workers, the audience was male, ranging in

Heavy duty.



If you can't afford printer downtime, pick the ones designed to take all the punishment you can dish out and still keep printing. Our 35 and 55 character-per-second daisywheels print sheaves of crisp, sharp letters at doubletime, with never a moan or groan. Call your distributor. Or contact Dataproducts at (213) 887-3924, 6200 Canoga Avenue, Woodland Hills, CA 91365. In Europe, 136-138 High Street, Egham, Surrey, TW 20 9HL England.

age from about 30 to 55. They considered themselves professional warehouse workers and had no intention of doing any other kind of work. None had more than a high-school education, although some were seeing their children through college. There were several recent immigrants, but they had come from English-speaking countries.

These people enjoyed the outdoor life and spent much of their free time hunting, fishing and camping. They got most of their information about the world from TV and pictorial magazines. They were politically and socially conservative and considered using a keyboard of any type "women's work."

Besides gathering factual information about users, it is important to know how they feel about the new technology. The users' attitudes toward the computer affect how they will learn to use it. Often, the user manual represents the only physical reality of the software. If the manual is thick and wordy, then the user perceives the software as difficult and complex. Jack's initial reaction to the original manual is a perfect example of this. In reality, he would only be using a small portion of the system, which was eventually explained in a very small book.

Negative attitudes

Negative attitudes create an atmosphere in which no learning can take place. While communicators cannot control the events surrounding automation, being aware of the impact of attitudes on learning is important.

In preparing the materials from which users learn to operate their computers, it helps to be familiar with the way people learn. First, you must get their attention. Second, they must be able to understand the message. Third, they must then be able to perform the behavior you want them to learn. And last, they must be able to repeat the behavior.

The manual is very important in getting the users' attention. Attention can be attracted by preparing interesting-looking materials. This is often best achieved with nonverbal communication such as illustrations. Before a person will read a manual, which is a rational and deliberate action, something must attract the person's attention. This step is especially important when the target audience is personal computer owners looking for software to buy in a retail store.

The information presented must be couched in terms that are understandable to the users. Presenting too much information is just as much a barrier to learning as is too little. Using language or metaphors that are inappropriate to the audience will ensure communication failure.

The true test of the users' understanding of the information contained in the manual is how quickly

IN DEPTH/THE TYRANNY OF WORDS

and easily they can use the computer. If, after reading the manual, the users cannot use the computer, then the manual doesn't work.

The last step in the learning process is the ability or desire to repeat the activity learned. If the user finds that performing is not rewarding, he will not continue to do it. This has happened to the home computer user who discovers that finding the information necessary to use the system is so unrewarding that it ends up gathering dust in a closet. Another example is the person who is afraid of being replaced by a computer at work. Economic survival is a powerfully motivating force. If a person thinks he will keep his job by not learning to use a computer, he may refuse to learn it.

Know your audience

This is a simple summary of a large body of research on human behavior. The more technical communicators know about their target audiences, the more effective their communication materials will be. Preparing training materials without this understanding is like trying to hit a target blindfolded.

When the design of the message is created by a group of highly competent specialists who have a deep understanding of the needs of the user, the result is a powerful and effective communication tool.

We need to move away from the dependence on a large book full of words that contains everything there is to know about the computer and its software. The assumption that the user will read the book from beginning to end before he uses the computer does not reflect the reality of the learning process.

Using a computer is something people do. They learn to use a computer the same way they learn other skills. Typically, people begin to learn by watching other people. They ask questions, read a bit and practice a lot. Keeping in mind a person's propensity for gathering bits and pieces of information from a variety of sources helps to break the big-book habit.

Designing any message involves a careful balance of words and pictures: of information that is presented verbally or that is best communicated visually; of information that is included or left out; or of information that needs to be repeated frequently or not at all.

The medium into which the message is packaged has a lot to do with how people react to the message, how they feel about it and how well they learn it. Film, video, print and person-to-person communication present different kinds and quantities of information.

Film and video are similar in their production and the kind of information presented. They differ mostly in the size of the audience to which they can project. While detailed, step-by-step information cannot be remembered by viewing a film or video, they provide an excellent way to set attitudes and give general overview information.

Power of print

Print is by far the most powerful medium for transmitting detailed information. By restricting the message to words, however, technical manuals fall into the same trap as most textbooks — they are incredibly boring to read and require highly motivated readers to plow through them. While adults will put up with such literature, children won't, and, therefore, children's books provide us with examples of combining text with illustrations to transmit information.

Combining various media, such as film for general, introductory information; video for showing details of physical procedures, such as

loading tapes onto a computer; and print for details the user will refer to over and over again, with person-to-person involvement of trainers, is the most effective and powerful approach communicating technical information. This combination breaks the message into various forms over time and can deal with the changing needs of the users as they progress in their learning.

The organization of the content is best when it reflects the behavior of the user, rather than the behavior of the machine. Breaking down the information by task categories or procedures enables users to have only that information which applies directly to their work. If one is a receiving clerk, one does not need the shipping clerk's documentation.

Recognizing the different information needs of the novice and the experienced user is also important. Many manuals begin with assembly instructions and skills training that are not used after the first few days. Unfortunately, the pages remain to become a minor barrier to more frequently used instructions further back.

While endless amounts of energy have been devoted to the verbal messages of technical writing, virtually no attention has been paid to the visual messages. Most training materials are visually unappealing. In the case of the packaging and the manuals that come with retail software, the contents do not live up to the promise of the covers.

While words are certainly a good way to transmit information, to disregard the impact of good visual communication on learning is like trying to make a hot fudge sundae without the hot fudge sauce.

The packaging or the physical form of the message serves to attract the attention of the audience and to build attitudes toward the product. Once the attention has been captured and the initial reaction of the user is positive, the design of the pages guides the eye to the order and importance of the words and pictures on the page.

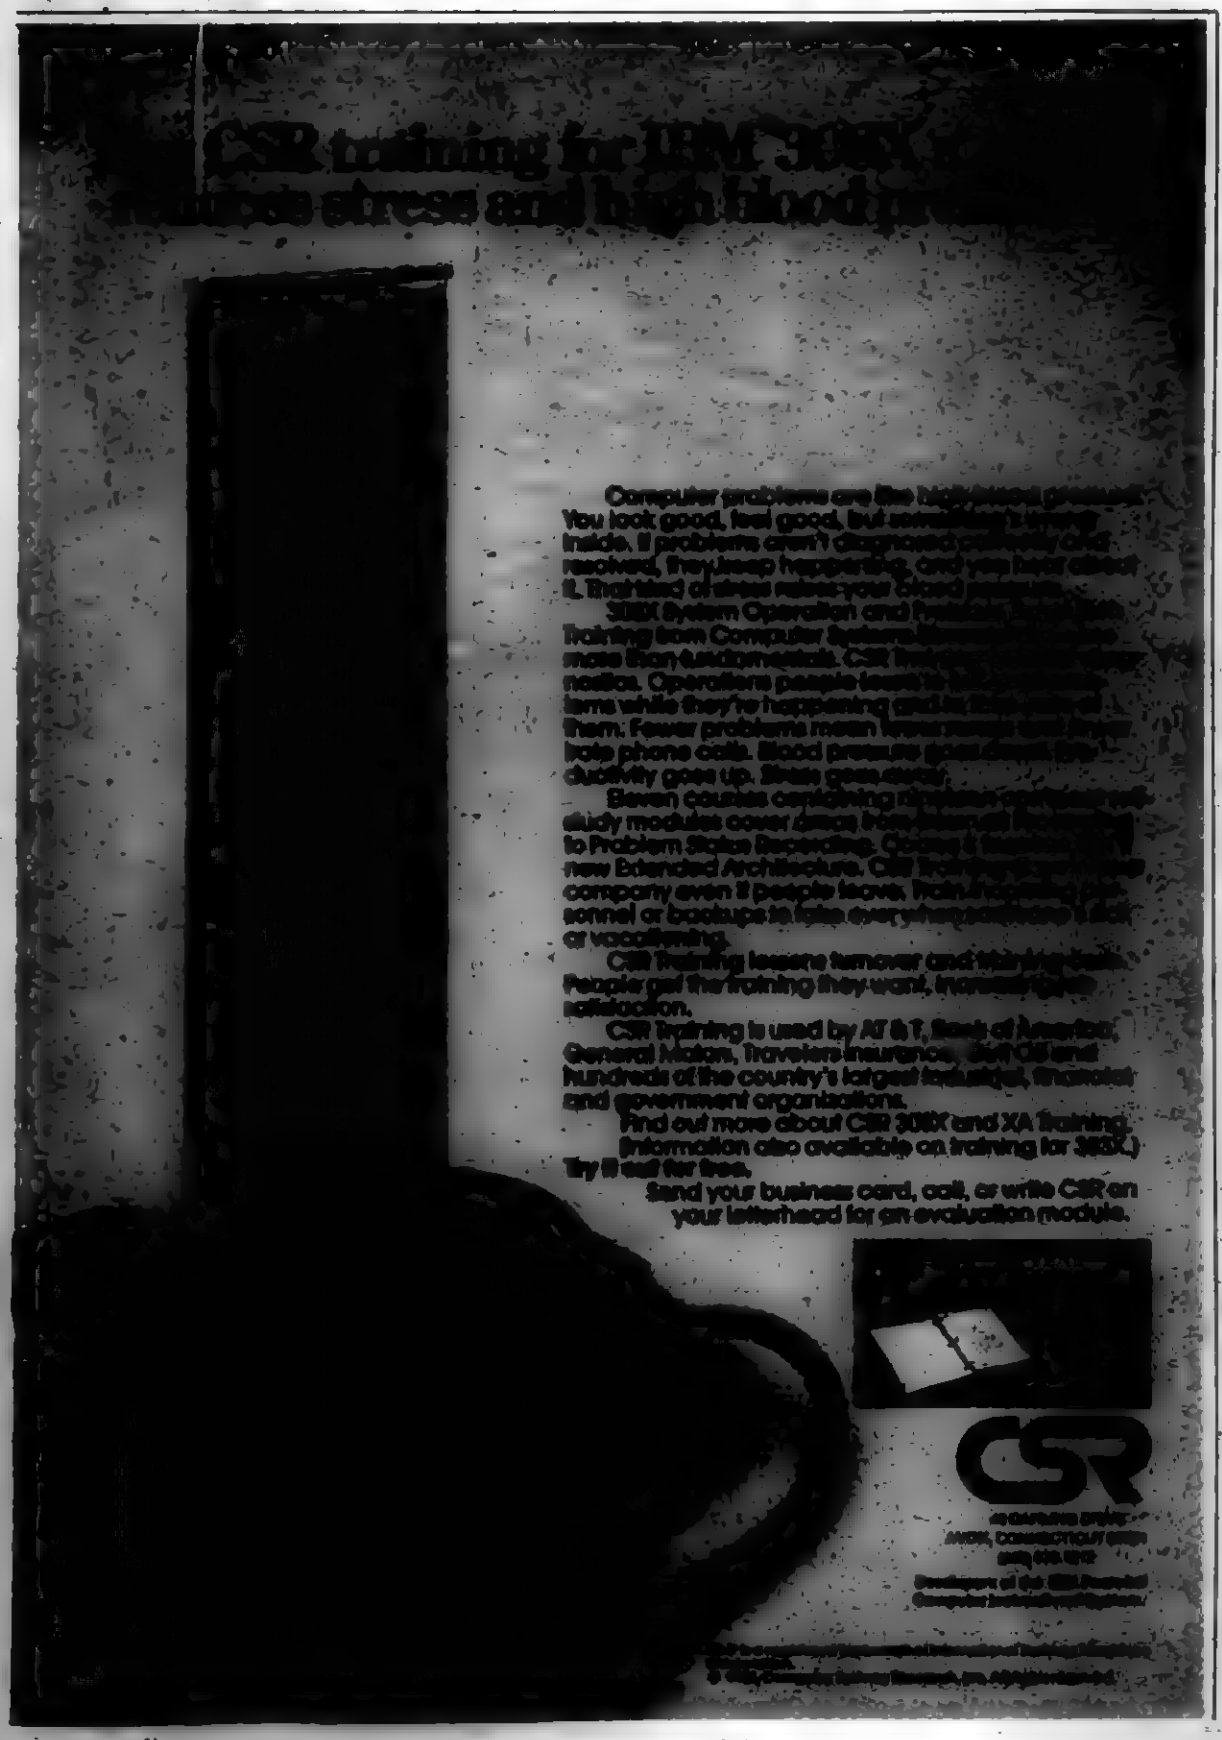
The proper use of illustration can eliminate pages of text and enhance the understanding of difficult and complex information.

On the other hand, illustrations added as decoration rather than as another expression of information become distracting noise, drawing the eye and the mind away from the communication process.

By combining the power of words with the power of pictures, the result is communication that is more effective than either alone.

By pulling together the information we have gathered about Jack and his needs, we can set up a structure from which to prepare communication materials for him. We have found out that Jack does not learn by spontaneously and enthusiastically reading 200 pages of text — indeed, who does? Jack prefers to see pictures and hear words. We know that he is somewhat discouraged by the apparent complexity of the new system, but given a chance, will go to great lengths to support his boss and the company for which he works.

The proper use of illustration can eliminate pages of text and enhance the understanding of complex information.



By pulling together the information we have gathered about Jack and his needs, we can set up a structure from which to prepare communication materials for him. We have found out that Jack does not learn by spontaneously and enthusiastically reading 200 pages of text — indeed, who does? Jack prefers to see pictures and hear words. We know that he is somewhat discouraged by the apparent complexity of the new system, but given a chance, will go to great lengths to support his boss and the company for which he works.

We know that Jack's first language is English and that his comprehension is good enough so that we don't have to make any special allowance for general information. However, because he has never used a computer before, unusual computer words and terms will need to be explained. We know that Jack is a man of action and the quicker he can use his computer the happier he will be about it.

Based on this, we created a manual that was the greatest possible contrast to the first manual Jack saw — a small, illustrated manual in the form of a comic book. Simple flowcharts illustrating his tasks replaced pages of text. The manual's size and humorous illustrations communicate the idea that the work is simple and might even be fun.

Although the manual looked different, it contained the same information as the larger book. The major difference was that we translated many pages of detailed directions into a few illustrated flowcharts. Each flowchart represented one entire type of job, showing all the steps and possible alternative actions Jack could take. This manual enabled him and his co-workers to use their system quickly and easily, with a minimum of assistance from the trainers.

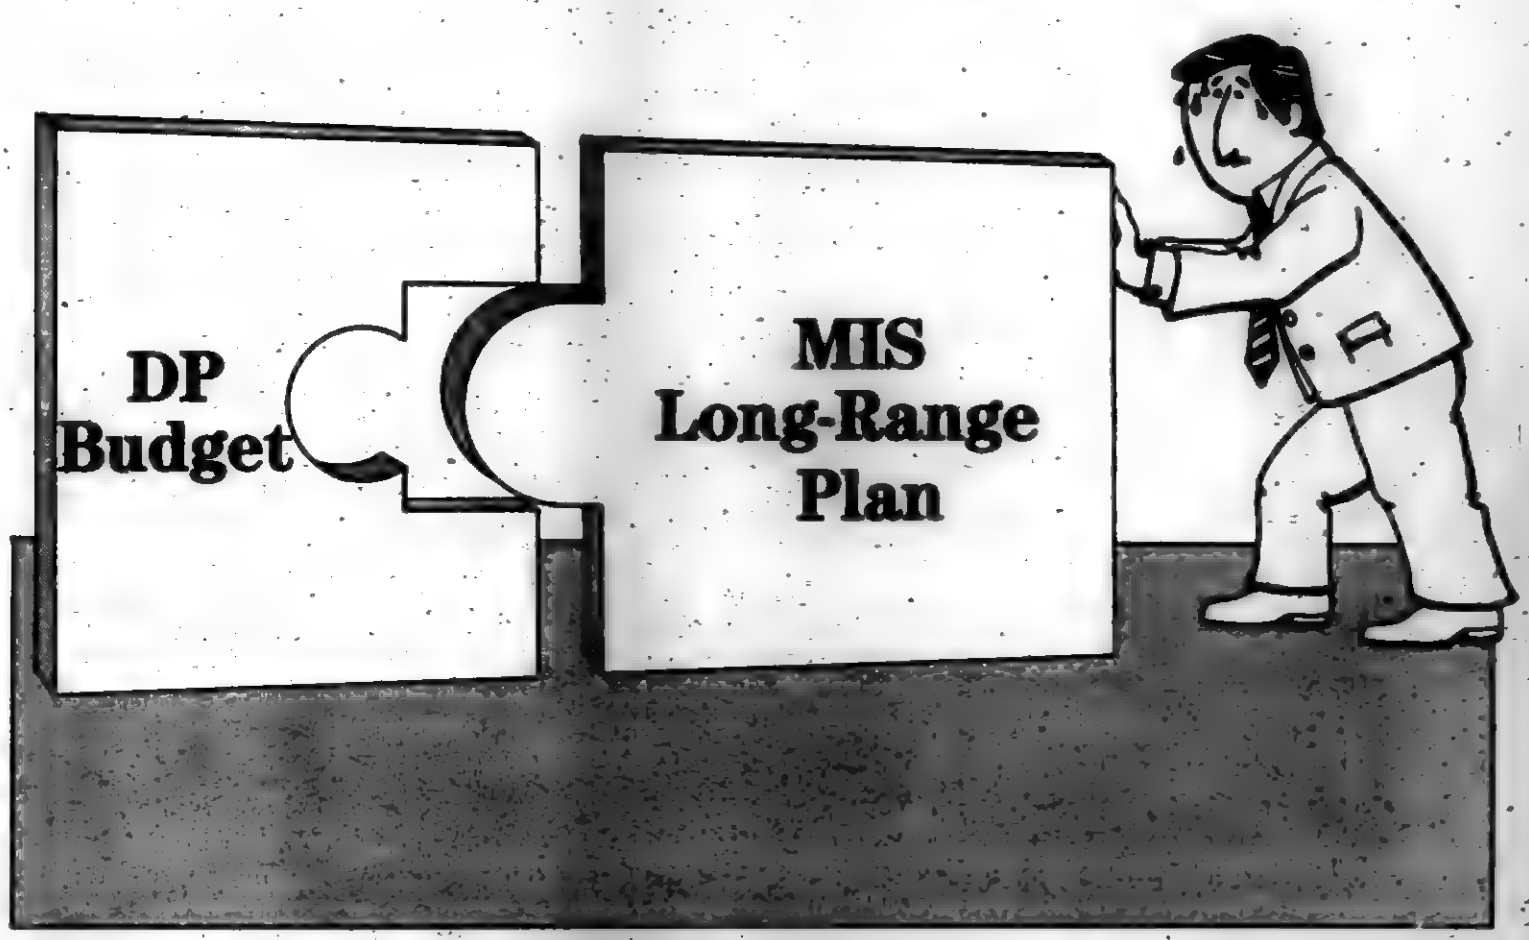
While we decided to produce a comic book, it is important to keep in mind that there are many different ways to communicate the same information to the same audience. When the audience changes, needs will be different and materials must be designed accordingly. Instead of being tied to an end product, a book full of words, if the focus is on the communication process, we can break the tyranny of words and start communicating.

About the author

Priscilla Burgess is a graduate student at Stanford University in communication research. While working on her degree, she has been consulting with high-tech companies on technical communication problems and teaching classes in technical writing. Burgess was formerly a manager of product communication for a Silicon Valley firm.

Mario Risso is an illustrator who lives and works in San Mateo, Calif.

IN DEPTH



Where it all begins: A budget that fits your plan

By Kenneth E. Phelan

The memorandum on your desk from the vice-president of finance informs you that next year's budget must be completed by the end of the month. He expects you to deliver a presentation to the steering committee to explain how requested expenditures are consistent with the strategic plan. Your immediate problem is to reduce the long-range goals and objectives to line items in the first year's budget.

The content and format of most strategic and tactical planning methodologies do not fit neatly into established budgeting practices. Most five- to 10-year strategic plans or three- to five-year tactical plans are documented in general terms. They list objectives, as well as business problems and opportunities. The plan may include briefs for proposed systems, along with estimates of costs and benefits. Implementation schedules are roughly sketched over a multiple-year calendar. The plan is organized by project rather than by the type of resources required.

Resource plans are essential to translating long-range plans into budgets. Even the more complete methodologies, however, do not generate resource requirements in enough detail to relate them to budget line items. To make the transition from long-range plan to annual budget, an operational (budget-year) plan must be formulated. Operational planning involves refining initial estimates in the long-range resource plan.

To develop an operational plan:

- Review and reassess the relative priorities of current and planned projects.
- Select specific projects for the near-term,

This past year's strategic planning efforts may have put you and your firm's top management on the same wavelength at last. Management may even agree to a five-year plan for revitalizing the systems department. The challenge now is to translate that plan into a first-year budget.

budget-year segment of the company's MIS long-range plan.

■ Rework the near-term segment for the upcoming fiscal year to achieve the appropriate level of detail for budgeting purposes.

After reviewing priorities and selecting the year's projects, a detailed estimate of required expenses should be developed for each one.

The monetary outlay to make progress toward the near-term segment of the MIS long-range plan represents incremental DP costs. Budgeting also encompasses two other dimensions: ongoing costs to maintain the status quo and unanticipated projects that are not parts of the plan but must be addressed as consequences of pressing regulatory or marketplace directives.

While the prior year's actual expenses provide an accurate basis for projecting ongoing costs for the upcoming year, it is obviously more difficult to ensure that adequate funding is set aside for unanticipated requirements. A useful technique is to define a contingency or research and development project category.

Experience with the unplanned project costs encountered over the previous several years should provide some guidance for determining the amount to allocate for contingency purposes.

All operating expenses, including those for ongoing, unanticipated and planned activities should be presented in a format that itemizes expenditures across six resource categories. The following framework can be used as a model for organizing and documenting a one-year DP operational plan in four sections.

Section I: Application systems agenda. This section should provide an in-depth discussion about each significant application system project for the upcoming fiscal year.

Projects of this nature include the study, design, programming, testing, documentation, training and installation of functional business systems and should be separated into three classifications of systems development effort:

■ Significant maintenance on existing systems.

■ Significant enhancements to existing systems.

■ Significant new systems development.

Narratives and exhibits should appear wherever appropriate for each of the following areas:

System description. This description should cover each system's expected capabilities and should explain how each system contributes toward solving business problems and/or capitalizing on opportunities. Each system should be clearly tied back to the MIS long-range plan to clarify and strengthen the justification for near-term funding and implementation.

Resource requirements. This subsection should project the costs required to implement each system and to sustain it as a part of ongoing operations. It should include an itemization of requisite resources and associated expenses for additional hardware, software, staffing, environmental facilities, supplies and administration, outside services and training.

Benefits summary. This comprehensive review of each project's anticipated tangible and intangible benefits should include supporting documentation that references relevant feasibility studies, reports, surveys, cost/benefit analyses and financial justifications.

Implementation schedule. The schedule should present estimates for major project milestones, such as anticipated start and completion dates for each system development phase.

Section II: Services and support agenda.

Projects covered in this section include installation, use and management of system control software or some other aspect of a data center's operational environment. Also included should

The TC-500A is available in 16- or 32-channel chassis configurations. 16-channel unit shown above.

COMDESIGN INTELLIGENT STATISTICAL MULTIPLEXERS:

MORE FEATURES FOR YOUR COMMUNICATIONS DOLLAR

An attractive price and a long list of features make ComDesign's TC-500A Intelligent Statistical Multiplexer a great value. In fact, it would be hard to beat this multiplexer for data concentration, error control and throughput.

But that's not all.

The advanced intelligence of the TC-500A also gives you the complete system control you would expect only from an expensive network processor.

IT'S FLEXIBLE

Compatible with virtually any host computer, the TC-500A can connect up to 32 terminals, printers, personal computers, or other CPU's over one phone line.* With all the performance of a direct connection. Just select the exact channel configuration you need. The TC-500A supports all popular speeds, flow control conventions, and special character formats.

The TC-500A's unique firmware module, Flexpak, permits easy in-the-field software upgrades and access to latest ComDesign software releases.

*Two synchronous or 20 asynchronous and 1 synchronous

Free application engineering and support is available to all customers from ComDesign's highly-qualified "data comm doctors."

EASY TO USE

The TC-500A is also surprisingly user-friendly. For starters, you never have to flip DIP switches or figure out complicated codes. As a matter of fact, the TC-500A is menu driven, in plain English. All commands are simply entered via the convenient front panel or through the supervisory CRT.

A NETWORK CONTROL CENTER TOO

The TC-500A's multiple microprocessor based architecture makes it powerful enough for network control and management functions. From either end of the network, you can monitor and test the entire system or its individual components, perform complete reconfiguration or change any operating parameter.

And, should anything ever go wrong, the TC-500A's extensive self-diagnostic capabilities make it easy to pinpoint the problem and effect immediate corrective action.

Add it all up, and we think you will agree, that the TC-500A will give you more for today's *and* tomorrow's communications dollar.

IN DEPTH/FROM PLAN TO BUDGET

■ Approximate costs (purchase prices, monthly rent and so forth).

Software subplan. List proposed acquisitions of proprietary or commercial software packages during the planning period. Provide pertinent detail, if available, for type of software, vendor, target installation date and approximate costs (license fees, monthly rent and so on).

Staffing subplan. Tally staffing requirements to reflect additional staffing through the planning period.

An examination of requirements in this area should produce projected monthly figures for skill type, number and employment costs (salaries, benefits, taxes, recruiting and so on) of people necessary to provide adequate data processing support and services and to develop, implement and maintain new application systems within prescribed target dates.

Environmental facilities, supplies and administration subplan. Determine likely significant changes to the physical site, supplies consumption or administrative expense as a consequence of working on the year's projects:

■ Fire suppression systems.

■ Normal and emergency electrical power.

■ Air-conditioning.

■ Physical security.

■ Office expansion.

Provide pertinent detail, if available, for the type of change, target date and approximate costs (purchase prices, monthly expenses and so on).

Outside services subplan. Indicate any expected noteworthy expenditures for data processing services to be supplied by concerns outside the company:

■ Consulting services.

■ Time-sharing activities.

■ Service bureau operations.

■ System analysis, design and programming.

■ Intercompany charges.

Provide pertinent detail, if available, for type of service, vendor, duration of service and approximate costs.

Training subplan. Improving the skills of data processing personnel to enable them to support project efforts implies training expense. For the skills that must be acquired, identify courses, costs and approximate travel allowance for each month in which training expense is anticipated.

A one-page synopsis should cover all the year's projects, cross-reference them to estimated costs in each of the six resource requirement categories and tally anticipated expenses by project.

Section IV: Resource allocation overview. This one-page synopsis should recap all the year's projects, cross-reference them to estimated costs in each of the six resource requirement categories and tally anticipated expenditures by project, as detailed in Sections I and II, and by category, as in Section III.

Appendices. Appendices should be included and referenced as deemed necessary to provide supporting detail when helpful.

Possible candidate topics include:

Pricing/reimbursement schedules. Data centers utilizing chargeback procedures can include current pricing schedules and a discussion of how full-cost reimbursement and/or accumulation of reserves is expected to be attained.

Feasibility studies, surveys, reports, special studies. A company also should provide any documentation that helps readers understand the plan. Examples include external studies and reports, internal feasibility studies or "white papers" to support specific recommendations.

After the operational plan is documented in this level of detail, transferring costs from each of the six resource subplans to budget worksheets is relatively simple. The task is streamlined by sorting budget line items according to the six resource requirement categories.

HARD TALK
Tom Hankel
CW News Editor

DEC, IBM race to grab limelight

The Keystone Kops are not dead. They're alive and well and working for Digital Equipment Corp. and IBM. The two firms are falling over themselves trying to rain on the other's parade.

On April 3, DEC scheduled a press conference in New York to announce its latest high-end VAX-11 processor, the 11/785. Held at the Windows on the World restaurant in lower Manhattan, the press conference was set to begin at 10 a.m. and segue into lunch at around 12:30 p.m.

Less than 24 hours before the DEC announcement, IBM sent invitations to its press conference, an announcement of a small System/36 and a rash of microcomputer-oriented software. That announcement was scheduled to begin at 1 p.m. at IBM's Madison Ave. office building (a good 30 traffic-ridden blocks away from the DEC announcement).

A coincidence? Don't bet on it. This is the second time IBM and DEC have scheduled press conferences at the same time. On Oct. 18, DEC held a press conference in Marlboro, Mass., to announce its Microvax system. About 48 hours prior to the announcement, IBM sent out invitations to its Manhattan press conference, scheduled for Oct 18. There, IBM announced the 3270 Personal Computer and the Personal Computer XT/370 plus about 30 unrelated products.

Strategy involved

Can it be the marketing wizards at IBM and DEC naturally choose the same day to announce their products? There is undoubtedly a strategy involved in picking the perfect date for a product announcement. Perhaps both DEC and IBM have honed that selection process down to such a science that they are driven to always pick the same day. Chances are, though, the marketing geniuses at both companies are so competitive they can't stand to see their competitor get an open shot at the limelight.

So which company is trying to step on the other company's toes? In both cases, DEC announced its press conference well in advance of IBM's. But in both instances, IBM announced many more, and more significant, products than DEC.

Did DEC get wind of pending IBM announcements and make a hurry-up attempt to steal part of the show? Or did IBM use its massive size to round up a bunch of products and announce them just to take away some of DEC's thunder?

Two possible reasons

In the April 3 case, DEC had not one, but two possible reasons for choosing that date for an announcement. C. Gordon Bell, the former vice-president of engineering for DEC, was slated to speak on what is going on inside DEC. The

CDC unwraps storage products for Cyber 170 Series 800 line

By James Connolly
CW Staff

MINNEAPOLIS — Control Data Corp. has announced a 9.6G-byte disk subsystem, mass storage controller and 55G-byte cartridge storage system for its Cyber 170 Series 800 family of mainframes.

The CDC 895 Disk Storage Subsystem contains four independent disk spindles that provide a sectored capacity of 2.4G bytes each for a total of 9.6G bytes per subsystem. The spindles are stored in a single cabinet and feature fixed-head disk assemblies.

According to the company, the average disk seek time is 16 msec, providing improved response time and increased throughput over the existing CDC 885. The 895's 3M byte/sec burst-transfer rate is said to be twice as fast as that of the 885.

The 895 includes data interface and dual-access control for all of the disk spindles in a subsystem. The dual access was designed to allow for any two control units to transfer data simultaneously from any two of up to 16 spindles in a subsystem. It is said to feature thin-film read/write heads and a recording density of 12.2M bit/sq in.

The CDC 7165 mass storage controller features two independent control units, each providing a path for simultaneous transfer of data between peripheral processor channels and the 895. It was designed to control up to four 895s totaling 16 spindles.

The CDC 7990 Mass Storage System was designed as an extension to disk file storage subsystems and as an alternative to magnetic-tape storage. It features 175M-byte cartridges stored in a system of cells providing 5.1G bytes of storage per square foot of floor space. It includes a storage controller and storage module storing up to 55G bytes. Each controller can control

See CDC page 71

HP reduces prices of OA systems

PALO ALTO, Calif. — Hewlett-Packard Co. has announced price reductions ranging from 43% to 54% on three of its office automation systems and unveiled four preconfigured HP 3000s designed for office automation applications.

The prices of the HP 3000 packaged systems represent reductions ranging from $3,600 to $18,600 compared with their separately priced components, HP claimed.

In addition, HP is offering the following three office automation configurations at reduced cost:

- Four HP 150 personal computers with six software packages for $15,000.
- Four HP 2623A word processing and graphics terminals with five software packages for $15,000.
- Two HP 2623A word processing and graphics terminals, two HP 150 personal computers and nine software packages for $22,000.

The four specially configured HP 3000 systems include:

- HP 3000 Series 39 with 1M byte of main memory, a 65M-byte Winchester disk drive with integrated cartridge tape backup, two communications controllers and a terminal as a systems control console. The price is $38,974, an $18,600 reduction.
- HP 3000 Series 39 configured the same way, but with a 132M-byte disk. It is priced at $45,924.
- HP 3000 Series 42 with a 1M-byte main memory and with disk caching. It is priced at $62,424.

See HP page 71

Have a story about graphics?

Computerworld's June Special Report will take a look at graphics systems. We will look at graphics on mainframes and graphics on micros. We will look at why DP users are spending so much time and money to draw those pictures. We will find out who is using those pictures and how they are using them.

The Special Report will focus on graphics from business graphics to computer-aided design, from stand-alone microcomputers to integrated systems. Contributions to the Special Report should take one of two forms: a tutorial article discussing an issue or trend or a user application story outlining a particular firm's experience with a graphics system or package.

Articles must be typed, double-spaced and can range in length from four to six pages. Artwork such as charts, graphs and photographs is encouraged.

Authors should include a brief biogra-

TI enhances several CPU lines

DALLAS — Texas Instruments, Inc. has announced six additions to its Business System 600 and 800 series of small business systems and added three models to its 300A series computers.

The Business System 300A models are said to feature the addition of local-area network capability, ergonomically designed terminal enclosures and a 1M-byte main memory capacity.

The Business System 600 and 800 series models feature the addition of 9-in. Winchester WD900 subsystems with 133M-byte or 425M-byte formatted storage and ¼-in. streaming tape drive for backup.

The announced Business System 600 and 800 models use TI's standard Model 931 terminal and support the languages, communications and utilities supported by existing Business System 600 and 800 models.

The announced models are:

- The 600A with 512K- or 1M-byte

Lisp offers entry-level LMI Lambda

Artificial intelligence system for use in office environments

CULVER CITY, Calif. — Lisp Machine, Inc. has announced an entry-level version of its LMI Lambda artificial intelligence system for use in office environments.

LMI Lambda/S is based on the Lisp language and is intended for AI research and applications. It is equipped with a 32-bit Lisp processor and provides computing power similar to that of the full-size LMI Lambda in a package slightly larger than a two-drawer file cabinet, according to the company.

A special cooling fan and low-noise disk drive are said to help it fit into office automation and similar applications.

The product features a 160M-byte Winchester disk drive and a 12-slot card cage.

The LMI Lambda/S can be used as a stand-alone machine, offering the power of Lisp Machine's Lisp (extended Zetalisp) environment, or as a workstation on a local-area network using a rack-mount LMI Lambda or other host computer as a file server, the vendor said.

Lisp software supplied with the machine can confer Lisp-like attributes on non-Lisp file servers, which lets it add intelligence to traditional data bases.

According to the company, the LMI Lambda/S can be utilized by OEMs seeking a delivery vehicle for expert systems and other artificial intelligence applications packages intended for use in an office setting, as well as by software developers for program development.

The LMI Lambda/S, scheduled for deliveries in May, is priced at $66,500.

Lisp Machine is located at 3016 S. Sepulveda Blvd., Culver City, Calif. 90230.

PROCESSORS

ARIEL CORP.
FFT 523

Ariel Corp. has announced the FFT 523, a single-card, fast Fourier transform (FFT) processor for the Hewlett-Packard Co. Series 200 desktop processors.

The FFT 523 plugs into a single backplane slot of the HP systems and performs FFTs by execution of a single program line in Basic or Pascal. Disk-based, machine-language driver routines provided with the 523 make the host-peripheral interface transparent to the user, the company said. Operating on 16-bit integer data, the FFT 523 is said to transform arrays of up to 1,024 complex points in a maximum of 9.2 msec. Two or more FFT processors can be installed in a single host for increased throughput, the company noted.

The FFT 523 is priced at $1,800 in single quantities, according to the vendor.

Ariel, 600 W. 116th St., New York, N.Y. 10027.

DATA STORAGE

CORVUS SYSTEMS, INC.
Omnidrive

Corvus Systems, Inc. has announced that it has included its Omninet local-area network interface in its line of Winchester disk drives. The Omnidrive disk drives reportedly also have no need for a dedicated disk server in network applications.

The Omnidrive disk drives use a 5 ¼-in. Winchester disk and replace most of the existing line of Corvus drives, according to the vendor. The drives will be available for the IBM Personal Computer and Personal Computer XT and the Corvus Systems Corvus Concept, Digital Equipment Corp. Rainbow 100, Apple Computer, Inc. Apple II, Texas Instruments, Inc. Professional and the Zenith Data Systems Z-100 computers.

The Omnidrive systems are available in the following storage capacities at the following prices: 5.5M bytes, $1,995; 11.1M bytes, $2,495; 16.6M bytes, $3,195; and 45.1M bytes, $4,995, according to the vendor.

Corvus Systems, 2100 Corvus Drive, San Jose, Calif. 95124.

IMPERIAL TECHNOLOGY, INC.
Megaram; Megastream

Imperial Technology, Inc. has announced its Megaram solid-state, nonrotating, disk emulating memory for the Digital Equipment Corp. VAX-11 series of computers. At the same time, the firm announced a streaming tape drive option for Megaram.

Megaram reportedly eliminates the rotational and head-positioning delays common to systems with rotating disks. It attaches to the Unibus of the VAX-11 processors and is said to be able to emulate either the RL01/RL02 series or the RK06/RK07 series of DEC disk drives.

The Megaram units are priced starting at $15,900 for the basic 2M-byte unit, and the cost increases by $4,500 for each additional 1M byte of

A Simple Plug For Datastream's New 5-in-1 Remote 3278 Terminal.

Anyway you look at it, the Datastream 878-15 is an extraordinary 3278 display station.

Look first at versatility. The 878-15 supports five screen sizes. IBM® 3278 Models 2 through 5. Plus DEC® VT100. So you can access any 3270 or minicomputer application from a single display station.

And all five screen sizes can be selected by the host. Or menu-selected by the operator.

Then take a look at the 878-15's sophisticated keyboard. It delivers complete 3278 functionality. And advanced 3290 features like 24 top row PF keys, an operator-definable 10-key pad and more. The 878-15 even offers a port for direct printer attachment.

The 878-15 features a standard 3278 keyboard plus 24 PF keys and an integral 10-key numeric pad. The 14" screen is available in green or amber phosphors.

And that brings us to the simple plug.

The 878-15 is designed for use with Datastream's BSC or SNA Remote Cluster Controllers, which allow the 878-15 to access its host or hosts over ordinary phone lines. All you have to do is plug it into a modem and dial in. Or connect it directly to the controller. Either way, you'll never see the expense of leased lines again.

Together, 878-15 and 178-2 Display Stations and our Remote Cluster Controllers make quite a team.

Offering advantages like sophisticated security. Remote diagnostics. Multiple concurrent sessions. Dual IBM host access. Minicomputer access. And communication with other peripheral devices.

If you're looking for flexible, reliable and inexpensive ways to extend your 3270 network, Datastream Display Stations and Remote Cluster Controllers are well worth looking into.

Call or write today. Datastream, 2520 Mission College Blvd., Santa Clara, CA 95050. (408) 986-8022. Outside CA, CALL TOLL FREE: 800-952-2500.

*IBM is a registered trademark of International Business Machines. *DEC is a registered trademark of Digital Equipment Corporation. ©1984 Datastream.

SYSTEMS & PERIPHERALS

Continued from page 66

storage up to 28M bytes.

Megastream, the tape drive option, is said to enable data stored in Megaram to be maintained in the event that ac power fails. The combination of Megastream and Megaram reportedly provides a nonvolatile, solid-state storage capability.

Megastream is housed in a 7-in., rack-mounted chassis and has a formatted capacity of 32M bytes on a removable ¼-in. tape cartridge.

Megastream is priced at $8,500.

Imperial Technology, 831 S. Douglas St., El Segundo, Calif. 90245.

TERMINALS

ANALOGIC CORP.
Linker 100

Analogic Corp. has announced a terminal that features serial communications with industrial monitor and control systems.

According to the vendor, Linker 100 can communicate with a remote host computer or with remote single intelligent peripherals from a central location via an RS-422 or RS-232C port.

Linker 100 is user-programmable for performing ramp/soak, cascade, ratio or custom algorithms.

The price for the single unit is $595, with delivery six weeks after receipt of order.

Analogic, Audubon Road, Wakefield, Mass. 01880.

NATIONAL COMPUTER COMMUNICATIONS CORP.
Tiny-Term

National Computer Communications Corp. has introduced a 14-lb CRT terminal that reportedly features an 80-col. by 25-line format.

Tiny-Term is said to feature a green-phosphor display, 14 programmable functions, two RS-232C ports and 128 graphics characters. An optional integral modem capable of storing up to 28 telephone numbers is available.

The asynchronous terminal has block-mode and full editing capabilities, the vendor said. It features up to 19.2K bit/sec communications speed.

Tiny-Term is priced at $450; the 300 bit/sec integral modem costs $395, and a 300/1,200 bit/sec modem option costs $595.

National Computer Communications, 260 West Ave., Stamford, Conn. 06904.

GRAPHICS SYSTEMS

MCDONNELL DOUGLAS AUTOMATION CO.
R-100T

McDonnell Douglas Automation Co. (McAuto) has announced a graphics workstation for its Place robotics cell design and simulation system. The R-100T is reportedly a tabletop version of the company's R-100 vector refresh display.

The terminal is said to be able to access Unigraphics, McAuto's computer-aided design and manufacturing system, to create cell geometry for Place. It is offered in black-and-white or color versions.

The R-100T is priced at $65,000 for black-and-white display and $73,000 for color display, prices which are said to be 40% lower than the R-100T's predecessor.

McAuto, P.O. Box 516, St. Louis, Mo. 63166.

POWER SUPPLIES

VIZ MANUFACTURING CO.
Model WP-29A

Viz Manufacturing Co.'s Test Equipment Division has introduced a variable-output, isolated ac power source, the Model WP-29A. The product reportedly provides ac output from 0V to 150V or 0A to 2.25A, continuous at 60Hz.

The WP-29A weighs 15 lb and is priced at $167.

Test Equipment Division, Viz Manufacturing, 335 E. Price St., Philadelphia, Pa. 19144.

BOARD-LEVEL DEVICES

EVENTIDE, INC.
WKBP-16 board

Eventide, Inc. has announced a 1M-byte memory board with 256K-bit chips for the Hewlett-Packard Co. Series 200 desktop computers.

The WKBP-16 board is designed to provide four times the memory density of previously available boards, according to Eventide.

The board is intended for use with the HP 9816, 9826 and 9836 computers, providing extra memory without expansion interfaces.

The board is available, priced at $4,200. Quantity discounts are available.

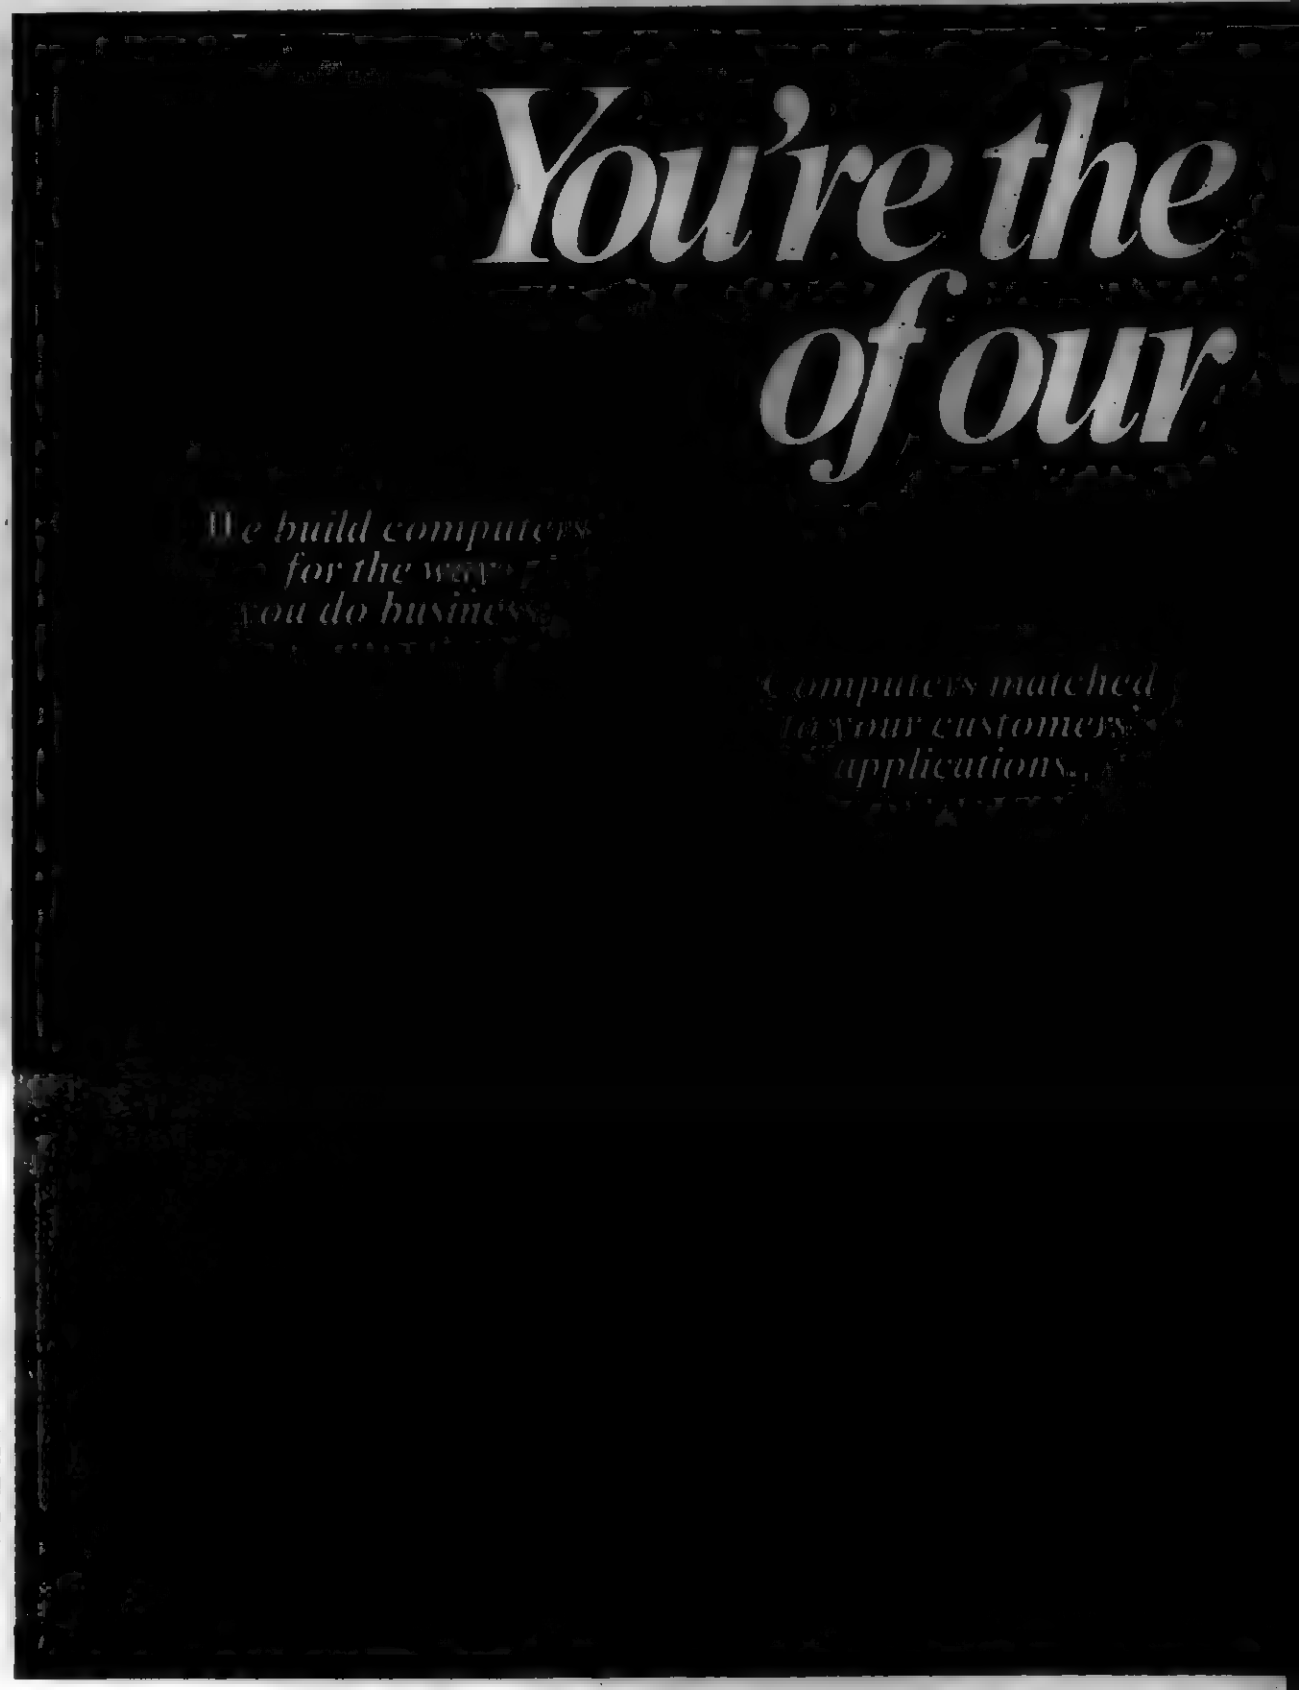
Eventide, One Alsan Way, Little Ferry, N.J. 07643.

ILC DATA DEVICE CORP.
BUS-64103

ILC Data Device Corp. has announced an MIL-STD-1553 Manchester II converter, BUS-64103, with encoding and decoding capabilities.

The BUS-64103 is said to include all functions for an interface between an MIL-STD-1553 serial multiplexer bus transceiver and an eight- or 16-bit parallel tristate highway.

Other features reportedly include encoder/decoder and dual-rank I/O registers; valid word, valid address



SYSTEMS & PERIPHERALS

and fault flags; and wraparound built-in test. It is packaged in a 1.1-in. by 1.7-in. hermetically sealed unit, the vendor said.

The BUS-64103 is priced at $450, with 90-day delivery.

ILC Data Device, 105 Wilbur Place, Bohemia, N.Y. 11716.

DATA-SUD SYSTEMS/U.S., INC. DSSE32RS

Data-Sud Systems/U.S., Inc. has announced a digital output board designed to be compatible with the VME bus and to provide the user with 32 isolated channels.

The DSSE32RS digital output board is said to feature hermetically sealed, double-contact, electromagnetic relays that are magnetically shielded and protected by a transient voltage suppressor. Output status is displayed on the front panel by eight LEDs, with display groupings selected by a four-position switch.

The board is priced at $695 and is available now.

Data-Sud Systems/U.S., 2219 S. 48th St., Tempe, Ariz. 85282.

CYBERCHRON CORP. CDM-82/23R

Cyberchron Corp. has introduced a 1M-byte memory card for Digital Equipment Corp.'s LSI-11 and Microvax I board-level products.

Based upon 64K-byte dynamic random-access memory, CDM-82/23R offers full byte parity, on-board software compatibility parity control and status registers, the vendor said. The board supports direct memory access protocols and has 22-bit addressing capability through 4M bytes, according to the vendor. The product reportedly uses delay-line timing, and its memory array is fully socketed.

CDM-82/23R costs $1,995.

Cyberchron, P.O. Box 196, Garrison, N.Y. 10524

INTEGRATED SOLUTIONS, INC. IS-68S

Integrated Solutions, Inc. has announced an integrated slave CPU on the Digital Equipment Corp. LSI-11 bus.

The IS-68S is based on the Motorola, Inc. 68000 microprocessor and was designed to coexist on the LSI-11 bus with either a host IS-68K board or with a DEC LSI-11/23, LSI-11/73 or Microvax. The dual-bus architecture of the card is said to permit all slaves to execute their own programs simultaneously at full speed without using the LSI-11 bus.

The card reportedly will operate at 12 MHz or with a 10-MHz option, with no wait states.

The IS-68S is priced at $2,695 for the 12-MHz version and $2,295 for the 10-MHz model. Quantity discounts are available.

Integrated Solutions, 2240 Lundy Ave., San Jose, Calif. 95131.

EMULEX CORP. SC7000

Emulex Corp. has announced a disk controller for connecting multiple multivendor disk drives to Digital Equipment Corp. VAX-11/750 and VAX-11/780 superminicomputers.

The SC7000 disk controller is said to utilize bipolar, bit-slice microprocessor technology. It is said to accommodate up to four physical (eight logical) industry-standard storage module drives or Winchester-type disk drives of 825M bytes or more capacity. It is also designed for serial data transfer rates of up to 1.5M byte/sec.

The controller is an extended-hex-size printed-circuit board that plugs into the bus of the VAX-11/750 via one of three available RH750 backplane slots or into one of two slots in the Emulex V-Master chassis, which installs in the VAX-11/780. According to the company, the controller is transparent to DEC software and diagnostics.

Delivery is 30 days after receipt of order. List price for the SC7000 is $8,950, with quantity discounts available.

Emulex, 3545 Harbor Blvd., P.O. Box 6725, Costa Mesa, Calif. 92626.

TIL SYSTEMS LTD. ZP1632

TIL Systems Ltd. has announced a 32-bit, multibus processor card designed by the Electrical Engineering Department of the University of Toronto. It reportedly features vectored interrupt support, 256K bytes of random-access memory, up to 128K bytes of read-only memory, two serial ports and a parallel port.

The board, the ZP1632, is reportedly built with several National Semiconductor Corp. components, including an NS16081 floating-point unit and an NS16062 main memory unit, which is said to implement a demand-paged virtual memory management architecture similar to that of the Digital Equipment Corp. VAX-11.

The ZP1632 is priced at $3,124..

TIL Systems, Suite 1100, 60 Yonge St., Toronto, Ont., Canada M5E 1H5.

SYSTECH CORP. VPC-2200

Systech Corp. has introduced the multibus VPC-200 Versatec, Inc. printer controller.

The product has a direct memory access, two-channel, multibus printer controller. One channel supports a Versatec, Inc. printer/plotter in either single-end or long lines differential mode. The second channel supports any standard compatible printer at rates up to 10,000 line/min, the vendor said.

The controller offers automatic printer selection. It also includes a

Continued on page 70

cornerstone business.

Software that speaks your customer's language.

SYSTEMS & PERIPHERALS

Continued from page 69

self-test feature, which does not require host software support, for the Versatec printer and for a Centronics Data Computer Corp./Dataproducts Corp. printer. A Unix driver is supplied with the controller to accelerate implementation on-site, a company spokesman said.

The price is $650.

Systech, 7630 Miramar Road, San Diego, Calif. 92126.

VOTAN, INC.
VSP1000; Voice Management System

Votan, Inc. has introduced a voice processor board that is said to incorporate voice recognition, speech compression and telephone interfacing facilities on a single board.

In addition, the company has announced the latest release of its Voice Management System, based on the new board, which provides eight simultaneous channels of voice I/O processing in a single chassis.

The VSP1000 voice processor board features continuous speech recognition, which reportedly allows an individual to speak to the unit in a normal conversational flow, without pauses between words. In addition, a word-spotting capability enables the system to pick out target words from a stream of normal conversation.

An option offered with the board is speaker-independent recognition, which the company claimed will recognize anyone's voice. It can understand a limited vocabulary without prior enrollment in the system. The digits zero through nine and the words "yes" and "no," as well as custom vocabularies, are available.

Other features of the VSP1000 include autoanswer, autodial and Touch-Tone encoding and decoding, plus the ability to operate over standard telephone lines. The board contains all the hardware necessary to service a voice channel under the control of a general-purpose system processor. The system processor may be any single-board, 8- or 16-bit CPU that interfaces with Intel Corp.'s Multibus.

The basic configuration consists of a 16-slot Multibus chassis, an Intel 8086-family system processor, 1M byte of random-access memory and one VSP1000 voice processor board per voice channel. Other hardware needed includes disk drives, a controller card and a CRT terminal.

The VSP1000 is available in single quantities for $2,500, with volume discounts available. The price for a standard, four-channel Voice Management System is $27,000; an eight-channel unit is $35,000. The speaker-independent recognition option is priced at $500 per four channels.

Votan, 4487 Technology Drive, Fremont, Calif. 94538.

AUXILIARY EQUIPMENT

INTERNATIONAL INFORMATION MANAGEMENT CONGRESS
Record Management Technology

The International Information Management Congress (IMC) has announced a training program designed to instruct employees in storing and retrieving manual files and computer memory.

The program, Record Management Technology, includes 297 color slides and a 52-page book, the vendor said.

Topics include records storage and retrieval, reprographics, micrographics and records management trends.

The training program costs $350.

IMC, Publication Sales, P.O. Box 34404, Bethesda, Md. 20817.

TEXAS INSTRUMENTS, INC.
Nubus

Texas Instruments, Inc. has announced that it is licensing its 32-bit Nubus technology to commercial and noncommercial users.

Designed at MIT, Nubus is a 10-MHz synchronous bus that reportedly provides a 37.5M byte/sec bandwidth and a processor-independent, memory-mapped architecture.

Nubus licenses to commercial users for a one-time $2,000 fee. Noncommercial licenses are available for $200.

Texas Instruments, Data Systems Group, 17891 Cartwright Road, Irvine, Calif. 92714.

MTI TECHNOLOGY CORP.
MTI 2200

MTI Technology Corp. has announced an exerciser designed to perform seven user-selected qualification tests automatically on floppy disk drives before they are used in a system.

The MTI 2200 reportedly can be used in the factory or in the field and will display results directly on an integral CRT terminal screen and optional thermal printer. It is menu-driven and has a Help function.

It reportedly features a nonvolatile, electronically erasable programmable read-only memory for short- or long-term storage.

The base price is $4,990, with quantity discounts. The optional thermal printer costs $290; an optional four-channel multiplexer, $475; and a 220V, 50Hz option, $75.

MTI Technology, 5950 Mandarin Ave., Goleta, Cal. 93117.

A.B. DICK CO.
Magna Dataped

A.B. Dick Co. has announced a slim-line numeric keyboard designed to enhance statistical applications of the firm's Magna information processing systems line.

The Magna Dataped connects to the main keyboard via a 24-in. flat

DayFlo announces a major revision of the fundamental law of computing.

SYSTEMS & PERIPHERALS

cable, allowing placement for left- or right-handed operation, according to the vendor.

It contains the 0 to 9 keys and special keys for typing and spreadsheet applications such as double zero, period, minus sign, enter, dollar sign, comma, tab, space, character correct and cursors, a spokesman said.

Available immediately, the Magna Datapad is priced at $400, according to the vendor spokesman.

A.B. Dick, 5700 W. Touhy Ave., Chicago, Ill. 60648.

KEYTEK INSTRUMENT CORP. Series 2000

Keytek Instrument Corp. has introduced a modular electrostatic discharge simulator group called the Series 2000.

According to the vendor, the simulators were designed to allow the user to define test configurations for both individual requirements and industry standards.

The Series 2000 allows customer selection of discharge networks for human-body simulation. It also provides tips to simulate tools or a human finger and current injectors to provide repeatable waveforms for diagnostic tests, according to the vendor.

Modules and accessories are available for separate simulations of the effect of predischarge corona, as well as both electric and magnetic fields, the vendor said.

Prices for the system start at $4,220.

Keytek Instrument, 12 Cambridge St., Cambridge, Mass. 01803.

memory, a 931 terminal and a 128M-byte WD800 disk drive.

■ The 991A with 512K- or 1M-byte main memory, a 931 terminal and a 425M-byte WD800 disk drive.

■ The 990A with 512K bytes of main memory, two 931 terminals and a 1383-byte WD800 disk drive.

■ The 990B with 512K bytes of memory, two 931 terminals that operate in a fiber-optic mode and a 136M-byte WD800 disk drive.

■ The 991A with 512K bytes of memory, two 931 terminals and a 425M-byte WD800 drive.

■ The 991B with 512K bytes of memory, two 931 terminals that operate in a fiber-optic mode and a 425M-byte drive.

Scheduled for shipments in August, the Business System 600 and 800 series models range in price from $42,950 to $64,500.

The Business System 300A series is packaged in a 931 terminal enclosure with 256K bytes of memory on a single board and the capacity to expand to 1M byte with add-on boards.

The 300A processors can be incorporated into Ethernet local-area networks with Business System 600 and 800 series computers and desktop TI Professional and Portable Professional Computers.

The announced models are the Business System 352A, priced at $9,995; the 371A, at $15,500; and the 372A, at $17,900. Shipments are scheduled for April.

TI can be reached through Box 402430, Dallas, Texas 75240.

GRAPHICS from page 65

phy and a telephone number at which they can be reached.

The deadline for submissions to the Special Report is April 25. If you have a picture of computer graphics that you would like to draw and a picture's worth or so of words, send them or any questions to Donovan White, Special Reports Editor, *Computerworld*, 375 Cochituate Road, Box 880, Framingham, Mass. 01701.

up to four modules.

All three products are scheduled for availability in the fourth quarter of this year.

The CDC 895 is priced at $93,710 or leases for $2,915/mo on a one-year lease and carries a monthly maintenance fee of $325. The CDC 7165 is priced at $72,130 and leases for $2,910/mo on a one-year plan. It has a monthly maintenance charge of $395. The CDC 7990 is priced at $460,000, plus cartridges, with a monthly maintenance fee of $3,460.

CDC is located at 8100 34th Ave. S., Minneapolis, Minn. 55417.

RACE from page 65

speech was to be the keynote address at the Decpo East 84 conference in Boston. DEC's New York press conference was scheduled to end minutes before Bell was supposed to begin speaking in Boston. But Bell wound up changing his topic at the last minute, finally giving a rehashed speech on fifth-generation computing. Another coincidence? Maybe. Perhaps there was a misunderstanding between Bell and the promoters of Decpo. Or, possibly, Bell decided it was pointless to make juicy comments about DEC if no one would be around to listen.

It is clear that a little competition goes a long way. The irony is that DEC and IBM should be above it.

Garbage in, garbage out.

Since computers were invented, the conventional wisdom has held that input that doesn't conform to the computer's highly structured needs will result in unintelligible output.

Which meant that you had to learn to think like a computer in order to use one.

Trouble is, the world isn't organized to suit computers. Data is never collected in the way you want to retrieve it. That's why traditional, rigidly structured databases often wind up hindering your work more than they help.

DayFlo offers a new approach to database management needs. It's a Fluid Format™ Personal Information Manager. Which means it approaches the world the same way you do: taking in unorganized data and organizing it into meaningful information.

DayFlo is a powerful tool for your IBM® PC XT. It accepts both structured and unstructured data. When you want to extract information, just type in the key words you're looking for. Instantly, DayFlo organizes the data according to your criteria. And reorganizes it according to new criteria whenever you wish.

Information from other programs, spreadsheets, word processing or accounting files, virtually any data in the system can be assimilated by DayFlo. And once the information is at hand, DayFlo lets you manipulate it at will to produce letters, memos, reports and much more. You can work at your computer the same way you work at your desk, even switching quickly from task to task, without ever losing your place.

DayFlo's concept is as simple as it is revolutionary. You no longer have to think for the computer. Instead, it can help you think better for yourself. Which leads, inevitably, to a brand-new version of computing's fundamental law.

DAYFLO Software™

Garbage in. Information out.

DayFlo, Inc., 2300 Michelson Dr., Bldg. 400, Irvine, CA 92715. Call Now: (800) 7DAYFLO (Outside CA), (800) CDAYFLO (CA Only)

The first professional computer that looks at information the way you do.

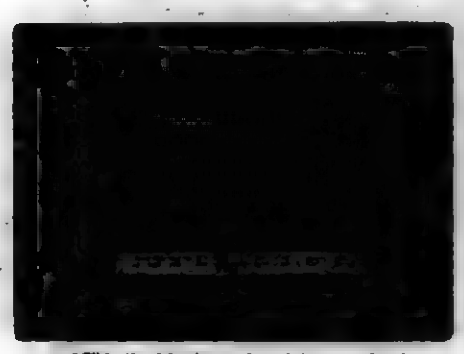
Place any document under the scanner, push a button and in seconds...

...it will appear on the monitor. You can store the whole document or isolate just part of it.

You can relocate any section...

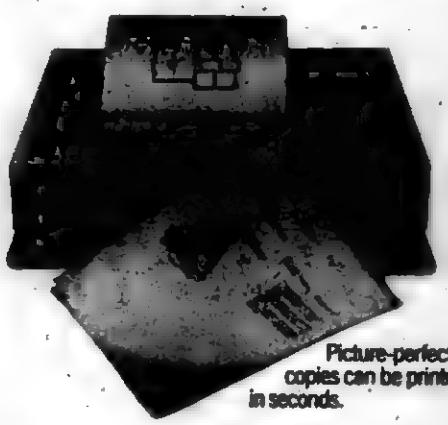
...and add text to create a new document, which can be printed or stored.

Filling out forms is a snap. Just place a form under the scanner...



...and fill in the blanks and update your database. Use the cursor (under "floor plan")...

...to bring up other image or data files associated with the original document.



Picture-perfect copies can be printed in seconds.

If you're in business, you get a lot of information exactly the way you're getting it right now.

From a piece of paper.

And a lot of time and money goes into managing that information.

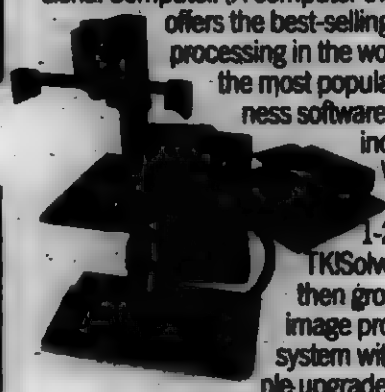
But now Wang is introducing a computer that can help you manage that information even better:

The Wang PIC™ image processing system.

With the Wang PIC, business information can be scanned, displayed, edited, filed, printed, and sent anywhere in the world. Documents can be enlarged, reduced, landscaped, and contrasted. All from one desk-top computer.

The Wang PIC can communicate with other Wang computers and even most mainframes.

And you can start with a Wang Professional Computer. (A computer that already offers the best-selling word processing in the world and the most popular business software—including Visi On,™ Lotus 1-2-3,® and TKISolver.™) And then grow to an image processing system with a simple upgrade.



If you would like a demonstration of The Wang PIC image processing system, call 1-800-225-9264. Or write to: Wang Laboratories, Inc., Business Executive Center, One Industrial Avenue, Lowell, MA 01851.

But do it today.

Because this is one new product you don't want to overlook.

MICROCOMPUTERS

MICRO BITS
Thomas W. Madron

Two architectures seen for IBM nets

For months, industry analysts have been predicting that IBM shortly will announce two microcomputer-oriented local-area networks using two quite different topologies and two quite different communications media. As these rumors persist, it may be time for at least a generic description of the two local-area network approaches.

Rumor has it one announcement will cover a token passing ring local-area network using a chip set developed by Texas Instruments, Inc. The second rumor suggests a broadband (CATV technology) carrier-sense multiple access/collision detection (CSMA/CD) local-area net allegedly being developed by Sytek, Inc. of Mountain View, Calif.

Both token passing and CSMA/CD are local-area network access techniques that address the problem of collisions when two or more signals are present simultaneously on the communications medium.

Token passing is a collision-avoidance technique in which each station is polled and must itself pass the poll along. CSMA/CD is an access method that manages collisions of data packets when they occur. Token passing is employed most frequently with a ring topology, while CSMA/CD is most commonly found with a bus-structured local-area network. Either access method can exist on virtually any medium and with either baseband or broadband systems.

With a CSMA/CD system, collisions are assumed to be a normal operational occurrence. Every network device listens all the time, but defers transmitting if the cable is in use. But in a highly loaded CSMA/CD network, the periods of silence may be very short, resulting in many collisions, which reduces network throughput since many retransmissions are required.

In baseband systems such as Ethernet, collisions are detected by adding a dc bias to the signal and having all stations look for a dc level greater than that of a single transmitter. On a broadband system (which cannot pass dc signals), when the transmitter receives the reflection of the message, bit-by-bit comparison is accomplished. Any discrepancy is assumed to be the result of a collision, and the signal is retransmitted. Broadband examples using CSMA/CD are Localnet 20 from Sytek and Net/One by Ungermann-Bass, Inc.

Token passing, which is still used largely for ring topologies, became commercially available in 1983 on systems with bus structures. Each network device is polled, and as that polling is done, each station has an opportunity to transmit. The token is simply the location of the poll on a polling list. Polling need not

Price, more than support, influencing volume micro sales

By Paul Kassakowski
CW Staff

DALLAS — MIS departments seem willing to sacrifice microcomputer support for lower prices, according to industry analysts who spoke at the Fortune 1,000 Personal Computer Market Forum held here early this month.

"Last year marked a watershed point in the microcomputer industry," proclaimed Egil Juliussen, chairman of Future Computing, Inc., the forum sponsor. "It marks the shift from volume sales through retail channels to direct sales channels. IBM's direct sales force gained control of Personal Computer sales and increased its [large company] market share from 14% in 1982 to 44% in 1983."

'Last year marked a watershed point in the microcomputer industry.' — Egil Juliussen, Future Computing, Inc.

Price is the major factor driving volume purchasers toward direct sales, speakers agreed. To compete on price with direct sales forces, retailers are unbundling training and support.

"There's no such thing as a free lunch," stated Ed Ramos, president of Future Information Systems, Inc., a New York City dealer. "I can cut the hardware price for volume sales customers, but they will pay for training classes and support, which normally are free."

Direct sales may offer lower prices, but customers receive only pieces of a total system, said Anthony Morris, president of Morris Decision Systems. "A hardware vendor cannot provide a system solution," he said. "Morris puts the pieces together for its customers. Direct salesmen leave the customer with that task."

Fueling the distribution shift last year was MIS departments' increased involvement in determining microcomputer purchases. "Microcomputer purchasing decisions shifted from a bottom-up to a top-down orientation," Juliussen claimed.

A Future Computing survey of large

MIS slow to switch micro packages

By Paul Kassakowski
CW Staff

MIS departments take a slow, plodding approach to evaluating software in the rapidly changing microcomputer arena, managers recently told *Computerworld*. "Once a company has chosen microcomputer software packages, inertia sets in, and [the firm is] slow to switch to other programs," said Thomas Sampon, partner at Arthur Young & Co.

This inertia is deliberate, one MIS manager said. "Once a company has used a particular package for a period of time, a tremendous amount of training time has been invested," said Andrew Langlois, MIS director at Moore McCormack, Inc. in Stamford, Conn. "To justify retraining users on another package, it has to have more than additional bells and whistles, such as a nicer screen or a few additional functions. The package has to allow users to work more quickly, which increases the company's productivity."

Langlois' group waits a few months after a package is introduced before evaluation. "We wait until the hoopla and hype die down," Langlois said. "Often, a package is not as good as initially advertised."

Managers noted that companies learn of significant new packages in a variety of ways: subscribing to end-user magazines, trade magazines and software review services; attending computer shows and seminars hosted by computer dealers; and listening to users.

"Sometimes the initial interest comes

Fortune communications packages to integrate 32:16 with IBM, Wang

REDWOOD CITY, Calif. — As one step in an effort to boost compatibility with industry standards, Fortune Systems Corp. early this month introduced two communications packages aimed at integrating the firm's multiuser 32:16 microcomputers within IBM and Wang Laboratories, Inc. environments.

Fortune's new 3780 remote job entry Binary Synchronous Communications (BSC) software will permit 32:16 users to share IBM and any other 3780-supported mainframe resources, said Robert Ruebel, senior vice-president of marketing. The new software, said to permit transfer of either Ascii or Ebcdic data at speeds up to 9.6K bit/sec, is available now for $995.

The new Fortune-Wang software interface allows 32:16 users to exchange documents and interact with products in the Wang OIS environment, Ruebel said. The interface will carry a $595 price tag. Like the 3780 emulation package, it requires Fortune's optional BSC board.

Within larger firms, "our communications strategy is to be IBM-compatible," remarked Fortune President James Campbell. "We'll go with a local-area network when a de facto standard becomes clear."

Fortune's 32:16, based on the Motorola, Inc. 68000 and running the company's version of the Unix operating system, is sold to both small businesses and large organizations "looking for fairly classical word processing and office automation solutions," Ruebel said.

Unix "means safety" for large firms because of its portability, multiuser capability and built-in features, Ruebel said.

Micropro introduces spelling checker

SAN RAFAEL, Calif. — Micropro International Corp. has introduced Correctstar, a 66,000-word spelling checker reportedly containing 99% of the most frequently used English words.

Automating the proofreading and correcting process, the product increases typing speed, a spokesman said.

"Now you can use the word you want, whether or not you know how to spell," said Donald Marro, vice-president of marketing.

Correctstar works with Micropro's Wordstar word processing package. To access Correctstar, users type "S" on Wordstar's opening menu, Micropro said. After suggesting a word, the user can correct the word as suggested, correct it globally, show the next or previous instance of the word, correct the word from the keyboard, add the word to a personal dictionary, bypass it one time, ignore the word or return to Wordstar, according to the vendor.

"The system is able to analyze words based on phonetic and linguistic principles and to recognize the patterns that characterize language," Marro said.

A user can create a personal dictionary of 1,500 words, which can include proper names or specific terms. When these names are used in later documents, Correctstar suggests misspellings, according to the vendor spokesman.

Correctstar requires 192K bytes of random-access memory and costs $195.

A version for the IBM Personal Computer is available now. Versions for Radio Shack's TRS-80 Model 2000, Digital Equipment Corp.'s Rainbow and Texas Instruments, Inc.'s Professional microcomputers will be added this month.

Additional information on Correctstar is available from Micropro International, which is located at 33 San Pablo Ave., San Rafael, Calif. 94903.

Direct micro said to be IBM-compatible

SANTA CLARA, Calif. — Direct, Inc. has introduced a personal computer for business uses said to be IBM Personal Computer-compatible and to emulate IBM 3270, 3278 and 3279 terminals and Hewlett-Packard Co. System 3000 terminals.

The Direct IPC features the Microsoft, Inc. MS-DOS 2.0 operating system, 128K bytes of internal memory, two floppy disk drives, two RS-232 asynchronous serial ports, one parallel printer port and five expansion slots, Direct said. Customizations can include memory expansion to 640K bytes, a color monitor with graphics and additional floppy disk drives.

The IPC's keyboard is said to be an improvement on the keyboard of the IBM Personal Computer because shift and return keys are in more familiar positions and LED indicators are used on the IPC's Caps and Num-lock keys to show status.

The computer's optional communications capabilities include emulation of the HP 2622A terminal, providing linkage with HP 3000 minicomputers, and IBM 3278 and 3279 coaxial interface support, permitting users to link directly to IBM 3274 or 3276 controllers. The latter option reportedly permits either Binary Synchronous Communications (BSC) or Systems Network Architecture/Synchronous Data Link Control (SNA/SDLC) host access depending on the controller's configuration. Options also allow the IPC to emulate IBM 3270 BSC or 3270 SNA/SDLC terminal communication.

"We feel we're more compatible with the IBM host environment than the IBM Personal Computer," commented Direct's vice-president of marketing, Homer Jamison.

In its basic version, the IPC comes with an amber monochrome monitor. A color graphics adapter and color monitor are also available. The basic IPC retails for $3,195. An IPC XD version, with a 10M-byte Winchester disk, 256K bytes of memory, one floppy disk drive and a monochrome monitor, is available for $5,195.

Direct is located at 4201 Burton Drive, Santa Clara, Calif. 95054.

TI unveils Basic compiler

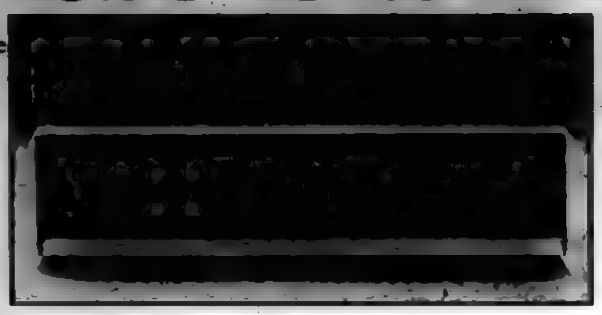
DALLAS — Texas Instruments, Inc. has introduced a high-speed MS-Basic compiler that the company said improves the performance of a Basic program as much as 120 times, with little or no modification.

The program runs on the TI Professional Computer and the TI Portable Professional Computer under Microsoft, Inc.'s MS-DOS 1.1 or 2.1 operating system.

The package is priced at $300, which includes a software diskette and a user's manual, the vendor spokesman said.

Texas Instruments can be reached through P.O. Box 402430, H-709, Dallas, Texas. 75240.

No other 3270 protocol converter can match all these features.



Since 1977, hundreds of companies all over the world including Bell Labs, Citicorp, ITT, Litton, Westinghouse—have used Local Data products to make IBM communications easy and inexpensive.

We believe the DataLynx™/3274 is the best price/performance 3270 protocol converter on the market.

So, before you buy any other protocol converter at any price, compare the DataLynx/3274 features first. Then decide.

- SNA/SDLC or BSC protocols supported. SNA is PU type 2.
- BSC for EBCDIC and ASCII.
- 16 bit, 8 MHZ Intel 8086-2 CPU.
- Auxiliary printer support allows each async port to have a separately addressable 3287 type printer. This feature enables dial users to combine CRT and print data over one dial-up line.
- 80 types of ASCII async display terminals can emulate IBM 3278 display stations, and ASCII async printers to emulate IBM 328X printers.
- Micro to main-frame support with our FileLynx™/3278 program for the IBM PC and PC compatibles supports terminal emulation and file transfer (upload/download).
- Hard copy KSR support with our "Paper/3278".
- Unique "paging" feature supports emulation of all models of the 3278 display station.
- Pseudo-transparency feature allows host application to transmit character and control codes to async terminal devices (e.g. graphics terminals, graph plotters, mini-computers, high-speed printers with down-loadable forms control units).
- "Compu" support for micro, mini and instrumentation computers as terminal devices.
- Dual host support.
- PROM cartridge for easy user upgrade of firmware.
- Powerful, friendly configurator mode, using menus to allow parameter definition for sync ports, logical units, async ports and terminal characteristics, including help utility.
- Configuration values saved in non-volatile EEPROM.
- Monitor mode displays current status of all ports and logical units.
- May be connected to a host directly (in modem eliminator mode), or via modems on a dedicated multipoint or point-to-point line (dial-up or dedicated), via RS-232C sync ports.
- Data rates to 19,200 bps (sync & async).
- Async ports may be configured for any of 15 fixed bit rates or "autobaud", with or without parity checking, and with a specified character format.
- Simple DTE/DCE change on all ports.
- Flow control on async ports may be configured for physical and/or logical signalling.
- Virtual device support enables reconnect of dial users independent of physical port.
- Security through dual level password protection.
- Emulation of standard 3278 keyboard functions is tailored for each supported terminal type.
- 25th status line emulation.
- SAS® graphics support.
- Base color support.
- 3278-5 (27 x 132 character screen) support on 9 channels with memory expansion option.
- LU configurator options provide support for various screen formats and printer page widths.
- Front panel includes 33 function status indicators.
- Self-test of channels, memory and firmware integrity is performed continually in background mode assisted by a "watchdog" timer.
- UL and FCC approved.

For more information about the remarkable DataLynx/3274 protocol converter, call or write today. And ask about our 30-day free trial program.

SYSTEMS

ALLOY COMPUTER PRODUCTS, INC.
PC-Slave/16; Multinet enhancements

Alloy Computer Products, Inc. has announced a multiuser system, PC-Slave/16, and has enhanced its Multinet system.

PC-Slave/16, which uses an Intel Corp. 8088 microprocessor, fits in the expansion slot of an IBM Personal Computer and drives a dumb terminal without degrading host performance, the vendor said.

With Alloy's PC-Real-Time Networking Executive, 12 PC-Slave/16s reportedly can be linked inside an Alloy expansion unit. Each slave is capable of running Microsoft, Inc.'s MS-DOS 2.1 or Digital Research, Inc.'s CP/M 86 operating systems.

Prices for PC-Slave/16 range from $1,195 to approximately $17,000.

As a two-user system, Multinet includes a master microprocessor, two user processors, up to 102M bytes of Winchester disk storage, cartridge tape, floppy disk drive and the CP/M operating system, the vendor said.

Multinet can be expanded to include a maximum of 16 eight-user systems. Multinet can link microcomputers using Zilog, Inc. Z80B or Intel 8086 microprocessors, the vendor said. The system provides file updating, record updating, multiuser record locking and automatic print spooling, according to the vendor.

Multinet prices range from $12,995 to $104,000.

Alloy Computer Products, 100 Pennsylvania Ave., Framingham, Mass. 01701.

KAYPRO, INC.
Perfect Software replaced

Kaypro, Inc. has replaced the Perfect Software package software bundled with its Model 2, Model 4, Model 10 and Robie desktop personal computers with software from Micropro International Corp.

Model 2 now includes Micropro's Wordstar, Mailmerge, Calcstar, Datastar and Supersoft; Oasis Systems, Inc.'s Word Plus; Chang Laboratories, Inc.'s Profit Plan; Kaypro's Multiformat and Digital Research, Inc.'s CP/M operating system.

Model 4, Model 10 and Robie include Micropro's Wordstar, Mailmerge, Calcstar and Infostar (which includes Reportstar and Datastar); Oasis Systems' Word Plus; Kaypro's Supprterm and Multiformat; Chang Labs' Microplan; Ashton-Tate's Dbase II and "Dbase II for the First-Time User"; and Digital Research's CP/M operating system.

Kaypro, 533 Stevens Ave., Solana Beach, Calif. 92075.

COMPUTER SYSTEMS
IBM/Personal Computer-Graphics

Computer Systems has introduced the IBM/Personal Computer-Graphics system, a workstation that features three-dimensional modeling and graphics processing.

According to the vendor, the system combines computer-aided design and color graphics functions with the flexibility of a graphics workstation in either stand-alone or remote terminal modes.

The system features an IBM Personal Computer with 128K bytes of random-access memory, a color monitor, 400 char./sec matrix printer and two digitizers. It runs under IBM's PC-DOS operating system, and AT&T's Unix is optional.

The IBM Personal Computer-Graphics system is priced at $4,900.

Computer Systems, 28401 Harper Ave., St. Clair Shores, Mich. 48081.

PRINTERS/PLOTTERS/PERIPHERALS

ity word processing, data processing and bit-image graphics.

The DMP-110 reportedly provides a variety of font styles, including a cursive italic and micro font, as well as fonts for correspondence and data processing. All fonts on the DMP-110 can be elongated, the company said, and the printer supports the use of underline.

The correspondence font prints at 10- or 12 char./in. or proportional spacing. In correspondence mode, the printer operates at 25 char./sec. Half-height printing, superscripts and subscripts can be achieved using the printer's micro font typestyle.

The data processing mode allows printing 10-, 12- or 17 char./in at speeds up to 50 char./sec in either standard, elite or condensed monospaced characters.

The DMP-110 may also be used to produce high-resolution, dot-addressable bit-image graphics, the company said.

The DMP-110 is priced at $299.95.

Radio Shack, 1800 One Tandy Center, Fort Worth, Texas 76102.

BOARD-LEVEL DEVICES

HEURIKON CORP.
HK68A versions

The Heurikon Corp. has introduced 512K-byte and 1M-byte versions of its HK68A microcomputer board. The HK68A, which plugs into a multibus, reportedly also features four to eight serial ports, 32K bytes of erasable programmable read-only memory, user programmable LEDs and dip switches and three programmable 16-bit counter/timer channels.

The increased memory of the HK68A reportedly allows it to run Unix programs without the need to add memory to the multibus.

The 512K-byte card is available for $4,465. The 1M-byte card is available for $5,465.

Heurikon, 3001 Latham Drive, Madison, Wis. 53713.

AUXILIARY EQUIPMENT

SPEECH PLUS, INC.
Calltext 5000

Speech Plus, Inc. has introduced an IBM Personal Computer-compatible text-to-speech converter and telephone interface board that is said to enable a user to access text data in voice through any Touch-Tone telephone.

The product, called Calltext 5000, is said to combine a telephone interface with Speech Plus' text-to-speech system to provide voice output with unlimited vocabulary for the Personal Computer. It can be programmed to answer a telephone, obtain text data from a host computer and supply text data in voice to the caller, the company said. It can also initiate calls, according to Speech Plus.

Other features of Calltext 5000 include compatibility with the IBM Personal Computer XT bus interface, conversion of serial Ascii English text to speech in real-time, ability to connect to a telephone network via a modular jack, autoanswer and autodial, on-board speaker amplification and RS-232 serial port.

The Calltext board is priced in single units at $2,700, including interface software.

Speech Plus, 461 N. Bernardo Ave., Mountain View, Calif. 94043.

RAINBOW TECHNOLOGIES, INC.
Software Sentinel

Rainbow Technologies, Inc. has announced a custom-coded hardware device designed to prevent users from running licensed software on more than one machine at a time.

Software Sentinel is intended for use by software developers who produce complex software for the IBM Personal Computer, Personal Computer XT and compatibles. The plug-in device is said to act as a security key that must be present before the software will operate.

Available now, the device costs approximately $50.

Rainbow Technologies, Box 7200, Costa Mesa, Calif. 92626.

SOFTWARE

LYTRON SYSTEMS, INC.
Lois

Lytron Systems, Inc. has introduced Lytronet Office Integration Software (Lois), a package that includes an operating environment, facility manager and DIF-to-Ascii data converter. Lois integrates different programs into a seamless operating environment and transfers data between applications, the vendor said.

Lois operates in four modes: single user; with Lytronnet (Lytron's local-area network); with other networks; and linked with a mainframe, the vendor said.

The program runs under IBM's PC-DOS or Microsoft, Inc.'s MS-DOS operating systems and costs $295, Lytron said.

Among the applications that run under Lois:

- Scratchpad, an electric notepad that can create, modify, distribute or file notes and memorandum, available for $60.
- Calendar, at $135, is a schedule planning program.
- File Cabinet, priced at $100, files, cross-indexes and retrieves information by file name, title, significant person, key word or date.
- Calculator, for $75, supports scientific notation, memory manipu-

Some data security methods work better than others.

TOP SECRET the state-of-the-art resource protection package for MVS works best of all.

TOP SECRET is data security at its best. Offering quick installation, phased implementation and comprehensive resource protection, TOP SECRET outdistances all other data security methods for total resource protection.

TOP SECRET immediately secures your most critical resources without impacting normal processing. Implement security with no delay and with absolutely no modifications to your operating system.

TOP SECRET is the only total resource protection package that offers comprehensive CICS security, including file and program control and protection down to the field level.

By using the Standard MVS Security Interface, TOP SECRET becomes an integral part of your operating system. Complete compatibility with all IBM and vendor products that use Standard Security is automatic and guaranteed, now and in the future.

TOP SECRET security comes with the same top-notch technical support that guarantees the quality and reliability of all CGA software products.

Protect your valuable data resources today. Join the MVS sites across the country that have considered every data security method and made the sure TOP SECRET choice.

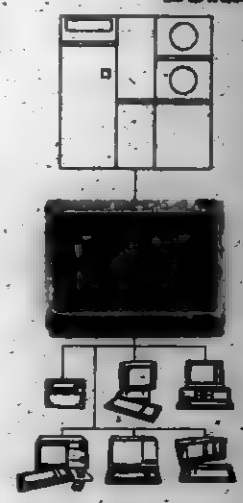
EVERYONE WHO WANTS TO USE THE COMPANY MAINFRAME RAISE YOUR HAND.

Introducing power to the people.

Better known as the Data Pipeline™ from Intel.

It's based on our iDIS™ Database Information System. A powerful, integrated package of hardware and software with multi-user capability built right in. And now, through iDIS, just about any pc or terminal can easily share data with just about any mainframe.



Our Data Pipeline™ allows practically any pc to share data with practically any mainframe.

With the iDIS Pipeline, you'll be able to establish and manage your pc-to-mainframe connections in a way never before possible. Yet you'll still be able to offer department users a fair degree of independence. Since iDIS comes with all the software they need. Starting with the Xenix® operating system, built around a relational DBMS. Plus the Multiplan® spreadsheet, word processing, electronic mail, and a forms/menu development tool.

The iDIS Pipeline is powerful, too. Each one will handle 5 full-time users, or between 12 and 15 on dial-up. And you can even network with other iDIS systems. But you're always in control. You decide which data are accessible, and extract only those to your iDIS system. Users then access their data sets from iDIS's hard disk.

Actually, using the iDIS Pipeline is a lot like giving users their own little mainframe.

Which is a lot better than giving them yours.

It's also a lot cheaper.

Less than half the cost of a direct pc-to-mainframe connection.

It's also fully supported and serviced from one responsive source. Us. Best of all, it's available now.

For more information about how our iDIS Data Pipeline can help you manage the revolution in your office, call us at 800-538-1876; in California, 800-672-1833. Or write Intel, Lit. Dept. H-18, 3065 Bowers Ave., Santa Clara, CA 95051.

Of course, if you're undecided about what to do you can always ask for a show of hands...

intel

According to the Gartner Group, who took the time to figure out all the hidden costs, each direct pc-to-mainframe connection costs approximately $22,000. Each. *Xenix and Multiplan are trademarks of Microsoft Corporation.* © 1986 Intel Corporation.

lation and financial modes.

■ Phone manager, which includes autodial capabilities, costs $150.

Lytron Systems, Building 2, 1675 N. 200 West, Provo, Utah 84604.

MICRO DATA BASE SYSTEMS, INC.
Knowledge Manager version

Micro Data Base Systems, Inc. has enhanced Knowledge Manager, an integrated information system for the IBM Personal Computer.

The new version reportedly performs calculations three times faster than earlier versions and integrates with three additional Micro Data Base Systems modules: Kgraph, Kpaint and Kmouse.

Knowledge Manager costs $500.

Micro Data Base Systems, P.O. Box 248, Lafayette, Ind. 47902.

CDEX CORP.
PC Expert

Cdex Corp. has introduced the PC Expert package, a computer-based training software package for the IBM Personal Computer.

The package consists of two training programs, "How to Use Your IBM PC" and "Cdex Training for DOS 2.0."

The first program helps users learn PC-DOS commands and special keys on the keyboard. It also introduces the user to operating systems such as Digital Research, Inc.'s CP/M and AT&T's Unix, as well as the Basic programming language and various types of applications software.

The second training program provides more comprehensive instruction in beginning and advanced PC-DOS commands. The program includes concepts, disk preparation and copying, file operation, structure directories, fixed disk systems and advanced DOS commands.

The PC Expert is priced at $139.95.

Cdex, 5050 El Camino Real, Los Altos, Calif. 94306.

DOW JONES INFORMATION SERVICES
Accounting Series

Dow Jones Information Services, a division of Dow Jones & Co., Inc., has introduced the three core modules of its seven-part Accounting Series. The software, for the IBM Personal Computer and Personal Computer XT, is said to support generally accepted accounting practices.

The core programs — general ledger, accounts payable and accounts receivable — each include a free customer training seminar developed by the Arthur Young accounting firm and one-year access to a toll-free hotline. The programs of the package reportedly are menu-driven, require a minimum of keystrokes and feature a word processing style editor.

The series is said to feature an automatic audit trail. Users are also said to be able to do "what-if" calculations using the series' pencil-posting capability.

The three core programs each cost $1,000, the vendor said.

Dow Jones Information Services, Rt. 1 and Ridge Road, South Brunswick, N.J. 08852.

VERTEX SYSTEMS
Xeno-Disk

Vertex Systems has announced the Xeno-Disk software conversion and production system for the IBM Personal Computer, Personal Computer XT and most compatible systems.

Xeno-Disk can read, write, format and duplicate nearly 60 different types of 5¼-in. double-density disk formats without additional hardware, Vertex said. In addition, 80-track formats reportedly can be supported with appropriate disk drives.

Running under IBM's PC-DOS or Microsoft, Inc.'s MS-DOS, Xeno-Disk modules are fully menu-driven, Vertex said.

Disk formats currently supported are said to include those of most popular computers running Digital Research, Inc. CP/M and CP/M 86, Radio Shack TRS-DOS 1.3, UCSD P-system, NEC Corp. NEC-DOS and European formats. Direct-disk format parameter input allows use of 40- and 80-track CP/M formats not currently available on the menu.

Vertex said optional utilities include 80Mate, a CP/M 80 emulator that simulates a CP/M 2.2 environment under PC-DOS or MS-DOS, and the 80Term terminal emulator, Vertex said.

Xeno-Disk is priced at $379.50. The 80Mate CP/M 80 emulator costs $99.50, and the 80Term terminal emulator costs $44.95.

Vertex Systems, 7950 W. 4th St., Los Angeles, Calif. 90048.

COSMOS, INC.
Revelation

Cosmos, Inc. has announced a relational data base management system for the IBM Personal Computer featuring compatibility with the Pick & Associates, Inc. Pick operating environment.

Revelation allows the user to develop a fourth-generation application and program generator that nonprogrammers can operate, according to the vendor. It also is said to provide communications so the IBM Personal Computer can move data, applications and programs up and down from the IBM Series/1, the Microdata Corp. Reality, the Evolution Computer Systems Corp. Evolution, the Applied Digital Data Systems, Inc. Addx Mentor, the Ultimate Corp. Ultimate and the Prime Computer, Inc. Information minicomputers.

Revelation is said to feature a file size limited only by disk size, record and field sizes variable up to 65,535 characters, user-assigned primary record keys, direct-access retrieval of records, report writer with multiple sort levels, a dynamic I/O buffer to reduce file accessing time, menu and command drive and a free-form English query language.

Revelation is designed to operate with IBM PC-DOS and Microsoft, Inc. MS-DOS and to utilize data and programs developed for those operating systems and Pick.

It is available for a one-time license fee of $950, including diskette and manuals.

Cosmos, 123 Furutree Drive W., Morton, Wash. 98356.

INDECES SERVICES
X-Cell 3.1

Indeces Services has announced X-Cell 3.1, a data management system for the IBM Personal Computer.

X-Cell features data entry, data retrieval, sorting, report generation, numeric generation and documentation generation, the vendor said.

X-Cell allows the user to define and allocate field space for any combination of alphanumeric and numeric entries, according to Indeces. X-Cell features search and sort capabilities that allow for inclusive and exclusive retrievals and sorts by 15 fields at a time, the vendor said.

X-Cell costs $175.

Indeces Services, 9 Pinecrest Drive, Taunton, Mass. 02780.

BLAISE COMPUTING, INC.
C View Manager; enhanced C Tools

Blaise Computing, Inc. has unveiled C View Manager and enhanced versions of its C Tools and C Tools 2. The software products run under IBM PC-DOS or Microsoft, Inc. MS-DOS.

C View Manager allows the system developer to design and save output screens, the vendor said. These screens can be recalled and displayed during a program run to inform the user about the program's status or to capture information, according to the vendor.

C View Manager works with Microsoft, Lifeboat Associates and Computer Innovations, Inc. C compilers. The product costs $275; source code for its C function library costs an additional $150.

C Tools reportedly possesses advanced string capabilities and the capability to access IBM Personal Computer hardware features, such as screen handling. It costs $125, the vendor said.

C Tools 2 works with PC-DOS 2.0, the vendor said. It costs $100.

Blaise Computing, 2034 Blake St., Berkeley, Calif. 94704.

See TOOLS page 82

FORTUNE from page 73

AT&T's introduction of Unix-based computer systems, meanwhile, is expected to prove a strong endorsement for the operating system. "The days of going out to find third-party [Unix] software developers are over," he maintained.

Fortune is located at 101 Twin Dolphin Drive, Redwood City, Calif. 94065.

We have a number of high performance communications controllers for Digital computers.

800-832-6277

and a number for them, too.

In fact, we have more microprogrammable, direct memory access communications controllers than anyone else.

So whether you need a controller for a VAX/VMS, UNIBUS PDP-11 or Q-BUS PDP-11 system, or to interface a public or private X.25 packet switching network, Digital has one that links with just about any computer.

Of course, you also get the full support of Digital, the world's second largest computer company.

Try our number. You'll find the human being on the other end every bit as intelligent as the communications controller we'll fix you up with.

NEW CICS Abend-AID

PRODUCT ANNOUNCEMENT

Abend-AID/CICS is a powerful software tool that transfers the burden of debugging CICS transaction abends from the programmer to the computer.

Abend-AID/CICS analyzes transaction abends, determines the cause and tells the programmer—What Happened, Why it Happened and Where it Happened. It also provides immediately On-Line the necessary supporting data in a concise, easy-to-use format.

Saves Programmer Time

☐ Complete, easy to understand diagnostics. Pinpoints the cause of the abend. Presents all the data needed to solve the abend. Immediate access On-Line through CICS, TSO/SPF or CMS. The region does not have to be active to view Abend-AID/CICS output.

Reduces Production Downtime

☐ Since Abend-AID/CICS is only invoked at the time of the abend it can be used both in test and production. Minimum overhead allows Abend-AID/CICS to work for all regions. Works instantly for all programs old and new. No recompiling. No programmer action required.

Greater Management Control

☐ An Abend Activity report can be viewed at any time to give you an up-to-the-minute picture of region abend activity. Report provides transaction code, terminal, abend code, program name and date/time information for all abends.

Greater Flexibility

☐ Exception tables enable you to choose desired output—or suppress output based on transaction code, terminal, abend code or any combination. Customized diagnostic modules can be created for user exits and specialized abend codes.

PYRAMID DATA LTD.
Numbercruncher

Customized business software applications reportedly can be created and run on the Eagle Computer, Inc. Spirit portable computer and Eagle XL personal computer with a new release of the Numbercruncher series of software products from Pyramid Data Ltd.

The Numbercruncher system for Eagle portable and personal computers includes all the features of Numbercruncher products currently available for the IBM Personal Computer and compatibles, PCjr and the Radio Shack 2000 personal computer, a spokesman for the vendor said.

The series provides a fourth-generation language said to enable users to modify their software. Products available range from the Numbercruncher I system, which allows users to create spreadsheets and reports, to the Numbercruncher III, which provides features such as integrated relational data base management, the spokesman said.

Prices for the custom Numbercruncher series range from $99.95 for the Numbercruncher I to $695 for the Numbercruncher III, according to the vendor spokesman.

Pyramid Data, P.O. Box 10116, Santa Ana, Calif. 92711.

MIS from page 73

from users; other times it comes from the personal computer department," said G. M. Hughes, vice-president at Pfizer Pharmaceuticals, Inc. in New York. "Users learn of new packages as quickly as we do."

Users play a critical role in the review process, according to Langlois. "In addition to personnel dedicated to evaluating microcomputer softare, users who suggest packages volunteer to be guinea pigs," he said.

Evaluation involves give-and-take between the users suggesting a package and the microcomputer support team, said William O'Neil, director of microcomputing for The First Boston Capital Group, Inc. in Tarrytown, N.Y. "Often, department senior managers choose a package and then turn to the MIS department for approval," O'Neil said.

The personal computer department weighs the user's suggested package against packages already approved for corporate use, O'Neil said. "There are 340 word processing packages for the IBM Personal Computer. Obviously, we can't support every package that a user desires, so we limit support to three packages for each application, such as word processing.

"The program must be easy to use and have on-line Help functions," O'Neil added. "Most users will not spend any time reading the user manual."

Users wanting to add their program to the approved list must make a case for the software, according to Langlois. "The user must sell the new product's benefits to the personal computer department," he said.

O'Neil listed cost savings as the primary criterion. "We wanted to transfer work in our word processing pool from minicomputers to microcomputers," he said. "So we added [to the approved list of packages] one microcomputer word processing package that resembled the minicomputer system. Savings in training costs justified the addition." Hughes said that after the evaluation process, users respect the department's choices.

SURVEY from page 73

companies found that 82% had designated a department to manage personal computers. In 77% of those firms, MIS was the department. "The remaining 23% assigned corporate personal computer decisions to the word processing or communications department," Juliussen reported.

The survey identified two key considerations for choosing microcomputers: the viability of the manufacturer and the micro's ability to communicate with a mainframe.

"The factors in selling to Fortune 1,000 customers — access to the mainframe and established contacts — favor IBM," said John Barns, president of Microcraft Corp.

Future Computing's survey supported Barns' assertion. The survey showed the numbers of installed micros: 59% are IBM; 19% are Apple Computer, Inc. micros; 6% each are from Radio Shack and Hewlett-Packard Co.; and 4% are Wang Laboratories, Inc. systems.

IBM was listed as the first choice of 67% of the companies surveyed. "No preference" was the second choice, with 24%. HP, with 4%, was the only other manufacturer with a significant market percentage.

Among companies that had signed volume purchase agreements, IBM has signed 69% of the companies surveyed; Apple, 6%; and Wang, Radio Shack, HP and Digital Equipment Corp. each 5%, according to the survey.

Future Computing said that IBM's sales to large companies comprise 50% of its Personal Computer sales, as opposed to 40% at DEC and 66% at Wang. On the other hand, 15% of Apple's and 10% of Radio Shack's personal computer revenue were said to come from the large business market.

NETS from page 73

take place in a centralized fashion, because each node can pass the token along following a transmission.

Because there are no collisions, a token passing system's capacity may be accurately calculated, although a token passing scheme relies on all devices being serially polled, which implies its own set of problems.

A token passing scheme can degenerate under heavy loads, which are measured in terms of the number of connections, since the token must pass every node before returning to any given connection.

A rather heated controversy has risen between supporters of CSMA/CD and token passing systems, and both systems have advantages and disadvantages. At this writing, neither system is clearly superior.

With appropriate network management techniques, either system will prove adequate. From a managerial perspective, the real issue is whether the local-area network vendor's overall design philosophy can meet the buyer's system needs.

Because support for the schemes seems to be as much taste as engineering principle, affected even more by marketing prowess, it is not surprising that IBM may launch both technologies into the increasingly crowded local-area network field. The advantage to the industry is that with IBM's backing, some consistency may come out of the chaos of local-area networks now on the market. The disadvantage is that IBM will take yet another step toward total domination of the industry.

COMPUTER INDUSTRY

INDUSTRY INSIGHT
Peter Bartolik
CW News Editor

Seeing red hinders high-tech trade

A presidential administration that campaigned partly on the promises of encouraging free enterprise and reducing government regulation and paperwork appears totally committed to shackling the competitiveness of high-technology industries.

Recent actions by the Reagan administration are certain to reduce the ability of high-tech firms to compete in the international marketplace: Digital Equipment Corp., the apparent unwitting player in a very muddled smuggling case late last year, recently was told it would have to abide by more stringent export regulations [CW, March 26]; the Department of Defense was empowered to review high-tech exports to allies suspected of being diversion points to Eastern bloc nations [CW, April 2]; and attempts to enforce U.S. export regulations within the borders of other countries, such as the UK [CW, April 9], have raised hackles.

It is idiosyncratic of self-professed conservative politics that the first commandment of free enterprise is promptly ignored whenever the flag of the Red Threat is waved.

The Reagan administration, and any other U.S. administration, certainly has the right and the duty to ensure that war-adaptable advanced technology is kept from the hands of countries that express, by word or deed, enmity for this country.

But manipulating such fears to enact blanket restrictions accomplishes little, other than hampering the efforts by U.S. industry to assert its well-earned prominence as an international leader in trade and the commercial exploitation of technology. It is particularly grating when such a turn of events appears, at least

CDLA wary of IBM Credit

Aftermarket a boon for firms seeking used CPUs

By F. Peter Model
Special to CW?

Second of two parts

During a meeting of the Computer Dealers & Lessors Association (CDLA) last fall, David A. Finley, president of IBM Credit Corp., told CDLA members Big Blue was not being predatory when it created the credit subsidiary two years earlier.

It proved to be a tough sell, and few CDLA members were in a mood to buy.

Under the John Opel regime, IBM concluded that its long-term growth objectives would be better served with a faster up-front payout on its huge investment in new computers; accordingly, it set up IBM Credit as a wholly owned subsidiary, headed by Finley, to raise new money from outside sources.

IBM, with its AAA public debt rating, had better access to outside financing, and IBM Credit quickly became the sixth-largest computer lessor. By retaining the investment tax credits on new machines, IBM Credit or its banking partners had access to better interest rates and could offer computer buyers better terms.

Look at the bright side, Finley told the dealers: The more new equipment IBM could sell, the more used equipment would have to flow out of the primary and into the secondary or aftermarket.

Privately, CDLA members found it hard to believe Finley's claim that IBM needs an orderly used market and wants nothing more than to coexist with used equipment dealers and lessors.

Not only are the CDLA dealers put out by reports that IBM Credit will pay bonuses to IBM field sales reps who steer leasing business its way, they're furious about talk of IBM paying them *commissions* and instituting a quota/goal program.

It's a no-win situation for dealers, perhaps, but not for businessmen who are looking for a good deal in used CPUs and peripherals. However, since most of the IBM Credit leases are for three to four years, the earliest the business community can expect the fallout of used, 1982-vintage computers to take place will be 1985.

Meanwhile, the pipelines are bulging. Over 33% of IBM's 1982 net earnings were

See CREDIT page 97

Worldwide intelligence organization targets U.S. technology, speaker says

By Patricia Keefe
CW Staff

BOSTON — U.S. high-technology companies and equipment are the prime targets of the "largest intelligence organization on earth," but government efforts to combat the Soviets are complicated by the fact that the high-tech industry is overwhelmingly in the civil domain, a ranking federal official lamented here recently.

Even worse, said Michael Marks, senior policy adviser to Undersecretary of State for Security Assistance, Science and Technology William Schneider Jr., there is evidence that Soviet efforts to acquire U.S. technology have become much more systematic and effective over the past 15 years.

"Western technology is the target of a massive, well-coordinated Soviet acquisition effort, orchestrated through legal and illegal methods and aimed at those technologies which promise the highest military payoff," said Marks, who delivered the keynote address here at the recent Symposium on the Transfer of Technology in the International Marketplace, sponsored by the Federal Bar Association. He cited a number of recent trends in Soviet activities:

■ Increasing priority is being given to dual-use commercial and emerging high technologies, perhaps indicating the military value placed upon them by the Soviet Union as well as their greater vulnerability to intelligence acquisition methods, Marks said.

See SOVIETS page 96

Instant Cure for Computer Indigestion

COMPUTER INDUSTRY

Rolm, Northern Telecom to supply NTT PBX systems

SANTA CLARA, Calif. — Nippon Telegraph and Telephone Public Corp. (NTT) recently selected Rolm Corp. and Northern Telecom, Inc. as suppliers of computer-controlled digital voice and data communications systems for NTT direct purchase and resale in the Japanese office automation market.

The contract award, Rolm said, is expected to result in revenues in the $10 million to $20 million range for 1984. The companies competed with established Japanese vendors, including Nippon Electric Co., Ltd.; Hitachi, Ltd.; and Fujitsu, Ltd., according to a spokesman for Rolm.

In early 1982, Rolm had been approved as a vendor of private branch exchanges (PBX) in Japan through an interconnect distributor. Rolm then became the first distributor of digital PBXs in Japan, as NTT had previously restricted the use of the devices.

According to a prepared statement, NTT said it intends to use the Rolm CBX system as the hub of information flow in an office/business environment. The equipment will be installed in medium-size to large offices, requiring 500 to 4,000 or more voice and data extensions, as the central controller for telephones, terminals, computers and facsimiles, NTT said.

According to Wolfgang Schwartz, vice-president and general manager of the Rolm International Telecommunications division, "With so many large Centrex-type systems existing in Japan today, that replacement market alone is huge."

Cbema says computer imports up

WASHINGTON, D.C. — U.S. imports of computers and business equipment grew four times faster than exports over the last three years, resulting in a steadily declining U.S. positive balance of trade, according to the Computer and Business Equipment Manufacturers Association (Cbema).

Cbema President Vico Henriques blamed the imbalance on the inflated dollar due to high interest rates and claimed the imbalance between the U.S. dollar and the Japanese yen gave Japanese manufacturers a 20% price advantage in the U.S.

The Cbema analysis, based on U.S. Bureau of the Census data, showed that while U.S. exports of computer equipment have risen at an average rate of 9% since 1981, they have been outpaced by imports, which have grown at an average rate of 36.8% since 1981. From 1982 to 1983, the Cbema analysis said, the positive balance of U.S. trade declined 12.6% percent from $6.62 billion to $5.79 billion.

Imports of data processing equipment from Japan reached $1.88 billion last year, an increase of 115% over 1982's $828 million.

Henriques said the downward trend in the U.S. positive balance of trade, a decline of 9% annually since 1981, showed a need for corrective U.S. trade policies. One change the government should make, he said, is to "rethink its proposed policies to place export control restrictions on microcomputers, an area in which the U.S. now is the leading exporter."

'There are days when I think AI can't come too soon.'

COMPUTER INDUSTRY

Fifth generation still 'creative dream,' says keynoter

By David Gosse
CW Staff

BOSTON — Despite some public relations hoopla, fifth-generation computer systems at this point in time remain "a creative dream and a vision of what computers can do," the former vice-president of engineering for Digital Equipment Corp. maintained last week.

In his keynote address at the annual Dexpo East '84 conference here, C. Gordon Bell, now chief technical officer for Encore Computer Corp., presented his own brief history of the evolution of the computer industry and speculated on future developments in store for fifth-generation systems.

Bell, the chief architect of DEC's PDP-11 minicomputer, joined Encore last July after more than 20 years at DEC.

The development of each new generation of computers, Bell said, has usually involved the convergence of several factors. Some key factors include need (often for national security purposes), a profit motive and technological and scientific innovation. "The interesting things about these generations is they're getting faster all the time," he added.

In Bell's opinion, today's systems are still part of the continued evolution of the third generation of computers. "We've been on a very long roll since the beginning of the integrated circuit."

He asserted that fifth-generation systems will likely result from continued technological evolution rather than from the "revolutionary" leap forward that some have suggested.

Bell said some discussion about the fifth generation has been nothing more than public relations hoopla. But, he added, "It's also, I think, a creative dream and a vision for what computers can do. And I think the Japanese have done an excellent thing in that regard."

Japanese challenge

Bell said the U.S. faces a considerable challenge from the Japanese in developing new technology. "I think the impressive thing is that they have goals and are focused on what they are doing; and they're getting results."

He suggested some goals the Japanese may have in their push to develop fifth-generation computers. Those benefits, he said, could include improving research techniques; learning knowledge engineering and artificial intelligence-based techniques; developing useful by-products; increasing parallelism; and repeating the success they have achieved with semiconductors and supercomputers.

Research in the U.S. on the next generation is very difficult, Bell said. There are still no prototypes developed, and universities and industries are poorly equipped for the research.

Bell summed up his view of the next generation. "I don't believe that revolution is what it will all be about," he said. "I think it will just be a matter of a tremendous amount of slow, very hard work."

NEW LIFE FOR 1401 PROGRAMS

CS-TRAN converts your 1401 object programs to COBOL, for the mainframe or mini of your choice.

CS-TRAN is the only translator that accepts your object programs, patches and all, yet allows you to include actual COBOL paragraph names and record definitions.

If you'd like more details about new life for your 1401 programs just call or write Russ Sandberg.

Sales up, but shipments might not keep pace: DG chief

By David Myers
CW New York Bureau

NEW YORK — Data General Corp.'s equipment sales have boomed since striking a historical low last June, but Edson D. deCastro, president of the 16-year-old computer maker, recently said shipments may not keep up the pace for the rest of the year.

In his first speech to Wall Street stock analysts in five years, deCastro said DG equipment sales grew 17% from the first quarter of the year to the second, but he added that rising demand is forcing DG to shave its profit margins in order to ship its products on time.

He said DG's highest priority for the rest of 1984 "is meeting customer demand in a timely fashion."

Under questioning by analysts, deCastro said DG lead times had stretched to four months by the end of 1983, but have since been reduced to three months.

To boost manufacturing, deCastro said DG has shifted to heavier purchases of parts made outside the company "at somewhat higher costs." As a result, the computer vendor's profit margins have not ballooned as quickly or as large as its sales figures, according to deCastro. "Our fall from grace was more rapid than our return," the DG president said, referring to the way the firm's profit margins plummeted to zero in 1982's final quarter.

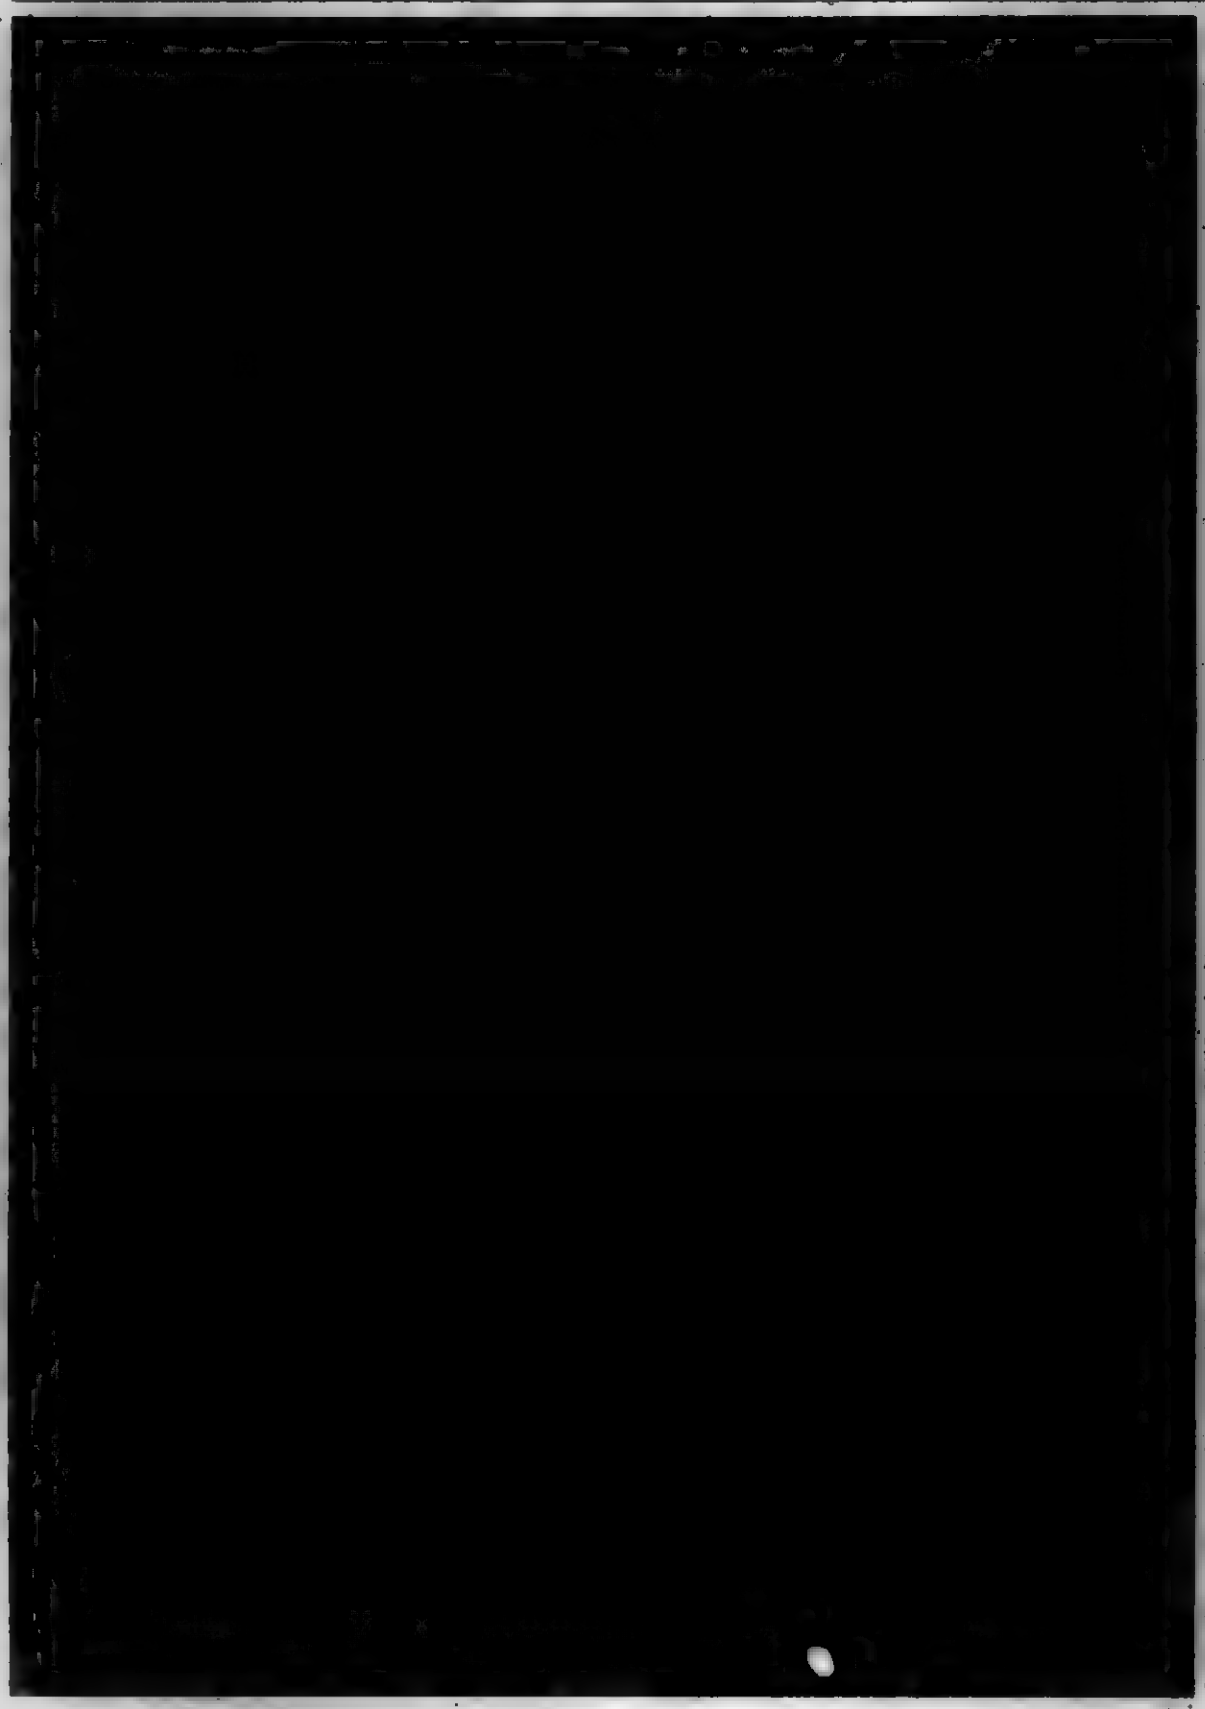
Noting that economists expect capital spending by durable goods manufacturers to rise through 1985, deCastro said DG expects demand for its three families of computers — the 32-bit MV series of superminis, the 16-bit Eclipse line and the microprocessor-based Desktop Generation of small machines — to grow through the next two years.

However, "the surge in shipments we achieved in the past two quarters may not be indicative of the next few quarters," deCastro warned the audience of stock watchers. "After all is said and done, this may result in little change in the earnings-per-share expectations for this fiscal year."

DG is now operating at a 7.3% margin of profit and expects to top 10% by year's end, deCastro said. "We might even be able to achieve margins above 15% at some time during the next few years," he said, but added that customer demands would make it unreasonable for the company to operate at that level for very long. DG is also expanding its manufacturing capabilities by spending $85 million on capital improvements this year, deCastro noted.

In reply to a question, deCastro said DG's goal this year is "to gain as much market share as we can." However, he went on to note that "we haven't seen anything to indicate that" DG is gaining share at the expense of its archrival Digital Equipment Corp.

Preceding deCastro to the podium, Robert C. Miller, the company's senior vice-president of the Business Products Group, said sales of the MV series of superminis would account for one-half of DG's sales this year.



Second quarter earnings at DG $12.6 million

WESTBORO, Mass. — Continuing its rebound from a three-year slump, Data General Corp. recently announced that profits for the second quarter ended March 10 more than doubled from the comparable quarter in fiscal year 1982.

Net earnings for the second quarter were $12.6 million, or 49 cents per share, compared with $5 million, or 21 cents per share, one year earlier. Revenues increased in the quarter to $229 million, up from $178.7 million in the second quarter of 1982.

It marked the third consecutive quarter in which sales and profits climbed, following a three-year decline in which annual profits slipped from a high of $54.6 million in 1980 to $23.1 million last year.

For the first two quarters of the current fiscal year, DG produced profits of $21.6 million, compared with $8.1 million in the first six months of last year.

One day after the financial report was issued, DG President Edson D. deCastro told the New York Society of Stock Analysts to expect little change in per-share earnings, because strong demand for products has caused the company to turn to outside parts suppliers, and the higher costs will cut into profit margin improvements.

The revenue growth of 27% experienced in the first six months of the fiscal year, $468 million compared with $368.4 million in the year-earlier period, may not hold up during the second half, deCastro said.

If you're not in *Computerworld's* next five special reports, look at the issues you'll be missing.

MAY 25
Software Productivity Packages
We'll tell our readers all about the software and services available to benefit DP managers and their technicians.
Closes May 11.

JUNE 25
Graphics Systems
If you have something to offer the graphics user, this is the place to be. We'll focus on the latest technologies, techniques, and applications.
Closes June 8.

JULY 2
NCC Preview issue
A detailed roundup of the vendors and products to see at the show (complete with booth numbers). Plus we'll take a look at the special attractions in Las Vegas.
Closes June 15.

JULY 9
NCC Show issue
We'll highlight *Data Pro's* yearly hardware survey. Readers always enjoy studying other user's candid ratings of systems and vendors.
Closes June 22.

JULY 16
NCC Wrap-up issue
Part 2 of *Data Pro's* hardware survey. Also, we'll let readers in on the major product announcements and happenings at the show.
Closes June 29.

Linear says National Semi suit deterrent to defections

By Peter Burrill
CW Staff

SANTA CLARA, Calif. — Charged by National Semiconductor Corp. with violating a 1982 settlement in a trade-secrets case, Linear Technologies Corp. recently claimed the charges are aimed at preventing further personnel defections from National Semi to Linear.

National Semi filed suit in Santa Clara Superior Court here late in March, charging that Linear had violated the terms of a confidential, out-of-court settlement that resolved charges filed against Linear in 1981. In its latest motion, National Semi has asked for punitive damages of $1 million and reimbursement of unspecified damages from alleged misappropriation of trade secrets.

Linear was founded in mid-1981 by Robert Swanson, formerly director of linear operations for National Semi, and an attorney for the young firm charged that the continuing court battle is a result of further employee defections.

Michael Ladra, an attorney with the Palo Alto, Calif., firm of Wilson, Sonsini, Goodrich and Rosati, told *Computerworld* that the previously confidential 1982 settlement included a prohibition against Linear's hiring additional National Semi employees and allowed National Semi a "one-time look" at Linear's manufacturing processes. Ladra said National Semi and Linear agreed to remove the confidential provision from the settlement as a result of the renewed court battle.

Linda Baker, spokeswoman for National Semi, declined to comment on the specific charges because of the confidentiality of the previous agreement.

She said the company is trying to open the previous agreement through the court process.

While the actual charges filed here recently by National Semi were sealed by court order, Ladra said Linear believes they were filed because Linear hired a regional sales manager away from National Semi. Ladra said the no-hiring ban expired last June, and Herb Wallack, the manager, left National Semi for Linear last December.

Ladra said the previous settlement did not determine the allegations of trade-secrets misappropriation and that it provided National Semi with the opportunity to examine Linear's processes, which was accomplished this past December. He said the inspection report cited "six minor items out of hundreds of different steps," but the inspector was not empowered to determine what, if anything, constituted a trade secret. Linear's position, Ladra said, is that any similarities between processes used by the two companies are a result of technology common to the industry.

Cases of this type rarely go to trial, Ladra said, but, he claimed, this case is a result of a vendetta by National Semi and may not be settled out of court.

Zilog files complaint against Xilinx

Charging misappropriation of trade secrets

By David Gross
CW Staff

SUNNYVALE, Calif. — Zilog, Inc. recently filed a lawsuit charging unfair competition, trade-secrets appropriation and breach of contract against Xilinx, Inc., a company formed in February by three former top Zilog executives.

The complaint, filed April 4 in the California Superior Court in Santa Clara County, centers on a product under development and names as defendants Xilinx of Los Gatos, Calif., and four former Zilog employees.

Three of the defendants are the co-founders of Xilinx: Bernard V. Vonderschmitt, formerly vice-president of Zilog's Components Division, now Xilinx's president; Ross H. Freeman, formerly director of integrated circuit engineering at Zilog, now vice-president of engineering at Xilinx; and James V. Barnett, formerly product line director at Zilog, now vice-president of marketing and sales at Xilinx. Also named as a defendant is William S. Carter who, in February, left his job as Zilog's director of integrated circuit design to join Xilinx.

The complaint, which primarily concerns an integrated circuit product under development at Xilinx, charges the defendants with "unfair competition, breach of fiduciary duty, wrongfully attempting to appropriate trade secrets and confidential information and breach of contract."

According to David J. Gueseman, Zilog's vice-president of marketing, the complaint centers on his company's claim that it has knowledge of Xilinx's plans to manufacture an integrated circuit product using Zilog trade secrets. He declined to comment on how Zilog knows about the Xilinx product.

Vonderschmitt denied Zilog's charges. "We are not designing and will not manufacture products that will in any way compete or have any relationship to products Zilog is making," he said after the suit was filed.

Vonderschmitt said his firm's product, which he described as an application-specific integrated circuit, uses a different process technology from Zilog's products.

"We interpret this suit primarily as a harassment to keep us from taking [Zilog] employees who are coming to Xilinx," Vonderschmitt said. He claimed that a lot of employees have left Zilog in the past 18 months, but not just to go to Xilinx.

Gueseman denied that the suit is intended to harass Xilinx. He confirmed that the company has lost some employees recently, but he added, "Our turnover rate is commensurate with the industry average of everyone here in Silicon Valley."

Zilog is asking the court for injunctive relief, an undisclosed amount in damages and punitive damages and payment of court costs.

Zilog, formed in 1975, manufactures microprocessors, microcomputers, peripheral support circuits and supermicrocomputer systems.

Apple, Sony will share research

NEW YORK — Apple Computer, Inc. and Sony Corp. recently announced an agreement to share existing research on hard disk technology.

Under the terms of the agreement, Apple Computer will provide Sony with its existing research on hard disk technology, thereby enabling Sony to expand its product line of computer peripheral devices for the OEM market.

Other details of the pact were not disclosed by the two companies.

Both Apple Computer and Sony said, however, that they plan to use the research independently as a basis from which to develop future advanced hard disk drive products.

Sony currently supplies Apple Computer with 3½-in. micro floppy disk drives for use with its Macintosh and Lisa 2 series microcomputers.

DEC TO IBM SNA

Now available...full SNA capability for your DEC computer! Comboard/SNA gives your terminals access to IBM interactive applications. Data can be transfered between systems transparently, all in the complete fully supported package, from Software Results.

Comboard/SNA is a proven and reliable, single-board, 256KB communications computer that plugs into your DEC Unibus. Teamed with Comboard software, the system is a cost-effective solution to troublesome SNA communications problems.

Comboard/SNA allows your DEC to emulate an IBM PU Type 2 communications node. You have a full gateway into your SNA without the trouble of passing through a secondary network.

For further information, fill in the coupon below or call Software Results... the leader in DEC to IBM communications.

One word from us could solve your PC service problems.

AMER

We've noticed that some words cause PC owners extreme anxiety. Words like "The disk drive blew..." "The data won't come up on the screen..." and "The printer won't print."

Service for a variety of systems.

Well, the next time words like that are echoing in your ears, just ask for Americare service from Xerox.

Unlike a lot of manufacturers and dealers, we don't restrict our repair service to one select brand. Instead, we service 22 of them, including 82 different models. From IBM PCs to Quadram boards. And from Amdek monitors to Okidata printers.

Repairs in 48 hours or less.

Our technicians undergo intensive training on the equipment we service. In fact, they probably know as much about servicing it as the people who made it.

And they work fast, so in most cases they can have your PC up and running

XEROX® and Americare™ are trademarks of XEROX CORPORATION.

Quadram® is a registered trademark of Quadram Corporation.

XEROX

ICARE™

again in 48 hours or less.

Of course, you can't get it back fast if the parts aren't available. Which is why we're downright obsessive about keeping our parts department well stocked.

Americare has Xerox Service Centers that provide you with a nationwide support system. And to make service even easier, you can reach us through our network of over 3,000 authorized computer dealers.

Well stocked parts departments.

A nationwide support system.

In addition, we offer a choice of on-site, depot or pick-up and delivery service. Year-long service contracts or time and materials service agreements are available.

So call 800-238-2300 for the Americare dealer nearest you.

AMERICARE™
PC repair beyond compare from Xerox

It's the first thing to do when you're looking for the last word in service.

Shift seen from micro software to support charges

By Paul Hemmelweit
CW Staff

DALLAS — As sales of microcomputer software to Fortune 1,000 companies shift from retailers to the vendors' direct sales forces, MIS departments may be saddled with annual support charges for packages like Lotus Development Corp.'s Lotus 1-2-3.

That was the message delivered by industry analysts at the Fortune 1,000 Personal Computer Market Forum, a two-day event held here recently by Future Computing, Inc., a Richardson, Texas, market research firm. Future Computing estimated that direct sales of microcomputer software will grow from $120 million in 1984 to $800 million in 1989, increasing in market share from 14% to 44%.

"The major reason for the shift is price," explained Egil Juliussen, chairman of Future Computing. "Large companies are used to 40% discounts for volume purchases. They want to continue to buy products that way."

As volume purchases increase, cost-free support may decrease, according to analysts. "Support is expensive," Jonathan Hathaway, co-founder of ITM Corp., pointed out. "The burden is placed on vendors to have a full-time technician. It makes sense to charge the end user for support services."

Similar trade-offs

Analysts saw similar trade-offs when mainframe software was introduced 20 years ago. "Mainframe software companies began selling software without support," said Howard A. Smith, senior vice-president at Management Science America, Inc. (MSA). "Customers would complain that there were problems with the package, and the vendor ended up supporting the package in any case. Not charging for support was a no-win situation for the vendor."

According to Future Computing, few microcomputer software companies are equipped to handle large companies' needs for volume purchases. Volume purchases require direct sales staffs, and such staffs for micro software are small. Sizes range from Ashton-Tate's four-member staff to Visicorp's sales force of 20, according to Future Computing. Even Lotus, which Future Computing said generated half of its $64 million in revenues last year from sales to large companies, has only a 12-member direct sales staff.

Information Unlimited Software, which benefits from the sales staff of its parent company, Computer Associates, is an exception, with 100 salesmen directly selling its products.

Microcomputer software companies should beef up these staffs dramatically, according to analysts. "As microcomputer software companies' revenues approach $100 million, direct sales become cost-effective," John Downing, chairman of Publishing Technology, Inc. said. "Soon there will be a significant increase in their direct sales efforts."

MSA, originally a mainframe software company that already had a direct sales staff in place, is teaming with microcomputer software companies to supply microcomputer software to large companies. MSA is using part of its sales force to market products from 50 microcomputer companies. MSA provides companies with training, a limited number of software packages and support. Choosing software is the customer's responsibility [CW, Feb. 20].

"Mainframe companies like to buy from a central source," MSA's Smith said. "Since we have significant market penetration in the mainframe world, we will offer customers the convenience of central purchasing and the benefit of support."

But these benefits are expensive. Each customer must commit to an initial purchase of $10,000 worth of software and a yearly purchase of $100,000.

Trilogy's Amdahl to step down as vice-chairman, director in June

CUPERTINO, Calif. — Trilogy, Ltd. announced last week that Carlton Amdahl is stepping down as vice-chairman and director of the company effective June 1.

Carlton Amdahl, son of company founder and chairman Dr. Gene Amdahl, will continue to serve as a consultant to the company, a Trilogy spokesman said.

Prior to the formation of Trilogy, Carlton Amdahl had served with Magnuson Computer Systems, Inc.

Trilogy also announced that Paul McEnroe, previously director of IBM's Raleigh Development Laboratory, was appointed vice-president of engineering of Trilogy Systems Corp., where he will be responsible for all aspects of the firm's computer design, design automation development, computer center operations and machine technology development.

Appointed vice-president of computer development at Trilogy Systems Corp. was David Anderson, formerly vice-president of engineering with Computer Research Corp., a Storage Technology Corp. subsidiary, and previously with IBM.

Anderson will have responsibility for the overall coordination of Trilogy's computer design activities, according to the spokesman for the firm.

HCSI-P.C. Telemart suit settled

LAUREL, Md. — Hammarly Computer Services, Inc. (HCSI) settled a $10.9 million breach of contract suit against P.C. Telemart and Larry A. Stockett eight hours before the case was to go to trial last month.

An attorney representing HCSI, a firm specializing in electronic mail and micro data communications software, said cash and other considerations were part of the settlement.

The suit had been brought Oct. 17 by HCSI and charged Telemart with breach of contract, racketeering and violation of copyright. HCSI had spent nearly 10 months developing software for Telemart, but had not been paid, the attorney said.

Stockett has reportedly resigned as Telemart's chief executive officer.

NEW COURSE ANNOUNCEMENT
SEND YOUR IMS PROBLEMS TO SCHOOL
Our instructors encourage students to bring actual programming assignments, debugging and/or design problems to class. Because they're committed to providing a real-life learning experience . . . experience that makes programmers immediately productive in an IMS environment.
Atre/SysEd courses, from Data Base Design, DB (DL/I) Application Programming, DC and Message Format Services Programming, and Utilities to advanced Recovery and Restart, are for highly motivated programmers who want to become IMS professionals and are willing to work hard. Our intensive training provides state-of-the-art instruction: a solid foundation in IMS fundamentals and insights into advanced material; extensive "hands-on" experience; and individual attention from highly qualified instructors.
Classes are held regularly at our fully equipped classroom/computer facilities in New York City and Chicago. Class size is limited, so applications are accepted on a first come first served basis. Customized course offerings are available for on-site sessions at company installations.
For more information, call David Shapiro (212) 889-3386.

U.S., foreign chip makers form trade statistics program

PARIS — Sixty-one semiconductor firms from the U.S., Europe and Japan meeting here recently formed the World Semiconductor Trade Statistics (WSTS) program.

The new program replaces the Semiconductor Trade Statistics Program, which started in the U.S. in 1976 under the auspices of the Semiconductor Industry Association (SIA) and was expanded in 1980 to include European manufacturers.

The program, reputed to be the first worldwide statistical reporting program for any industry, is designed to provide participating firms with timely data on product shipments to all markets in the world.

It will provide each member with a monthly report covering all major markets for 38 product lines, according to Jean Caillot, executive vice-president of Thomson International, who was elected to chair the WSTS.

According to the SIA, the agreement, reached with Japanese industry to participate with U.S. and European vendors in a global statistics program, follows an extended study by all parties and is based on a new charter for governance ratified at the recent meeting here.

The WSTS is sponsored by semiconductor trade associations from the respective regions — the SIA for the U.S., the European Electronics Components Association for Europe and the Electronic Industries Association for Japan. The program will continue to be administered by the SIA until an independent administration can be established, according to the SIA spokesman.

McAuto announces subsidiary

ST. LOUIS — McDonnell Douglas Automation Co. (McAuto) has formed a new subsidiary called Cimtek to market products for automated manufacturing.

Cimtek, an acronym for Computer-Integrated Manufacturing Technology, will focus on computer-aided manufacturing, computer-aided engineering, robotics, process planning, production planning and control and data base management.

Manufacturing industry products, chiefly computer-aided design and manufacturing systems, accounted for $65.6 million of McAuto's sales last year. This year, according to McAuto, the company expects that total to reach $100 million.

Last month, McAuto, after concluding an agreement to purchase Tymshare, Inc., announced a decision to form several single-industry businesses, the first being McDonnell Douglas Health Systems, Inc.

McAuto Senior Vice-President John J. Clancy will serve as president of Cimtek.

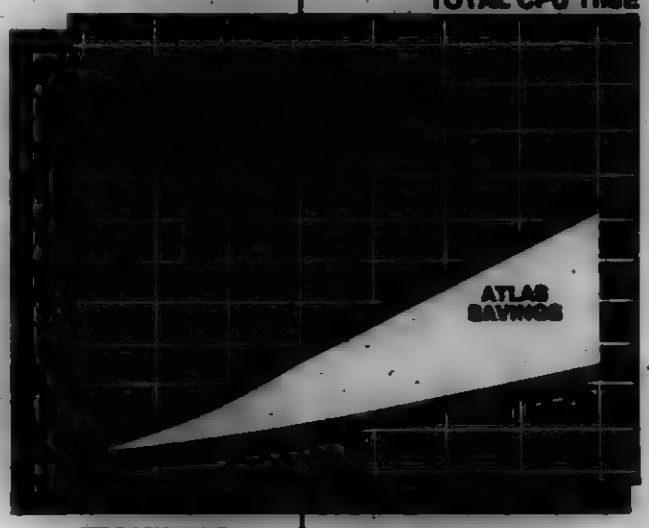
Monolithic revenues up

SANTA CLARA, Calif. — Monolithic Memories, Inc. recently reported second-quarter revenues of $40.1 million, an 87% gain over the corresponding quarter in 1983.

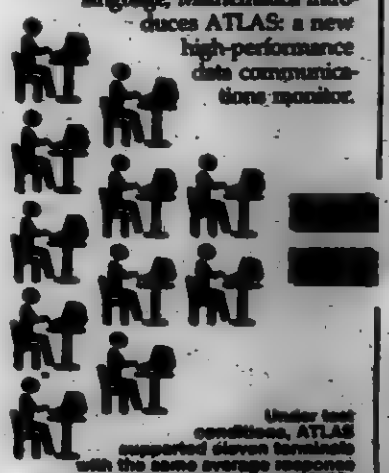
Profits for the second quarter ended March 18 were $5.5 million, or 29 cents per share, compared to profits of $862,000, or 5 cents per share, during the same period last year. The company said its second-quarter earnings were the largest of any 12-week period in the firm's history.

The company's sales during the first half of fiscal 1984 were $73.2 million, a 90% increase over the comparable period last year.

IF YOU KNOW RAMIS II, YOU'LL UNDERSTAND WHY ATLAS™ BEATS CICS!



With the same combination of innovative technology and practical features that has made RAMIS II the leading fourth-generation language, Mathematica introduces ATLAS: a new high-performance data communications monitor.



Under test conditions, ATLAS supported eleven terminals with the same average response time as a single terminal under CICS.

CICS/VS is a registered trademark of International Business Machines Corp.

ATLAS PUTS YOU A GENERATION AHEAD

ATLAS inaugurates a whole new generation in data communications software. Because CICS and other traditional monitors were initially developed in the late 1960s and early 1970s, they incorporated functions like "pseudo-tasking" to compensate for deficiencies in the operating systems then in use. Today, those functions remain and they impose layers of overhead to burden your computer—unless you use ATLAS.

Designed for the 1980s and beyond, ATLAS is the first monitor to truly unlock the power of IBM's 4300 series computers and DOS/VSE operating system. The result is more productive application development, high reliability, and dramatically reduced systems programming demands. But most of all, dramatically improved performance.

TEST ATLAS YOURSELF

In a recent test, ATLAS outperformed CICS/VS by more than 2 to 1 in both elapsed time and CPU time. And the heavier the load, the better ATLAS performed.

To find out exactly what the next generation in data communications can mean to your organization, try the ATLAS performance test on your computer. Whether you use ATLAS alone or together with RAMIS II, you will be able to support more terminals, improve response time, and get more work done in the rest of your DOS/VSE partitions.

To arrange a free trial or for more information, contact your local Mathematica office, call toll free (800) 257-5171, or return the coupon below.

[illegible]

Kenco, Inc. announced it has split its hospital division, Kenmed Hospital Systems, into two units: the Kenmed/IBM business unit and the Kenmed/Wang unit. The change is due to its recent agreements with IBM and Wang under which it will sell IBM hardware nationally and sell Wang hardware on the East Coast.

■

Sears Merchandise Group is increasing the number of Sears business systems centers; it plans to open 40 to 50 units this year. The first 10 will open in early April.

■

SATM Midwest, Inc., a subsidiary of ATM Network Management Corp.,

[illegible] AND ACQUISITIONS

IBM International Corp. of Sunnyvale, Calif., has acquired the microsystems and IBM-compatible memory product businesses of Intersil Systems, Inc., a subsidiary of General Electric Co. The acquisition was made for approximately $13 million.

■

Bemal Systems Corp., Washington, D.C., announced the acquisition of **Amdital**, a computer hardware/software firm. Terms of the sale were not available.

■

Zentec Corp. of Santa Clara, Calif., has sold the principal assets of **Shasta General Systems, Inc.** to **K-G Interests** of Houston. All of Shasta's inventory in hardware, software, software source code, object code and accounts receivable is included in the sale. The contract includes provisions for the new owner to provide service and support to Shasta dealers. Zentec ended its dealer distribution activities in early 1984 because the Shasta operation had not achieved its profit goals and had become a drain on the company's resources.

■

Perfectdata Corp. of Chatsworth, Calif., announced the acquisition of **International Data Automation, Ltd.**, London. The international operations of Perfectdata will now be under Perfectdata International. The acquisition is expected to increase the company's penetration of the European marketplace.

■

Dovetail Systems, Inc. of Sunnyvale, Calif., has purchased **Software Assistance** and market rights to several Software Assistance products for an undisclosed amount of cash and Dovetail stock. The products will continue to be marketed under the Software Assistance name, but with several major changes.

■

Bechtel Investments, Inc. of San Francisco, a subsidiary of Bechtel Group, Inc., announced it has acquired a substantial interest in **Data Securities International, Inc. (DSI)**. DSI provides a business security service for the software industry through a special type of escrow service that is known as proprietary deposit.

EFI announced an agreement to allow financial institutions throughout Illinois that are serviced by these companies to share automated teller machines.

■

Xemag has announced that the company headquarters will move to a new 16,000-sq-ft facility in Menlo Park, Calif., at the end of March. Xemag is a wholly owned subsidiary of Xidex Magnetics, Inc., manufacturers of flexible magnetic media.

■

Wyly Corp. announced that its **Open Systems, Inc.** microcomputer software subsidiary has been selected to provide the accounting software carried by the Nynex Corp. business computer systems retail stores in the New York and New England area.

The board of directors of the **American Electronics Association** has authorized formation of a new council in the state of Florida. The new council will be the 14th in the U.S. for the trade association, which serves the electronics and information technology industries.

■

The Ultimate Corp. and **Insurnet, Inc.** announced an agreement according to which Ultimate will provide Insurnet with more than 1,000 minicomputer systems over the next five years. The value of these systems, associated peripherals and spare parts is estimated to be $45 million. The Ultimate computer systems are also being used by Insurnet to support data communications services between insurance agencies and underwriter companies. Quotron Systems, Inc. will perform pre- and post-installation maintenance for Ultimate's Digital Equipment Corp.-based systems supplied under the agreement. Honeywell, Inc.'s national maintenance organization will continue to perform maintenance services for the larger Ultimate Honeywell-based computer systems.

■

Theodore G. Paper Jr., IBM vice-president, has been named president and chief executive officer of the joint videotex venture by CBS, Inc., IBM and Sears Roebuck & Co. The partnership was formed to develop a commercial videotex service that can be used by people with home and personal computers. The partners also announced the formation of a committee that will oversee operations of the new venture.

DON'T LET THE STEPS KILL YOU.

Take The Ramp. ROLM has perfected a breakthrough communications controller: The CBX II.

It's the centerpiece for a spectacular new ROLM® business telephone system—the fastest, most advanced way to manage voice and data in the world.

Instead of the typical stop-start steps of expansion, CBX II lets you grow smoothly, easily and very, very cost-effectively.

You can move up The Ramp from sixteen phones to more than ten thousand phones, terminals and personal computers. You can store and forward messages. You can monitor costs. You can have the least expensive long distance routes automatically, instantly. You can even network networks, from Dow Jones to the IBM Infonet. And we're plugged into

COMPUTER INDUSTRY

EXECUTIVE CORNER

Richard C. Schultz has been elected vice-president and comptroller of Perkin-Elmer Corp.

■

Harris Corp. has eliminated regional levels of management and announced the promotion of three regional directors in the customer support division. They are **Carleton Smith**, vice-president, Eastern operations; **David Fanning**, vice-president, Western operations; and **John Hammond**, director of division programs.

■

Donald D. Baron has been named vice-president of corporate manufacturing technology at Honeywell, Inc.

■

Thomas R. Brimer has been promoted to vice-president and general manager of Harris Corp.'s Interactive Products Division.

■

Dr. Hollis L. Caswell has been elected vice-president, special programs, at Burroughs Corp. Dr. Caswell was formerly with IBM, where he spent more than 25 years in various senior management positions.

■

A. B. Fopiak has been promoted to executive vice-president of Technology Information Products Corp.

■

William A. Hart, president and chief operating officer since August 1983 of Interdyne Co., will resign his responsibilities due to health reasons as soon as a successor has been found. Hart will continue to serve the company in a consulting capacity in the general management area.

■

James J. O'Connor has been named president of Telecom Plus of Southern New England, Inc.

■

John G. Dickerson has been named president of Stoneware, Inc.

■

Darrell Baldwin has been appointed president and chief operating officer of Philips Information Systems, Inc.

■

Dennis M. Feck, formerly the general manager at NCR Corp.'s engineering and manufacturing division at San Diego, has been named president, chief executive officer and chairman of the board at Saber Technology Corp.

■

Anthony J. Florence, formerly sales director with the North American Division of International Computers Ltd., has been appointed president of Precision Software, Inc.

■

Johann Tam, senior vice-president, engineering, has been named to the position of senior vice-president, advanced development, of Silicon Valley Group, Inc. (SVG). **Arthur G. Silver** has joined SVG as vice-president, engineering and development.

■

John A. Howe has been elected to senior vice-president and general manager of Wyly Corp.

■

Tayne M. Blam has been elected vice-president, corporate product development, of Mohawk Data Sciences Corp.

■

Charles D. Tillett has joined Lexicon Corp. as vice-president to implement an expansion of manufacturing.

■

Richard M. Wetnal has been named vice-president of engineering of the identification systems division of Data Card Corp.

■

Jack Rose has been named vice-president and general manager of Harris Corp.'s government electronic systems division.

■

Keith Sorensen has been appointed vice-president, software development, of Ramtek Corp.

■

J. Gerard Cregan has been named vice-president, manufacturing, of Raster Technologies, Inc. Cregan was a former employee of General Electric Co. **Derek Wilkes** has been named Raster's vice-president of programs and product engineering.

■

James R. Bloom has been appointed vice-president and general manager of the large computer products division of Honeywell, Inc. in Phoenix.

■

W. James McNerney Jr. has been named senior vice-president of General Electric Information Services Co. He will also serve as president of the GE Software Products Corp., Software International Corp. and Energy Enterprises.

■

Giovanni Pol has been elected as director and chief financial officer of Docutel/Olivetti Corp.

■

Anthony J. DePaul has been elected as chairman of the board and chief executive officer of Cogito Data Systems, Inc. **Don E. Ackerman** has resigned as Cogito's chairman, but remains a director.

■

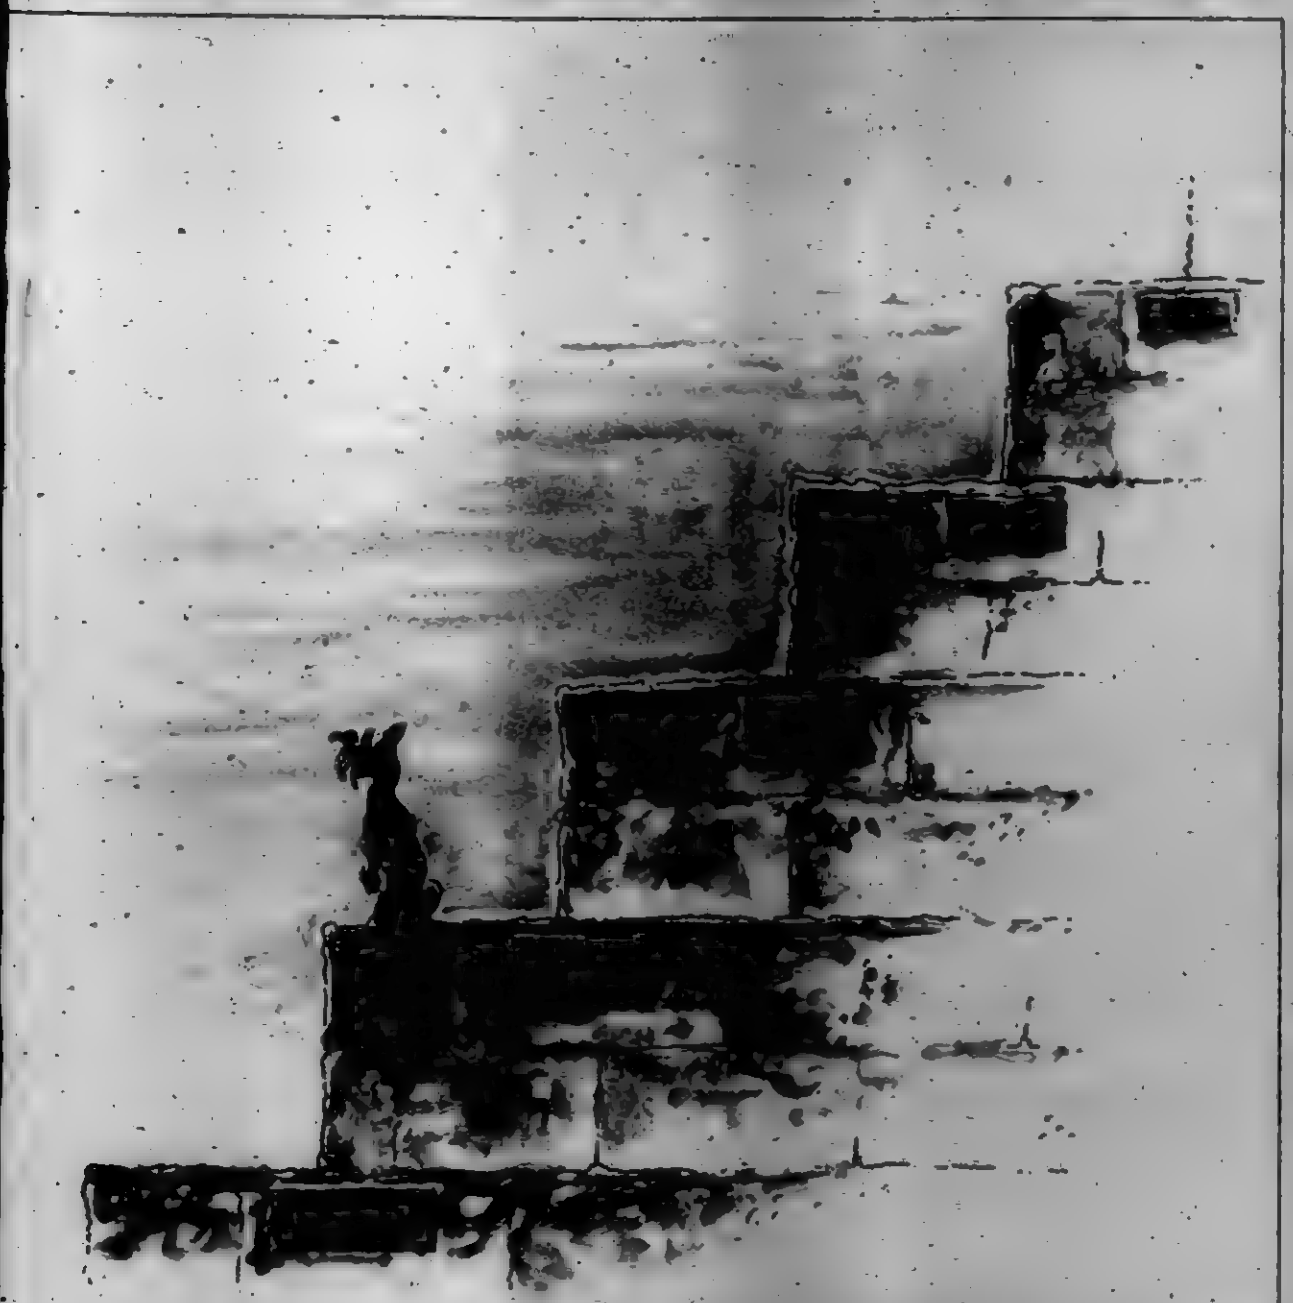
William T. Baker has been appointed president and chief executive officer of Island Graphics Corp.

■

Jeffrey L. Thwaite has been appointed president and chief executive officer of Zentec Corp.

■

Matthew A. Kenney has been appointed president and chief operating officer of Racal-Milgo, Inc. **Edwin J. Hilpert** has been promoted to executive vice-president of the firm and president of Racal-Milgo Government Systems, Inc. **Raymond P. Colucci** has been appointed president of Racal-Milgo's manufacturing division.



IBM and HP and DEC and Data General and the other movers and shakers to guarantee that we can take their new products and new systems in stride.

The CBX II is just the latest reason why ROLM is the choice of more than two-thirds of the *Fortune 500* companies, why more than fourteen thousand ROLM systems are up and running today.

When it's all said and done, the best thing about The Ramp is that it ends that recurring nightmare that you may be buying a business communications system that can't grow, can't change or has a big, gee whiz capability missing.

You can make your life a lot simpler. Just skip the steps and take The Ramp.

ROLM

4900 Old Ironsides Drive, M/S 626, Santa Clara, CA 95050 • 800-538-8154 (In Alaska, California and Hawaii, call 408-986-3026.)

Top priority given to stemming flow of tech to Soviets

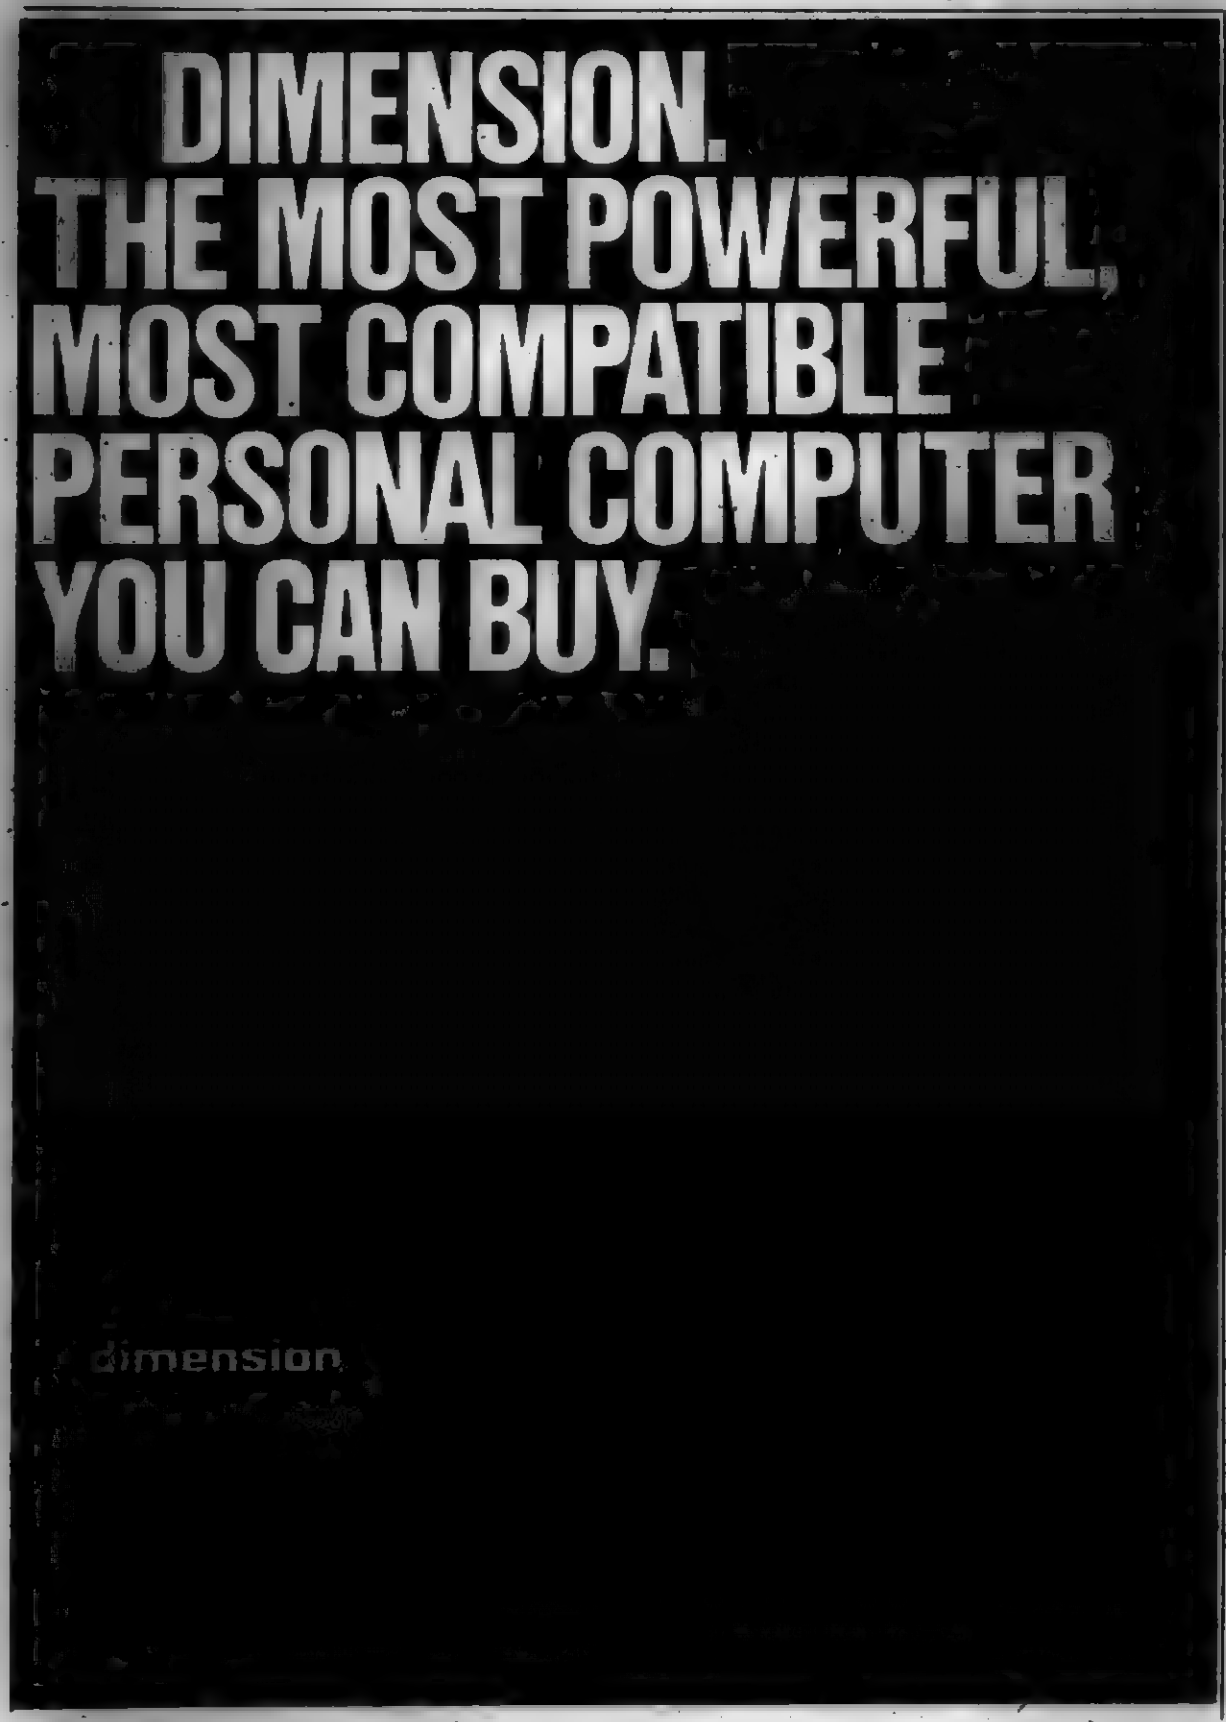
BOSTON — The Reagan administration has given top priority to fighting Soviet efforts to increase military power using "the fruits of Western technology," according to Michael Marks, a senior policy adviser on the staff of the Undersecretary of State for Security Assistance, Science and Technology.

Soviet efforts to date have saved them millions in research and development expenses while costing the West billions by forcing an accelerated pace of arms modernization, Marks contended in his keynote address here at the recent Symposium on the Transfer of Technology in the International Marketplace.

In an effort to "stem the flow" of strategic technology to the Soviets, an interagency organization was created in late 1982. Called the Senior Interagency Group (SIG) on the Transfer of Strategic Technology, it was created to bring all government agencies with strategic technology programs or interests together at a policy-making level to coordinate technology transfer activities, he said. The group is committed to strengthening another agency, the Coordinating Committee for Multiple Strategic Controls (Co-Com) and to drafting a comprehensive U.S. technology transfer policy for presidential decision.

According to Marks, SIG has resulted in a number of initiatives, including:

- Major bilateral dialogues with key high-tech allies, seeking enhanced government awareness of the technology transfer issue and a strengthening of their national export licensing and enforcement.
- Raising the intelligence priorities within allied intelligence agencies. "Of the approximately 80 expulsions or arrests of Soviet intelligence officers in 1983 in the industrial democracies, we believe more than half were involved in strategic technology collection," Marks said.
- Strengthening the U.S. visa mechanism by adopting a new policy of denying and restricting visas when there is evidence that the applicant intends to acquire controlled U.S. technology illegally.



SOVIETS from page 83

- Acquisitions of U.S. technology are being stepped up beyond U.S. borders.
- The role of Eastern European intelligence services has increased steadily since Western sanctions against the Soviet Union were initiated following "aggressive acts" in Afghanistan and Poland.
- Greater emphasis is being placed upon acquiring Western production technology and equipment, as opposed to end products. "This reflects the Soviet need to become self-sufficient and to increase the efficiency of large-volume production," Marks said. Much of this technology and equipment is subject to export controls, and its acquisition often is accomplished through intelligence-directed trade diversions, he added.
- Weapon-related acquisitions increasingly are more selective, focusing on critical components and materials necessary to achieve greater performance.

In short, according to Marks, the Soviets are determined and well-financed and are increasing their efforts. Yet because much of the targeted high technology lies within the civil rather than military domain, "the ability of the federal government to control the dissemination of this technology to the Soviet Union is vastly more difficult than controlling the critical technology of a generation ago," Marks said.

However, continuing cooperation between the government and the private sector is one way to fight the Soviet threat, Marks said. "With your goodwill and support, we will be able to manage our own technology losses and bring increasing pressure on our allies to conform their export policies to ours. Without your participation, we will . . . sell the rope to hang ourselves," Marks warned his audience.

'Quit saying you were replaced by a computer. All they did was move your desk!'

CREDIT from page 83

from "conversion sales" — rental customers buying on-site equipment, partly with accumulated "rental credits" (up to 50% of list price), at the end of their leases. Many then recoup by selling these goods to CDLA dealers. According to CDLA President Richard A. Forsythe, IBM's conversion business in the U.S. alone grew by 53% last year.

Why IBM is doing what it's doing should be obvious: 25 years after the consent decree that ordered IBM to sell its equipment instead of only leasing it, just 39% of Big Blue's customers are buying.

For growth-minded IBM, that's too slow a return on capital. Hence, OPM — other people's money — will ensure that IBM meets its stated growth projections without having to float another public issue.

In 1983, according to International Data Corp., a Framingham, Mass.-based research firm, the $22.6 billion (value shipped) U.S. computer market showed a 60:40 mix of general-purpose mainframes ($11.8 billion).

Over the next three years, the ratio will flip-flop, with minis and micros dominating. The big-box lessors will just have to adapt to change, said Adolph Monosson of Boston's American Used Computers, Inc.

The CDLA also looks upon depreciation schedules and the investment tax credit as means to move hardware into the hands of the user and is lobbying Congress for a faster depreciation schedule.

A trickier issue is how close CDLA members should get to the more aggressive IBM. Reportedly, IBM Credit has sought access to CDLA's information network to report computers coming off lease. According to CDLA Executive Director James F. Benton, "The ticklish question is this: Should the members allow their biggest single supplier to get onto their trading network?" Benton did not raise the issue of whether IBM Credit, as sixth-largest lessor, should be invited to join the CDLA.

RESTRICT from page 83

partially, to result from bureaucratic infighting.

Just about any commodity sold in international markets has some military value; grain, for instance, is vital to an army's food supply chain, but you won't find the Reagan administration reasserting a grain embargo in this election year.

The danger of restrictions on U.S. enterprise is that they harm the U.S. more than the Soviets; witness the embargo on equipment for the Soviet pipeline. Anything commercially available someplace in the world is obtainable by a government's intrepid agents. Trying to make acquisitions more difficult by restricting imports to allies merely serves to turn buyers to more dependable suppliers; in this case, perhaps; enhancing the attractiveness of Japan's vendors.

The conservative philosophy must come to grips with the inherent contradiction between free trade and fear of what the Communists can do with a piece of equipment. Rather than wasting efforts on attempts to block the Soviet bloc from catching up, it would seem much more lucrative to spend those efforts ensuring that the U.S. is always at least one step ahead.

Discrimination suit against IBM dropped

By Bryan Wilkins
CW Washington Bureau

BALTIMORE — A federal judge has thrown out a discrimination suit filed by black managers at IBM's Maryland data processing offices.

U.S. District Court Judge Norman Ramsey said in dismissing the suit on March 29 that there "is absolutely no evidence of any systematic pattern or practice of discrimination within IBM."

The ruling followed a lengthy court battle between the company and the Equal Employment Opportunity Commission (EEOC), which represented the employees.

Approximately 200 black managers and professional staff employed at nine IBM data processing facilities in the state charged that, during the mid- and late 1970s, they were lagging in promotions and job assignments compared with their white counterparts.

According to the suit, the black employees said that IBM conducted "performance appraisals" that contained racially discriminating evaluation standards.

IBM vigorously denied the charges and submitted statistical evidence to refute the employees' allegations.

In the proceedings before the EEOC, IBM submitted statistics showing that, between 1973 and 1981, the number of black managers in Maryland facilities increased from 59 to 145, or from 6.3% to 12.3% blacks in the work force.

The original class action suit was filed by the EEOC on behalf of the black IBM employees in 1980, after a complaint by one former employee, George Hunter, was expanded to include all blacks working at Maryland facilities.

However, the EEOC lawyer prosecuting the case said last year, as preparations for the trial were under way, that the facts of the case had been limited to the years between 1973 and 1981 for IBM employees in Maryland.

Announcing

The one-stop, international advertising service for micro marketers.

You'll reach microcomputer buyers all over the world with *Computerworld's* International Marketing Services (CWIMS). Because we have the microcomputer market *covered* with an international network of publications. And what a market!

As the need for computerization in government, industry and educational systems all over the world becomes more acute, countries look to the cost-effective, adaptable microcomputer to bring them into the computer age. This means a very lucrative market for the U.S. micro marketer, since international product demand exceeds product supply.

Now, with the help of *Computerworld's* International Marketing Services, you can advertise in 15 magazines devoted exclusively to supplying information to microcomputer users in: Australia *(MicroWorld, PC World)*, Brazil *(MicroMundo)*, Denmark *(Micro Verden)*, Finland *(Mikro)*, France *(Golden, PC World)*, Japan *(PersoCom World)*, Norway *(Mikro Data)*, Sweden *(MicroDatorn, Min Hemdator)*, Spain *(Micro Sistemas)*, The Netherlands *(MicroInfo)*, West Germany *(Micro-Computerwelt, PC Welt)*. And, your advertising message can reach buyers of microcomputer products and services around the world through special micro sections in any of our 40 publications in 25 countries.

Act now—and take advantage of this international demand for microcomputer products. Whether you want to test the market—or locate a distributor or representative—our publications will put you in touch with the right people around the microcomputer world.

For more information on getting international micro coverage, call Diana La Muraglia, General Manager, International Marketing Services, toll-free, at 800-343-6474. In Massachusetts, call 617-879-0700 or return the coupon below.

POSITION ANNOUNCEMENTS

Value Added Networking... a Major Commitment at GE Information Services

Today's GE Information Services

General Electric Information Services is introducing its Mark-Net™ value added network, which integrates communications and data processing technology to deliver computing solutions.

VAN Communications Consultants throughout the U.S.

If you're an experienced telecommunications services specialist, you could play a key role in the introduction and implementation of this major new product. As a VAN Communications Consultant, you will work closely with our established sales force to provide in-depth technical and sales assistance before, during and after the sale. To qualify, you should have a technical degree and several years experience in the data communication/networking field as a sales engineer, technical rep or consultant. Contact any of the addresses below regarding these positions.

VAN Product Planners at our Rockville, Md., headquarters

Your responsibilities will include market requirements, product definition, technical cross functional project management, pricing and costing for specific products, and customer support. You should have strong marketing and/or communications experience. Technical candidates should have an advanced degree and technical communications project management experience. In-house consulting experience is desirable. Marketing candidates should have an MBA, project management experience and business/marketing experience in the computer/communications industry. Contact our Rockville, Md., location regarding these positions.

Requirements

Knowledge of network architecture, asynch and bisynch protocols, protocol conversion, packet networks, X.25, IBM SNA, micros, and/or LAN/PBX is important, along with excellent verbal and written communications skills.

Our Future and You

Backed by the resources of General Electric Company, GE Information Services will play a major role in the future of business information solutions. Our highly competitive salaries are enhanced by our comprehensive employee benefits program. If you are ready to make the ultimate commitment to your career future, send your resume and salary requirements in confidence to: **Professional Staffing, (C-0401), General Electric Information Services Company**

- 401 North Washington Street, Rockville, Md. 20850
- 140 East Ridgewood Avenue, MACK Center III, Paramus, NJ 07652
- 614 Commerce Drive, Oak Brook, IL 60521
- Two Embarcadero, Suite 1750, San Francisco, CA 9411]

INFORMATION SERVICES

General Electric Information Services Company, U.S.A.

An Equal Opportunity Employer

LEAD SYSTEMS ANALYST

West Virginia Network for Educational Telecomputing has an immediate opening for a Lead Systems Analyst in the Administrative Services area.

The incumbent will serve as the backup to the Data Base Administrator and as the Project Leader for Accounting Systems. Responsibilities include, continued support for the database system (ADABAS), implementation and maintenance of new and existing accounting systems, and supervision of Systems Analyst and Programmers.

Requirements: BS, plus 6 years programming and analysis, one year as a project leader; significant background in systems analysis and design of financial systems and/or database administration, excellent oral and written communication skills.

Salary: Low 30's. Apply by May 1, 1984 to Mrs. Ricki Dulin, Personnel Officer, 837 Chestnut Ridge Road, Morgantown, WV 26505. Phone: (304) 293-5192. An Equal Opportunity Employer.

LYNDON STATE COLLEGE
LYNDONVILLE, VERMONT

Small state college (1,400 students) in beautiful northeastern Vermont seeks qualified faculty for appointments starting September 4, 1984. Ranks of instructor-associate professor determined on credentials and experience. Salary is negotiable with liberal fringe benefits.

FACULTY VACANCIES - Permanent part-time:

COMPUTER SCIENCE - Full-time, tenure-track position leading courses in ACM four-year program; knowledge of VAX 11/780 and UNIX preferred. Doctorate in Computer Science or related field required for tenure decision; MS and active pursuit of doctorate required for employment. Courses have VAX 11/780, time-share on VAX 11/785, 18-terminal lab, twenty additional work stations. Undergraduate program will begin third year this Fall.

MATHEMATICS OR COMPUTER SCIENCE - Full-time tenure-track position in Mathematics and programming; serve half-time as Coordinator Academic Computing Services for above facilities. Nine and one-half month position, duties from August 20 to June 1 each academic year. Doctorate in Mathematics, Computer Science or related field required for tenure decision; MS, experience in computer applications in other fields and ability to work with faculty required for employment.

Send letter of application, resume and letters of references for all the above positions by May 1, 1984 to Dr. Perry Viles, Acting Dean of Academic affairs, Lyndon State College, Lyndonville, VT 05851.

LYNDON STATE COLLEGE IS AN EQUAL OPPORTUNITY EMPLOYER

DIRECTOR OF DATA PROCESSING SERVICES

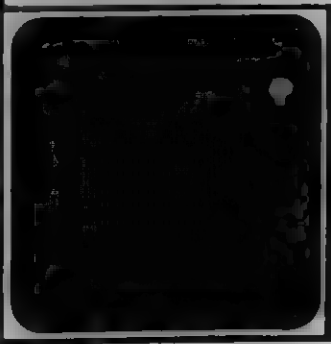
(Sedgwick County, Kansas)

Sedgwick County Data Processing provides service to both Sedgwick County and the City of Wichita, Kansas. This rapidly growing operation utilizes the most advanced program techniques, state-of-the-art hardware, and employs a highly trained professional staff. The director reporting directly to the County Administrator, directs the activities of 61 professional, technical and support staff, and manages a budget of $2.75 million.

To qualify, applicants should have a degree in computer science, business or public administration or related field and a history of successful data processing management. Starting pay is $43,013 to $47,313.

To apply send a letter of application and resume detailing your achievements to Mary Ann Mamoth, Personnel Director, SEDGWICK COUNTY PERSONNEL DEPT., 510 N. Main, Wichita, KS 67203.

Sedgwick County is an Equal Opportunity/Affirmative Action Employer.



Software Engineers Systems Analysts Programmers
$25,000-$55,000

NORTHROP ADVANCED SYSTEMS DIVISION...

THE FUTURISTS

Southern California

DATA PROCESSING

The futurists of Northrop's Advanced Systems Division in Southern California are directing their computer skills beyond the present and into the next century of aerospace. If you've got the ability and desire to glimpse the future in your discipline, you can participate side by side with the finest minds in the aircraft industry within our newest facility in Pico Rivera. Examine the opportunities listed below and join the futurists.

Network Communications

Need individuals with experience in maintenance and installation of computer hardware in a large IBM environment. Assignments involve troubleshooting problem hardware, designing hardware networks, assessment of comprehensive plans for installation of computer hardware and actual installation of various types of standard and graphic devices and minicomputers for business and scientific applications. Knowledge of ASYNC, BISYNC and SNA/SDLC protocols is expected.

Capacity Planners

Performance and tuning systems programmers with experience in tuning J. O. configurations job mix with heavy MVS. Familiarity with reporting techniques, graphical representation and SAS, as well as performance experience with Omegamon, SMF and RMF is required.

IMS Systems Programmers

Must have thorough knowledge of the IBM installation procedures for program products and other software that relates to IMS. Knowledge of ACB, PCB and complete SYSGEN process is required. Successful candidates will provide assistance to programming personnel related to procedures and policies of IMS.

Network Design Specialists

Must be experienced in design and analysis of 3705 FEP, and 3274 CU's in various configurations using SNA in a large IBM environment running JES 2 VTAM/TCAM. A working knowledge of ASYNC, BISYNC and SDLC diagnostic equipment in extensive on-going data testing and hardware feasibility studies.

Sr. ILS Systems Analysts (Scientific)

Must be capable of developing information systems requirements as well as estimating and documenting scientific oriented computer applications. Requires experience with a variety of modeling applications such as: maintenance data, maintainability, reliability, availability, cycle cost, etc. Must have 5 or more years recent military aerospace experience in one or more of the above. A BS/MS degree is preferred.

Computer Systems Technical Writer

Will develop documentation required for the development and implementation of business and scientific systems and models. Will ensure that all documentation is of high quality, meets commercial/military standards, reflects actual procedures/practices and is completed on schedule. Must have excellent oral and written communication skills. A BS/BA degree preferred. Previous ILS aerospace experience a plus.

Business Systems Programmers/Analysts

Will analyze and formulate system design solutions by coordinating with analytical and user personnel. IBM hardware must have IMS experience with emphasis in IMS DB/DC, COBOL, and other related software. ILS and Mark V experience a plus.

Responsibilities include designing, coding, testing, and implementing interactive business systems. Will work closely with requirements and in converting to the use of data processing systems. Will develop objectives for improving systems and perform liaison between engineering users and the data processing organization. Will assist in training of engineering user personnel in systems procedures. Qualified applicants should have analytical and systems design experience which include the following:

Engineering Systems Analysts

Will assist engineering users of data processing systems and services in establishing and planning for engineering systems requirements and in converting to the use of data processing systems. Will develop objectives for improving systems and perform liaison between engineering users and the data processing organization. Will assist in training of engineering user personnel in systems procedures. Qualified applicants should have analytical and systems design experience which include one or more of the following areas:

- NASTRAN Modeling and Simulation, finite element analysis used for avionics and structure.
- On-Line Systems for administration (drawing/change control, specifications, structures)
- CAD/CAM Computer Aided Design and tooling for interactive graphics.

Manufacturing Systems Analysts

Will assist Manufacturing users of data processing systems and services in establishing and planning for manufacturing systems requirements and in converting to the use of data processing systems. Will develop objectives for improving systems and perform liaison between manufacturing users and the data processing organization. Will assist in training of manufacturing user personnel in systems procedures. Qualified applicants should have analytical and systems design experience which include one or more of the following areas:

- Manufacturing Engineering applications, tooling, production planning
- Industrial Engineering - major instances, computation and data manipulation, MIL-STD-1567 & 1528.
- Operations Control - Labor and tracking data collections, shop floor control, inventory management, automated warehouses, capacity planning, scheduling.
- Material Control Procurement and material planning.
- Facilities and Transportation - Request tracking, inventory, vehicle dispatch and tracking, equipment maintenance.

Financial Systems Analyst

Will assist financial users of data processing systems and services in establishing and planning for financial systems requirements and in converting to the use of data processing systems. Will develop objectives for improving systems and perform liaison between financial users and the data processing organization. Will assist in training of financial user personnel in systems procedures. Qualified applicants should have analytical and systems design experience which include one or both of the following areas:

- Cash Management and Accounting - payroll, general ledger, budgets and accounts payable.
- Controller - Manufacturing technology as applied to controller, IMS, TSO and FORTRAN applications/development.

Data Processing Equipment Configuration Specialists

Your responsibilities will include equipment evaluation, acquisition recommendations, configuration design, installation planning, terminal and control unit installations, site facilities planning, and equipment and facilities inventory tracking.

Data Base Analysts/Designers

Several new positions are available including Data Base Design, MP and SMP processing support, DB, traditional IMS and newer relational, DB, products, IBM Data Dictionary automation and support, IMS Control Block (DBD, PSB, ACB) Generation. Other opportunities include the responsibility of evaluating DMBS related software, develop recommendations for advanced technical processing to upper management, as well as provide assistance to End Users, Requirements Planners, Systems and Programming Analysis and other DP duties. Experience in IMS Data Base Administration and/or design with a background in IMS on-line and/or Batch Message Processing required.

Selected candidates will receive excellent salaries and a wide variety of benefits. Please send your resume and salary history to:

WE WOULD LIKE TO CARRY YOU BACK TO "OLD VIRGINIA"...
CONTEL STYLE

We are Continental Page Engineers, Inc. of Vienna, Virginia. We are part of the 22,000 person Continental Telecom family. Continental Page Engineers is a provider of communications engineering and construction services to the Government Sector.

Located in pastoral Northern Virginia our country roads are home to many of the country's most respected high-tech engineering and consulting firms. Here you can experience a gentler life style with choices as varied as a walk along the Appalachian Trail or a scenic drive through the Shenandoah Valley. . . all still within easy reach of the museums and theatres of cosmopolitan Washington, D.C.

Since our acquisition by Continental in 1981 we have gone through an organizational metamorphosis—combining 35 years of international EFGI field expertise with the innovation and strength of CONTEL—an aggressive leader in the telecommunications field. As part of our technical enhancement program we are seeking creative contributors to help us rebuild our software development group. Current opportunities exist for:

— Director, Computer Applications and Software Development

This is a position for an individual with 8+ years experience in computer applications and in development of mini and/or micro computer software packages for engineering environments (including real-time operating systems). Three plus years management experience including responsibility for a technical support staff.

— Software Development Specialists

Candidates should be degreed and have a minimum of two years experience developing software (C, PASCAL, FORTRAN, Microcode and/or assembly languages) for DEC PDP-11 or VAX computers running RSX-11 M or UNIX operating systems.

— Systems Engineers

Individuals should be degreed and possess a minimum of five years experience designing real-time engineering systems, i.e., CAI and local and wide-area network applications. Interactive graphics experience is a plus.

Contel Page offers an excellent benefit package including medical, dental, life and AD&D and disability coverages, pension, stock option and participation plans.

Please send resume including salary history to:

Bev Cunningham

CONTEL

Equal Opportunity Employer M/F/H/V

Join the Leader in Computer-Aided Engineering

Mentor Graphics Corporation is a pioneer in the development of advanced CAE workstations for circuit and/or digital systems design. Product innovation and excellence, combined with an aggressive marketing and business approach, have quickly brought us to the forefront of this exciting, new industry. In record time, we have captured the lead in U.S. sales and are emerging rapidly as the industry leader worldwide. Our exceptional growth creates the following outstanding opportunities:

Field Applications Engineers

You will be responsible for providing both pre- and post-sales applications engineering support to customers in these key territories. Your primary responsibilities will include product demonstrations, benchmarks and technical consultation. Positions are available in Baltimore, Boston, Chicago, Minneapolis, Orlando, Phoenix, St. Louis, San Jose and Seattle.

To qualify, you must have a successful background in sales support, a BSEE or equivalent and excellent problem-solving skills. Experience in circuit design, CAE/CAD or ATE systems, analysis tools and/or computer systems is preferred. The ideal candidate will also demonstrate a good understanding of computer operating systems and high-level programming languages. We offer an excellent base salary, plus additional incentives, including a bonus program.

Sales Engineers/ Account Managers

You will be responsible for generating new sales prospects and for aggressively developing and managing customer accounts in one of the following territories. We are looking for truly outstanding sales professionals who have consistently achieved or exceeded sales goals and who excel in the area of new account development. Positions are available in Baltimore, Boston, Dallas, Denver, Detroit, Phoenix, St. Louis, San Jose, Seattle and New Jersey.

Your credentials must include 3-5 years of demonstrated success selling CAE/CAD or ATE systems to the electronic design market, and a BSEE, or equivalent. We are prepared to offer an excellent base salary, an escalating commission plan with unlimited earnings potential, a car allowance plus additional incentives.

Design Engineers

We are looking for highly motivated and innovative software and/or hardware design engineers capable of making substantial contributions to advancing state-of-the-art CAE technology. A bachelor's or advanced degree in Electrical Engineering or Computer Science and knowledge of high-level programming languages are required. Several positions are available in our Portland, Oregon and Santa Clara, California offices. We are working in the following areas:

- CAD/CAM
- Simulation
- Analysis
- Computer Graphics
- VLSI Design

If you are interested in being considered for one of these unusually rewarding opportunities, please mail your resume and salary requirements to: **Barbara Elliott, MENTOR GRAPHICS CORPORATION, 8500 S.W. Creekside Place, Beaverton, OR 97005-7191. (503) 626-7000.**

TEAMWORK

THE FORCE THAT DRIVES DALMO VICTOR

Dalmo Victor's feats of technology in Digital Avionic Systems can only be accomplished by the combined efforts of a dedicated team of professionals.

These feats, which include the finest, most advanced EW Systems at work in the free world today, now encompass ground, sea and airborne digital radar systems, antenna design, microwaves, magnetic systems, lasers, infrared and optoelectronics.

Join forces with the Dalmo Victor Team

SOFTWARE DEVELOPMENT ENGINEERS

Senior & Intermediate level positions available for those interested in the development of complex real-time software packages for commercial and military avionics systems. Must be experienced in the development of structured software packages from specification through validation; familiarity with Data General Assembler and block structured HOL and 68/20 or C/3 (or equiv.) desirable.

ELECTRONIC DESIGN ENGINEERS

NEW OPPORTUNITIES, created by expanding programs and new business developments, exist for Senior & Intermediate level Hardware Design Engineers. As a member of our Design Group, you will play a lead role in the design and development of high speed processors for Airborne EW systems. BS/MSEE and at least 5-10 years computer hardware experience required plus familiarity with current technology in both analog and digital circuitry.

Please send resume including salary history, in confidence, to Professional Employment, Dept. CW-416, Dalmo Victor, 1515 Industrial Way, Belmont, CA 94002. (415) 594-2000. An Affirmative Action Employer. U.S. CITIZENSHIP REQUIRED. Individuals only apply.

Software Systems Engineers
Software Development Engineers

If you want to build a new software division capable of providing total life cycle support...

Harris Can Make It Happen

If you want an aggressive entrepreneurial setting—then the Software Operation of Harris Government Information Systems Division could be the place for you. We are developing and using state-of-the-art methodologies, and have the opportunities for you to achieve the recognition you deserve. Positions are available in our Florida, Colorado Springs, and Washington D.C./Baltimore facilities. Requirements: BS in CS, EE or related technical disciplines. MS or PhD desirable. Experience in the government contracting environment helpful.

SOFTWARE SYSTEMS ENGINEERS
System-level design experience desired in some of the following: C³I Systems, Large Scale Databases, Local and Wide-Area Networks, Real-Time Data Acquisition, Interactive Graphics, Modeling and Simulation, Man-Machine Interface, Advanced Software Methodologies and Software Tool Development. Experience desired with Requirements Analysis Languages, Subsystem Definition, Proposal Preparation and Software Costing Models.

SOFTWARE DEVELOPMENT ENGINEERS
Experience sought in the design and implementation of software using structured languages (and programming techniques) including PASCAL, "C," ADA, FORTRAN 77 with DEC, DATA GENERAL, or HARRIS 800/500 Systems. Exposure to modern design methodology (such as PDLs) and structured development (team concept/structured walkthroughs) of medium to large scale software systems desired.

We are part of the Fortune 300 Harris Corporation, Florida's largest industrial employer. We offer an excellent compensation and benefits package, a formal merit review program, and outstanding advancement opportunities.

If you feel that your present position doesn't offer the kind of challenge and recognition you really want, call Julian D. Kaufmann, COLLECT, Monday thru Friday, 8 am-5 pm, EST at (305) 676-6467, for more information. Or send a resume to his attention at Harris GISD— Software Operations, Dept. CW, 150 Wickham Road, Melbourne, Florida 32901-1132. For further information after business hours, call 1-800-327-8552.

U.S. CITIZENSHIP REQUIRED.
SBI MAY BE REQUIRED.

POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS

Cheryl had wanted, for a long time, to move to another city clear across the country. Her problem was that she lacked information about wage levels, cost-of-living expenses, housing, etc. Also, she was not sure of the best way to find a good EDP position in her preferred city.

She had gone to other placement firms that were not nationally structured to help her. Then she came to us... and we made it easy for her. We contacted our affiliated office in her preferred city, got all of the information she needed on wage levels, cost-of-living expenses, housing, etc. We also arranged five employment interviews for her. She accepted an EDP position she felt was ideal for her, and her new employer paid all her interview and relocation expenses.

We can do the same thing for you, as we have done for thousands of others. Come in. Call. Or mail your resume to the firm nearest to you. Confidentiality is assured. Company clients assume our fees.

POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS

The National Radio Astronomy Observatory is a national center providing facilities to researchers in many areas of radio astronomy in the United States. Our facilities use expertise in real-time data acquisition and control, information retrieval techniques, image enhancement techniques, graphical image displays, video cassette data storage, etc. NRAO is recruiting Senior Computer Professionals for the Very Large Array (VLA) facility and for the Very Long Baseline Array (VLBA) project. The VLA comprises twenty-eight 25m diameter antennas forming an array 36km in diameter on the Plains of San Augustin, approximately 50 miles west of Socorro, New Mexico. The computers currently in use at the VLA include an on-line system comprising 8 ModComps and data reduction systems using many PDP-11s and VAX-11/780s with FPS AP-120B array processors and a DEC-10. The observatory is now accepting applications for the following position with the VLA:

SENIOR APPLICATIONS PROGRAMMING ANALYST

Will work with a small group of programmers and astronomers to develop data reduction systems, which produces and enhances digital images from VLA observations. The position requires ability to specify, design, implement, test and document software systems, to analyze and enhance existing software and hardware procurements. A bachelor's degree in a related field together with at least 5 years' experience in scientific computing is desirable. A broad knowledge of available computer architectures would be an advantage.

The VLBA will be a transcontinental version of the VLA, comprising ten 25m antennas spaced across the nation including sites in Puerto Rico and Hawaii, the operations center to be in in Socorro.

The observatory is now accepting applications for the following position with the VLBA project:

SCIENTIFIC PROGRAMMER

The successful applicant will work with a small group of programmers and engineers to develop the on-line real-time monitor, control, and data acquisition software both at the central facility and at the remote locations. Tiers a pleasant rural environment, has an excellent climate and is the home of New Mexico Institute of Mines and Technology. The observatory offers excellent benefits and working conditions. Persons applying for these positions should send their resume and salary requirements to:

An Equal Opportunity Employer M/F/H

UNIVERSITY OF EVANSVILLE

Growing department in small, urban, private University seeks tenure-track faculty with an interest in computer education to contribute to an applied undergraduate program in a nationally recognized graduate program in location oriented. The University of Evansville offers an extensive array of programs where high quality and unobtrusive encourage efforts to extend the University's impact beyond the Midwest. The Department of Computing Services is the largest department within the School of Engineering and Applied Science, but it serves students throughout the University. A very productive relationship has been established between the Department and the School of Business Administration, the Department of Mathematics and Physics in the College of Arts and Sciences, the School of Education and the Department of Electrical Engineering, all of which have established minors in Computing Science. The Department has an established interest in programs which address the computer education needs of faculty from small colleges, but it is also preparing a graduate program in Management Information Systems.

Doctoral-level faculty are invited to apply for Associate or full Professor appointment, based on teaching and professional stature. Appropriately experienced Masters-level faculty will be considered for Assistant or Associate level appointments. Salaries and benefits are very competitive for IIA category colleges. Address inquiries or resumes to Dr. William Mitchell, Chairman, Department of Computing Science, University of Evansville, P.O. Box 329, Evansville, IN 47702. EOE/AA Employer.

Supervisor/ Technical Services

Become part of our strong growth team in this new position at Pacific Telecom, located in the Beautiful Southern Washington Area of the Pacific Northwest.

Reporting to the Manager of Computer Operations, you will be responsible for the technical support of all hardware, software and communications networks associated with the Vancouver Data Center including:

- Supplying software system support including planning, design, problem solving and maintenance
- Matching hardware and systems software to departmental needs
- Providing technical advice to other Information Services Managers
- Establishing and controlling technical system support standards
- Assisting in capacity planning and future communications development
- Selecting, motivating and training departmental personnel

To qualify, you must have 5 years progressively responsible experience interacting with large IBM mainframe computer systems. Prior exposure to DEC, VAX/VMS or Honeywell DPS8 systems desirable. 2 years supervisory experience preferred.

PACIFIC TELECOM

We offer outstanding salaries and benefits in an unusually attractive environment. For immediate consideration, please send your resume to or phone Isaac Dixon, Personnel Analyst, PACIFIC TELECOM, P.O. Box 9901, Vancouver, WA 98668-9901. (206) 696-6891. Individuals only apply. Equal opportunity employer.

Manager Data Base Administration IDMS

Join the Space and Communications Group of Hughes Aircraft in Southern California, the people who have launched more communications satellites than all others combined. We are a rapid-growing, dynamic organization pushing data base technology to its limits. Based on IDMS, we are building one of the most advanced integrated data bases in the aerospace industry.

We are looking for a leader who will manage a team of ten or more data base administrators supporting IDMS data base development. If you have a degree in Business, Computer Science, Mathematics or Engineering, and preferably three or more years of IDMS data base development experience, Hughes is THE career opportunity for you.

Located west of Los Angeles, in El Segundo, California, Hughes' S&CG offers competitive salaries, excellent benefits, and a liberal relocation program. Send us your resume NOW, or call LARRY TOWNER, Manager of Data Administration, collect at (213) 414-7581.

Address your resume to: Judy Jones, S41/A300, Hughes Aircraft Company, Space & Communications Group, Employment Dept. WC-839, P.O. Box 92919, Los Angeles, CA 90009.

RESULTS

Whether you're buying, selling, swapping, hiring or looking, you get results from **Computerworld classifieds.** Maybe that's why **Computerworld** gets more classified advertising than all the other computer publications put together!

Technology-Driven MIS Environment

Fairchild Digital Test Systems in San Jose California dominates the world market for LSI/VLSI test systems, with over 1,000 systems installed. Our new Sentry 50 system, far and away the most sophisticated for VLSI, demonstrates how technology drives us. It could drive you to new career heights with a proven leader.

MIS Software Supervisor MVS, CICS, IMS/DB, JES2, VTAM

Take charge of our Systems Software function, running under MVS with CICS, IMS/DB, JES2 and VTAM. Reporting directly to the MIS Manager, you will oversee installation and ongoing support of program products including performance analysis, problem-solving, programmer support, data base design/analysis, and technical planning for both hardware and software. If you have a BS in Computer Science or equivalent plus at least 5 years solid systems programming experience in an MVS environment, you could be the skilled leader we seek. Your proven background in VTAM, CICS, JES2 and IMS/DB subsystems will be essential qualifications.

Senior Programmer/Analyst

If you have 5+ years program/analysis experience and a strong Manufacturing Systems background, this diversified opportunity could be for you. You will analyze business applications and resolve problems with new program design or modification of existing software. You'll perform the entire range of programming functions from flowcharts to test/debug, with emphasis on logic problems, comprehensive documentation, test and linkage to other software. A BS in Computer Science or equivalent with programming language expertise in COBOL, CICS, IMS and DL1 essential. Proficiency in systems development methods a must. Some COPICS or Marketing Systems experience a plus.

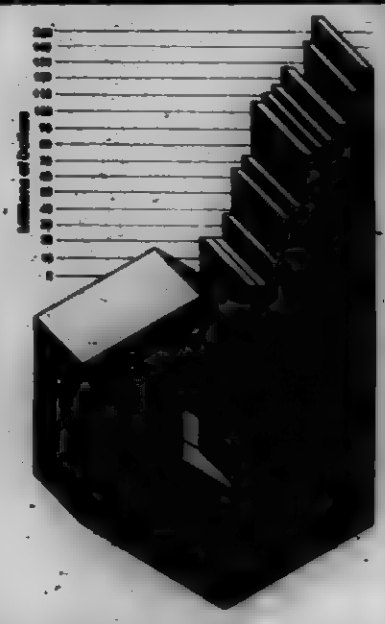
Your software expertise will expand at Fairchild Digital Test Systems. For immediate confidential consideration, please send your resume to Steve Hyndman, Fairchild Digital Test Systems, M/S 36-832P, 1725 Technology Drive, San Jose, CA 95115. (408) 998-0123. Equal opportunity employer. Principals only please.

FAIRCHILD DIGITAL TEST SYSTEMS SAN JOSE, CA

A Schlumberger Company

Software & Hardware Engineers

BE A PART OF A LIVING AMERICAN SUCCESS STORY!



Since 1961, we have grown from 11 to over 850 employees. As of 4th quarter, 1983, sales have grown from market entry to over $127 million and order backlog to over $243 million. The reason? Customer-oriented design, marketing and servicing of advanced digital switching systems that meet the needs of today...and tomorrow. If you would like to be part of a group that is writing a new chapter in telecommunications history, consider the following areas:

CALL PROCESSING
Design and development of real time telephone, attendant, trunk control and call processing software.

MAINTENANCE/DIAGNOSTICS
Design and development of configuration, control and diagnostics software for distributed processing systems.

OPERATING SYSTEM
Design and development of real-time operating systems software for distributed microprocessor based systems. Software includes: nucleus (process and memory management, inter-process communications), debugger, processor start-up, file management and utilities, data link communication protocols, and man-machine interface.

SWITCH ADMINISTRATION
Design and development of distributed processing software for database management, system performance monitoring (traffic measurements), call data recording (AMA), system overload management, and telephone network management.

HARDWARE DESIGN
Design experience should include microprocessor communication interfaces, peripheral controllers and memory systems. Minimum of three years experience designing T1 interfaces, lines or trunks for digital central offices, PABX's or subscriber carrier equipment. Familiarity with Z80, Z8000 or other microprocessors, as well as dynamic Ram components is a must.

SYSTEM INTEGRATION AND SUPPORT
Hardware and software test and integration on system level. Interface with customer and field operations.

All positions require a BS/MS CS, EE, Math or related discipline. Experience with Assembly language and/or "C" highly desirable.

We can offer competitive salaries, extensive company-paid benefits, and excellent potential for professional recognition...and advancement. For prompt consideration, please send your resume to:

Staffing Manager
Dept. 1000
Digital Switch Corporation

HELP WRITE A NEW CHAPTER IN TELECOMMUNICATIONS HISTORY

Senior Software Systems Engineers

Work at the cutting edge of advanced software development in a desirable sunbelt location.

The Government Systems Sector of Harris Corporation develops state-of-the-art software systems for the communications and information processing segments of government and the military.

To strengthen and complement our technology base, we are seeking several senior-level professionals to function as key consultants. They will support day-to-day issues regarding technology application, determine and lead the direction of future technologies and consult in the development of customer oriented applications and systems.

To qualify for these positions, you should have 10+ years' systems experience, and in-depth knowledge and hands-on experience in two or more of the following areas:

- UNIX tools, administration and systems internals
- Knowledge based systems
- ADA compilers and ADA support environment
- DBMS internals and applications

Harris offers a work environment well suited for leading edge technologies, in a Florida ocean-side setting that emphasizes quality of life.

If you are interested in working at the forefront of software development in a highly desirable geographic location, call P.H. Gribbin COLLECT at 305-725-7342. Or send your resume to his attention at Harris Government Systems Sector, Dept. CW, P.O. Box 37, Melbourne, FL 32902

U.S. CITIZENSHIP REQUIRED
We are an equal opportunity employer M/F/H/V

IF IT'S HAPPENING IN ELECTRONICS, IT'S HAPPENING AT HARRIS.

COMPUTER PROFESSIONALS

Help us build the foundation for tomorrow's software

Foundation Computer Systems is a software research and development company. Our satisfied customers include several Fortune 500 companies. Our Cary, NC location is adjacent to the Research Triangle Park and three major universities.

We work with many kinds of computers, languages, and operating systems. In the past year we have doubled the size of our technical staff, while maintaining our profitability. Our staff is still growing, and we need more good people. We have openings for hard working and experienced:

- application programmers–COBOL
- systems programmers–C
- operating systems programmers–Unix™, VMS™
- database programmers–C, relational
- software technical writers
- compiler developers–C, COBOL, Pascal, FORTRAN, BASIC

In addition to providing consulting services, we have produced our own product, called ALLY™. ALLY integrates an easy-to-use application development system with the industry's most powerful window-oriented screen management system. Several major computer manufacturers have purchased ALLY licenses.

Our exciting projects will allow you to make the most of your talents and skills. We offer the best of two worlds: a fast-moving, small-company atmosphere, along with big-company benefits, rewards and security.

To arrange an interview, send your resume to:

Information Systems Specialists

Could your career use a world-class connection?

Where

General Electric in Waterford, NY is a recognized leader in silicones—as inventor and developer of the technology, as creator of new applications and markets, as pioneer in manufacturing process controls, as a state-of-the-art operation in every phase, every department. We now have career openings for advancing our information management systems.

Doing what

Specialist, Information Systems

To develop system design specifications for Manufacturing/Engineering Information Systems. This includes directing project teams in design, programming and documentation, creating new techniques in information systems and monitoring their effectiveness. Requires continual effective communication with user community and systems staff. You'll need a pertinent degree and 5-7 years of system/design experience in manufacturing systems, including MRP Production Control, Inventory, and Cost Systems. Knowledge of distributed systems techniques in IBM 370 environment is important.

Specialist, Data Base Administration

For administering support of a complex IDMS data base while establishing control of data access and manipulation and installing procedures for optimizing available storage space. Includes defining, installing, maintaining and documenting a system providing on line access to the data base.

You'll need a pertinent degree or equivalent with 3-5 years in Data Base/CICS; design, definition, application with IDMS or a relational DB; and knowledge of such tools as ASM/2 and ACF2 and Culinets add-on line.

Specialist, System Programmer

To be responsible for installation, maintenance and performance of the MVS operating system on the central computer. Includes problem determination and resolution, installation and documentation of procedures, determining best hardware and software for requirements, and providing documentation of host systems for operators, support personnel and users.

You'll need a college degree (or Associates with added experience) with 2-4 years in installation and maintenance of MVS operating systems, including use of SMP, experience in performance tuning and capacity planning, and knowledge of majority of: SPF, SMF/RMF, ACF2, SAS, VTAM and ASM/2.

With these advantages

Respect for creative solutions, an environment of thorough professionalism, excellent salaries and comprehensive benefits. To explore your potential here, please send resume with salary history—indicating position of interest—to Mr. David Troyner, Employee Relations, Ref. 48-S, General Electric Company, Silicone Products Division, Waterford, NY 12188.

The future is working at General Electric

An Equal Opportunity Employer

Software Professionals:

Link your Achievements to Ours

The fulfillment of a bright future doesn't just happen. It takes foresight—choosing the right company. A company that can offer the challenges, experiences and diverse exposure to take you beyond previous limits. A company like Raytheon Service Company.

At Raytheon Service Company, we provide world-wide engineering services for a broad spectrum of government and commercial customers. Services that keep, even the most advanced and sophisticated systems in top operating condition. Backed by the extraordinary range of resources of Fortune 100 Raytheon, we are constantly expanding our capabilities to meet the ever changing and challenging demands of future technology. And now we are looking for software professionals, with that same sense of challenge and ambition, to link their talents with ours.

Together, we can achieve. The following opportunities are now available:

Aegis Simulation Software

Software engineers are required to provide on-site support to the Naval Surface Weapons Center at Dahlgren, VA for the AEGIS fire control system life cycle maintenance and fire control system functional simulation programs. Requires a BSCS or equivalent experience in design and development of real-time computer programs, and 2 years experience in AEGIS computer programming.

Tomahawk Software Support

We have current opportunities available for software engineers possessing a strong background in Tomahawk Cruise Missile Software at our Dahlgren, VA facility. BSCS or equivalent is required. Additional experience in simulator programming a definite plus.

Computer Aided Instruction

We are looking for key contributors to provide both hardware and software support for our interactive videodisc CAI training programs in Burlington, MA and at Beech Aircraft Corporation in Wichita, KS. The ideal candidates will have a BSEE and programming experience in assembly, compiler languages (e.g., BASIC, PASCAL, "C") on microcomputer systems (especially SONY equipment). Digital and analog electronics experience essential. Instructor training experience in electronics preferred.

Marketing Manager

This position, located in Mt. Laurel, NJ, entails the identification and pursuit of new business opportunities and the formulation of capture plans, proposal strategies and overall marketing plans. You will provide the DoD marketplace with software engineering services including simulation modeling, scientific programming for computer-assisted engineering research, and real-time software development. This responsible position requires significant experience in marketing software or similar products/services to governmental agencies, knowledge of government procurement practices and prior experience in direct sales.

Advanced Navy Systems

We have immediate and on-going needs for software engineers with a technical degree and at least 5 years experience with Advanced Navy Systems' including surface and underwater fire control, missile guidance, radar data processing, system simulation and automatic test equipment. Proficiency in CMS-2, ULTRA-16/32, Ada, "C", JOVIAL and/or ATLAS is needed and experience in the AN/UYK-7/11/20/43/44, MB8000 or VAX 11/780 is preferred. Knowledge of MIL STD 480 and MIL STD 1679 a plus. Locations available include: Mount Laurel, NJ, Dahlgren, VA, Portsmouth/Newport, RI and Massachusetts. *Several positions offer the opportunity for travel and overseas assignment.*

Software Diagnostics

We currently have openings in Massachusetts for software engineers to design, develop and test diagnostic software for digital and analog hardware in PATRIOT, a large scale, complex, computer controlled air defense system. You will be primarily utilizing a structured, high level language as well as assembly language and microcode, and work closely with hardware engineers to define joint hardware/software requirements. A BA or BS in Math or Science, plus a minimum of 2 years of closely related experience in software development is required, along with an in-depth understanding of hardware and structured programming techniques.

These are only a few of the outstanding Software opportunities currently available. We offer competitive salaries and a comprehensive company-paid benefits package. If you qualify and are interested, please forward resumes in complete confidence to: Dr. Barbara Lashbrook, Dept. CW4, Raytheon Service Company, 2 Wayside Road, Burlington, MA 01803.

AT FAIRCHILD WESTON: INDIVIDUALS HAVE PROJECT RESPONSIBILITY

Look to Fairchild Weston if you seek the individual challenges, responsibilities and rewards of seeing projects through from start to finish. For 38 years, we've been the leader in EMR telemetry, signal processing and data acquisition systems. Our technological excellence and innovation have resulted in steady sales growth, creating exciting career opportunities for experienced engineering and/or computer science professionals.

The following positions require U.S. citizenship, and extensive background investigations may be conducted:

SENIOR SOFTWARE Q.A. ENGINEER

An exciting career opportunity exists for an individual experienced in software quality assurance. We seek a person with strong leadership skills to develop and head our software Q.A. function. Experience with real-time software specifications, design, development and documentation desired. Experience with software Q.A. mil-standards required. The successful applicant will develop and implement a Q.A. program for our system software products. A BSEE or BSCS or applicable experience preferred.

SOFTWARE SPECIALISTS

Positions require experience in the design and implementation of large scale real-time systems utilizing structured methology. Experience with VAX-11, RSX-11M or VMS operation systems and assembly language/FORTRAN required. Knowledge of signal processing, graphics, data base implementation or large scale netted computer systems is highly desirable. Project leader position requires prior experience with proposal generation and cost estimating.

Fairchild Weston offers top compensation, liberal fringe benefits, relocation assistance, and a casual but challenging work environment.

Sarasota is a beautiful beach community on Florida's Gulf Coast. Sarasota enjoys a respected school system, attractive residential communities, a low tax structure, no state income tax, and a year 'round recreational climate.

Manager Technical Support Center

Be part of the exciting new high-tech product advances at NCR.

In this new, highly visible position, combining technical and marketing skills, you will manage hardware/software technical support professionals in third party development of hardware and software packages for the NCR Personal Computer. Reporting to the General Manager, you will also be involved in product demonstrations/promotions to major customers and dealers.

Your background should include a BSEE/BSCS, MBA preferred; and experience in software development with a proven track record in marketing.

Salary is commensurate with experience. Benefits are excellent. And the location near Greenville is ideal for working and living. Send your resume with salary history/requirements to: Bill Tisdell, ISAACS, NCR Corporation, Dept. A-68, 1159 Anderson Drive, Liberty, South Carolina 29657. (No agencies, please).

TECHNICAL ANALYST
Systems Programming
San Francisco Position

In the 70's, Walker was rated at the top of *International Computer Programs'* list of the 15 leading young computer companies to watch. In the 80's. This prediction for success is being realized. Walker's extensive R&D efforts have taken it from being a one-product company to an organization which has both superior computer technology and top-rated financial applications systems. We remain committed to raising the current state of the art in computer technology and fulfilling public prediction for our continued success. To assist us in achieving our goals, we are looking for dedicated computer professionals.

We are currently seeking a Technical Analyst with systems programming experience to provide technical support to customers using on-line application in several DB/DC systems environments. You will perform analysis in system related areas, as well as define the resolution of technical problems and assist customers in applying solutions. To qualify for this position, you must have 4 or more years systems programming experience in IMS, CICS, ADABASE or other DB systems with telecommunications in an OS/DOS environment. Experience in an IBM mainframe environment is also required, as is outstanding problem solving and analytical ability. Since this is a position requiring heavy customer contact, you must possess strong written and verbal communications skills. College or related experience would be considered helpful. This position does not involve travel.

In addition to high growth potential in a progressive environment, we offer an excellent salary and benefits package. Please send your resume to the Director of Human Resources, Walker Interactive Products, 100 Mission Street, Suite 300, San Francisco, CA 94105.

We are an equal opportunity employer.

Wanted: D/P Professionals
for a PRIME INFORMATION SYSTEM

Hardware Communications Expert

We are searching nationally for the best hardware and communications expert money can buy! We need someone with at least 3 years experience on Prime Computers to administer and develop a nationwide communications network. You will be responsible for a Prime 9650 with the Information Operating System that supports over 80 users nationwide. You will research, make recommendations and negotiate for hardware and communications equipment. You will manage the hardware side of a rapidly expanding DP department.

Salary range - $30,000 to $50,000 per year based on experience and background.

Programmer/Analyst

We need a strong applications programmer with at least 2 years experience on Prime Computers to develop software on our Prime 9650 with the Information Operating System. Your responsibilities will include design and implementation of new systems, enhancement of existing systems, and interfacing with our documentation and communication personnel.

Salary range - $25,000 to $40,000 per year based on experience and background.

Benefits:
Substantial performance bonus program
Top line health and insurance benefits
Great location - Santa Cruz, California
Corporate commitment to leading edge technology
Exciting R & D atmosphere

NEW 4381 INSTALLATION

The following expert staff are required to form the technical nucleus of the newly expanded Computer Department of the Royal Cimon Police. Micros, Minis and Word Processors are already in use and an IBM 4381 is on order.

The Royal Cimon Police is an expanding and progressive Force with wide ranging responsibilities, including Customs and Immigration.

A) DATABASE ADMINISTRATOR $ 42,000

Minimum of 8 years experience of which at least 3 years must have been spent as a database designer or database administrator in an online, realtime IMS/CICS environment. Must have been responsible for the design and implementation of at least one large and complex IMS/CICS database.

B) PROJECT LEADER $ 35,000

Minimum of 8 years IBM experience of which at least 3 years must have been as a chief systems analyst or project leader in an online realtime environment using MVS, IMS, CICS, and COBOL. Database design experience an advantage, as would be a knowledge of SNA and PL/1.

C) SENIOR ANALYST/PROGRAMMERS $ 29,000

Minimum of 5 years IBM experience of which at least 3 years must have been spent designing and programming online applications in a CICS/DL/1 environment using COBOL, including at least one major project from design to implementation.

D) SENIOR SYSTEMS PROGRAMMERS $ 29,000

Minimum of 5 years IBM experience of which at least 3 years must have been spent in a systems support role in an MVS, IMS, CICS environment. Experience of SNA an advantage.

These appointments are family status and offered on contract terms of service for an initial period of 2 years. The tax-free salaries shown above are calculated at current exchange rates and are inclusive of an 'end of contract' payment of 20% of the amount shown per annum. Other benefits include furnished, air-conditioned accommodation, car, medical treatment, and 60 days leave per annum for the database administrator and project leaders (45 days for the other posts).

Applications with detailed curriculum vitae attached should be forwarded not later than 30th April to:

Inspector General of Police and Customs, Attn: Assistant Inspector General (P), C/o. Gregg International, P.O. Box 11618, Kansas City, MO 64138.

TECH SUPPORT $30-45,000

Growth positions in the Twin Cities and surrounding areas. MANAGER: Supervise 4 Systems Programmers. Job planning and analysis. Requires 2 yrs in OS communications experience. 2 + yrs systems programming & strong interpersonal skills. Job #6807 IMS DATA BASE ANALYST: Must have 2 yrs IMS exposure in Data Dictionary and TSO/SPF. Job #6824 DOS/VSE SYSTEMS PROGRAMMER: Requires 2 yrs Data Communications (must be CICS/VTAM). Job #4869 DATA BASE ADMINISTRATOR: Prefer some DEC VAX 11/780 experience with VAX/VMS. Must Require: existence of theoretical data base design (logical database) systems a plus. Job #6825 FEE PAID

Will the real lessor please stand up!

Who do you want to deal with during your computer lease?

An investor? An insurance company? A consortium of banks? Or your leasing company!

As computer experts, we understand your individual equipment requirements. Hartford Computer Group doesn't sell your leased equipment to an investor who will not understand or care about your requirements.

When you sign a lease with Hartford Computer Group, you deal only with us. We maintain complete ownership and control of your leased equipment and can therefore give you the *flexibility* you want in a computer lease. We can do this only by refusing to participate in tax-advantaged leasebacks that give investors control over your leased equipment. Tax-advantaged leases allow for little or no flexibility!

We give you Hartford Computer Group. Want to lease computer equipment? Want to upgrade your computer equipment, renew your lease, or change your leased system completely? With no outside investors or participants to inhibit your transaction, Hartford Computer Group is free to offer the ultimate flexibility in customer service.

You deal with one company, before and after the lease begins, the real lessor... Hartford Computer Group!

Your questions about our unique computer leasing program are answered in our brochure. Write or call for your copy.

HOW TO SAVE $30,000 PER MONTH ON A 3083 LEASE.

Lease the same 3083 that IBM leases for over $92,000 per month from Randolph—for less than $62,000 per month. That adds up to savings of $1,440,000 over a four-year lease period. If you're renting an older machine, Randolph may save you even more—and you'll get about four times the throughput in the bargain.

WHEN IS THE BEST TIME TO TALK TO RANDOLPH ABOUT LEASING A 3083?
Now—because Randolph has 3083's available for 4th quarter delivery. But it's never too late, even if you already have a machine installed. Whatever your situation, we can tailor a lease that will fit your exact needs and let you start saving money right away.

TALK TO RANDOLPH NOW.
We can solve problems like these, and more . . .
Stuck with a lease on your old machine?
We'll sublease it, and provide a new lease on a 3083.
Own a 3083 but need cash?
Sell your machine to Randolph, and we'll lease it back to you.
Machine installed on a rental basis?
We'll show you how to end the lease and install a new 3083. Any termination charges can be folded into your new Randolph 3083 lease.

LEASING COMPUTERS IS OUR ONLY BUSINESS.
At Randolph, our people have an average of 18 years in the DP industry . . . from 360's to 3081's. They know all about alternative financing to be sure, but they also know their way around a DP department and the hardware in it.

WE LEASE MORE THAN 3083's.
Whatever your needs, now is the time to talk to Randolph. We provide leases for IBM 303X, 4300 and 3081 systems and peripherals—disks, tapes—as well as 3083's.

UNIQUE FINANCIAL STABILITY.
We're an important part of one of the nation's oldest and leading financial institutions . . . The First National Bank of Boston. 19 years in computer leasing gives added assurance that Randolph will continue as the leader in the computer leasing industry . . . continue to live up to the terms and conditions of our agreements . . . provide upgrades . . . fulfill all of our commitments.

LET RANDOLPH HELP YOU SAVE $30,000 PER MONTH.
We can solve a lot of problems for you, and save you money, too. Talk to Randolph now . . . call Joseph B. Kelly, Jr., Executive Vice President, 800-243-5307

537 Steamboat Road
Greenwich, Connecticut 06830

BUSINESS OPPORTUNITY

YOUR COMPANY PRESIDENT RESPECTFULLY REQUESTS THAT YOU IGNORE THIS AD.

You already know the frustrations inherent to your job. It's time you heard about the rewards.

Your expertise has put you in a position to take advantage of an opportunity that not too many people have in their lifetime.

To be your own boss. To call your own shots. To control your own future.

And that's what we're offering you at The Software Place.

Perhaps the finest retail source of business and personal software now expanding in selected markets across the nation, The Software Place is part of a segment that analysts project will more than double in sales each year to $2.9 billion by 1988.

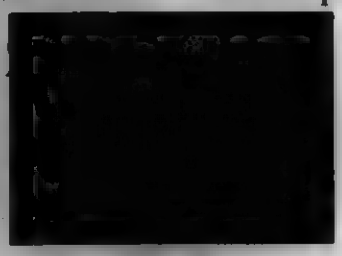
And you can be a part of it as an owner/manager of your own store.

Franchise opportunities are now available to qualified individuals with $50,000 liquid capital and the ability to obtain $110,000 additional financing.

In return, you'll receive one of the most comprehensive franchise programs in the industry. A program that analyzes your market area to determine the most advantageous site for your Software Place store and then goes on to take you through store opening and beyond. Including ongoing technical support that continues throughout the life of the store.

Give us a call. If you meet the requisites outlined in this ad, we'll send you our complete information package, including our videotaped presentation.

We think you'll find that it contains a wealth of information.



THE SOFTWARE PLACE™

8701 North MoPac Blvd, Suite 165 Austin, Texas 78759 512 343-0414

COMPUTERWORLD

COMPUTERWORLD's paid circulation climbed to over 125,000 this spring. Folio 400 (Folio Magazine's study of trade publication performance) placed us first in total revenue. As the industry grows, so will COMPUTERWORLD. It will continue to offer the high quality news coverage and editorial content that has attracted its readers. What does that mean to you, our advertisers? Good news...in the form of wide exposure.

The Classified section of the newspaper is laid out in an attractive format and is easy to read. It offers classifications to solve a variety of problems: Position Announcements, Positions Wanted, Buy - Sell - Swap, Software for Sale, Software Wanted, Time & Services, Real Estate, Publications, Bids & Proposals, Auctions, Seminars & Conferences.

Our BULLETIN BOARD section is ideal for the smaller companies who want a low-cost way to sell pieces of equipment (hardware or software). The BULLETIN BOARD is laid out as a quick reference for potential buyers who know what they are after.

So, as a nationwide publication, we give you the exposure you want. As a weekly publication, we give you the immediacy your advertisements need.

A number of special issues of COMPUTERWORLD are scheduled to run in 1984. Each of these issues will feature one aspect of the computer industry and give our advertisers a chance to reach a more-select audience. These are the topics the issues will cover:

- April 30 - Micros in Big Business
- May 28 - Software Productivity
- June 25 - Graphics Systems
- July 2, 9, 16 - NCC Issues
- August 27 - Minis & Small Business Systems
- September 24 - Data Base Management Systems
- October 29 - Protecting the Corporate Information Resource
- November 26 - Data Communications Terminals

COMPUTERWORLD publishes every Monday with an ad deadline of 10 days prior to each issue date. You may send in copy to be pubset or camera-ready material (velox or negative) via the mail. We provide telecopier service and will also take ads over the phone.

Information concerning classified advertising rates, color costs, ad sizes, mechanical specifications along with more detailed information on the special issues is contained in the 1984 Rate Card #19 and Media Kit.

Our mailing address is COMPUTERWORLD, Classified Advertising, 375 Cochituate Road, Box 880, Framingham, MA 01701. Or call for more information at 1-800-343-6474 or, in Massachusetts, (617) 879-0700.

ORDER FORM
COMPUTERWORLD BULLETIN BOARD

Issue Date(s): Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Software, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 451) should be clearly typewritten. Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $180.00 (One unit minimum and no fractional units allowed.) There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

Issue Date(s): _____

SOFTWARE FOR SALE

AT AT&T, WE TEACH UNIX™ OPERATING SYSTEMS AS IF WE INVENTED THEM.

Announcing training from the creators of the UNIX Operating Systems.

Now everyone can get top quality UNIX Operating Systems training, from the people who created them—AT&T Bell Laboratories. Along with our certified instructors, we offer a complete curriculum for UNIX Operating Systems, including UNIX System V.

These courses are the same as those conducted internally at AT&T Bell Laboratories. And we furnish them at your location or at one of our conveniently located centers: Princeton, NJ; Chicago, IL; Columbus, OH; and Sunnyvale, CA.

We provide an individual terminal for each student. And in the evening, the use of our facilities and terminals is available at no extra cost. In addition, volume discounts are available.

All UNIX Operating Systems courses are designed and developed to high quality standards by AT&T, as part of a total commitment to UNIX Operating Systems support. Now with our training, you can learn firsthand, what everyone else has been teaching secondhand.

For information, call us at 800-221-1647 or write to AT&T, P.O. Box 2000, Hopewell, NJ 08525.

SERIES/1 SPECIALISTS

COMPUTERWORLD CLASSIFIEDS WORK!

It's easy to advertise in COMPUTERWORLD. If you don't have an advertising agency to supply us with copy, layout and order, or camera ready mechanical, stat or film negative of your ad, just call one of our ad-takers at 1-800-343-6474. They will be glad to take your ad and typeset it in available fonts at no extra charge. If you have lengthy ads that require logos and artwork, just send a clean typewritten copy of your ad to the classified advertising department at COMPUTERWORLD (telecopier service is available); note the ad size you want; and, if you want your company logo to appear in your ad, please be sure to include a camera-ready copy with your insertion order. You should also supply any special borders, headlines and artwork that you want in your ad. Our Art Department will follow your suggested layout as closely as possible if you wish to send one.

Ad closing is every Friday, 6 working days prior to issue date.

Rates: Open rate is $128.10 per column inch. Columns are 2" wide. Minimum ad size is 2 column inches (1 column wide by 2 inches deep), and costs $256.20 per insertion. Additional space is available in half inch increments. Some sample sizes and costs are shown.

1 col X 4" - $ 512.40
2 cols X 4" -$1024.80
2 cols X 5" -$1281.00
2 cols X 8" -$2049.60

Discounts are available when you run more than 35 column inches of advertising in a year anywhere in Computerworld. Box Numbers are available, $15 per insertion.

To reserve space for your ad, or if you'd like more information on Classified advertising in COMPUTERWORLD, call our office nearest you.

Need general accounting software for IBM System/38?

We've simply solved your problem.

LAWSON ASSOCIATES has solved it with the first general accounting software specifically designed for IBM System/38. Not merely compatible, but state-of-the-art to fully utilize your computer's capabilities. Compare. You won't find a total software solution like it anywhere else.

DESIGN FEATURES: They include: on line systems using data base management; menu driven, user friendly programs written in RPGII, the System/38 language; and integrated modules. Their benefits: ease of installation and use, plus maximum employee productivity.

INTEGRATED MODULES: Those available include: General Ledger and Report Writer/Accounts Payable/Accounts Receivable/Fixed Assets/Payroll/Personnel/Purchase Order/Order Entry/Inventory Control

SERVICE FEATURES: Fully documented and supported. Onsite training and implementation. One year warranty. Available now for immediate installation.

SECURITY

Protect sensitive information with *Ven-Tel's 212 SECURITY PLUS*. Password restrict any terminal to calling only the destinations and applications you authorize. Telephone numbers, passwords, account numbers, and log-in codes are concealed to prevent unauthorized disclosure or use.

Ven-Tel security is not limited to password protection. You are secure in the confidence that your Ven-Tel modem is the most reliable and dependable in the world.

Security is the assurance that Ven-Tel has committed the investment in research, development and production facilities necessary to continued industry leadership and provide off-the-shelf delivery.

Security is knowing that the modem you buy from Ven-Tel is the most modern, technologically-advanced product available on the market today. It is knowing that when you need help, a Ven-Tel technical support specialist is as close as a telephone call. It is the confidence that Ven-Tel will be there with service and support for your equipment as long as you own it.

For information call: (800) 538-5121
